

# MAX5713/MAX5714/MAX5715

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### General Description

The MAX5713/MAX5714/MAX5715 4-channel, low-power, 8-/10-/12-bit, voltage-output digital-to-analog converters (DACs) include output buffers and an internal reference that is selectable to be 2.048V, 2.500V, or 4.096V. The MAX5713/MAX5714/MAX5715 accept a wide supply voltage range of 2.7V to 5.5V with extremely low power (3mW) consumption to accommodate most low-voltage applications. A precision external reference input allows rail-to-rail operation and presents a 100k $\Omega$  (typ) load to an external reference.

The MAX5713/MAX5714/MAX5715 have a 50MHz 3-wire SPI/QSPI™/MICROWIRE®/DSP-compatible serial interface that also includes a RDY output for daisy-chain applications. The DAC output is buffered and has a low supply current of less than 250 $\mu$ A per channel and a low offset error of  $\pm 0.5$ mV (typ). On power-up, the MAX5713/MAX5714/MAX5715 reset the DAC outputs to zero, providing additional safety for applications that drive valves or other transducers which need to be off on power-up. The internal reference is initially powered down to allow use of an external reference. The MAX5713/MAX5714/MAX5715 allow simultaneous output updates using software LOAD commands or the hardware load DAC logic input (LDAC).

A clear logic input ( $\overline{\text{CLR}}$ ) allows the contents of the CODE and the DAC registers to be cleared asynchronously and sets the DAC outputs to zero. The MAX5713/MAX5714/MAX5715 are available in a 14-pin TSSOP and an ultra-small, 12-bump WLP package and are specified over the -40°C to +125°C temperature range.

### Applications

- Programmable Voltage and Current Sources
- Gain and Offset Adjustment
- Automatic Tuning and Optical Control
- Power Amplifier Control and Biasing
- Process Control and Servo Loops
- Portable Instrumentation
- Data Acquisition

QSPI is a trademark of Motorola, Inc.

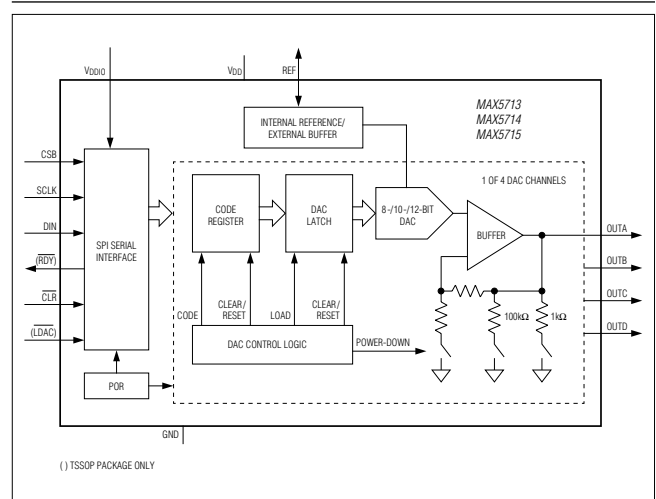

MICROWIRE is a registered trademark of National Semiconductor Corporation.

### Benefits and Features

- ◆ **Four High-Accuracy DAC Channels**
  - ◇ 12-Bit Accuracy Without Adjustment
  - ◇  $\pm 1$  LSB INL Buffered Voltage Output
  - ◇ Monotonic Over All Operating Conditions
  - ◇ Independent Mode Settings for Each DAC
- ◆ **Three Precision Selectable Internal References**
  - ◇ 2.048V, 2.500V, or 4.096V
- ◆ **Internal Output Buffer**
  - ◇ Rail-to-Rail Operation with External Reference
  - ◇ 4.5 $\mu$ s Settling Time
  - ◇ Outputs Directly Drive 2k $\Omega$  Loads
- ◆ **Small 5mm x 4.4mm 14-Pin TSSOP or Ultra-Small 1.6mm x 2.2mm 12-Bump WLP Package**
- ◆ **Wide 2.7V to 5.5V Supply Range**
- ◆ **Separate 1.8V to 5.5V V<sub>DDIO</sub> Power-Supply Input**
- ◆ **50MHz 3-Wire SPI/QSPI/MICROWIRE/DSP Compatible Serial Interface with  $\overline{\text{RDY}}$  Output**
- ◆ **Power-On-Reset to Zero-Scale DAC Output**
- ◆  **$\overline{\text{LDAC}}$  and  $\overline{\text{CLR}}$  For Asynchronous Control**
- ◆ **Three Software-Selectable Power-Down Output Impedances**
  - ◇ 1k $\Omega$ , 100k $\Omega$ , or High Impedance

