Evaluates: MAX96724F

MAX96724 DPHY Evaluation Kit

General Description

The MAX96724 DPHY evaluation kit (EV kit) provides a proven design and reliable platform to evaluate the MAX96724, MAX96724F, and MAX96724R devices using standard FAKRA coaxial cables or a MATE-AX cable. These deserializer devices support high-bandwidth, gigabit multimedia serial links (GMSL-1 or GMSL-2) and offer spread spectrum and full-duplex control channel features. The EV kit includes a simple-to-use Windows 10® or higher compatible graphical user interface (GUI) to exercise device features. The EV kit comes with a MAX96724, MAX96724F, or MAX96724R IC installed on board.

For complete GMSL-2 evaluation using standard FAKRA coax cables, order the MAX96724 coax EV kit along with a companion serializer board, such as the MAX96717 coax EV kit. For a detailed look at all GMSL-2 features, including information on how to use the parts, see the newest GMSL-2 User Guide found in Analog Devices' GMSL customer portal folder. For more information on how to design customized hardware with GMSL2 devices, see the newest GMSL2 Hardware Design Guide in Analog Devices' GMSL customer portal folder.

Note that throughout this document:

- Deserializer refers to the MAX96724, MAX96724F, and MAX96724R.
- Serializer refers to any GMSL-1 or GMSL-2 serializer device, particularly the MAX96705 or MAX96717.
- Coax cables refer to both coax and MATE-AX applications. The MATE-AX connector is not installed by default, and the EV kit does not come with a MATE-AX cable. See the Bill of Materials for ordering information.
- GMSL1 links are required to use high-immunity mode. Links that do not use high-immunity mode are not recommended for new designs.

Features

- The MAX96724 Deserializer Accepts GMSL Data from the Serializers and Converts it into MIPI CSI-2.
 - Backward-Compatible to Accept GMSL-1 Serial Data
 - Quad Inputs can Mix and Match GMSL-1 and GMSL-2
 - Outputs are Compliant to MIPI D-PHY v1.2 and CSI-2 v1.3 Specifications
- Windows 10® or Higher Compatible Software Support
- USB-Controlled Interface (Cable Included)
- Powerful, Simple-to-Use GUI for Comprehensive Device Feature Evaluation
- Board Powered by USB, 12V Wall Adapter, or External Power Supply
- Proven PCB Layout
- Fully Assembled and Tested

MAX96724 DPHY EV Kit Files

FILE	DESCRIPTION
MAXSerDesEV-GMSLInstall.exe	Installs the EV kit software (GUI) onto Windows 10 or higher computers. Includes GUI user's guide, microcontroller firmware, and documentation.
MAXSerDesEV-GMSL.exe	GMSL graphical user interface (GUI) program.

Quick Start

This procedure applies to both coax and MATE-AX EV kits. [Figure 5](#) shows a typical application using a MAX96724 family deserializer to interface with four MAX96717 or MAX96705 camera modules.

Required Equipment

The following equipment is required to successfully use the MAX96724 DPHY EV kit in a serial link coax cable configuration:

- MAX96724 DPHY EV kit
- MAX96717 or MAX96705 serializer EV kits or camera modules
- FAKRA coax cable assembly
- PC with Windows 10® or higher and GMSL-2 software
- Power supply source (500 mA USB port, 5V/1A DC supply, or 12V barrel jack DC supply)
- Micro-USB cable

Procedure

The MAX96724 DPHY EV kit is shipped with the fully assembled and tested PCB. Follow these steps to verify the board operation:

- 1) Connect the MAX96724 DPHY EV kit PCB through the board's Micro-USB port (J12) to a Windows 7® or Windows 10® PC.
- 2) Download and install the latest GMSL-2 GUI software from the Analog Devices Sharefile site to the PC. If needed, contact the factory for additional information on accessing the software. Refer to the GMSL GUI User Guide for detailed software instruction.
- 3) Verify the MAX96724 DPHY EV kit PCB's red power switch (SW4) is OFF.
- 4) Verify all jumper positions on the PCB are properly set to meet the requirements of the application. Figure 4 shows the possible jumper positions for various configurations. The default jumper settings place the device under test (DUT) into the I²C mode, selects 3.3V as the VDDIO voltage and 1.2V as the VDD voltage, and selects the board to be powered by the 12V DC barrel jack.
- 5) Connect a power supply to the MAX96724 DPHY EV kit. The board provides three power supply options (selected through the jumper JMP1):
 - A 12V DC supply connected through the barrel jack (J13) or terminal block (J14)
 - A 5 V DC supply from the Micro-USB port (J12) connected to the PC
 - An external 5V to 17V DC supply through EXT (J15) and GND (J16) test points
- 6) Define the application specific power-up configuration for the DUT, using the GMSL-2 GUI to set the device's CFG pins into the required modes. This requires power (see the following [Configuration \(CFG\) Pin Settings](#) section). The MAX96724 must be configured to have the same link data rate (3Gbps or 6Gbps) and mode (tunnel or pixel) as the companion serializer board. The DUT must be power cycled if any changes are made to the CFG pins (or use SW1, the RESET button on the board, to reset the DUT).
- 7) Power up the board by moving the red power switch (SW4) to the ON position. The green power LEDs for DS6, DS11, and DS12 light indicate the correct power settings. The Teensy LED (DS3) flashes to indicate the board firmware is functional. If the Teensy LED is not flashing, see the [Troubleshooting](#) section.
- 8) Verify the LOCK LEDs on both the serializer and deserializer EV boards light up, indicating the link is successfully established. If the LOCK_LED is off, see the [Troubleshooting](#) section.
- 9) Start the GMSL2 EVKIT Software (GUI).
- 10) The GUI automatically searches for any active listener in both the I²C and UART modes, and identifies valid GMSL products. Once the serializer and deserializer are identified, they appear as tabs in the GUI.
- 11) Read register 0x00 in both the serializer and deserializer to ensure both devices are active. This can be verified by an I²C ACK.

After completing these steps, basic board initialization is complete, the link is established, and the system is ready for use. Use the GMSL-2 GUI to access internal registers locally or remotely. Ensure both the serializer and deserializer are identified correctly in the GUI. Refer to the GMSL GUI User Guide for GUI operation, and the GMSL2 User Guide to configure this device and its available features.

Figure 5. Typical Application Block Diagram using MAX96724 DPHY EV Kit

Configuration (CFG) Pin Settings

- 1) Like other GMSL2 devices, configuration pins are used to set desired working modes during power-up for the MAX96724.
- 2) There are two analog and two digital (I²C configurable) potentiometers on board to set the CFG pin levels. The digital potentiometers are connected by default. Alternatively, rework the 0 Ω resistors to connect the analog potentiometers and tune the voltage manually. Voltages on CFG pins can be monitored through CFG0 and CFG1 test points (loop type terminals). Use the default connection and configure the power-on reset (POR) mode through the GUI using the **Config Options** page under **Options**. For more details, refer to the GUI User Guide.
- 3) [Table 1](#) and [Table 2](#) indicate the voltages for the CFG pins for different modes of operations. The CFG pin voltages latch at power-up and are not volatile after power-off due to the digital potentiometers' EEPROM. Any of the settings can be changed by the software through register writes after power-up. The CFG0 pin sets the device address for I²C. For example, a default 0x4E I²C address (8-bit write) is CFG0 state 0 (0% of VDDIO, i.e., pulldown). The CFG1 pin sets COTP (coax or twisted-pair mode), GMSL-2 versus GMSL-1 mode, the default forward rate (3Gbps or 6Gbps) when in GMSL-2 mode, and the high-immunity mode (HIM) (enabled or disabled) when in GMSL-1 mode. For example, a default value for GMSL-1 coax HIM enabled is CFG1 state 7 (100% of VDDIO).

Table 1. MAX96724 CFG Pin Settings

CGP INPUT (% VDDIO)		CFG0	CFG1		
CFG STATE	MIN/TYP/MAX % OF VDDIO	DEVICE I ² C ADDR	CXTP	GMSL-1/GMSL-2 MODE	HIM/GMSL-2 RATE
0	0.00 / 0.00 / 11.7	0x4E	COAX	GMSL-2	6Gbps
1	16.9 / 20.2 / 23.6	0x5C			3Gbps
2	28.8 / 32.1 / 35.5	0x9C		GMSL-1	HIM Disabled*
3	40.7 / 44.0 / 47.4	0x9E	STP	GMSL-2	6Gbps
4	52.6 / 56.0 / 59.3	RSVD			3Gbps
5	64.5 / 67.9 / 71.2	RSVD		GMSL-1	HIM Enabled
6	76.4 / 79.8 / 83.1	RSVD			HIM Disabled*
7	88.3 / 100 / 100	RSVD	COAX	GMSL-1	HIM Enabled

*Note: High-immunity mode (HIM) is required for new designs.