### Functional Diagram

### ABSOLUTE MAXIMUM RATINGS

|  |  |   |                 |
|--|--|---|-----------------|
| $V_{DD}$ , $V_{DDIO}$ to GND .....                                 | -0.3V to +6V   | Maximum Continuous Current into Any Pin .....       | $\pm 50$ mA     |
| $OUT_{-}$ , REF to GND .....                                       | -0.3V to the lower of<br>( $V_{DD} + 0.3$ V) and +6V   | Operating Temperature Range .....                   | -40°C to +125°C |
| $CSB$ , $SCLK$ , $\overline{LDAC}$ , $\overline{CLR}$ to GND ..... | -0.3V to +6V   | Storage Temperature Range .....                     | -65°C to +150°C |
| $DIN$ , $\overline{RDY}$ to GND .....                              | -0.3V to the lower of<br>( $V_{DDIO} + 0.3$ V) and +6V | Lead Temperature (TSSOP only)(soldering, 10s) ..... | +300°C          |
| Continuous Power Dissipation ( $T_A = +70^{\circ}$ C)              |  | Soldering Temperature (reflow) .....                | +260°C          |
| TSSOP (derate at 10mW/°C above 70°C) .....                         | 797mW  |   |                 |
| WLP (derate at 16.1mW/°C above 70°C) .....                         | 1288mW   |   |                 |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### PACKAGE THERMAL CHARACTERISTICS (Note 1)

|  |         |  |        |
|--|---------|--|--------|
| TSSOP  |         | WLP  |        |
| Junction-to-Ambient Thermal Resistance ( $\theta_{JA}$ ) ..... | 100°C/W | Junction-to-Ambient Thermal Resistance ( $\theta_{JA}$ ) |        |
| Junction-to-Case Thermal Resistance ( $\theta_{JC}$ ) .....    | 30°C/W  | (Note 2) .....   | 62°C/W |

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

**Note 2:** Visit [www.maximintegrated.com/app-notes/index.mvp/id/1891](http://www.maximintegrated.com/app-notes/index.mvp/id/1891) for information about the thermal performance of WLP packaging.

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### ELECTRICAL CHARACTERISTICS (continued)

( $V_{DD} = 2.7V$  to  $5.5V$ ,  $V_{DDIO} = 1.8V$  to  $5.5V$ ,  $V_{GND} = 0V$ ,  $C_L = 200pF$ ,  $R_L = 2k\Omega$ ,  $T_A = -40^\circ C$  to  $+125^\circ C$ , unless otherwise noted. Typical values are at  $T_A = +25^\circ C$ .) (Note 3)

| PARAMETER                          | SYMBOL    | CONDITIONS   | MIN | TYP | MAX | UNITS |
|------------------------------------|-----------|--|-----|-----|-----|-------|
| SCLK Fall to $\overline{RDY}$ Fall | $t_{CRF}$ | Applies to 24th SCLK falling edge, $C_{LOAD} = 20pF$ |     |     | 40  | ns    |
| SCLK Fall to $\overline{RDY}$ Hold | $t_{CRH}$ | Applies to 24th SCLK falling edge, $C_{LOAD} = 0pF$  | 2   |     |     | ns    |
| CSB Rise to $\overline{RDY}$ Rise  | $t_{CSR}$ | $C_{LOAD} = 20pF$ (Note 13)                          |     |     | 40  | ns    |

**Note 3:** Electrical specifications are production tested at  $T_A = +25^\circ C$ . Specifications over the entire operating temperature range are guaranteed by design and characterization. Typical specifications are at  $T_A = +25^\circ C$ .

**Note 4:** DC Performance is tested without load.

**Note 5:** Linearity is tested with unloaded outputs to within 20mV of GND and  $V_{DD}$ .

**Note 6:** Offset and gain errors are calculated from measurements made with  $V_{REF} = V_{DD}$  at code 30 and 4065 for MAX5715, code 8 and 1016 for MAX5714, and code 2 and 254 for MAX5713.

**Note 7:** Subject to zero and full-scale error limits and  $V_{REF}$  settings.

**Note 8:** Measured with all other DAC outputs at midscale with one channel transitioning 0 to full scale.

**Note 9:** On power-up, the device initiates an internal 200 $\mu s$  (typ) calibration sequence. All commands issued during this time will be ignored.

**Note 10:** Guaranteed by design.

**Note 11:** All channels active at  $V_{FS}$ , unloaded. Static logic inputs with  $V_{IL} = V_{GND}$  and  $V_{IH} = V_{DDIO}$ .

**Note 12:** Daisy-chain speed is relaxed to accommodate ( $t_{CRF} + t_{CSS0}$ ) with margin (derived specification, not production tested).

**Note 13:** This specification and its propagation through the chain limits how quickly an aborted daisy-chain command can be followed by another daisy-chain command, to be applied on a per-device basis.

# MAX5713/MAX5714/MAX5715

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### **Detailed Description**

The MAX5713/MAX5714/MAX5715 are 4-channel, low-power, 8-/10-/12-bit buffered voltage-output DACs. The 2.7V to 5.5V wide supply voltage range and low-power consumption accommodates most low-power and low-voltage applications. The devices present a 100k $\Omega$  load to the external reference. The internal output buffers allow rail-to-rail operation. An internal voltage reference is available with software selectable options of 2.048V, 2.5V, or 4.096V. The devices feature a 50MHz, 3-wire SPI/QSPI/MICROWIRE/DSP-compatible serial interface to save board space and reduce the complexity in isolated applications. The MAX5713/MAX5714/MAX5715 include a serial-in/parallel-out shift register, internal CODE and DAC registers, a power-on-reset (POR) circuit to initialize the DAC outputs to code zero, and control logic.  $\overline{\text{CLR}}$  is available to asynchronously clear the device independent of the serial interface.

### **DAC Outputs (OUT<sub>n</sub>)**

The MAX5713/MAX5714/MAX5715 include internal buffers on all DAC outputs. The internal output buffers provide improved load regulation for the DAC outputs. The output buffers slew at 1V/ $\mu\text{s}$  (typ) and drive resistive loads as low as 2k $\Omega$  in parallel with as much as 500pF of capacitance. The analog supply voltage ( $V_{\text{DD}}$ ) determines the maximum output voltage range of the devices as  $V_{\text{DD}}$  powers the output buffer. Under no-load conditions, the output buffers drive from GND to  $V_{\text{DD}}$ , subject to offset and gain errors. With a 2k $\Omega$  load to GND, the output buffers drive from GND to within 200mV of  $V_{\text{DD}}$ . With a 2k $\Omega$  load to  $V_{\text{DD}}$ , the output buffers drive from  $V_{\text{DD}}$  to within 200mV of GND.

The DAC ideal output voltage is defined by:

$$V_{\text{OUT}} = V_{\text{REF}} \times \frac{D}{2^N}$$

where D = code loaded into the DAC register,  $V_{\text{REF}}$  = reference voltage, N = resolution.

### **Internal Register Structure**

The user interface is separated from the DAC logic to minimize digital feedthrough. Within the serial interface is an input shift register, the contents of which can be routed to control registers, individual, or multiple DACs as determined by the user command.

Within each DAC channel there is a CODE register followed by a DAC latch register (see the *Detailed Functional Diagram*). The contents of the CODE register

hold pending DAC output settings which can later be loaded into the DAC registers. The CODE register can be updated using both CODE and CODE\_LOAD user commands. The contents of the DAC register hold the current DAC output settings. The DAC register can be updated directly from the serial interface using the CODE\_LOAD commands or can upload the current contents of the CODE register using LOAD commands or the  $\overline{\text{LDAC}}$  hardware pin.