Table 2. MAX96724F and MAX96724R CFG Pin Settings

CGP INPUT (% V _{DDIO})		CFG0	CFG1		
CFG STATE	MIN/TYP/MAX % OF V _{DDIO}	DEVICE I ² C ADDR	CXTP	GMSL-1/GMSL-2 MODE	HIM/GMSL-2 RATE
0	0.00 / 0.00 / 11.7	0x4E	COAX	GMSL-2	3 Gbps
1	16.9 / 20.2 / 23.6	0x5C			
2	28.8 / 32.1 / 35.5	0x9C		GMSL-1	HIM Disabled*
3	40.7 / 44.0 / 47.4	0x9E	STP	GMSL-2	3 Gbps
4	52.6 / 56.0 / 59.3	RSVD			
5	64.5 / 67.9 / 71.2	RSVD		GMSL-1	HIM Enabled
6	76.4 / 79.8 / 83.1	RSVD			HIM Disabled*
7	88.3 / 100 / 100	RSVD	COAX	GMSL-1	HIM Enabled

*Note: High-immunity mode (HIM) is required for new designs.

Deserializer Jumper/Connector/Switch/Test Point Descriptions

The following table contains details of all the connectors, jumpers, switches, and test points of the EV kit.

The power configuration of the EV kit hardware can be reconfigured to allow external supply connections. [Figure 6](#) shows the power connection options.

Table 3. Deserializer Jumper/Connector/Switch/Test Point Descriptions

VALUE	NAME	DEFAULT POSITION	FUNCTION
JMP1	VSUP	*12V	Board powered from 12V Barrel Jack or 12V Power-over-Coax (POC)
		USB_5V	Board powered from USB 5V sourced from Micro-USB connector.
		EXT	Board powered from external loop connector (EXT) ranged from 5V up to 17V
J1	VDD	*1V	VDD connect to 1V
		1V2	VDD connect to 1.2V
J2	LOCK	*LOCK	LOCK LED indicates lock status of GMSL link
		ERRB/LOCK	LOCK LED indicates ERRB/LOCK status
JMP2	VDDIO	1V8	VDDIO connect to 1.8V
		*3V3	VDDIO connect to 3.3V
		2V5	This should not be used and is unsupported
J21	VDD_REF	Open	Reference voltage for level shifter from external supply
		*Short	Reference voltage for level shifter from on-board 3.3V
J18	TX_SCL	*TNZ_SCL	U1 SCL/Tx pin connected to Teensy uC SCL pin
		TNZ_RX	U1 SCL/Tx pin connected to Teensy uC Rx pin
J19	RX_SDA	*TNZ_SDA	U1 SDA/Rx pin connected to Teensy uC SDA pin
		TNZ_RX	U1 SDA/Rx pin connected to Teensy uC Tx pin
J23	EXP	SDA_RX	U1 SDA/RX pin for testing and probing
		SCL_TX	U1 SCL/TX pin for testing and probing
J3	POCA+	*VPOC_1	PoC voltage from MAX20087 output1
		Open	PoC disabled
J4	POCB+	*VPOC_2	PoC voltage from MAX20087 output2
		Open	PoC disabled
J5	POCC+	*VPOC_3	PoC voltage from MAX20087 output3
		Open	PoC disabled
J6	POCD+	*VPOC_4	PoC voltage from MAX20087 output4
		Open	PoC disabled
J12	USB	--	On-board USB connector
J13	+12V	--	12V Input barrel jack connector
J14	+12V	--	12V Input terminal block connector.
J15	EXT	--	Loop connector to apply external voltage (3.7V to 17V)
J16	GND	--	GND loop connector
J17	EXT_I2C	--	Header connections for external I ² C.

Table 3. Deserializer Jumper/Connector/Switch/Test Point Descriptions (continued)

VALUE	NAME	DEFAULT POSITION	FUNCTION
SW1	SW1	--	Push button switch for U1 power-down/reset
SW2	SW2	ON/OFF	Slide switches to external pullups for MFP7/MPF8 when used as I ² C
SW3	SW3	--	Push button switch to program Teensy uC
SW4	SW4	ON/OFF	Slide switch for board power-up
SW5	SW5	ON/OFF	Enable/Disable I ² C to high-speed connector
TP1	CAPVDD	--	CAPVDD test point
TP2	CFG1	--	CFG1 test point
TP3	CFG0	--	CFG0 test point
TP4	USB5V	--	USB 5 V power test point
TP5	12V	--	12V rail test point for input barrel jack connector
TP6	3V3	--	3V3 rail test point
TP7	1V8	--	1V8 rail test point
TP8	1V2	--	1V2 rail test point
TP9	1V0	--	1V0 rail test point
TP10	VDD18	--	VDD18 test point
TP11	VDD	--	VDD test point
TP12	VDDIO	--	VDDIO test point
TP13	VTERM	--	VTERM test point
TP14	ALTSCL	--	Teensy uC alternate SCL pin test point. (Debug only)
TP15	ALTSDA	--	Teensy uC alternate SDA pin test point. (Debug only)
IMPORTANT LED INDICATORS			
VALUE	NAME	DEFAULT POSITION	FUNCTION
DS1	LOCK	--	LOCK LED (green)
DS2	ERRB	--	ERRB LED (red)
DS3	DS3	--	TEENSY LED (red)
DS4	3.3V ERROR	--	3.3V ERROR (red)
DS6	3.3V	--	3.3V (green)
DS7	1.0V ERROR	--	1.0V error (red)
DS8	1.2V ERROR	--	1.2V error (red)
DS9	1.8V ERROR	--	1.8V error (red)
DS10	2.5V ERROR	--	2.5V error (red)
DS11	USB 5V	--	USB 5V (green)
DS12	12V	--	12V (green)

*Default Position

Troubleshooting

If the MAX96724 DPHY EV kit fails to power-up or does not function properly, try the following appropriate remedial actions:

- 1) Verify the board's red power switch (SW4) is set to ON.
- 2) Verify each of the green power LEDs (12V, 3.3V, and 1.8V) on the MAX96724 DPHY EV kit lights up. The 5V LED lights up only when the Micro-USB is connected. The 1.0V, 1.2V, 1.8V, 2.5V, 3.3V LEDs (red) light up if the voltages are not present.
- 3) Verify all jumpers are correctly set. Refer to the default jumper settings table in the serializer and deserializer EV kit data sheets for details. Ensure all jumpers are firmly attached and replace the loose or damaged ones.
- 4) Verify the USB cable is properly connected.
- 5) Verify the coax cable connection between the serializer and deserializer is stable. Occasionally, the issue can be that the coax cable is not properly connected between the OUT+ of the serializer to the IN+ of the deserializer.
- 6) Validate the DUT is not inadvertently put into the Teensy reset mode. The board's TEENSY_RST button should only be pressed when the firmware is flashed to the DUT. If the button is pressed during normal operation, the device goes into the Teensy reset mode. Power cycle the board to resume normal operation with the current firmware.
- 7) Validate the correct CFG pin voltages correspond to the expected device mode. Check the method of biasing the CFG voltage at power-up. Measure the voltages at the pins. For further details, see the [Configuration \(CFG\) Pin Settings](#) section.
- 8) The LOCK LED does not light up when connected to the GMSL1 serializers without proper control link configurations.
- 9) The LOCK LED only lights up when all enabled links (configured through register 0x0006) are locked in the GMSL2 mode.
- 10) Validate the microcontroller firmware is active by observing the blinking red Teensy LED (DS3) at power-up. It should remain constantly on afterwards. If the LED is not blinking, or not constantly on after power-up, refer to the available software documentation to reprogram the microcontroller.
- 11) Verify the PC is detecting the COM port when the Micro-USB cable is connected. Use the Windows Device Manager to check the COM port status.
- 12) Power-cycle the board and reopen the GUI.
- 13) Use a new or different serializer or deserializer board.

MAX96724 EV Kit Schematics

The schematic diagram illustrates the GMSL2-COAX PCB layout, showing four signal paths (INA+, INB+, INC+, IND+) and their corresponding termination and matching networks. The diagram includes components like capacitors (C1-C4), inductors (L1-L4), resistors (R1-R4), and connectors (DNI, DNI1).

POWER

MAX CURRENT
50mA @ 3.3V (10mA MAX9224 VDDIO F USED, 30mA MCU ISMA OTHERS)
50mA @ 1.2V (10mA MAX9224 VDDIO F USED, 30mA MCU ISMA OTHERS)
50mA @ 1.2V (50mA MAX9224 VDD F USED, 100mA V/FERR)
100mA @ 1V (50mA MAX9224 VDD F USED)
100mA @ 2.5V (100mA MAX9224 VDDIO F USED)