The contents of both CODE and DAC registers are maintained during power-down states, so that when the DACs are powered on, they return to their previously stored output settings. Any CODE or LOAD commands issued during power-down states continue to update the register contents. SW\_CLEAR and SW\_RESET commands reset the contents of all CODE and DAC registers to their zero-scale defaults.

### **Internal Reference**

The MAX5713/MAX5714/MAX5715 include an internal precision voltage reference that is software selectable to be 2.048V, 2.500V, or 4.096V. When an internal reference is selected, that voltage is available on the REF pin for other external circuitry (see the [Typical Operating Circuits](#)) and can drive a 25k $\Omega$  load.

### **External Reference**

The external reference input has a typical input impedance of 100k $\Omega$  and accepts an input voltage from +1.24V to  $V_{\text{DD}}$ . Connect an external voltage supply between REF and GND to apply an external reference. The MAX5713/MAX5714/MAX5715 power up and reset to external reference mode. Visit [www.maximintegrated.com/products/references](http://www.maximintegrated.com/products/references) for a list of available external voltage-reference devices.

### **Load DAC ( $\overline{\text{LDAC}}$ ) Input (TSSOP Package Only)**

The MAX5713/MAX5714/MAX5715 feature an active-low  $\overline{\text{LDAC}}$  logic input that allows the outputs to update asynchronously. Connect  $\overline{\text{LDAC}}$  to  $V_{\text{DDIO}}$  or keep  $\overline{\text{LDAC}}$  high during normal operation when the device is controlled only through the serial interface. Drive  $\overline{\text{LDAC}}$  low to simultaneously update the DAC outputs with data from the CODE registers. Holding  $\overline{\text{LDAC}}$  low causes the DAC registers to become transparent and CODE data is passed through to the DAC registers immediately updating the DAC outputs. A software CONFIG command can be used to configure the  $\overline{\text{LDAC}}$  operation of each DAC independently.

# MAX5713/MAX5714/MAX5715

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### Clear Input ( $\overline{\text{CLR}}$ )

The MAX5713/MAX5714/MAX5715 feature an asynchronous active-low  $\overline{\text{CLR}}$  logic input that simultaneously sets all four DAC outputs to zero. Driving  $\overline{\text{CLR}}$  low clears the contents of both the CODE and DAC registers and also aborts the on-going SPI command. To allow a new SPI command, drive  $\overline{\text{CLR}}$  high, satisfying the  $t_{\text{CSC}}$  timing requirement.

### Interface Power Supply ( $V_{\text{DDIO}}$ )

The MAX5713/MAX5714/MAX5715 feature a separate supply pin ( $V_{\text{DDIO}}$ ) for the digital interface (1.8V to 5.5V). Connect  $V_{\text{DDIO}}$  to the I/O supply of the host processor.

### SPI Serial Interface

The MAX5713/MAX5714/MAX5715 3-wire serial interface is compatible with MICROWIRE, SPI, QSPI, and DSPs. The interface provides three inputs, SCLK, CSB, and DIN. The chip-select input (CSB, active low) frames the data loaded through the serial data input (DIN). Following a CSB input high-to-low transition, the data is shifted in synchronously and latched into the input register on each falling edge of the serial clock input (SCLK). Each serial operation word is 24-bits long. The DAC data is left justified as shown in Table 1. The serial input register transfers its contents to the destination registers after loading 24 bits of data on the 24th SCLK falling edge. To initiate a new SPI operation, drive CSB high and then low to begin the next operation sequence, being sure to meet all relevant timing requirements. During CSB high periods, SCLK is ignored, allowing communication to other devices on the same bus. SPI operations consist-

ing of more than 24 SCLK cycles are executed on the 24th SCLK falling edge, using the first three bytes of data available. SPI operations consisting of less than 24 SCLK cycles will not be executed. The content of the SPI operation consists of a command byte followed by a two byte data word.

Figure 1 shows the timing diagram for the complete 3-wire serial interface transmission. The DAC code settings (D) for the MAX5713/MAX5714/MAX5715 are accepted in an offset binary format (see Table 1). Otherwise, the expected data format for each command is listed in Table 2. See Figure 3 for an example of a typical SPI circuit application.

### SPI Daisy Chain/ $\overline{\text{RDY}}$ Output (TSSOP Package Only)

The elongated programming operation is typically used for devices in daisy-chain applications. The  $\overline{\text{RDY}}$  output in the TSSOP version of the MAX5713/MAX5714/MAX5715 feeds the CSB input of the next device in the daisy-chain. The MAX5713/MAX5714/MAX5715 pulls the  $\overline{\text{RDY}}$  output low on the 24th SCLK falling edge, allowing the next device in the chain to begin its SPI operation, commencing with the 25th SCLK falling edge. See Figure 2 for timing characteristics of the elongated SPI programming operation. In practice ( $t_{\text{CRF}} + t_{\text{CSS0}}$ ) requirements will limit the daisy-chain SPI speed. Also in daisy-chain applications, a partial write to the chain is possible as long as the  $t_{\text{CSA}}$  is met for the first device the user chooses not to program. See Figure 4 for an example of a daisy-chain circuit application.

| Reserved Commands: Any commands not specifically listed above are reserved for Maxim internal use only. |     |     |     |     |          |           |          |       |                           |     |     |     |                          |       |       |       |   |    |    |    |                                   |    |    |    |  |  |

# MAX5713/MAX5714/MAX5715

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### **CODEn Command**

The CODEn command (B[23:20] = 0000) updates the CODE register contents for the selected DAC(s). Changes to the CODE register content based on this command will not affect DAC outputs directly unless the  $\overline{\text{LDAC}}$  is in a low state or the DAC latch has been configured to be transparent. Issuing the CODEn command with DAC SELECTION = ALL DACs is equivalent to CODE\_ALL (B[23:16] = 10000000). See [Table 2](#) and [Table 3](#).

### **LOADn Command**

The LOADn command (B[23:20] = 0001) updates the DAC register content for the selected DAC(s) by uploading the current contents of the CODE register. The LOADn command can be used with DAC SELECTION = ALL DACs to issue a software load for all DACs, which is equivalent to the LOAD\_ALL (B[23:16] = 10000001) command. See [Table 2](#) and [Table 3](#).

### **CODEn\_LOAD\_ALL Command**

The CODEn\_LOAD\_ALL command (B[23:20] = 0010) updates the CODE register contents for the selected DAC(s) as well as the DAC register content of all DACs. Channels for which the CODE register content has not been modified since the last load to DAC register or  $\overline{\text{LDAC}}$  operation will not be updated to reduce digital crosstalk. Issuing this command with DAC\_ADDRESS = ALL is equivalent to the CODE\_ALL\_LOAD\_ALL (B[23:16] = 1000001x) command. The CODEn\_LOAD\_ALL command by definition will modify at least one CODE reg-

ister. To avoid this, use the LOADn command with DAC SELECTION = ALL DACs or use the LOAD\_ALL command. See [Table 2](#) and [Table 3](#).

### **CODEn\_LOADn Command**

The CODEn\_LOADn command (B[23:20] = 0011) updates the CODE register contents for the selected DAC(s) as well as the DAC register content of the selected DAC(s). Channels for which the CODE register content has not been modified since the last load to DAC register or  $\overline{\text{LDAC}}$  operation will not be updated to reduce digital crosstalk. Issuing this command with DAC SELECTION = ALL DACs is equivalent to the CODE\_ALL\_LOAD\_ALL command. See [Table 2](#) and [Table 3](#).

### **CODE\_ALL Command**

The CODE\_ALL command (B[23:16] = 10000000) updates the CODE register contents for all DACs. See [Table 2](#).

### **LOAD\_ALL Command**

The LOAD\_ALL command (B[23:16] = 10000001) updates the DAC register content for all DACs by uploading the current contents of the CODE registers. See [Table 2](#).

### **CODE\_ALL\_LOAD\_ALL Command**

The CODE\_ALL\_LOAD\_ALL command (B[23:16] = 1000001x) updates the CODE register contents for all DACs as well as the DAC register content of all DACs. See [Table 2](#).

**Table 3. DAC Selection**

| B19 | B18 | B17 | B16 | DAC SELECTED |
|-----|-----|-----|-----|--------------|
| 0   | 0   | 0   | 0   | DAC A        |
| 0   | 0   | 0   | 1   | DAC B        |
| 0   | 0   | 1   | 0   | DAC C        |
| 0   | 0   | 1   | 1   | DAC D        |
| X   | 1   | X   | X   | ALL DACs     |
| 1   | X   | X   | X   | ALL DACs     |

# MAX5713/MAX5714/MAX5715

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### POWER Command

The MAX5713/MAX5714/MAX5715 feature a software-controlled power-mode (POWER) command (B[23:20] = 0100). The POWER command updates the power-mode settings of the selected DACs while the power settings of the rest of the DACs remain unchanged. The new power setting is determined by bits B[17:16] while the affected DAC(s) are selected by bits B[11:8]. If all DACs are powered down, the device enters a STANDBY mode.

In power-down, the DAC output is disconnected from the buffer and is grounded with either one of the two selectable internal resistors or set to high impedance. See [Table 5](#) for the selectable internal resistor values in power-down mode. In power-down mode, the DAC register retains its value so that the output is restored when the device powers up. The serial interface remains active in power-down mode.

In STANDBY mode, the internal reference can be powered down or it can be set to remain powered-on for external use. Also, in STANDBY mode, devices using the external reference do not load the REF pin. See [Table 4](#).

### SW\_RESET and SW\_CLEAR Command

The SW\_RESET (B[23:16] = 01010001) and SW\_CLEAR (B[23:16] = 01010000) commands provide a means of issuing a software reset or software clear operation. Use SW\_CLEAR to issue a software clear operation to return all CODE and DAC registers to the zero-scale value. Use SW\_RESET to reset all CODE, DAC, and configuration registers to their default values.

**Table 4. POWER (100) Command Format**

| B23                         | B22 | B21 | B20 | B19 | B18 | B17   | B16 | B15        | B14 | B13 | B12 | B11   | B10 | B9 | B8 | B7         | B6 | B5 | B4 | B3 | B2 | B1 | B0 |   |

| Default Values (all DACs) □ |     |     |     |     |     | 0   | 0   | X          | X   | X   | X   | 1   | 1   | 1  | 1  | X          | X  | X  | X  | X  | X  | X  | X  | X |

**Table 5. Selectable DAC Output Impedance in Power-Down Mode**

| PD1 (B17) | PD0 (B16) | OPERATING MODE   |
|-----------|-----------|--|
| 0         | 0         | Normal operation   |
| 0         | 1         | Power-down with internal 1kΩ pulldown resistor to GND.   |
| 1         | 0         | Power-down with internal 100kΩ pulldown resistor to GND. |
| 1         | 1         | Power-down with high-impedance output.                   |

# MAX5713/MAX5714/MAX5715

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### CONFIG Command

The CONFIG command (B[23:20] = 0110) updates the LDAC and LOAD functions of selected DACs. Issue the command with B16 = 0 to allow the DAC latches to operate normally or with B16 = 1 to disable the DAC latches, making them perpetually transparent. Mode settings of the selected DACs are updated while the mode settings of the rest of the DACs remain unchanged; DAC(s) are selected by bits B[11:8]. See [Table 6](#).

### REF Command

The REF command updates the global reference setting used for all DAC channels. Set B[17:16] = 00 to use an external reference for the DACs or set B[17:16] to 01, 10, or 11 to select either the 2.5V, 2.048V, or 4.096V internal reference, respectively.

If RF2 (B18) is set to zero (default) in the REF command, the reference will be powered down any time all DAC channels are powered down (in STANDBY mode). If RF2 (B18 = 1) is set to one, the reference will remain powered even if all DAC channels are powered down, allowing continued operation of external circuitry. In this mode, the 1µA shutdown state is not available. See [Table 7](#).

**Table 6. CONFIG Command Format**

# MAX5713/MAX5714/MAX5715

## Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and SPI Interface

### Applications Information

---

#### Power-On Reset (POR)

When power is applied to  $V_{DD}$  and  $V_{DDIO}$ , the DAC output is set to zero scale. To optimize DAC linearity, wait until the supplies have settled and the internal setup and calibration sequence completes (200 $\mu$ s, typ).

#### Power Supplies and Bypassing Considerations

Bypass  $V_{DD}$  and  $V_{DDIO}$  with high-quality ceramic capacitors to a low-impedance ground as close as possible to the device. Minimize lead lengths to reduce lead inductance. Connect the GND to the analog ground plane.

#### Layout Considerations

Digital and AC transient signals on GND can create noise at the output. Connect GND to form the star ground for the DAC system. Refer remote DAC loads to this system ground for the best possible performance. Use proper grounding techniques, such as a multilayer board with a low-inductance ground plane, or star connect all ground return paths back to the MAX5713/MAX5714/MAX5715 GND. Carefully layout the traces between channels to reduce AC cross-coupling. Do not use wire-wrapped boards and sockets. Use shielding to minimize noise immunity. Do not run analog and digital signals parallel to one another, especially clock signals. Avoid routing digital lines underneath the MAX5713/MAX5714/MAX5715 package.

### Definitions

---

#### Integral Nonlinearity (INL)

INL is the deviation of the measured transfer function from a straight line drawn between two codes once offset and gain errors have been nullified.

#### Differential Nonlinearity (DNL)

DNL is the difference between an actual step height and the ideal value of 1 LSB. If the magnitude of the  $DNL \leq 1$  LSB, the DAC guarantees no missing codes and is monotonic. If the magnitude of the  $DNL \geq 1$  LSB, the DAC output may still be monotonic.

#### Offset Error

Offset error indicates how well the actual transfer function matches the ideal transfer function. The offset error is calculated from two measurements near zero code and near maximum code.

#### Gain Error

Gain error is the difference between the ideal and the actual full-scale output voltage on the transfer curve, after nullifying the offset error. This error alters the slope of the transfer function and corresponds to the same percentage error in each step.

#### Zero-Scale Error

Zero-scale error is the difference between the DAC output voltage when set to code zero and ground. This includes offset and other die level nonidealities.

#### Full-Scale Error

Full-scale error is the difference between the DAC output voltage when set to full scale and the reference voltage. This includes offset, gain error, and other die level nonidealities.

#### Settling Time

The settling time is the amount of time required from the start of a transition, until the DAC output settles to the new output value within the converter's specified accuracy.

#### Digital Feedthrough

Digital feedthrough is the amount of noise that appears on the DAC output when the DAC digital control lines are toggled.

#### Digital-to-Analog Glitch Impulse

A major carry transition occurs at the midscale point where the MSB changes from low to high and all other bits change from high to low, or where the MSB changes from high to low and all other bits change from low to high. The duration of the magnitude of the switching glitch during a major carry transition is referred to as the digital-to-analog glitch impulse.

The digital-to-analog power-up glitch is the duration of the magnitude of the switching glitch that occurs as the device exits power-down mode.

### Ordering Information

| PART          | PIN-PACKAGE | RESOLUTION (BIT) | INTERNAL REFERENCE TEMPCO (ppm/°C) |
|---------------|-------------|------------------|------------------------------------|
| MAX5713AUD+T  | 14 TSSOP    | 8                | 10 (typ)                           |
| MAX5714AUD+T  | 14 TSSOP    | 10               | 10 (typ)                           |
| MAX5715AAUD+T | 14 TSSOP    | 12               | 3 (typ), 10 (max)                  |
| MAX5715BAUD+T | 14 TSSOP    | 12               | 10 (typ)                           |
| MAX5715AWC+T  | 12 WLP      | 12               | 3 (typ), 10 (max)                  |

**Note:** All devices are specified over the -40°C to +125°C temperature range.

+Denotes a lead(Pb)-free/RoHS-compliant package.

T = Tape and reel.

### Chip Information

PROCESS: BiCMOS

### Package Information

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](http://www.maximintegrated.com/packages). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

| PACKAGE TYPE | PACKAGE CODE | OUTLINE NO.             | LAND PATTERN NO.                               |
|--------------|--------------|-------------------------|--|
| 14 TSSOP     | U14+1        | <a href="#">21-0066</a> | <a href="#">90-0113</a>                        |
| 12 WLP       | W121B2+1     | <a href="#">21-0009</a> | Refer to <a href="#">Application Note 1891</a> |
