MAXIM

Dual 1:5 Differential Clock Drivers with LVPECL Inputs and LVDS Outputs

General Description

The MAX9317/MAX9317A/MAX9317B/MAX9317C low-skew, dual 1-to-5 differential drivers are designed for clock and data distribution. The differential input is reproduced at five LVDS outputs with a low output-to-output skew of 5ps.

The MAX9317/MAX9317A are designed for low-voltage operation from a 2.375V to 2.625V power supply for use in 2.5V systems. The MAX9317B/MAX9317C operate from a 3.0V to 3.6V power supply for use in 3.3V systems. The MAX9317A/MAX9317C feature 50Ω input termination resistors to reduce component count.

The MAX9317 family is available in 32-pin 7mm × 7mm TQFP and space-saving 5mm × 5mm QFN packages and operate across the extended temperature range of -40°C to +85°C. The MAX9317A is pin compatible with ON Semiconductor's MC100EP210S.

Applications

Precision Clock Distribution

Low-Jitter Data Repeaters

Data and Clock Drivers and Buffers

Central-Office Backplane Clock Distribution

DSLAM Backplanes

Base Stations

ATE

Pin Configurations appear at end of data sheet.

Features

- **Guaranteed 1.0GHz Operating Frequency**
- **145ps (max) Part-to-Part Skew**
- **5ps Output-to-Output Skew**
- **330ps Propagation Delay from CLK_ to Q_**
- **2.375V to 2.625V Operation (MAX9317/MAX9317A)**
- **3.0V to 3.6V Operation (MAX9317B/MAX9317C)**
- **ESD Protection: ±2kV (Human Body Model)**
- **Internal 50Ω Input Termination Resistors (MAX9317A/MAX9317C)**

Dual 1:5 Differential Clock Drivers with LVPECL Inputs and LVDS Outputs

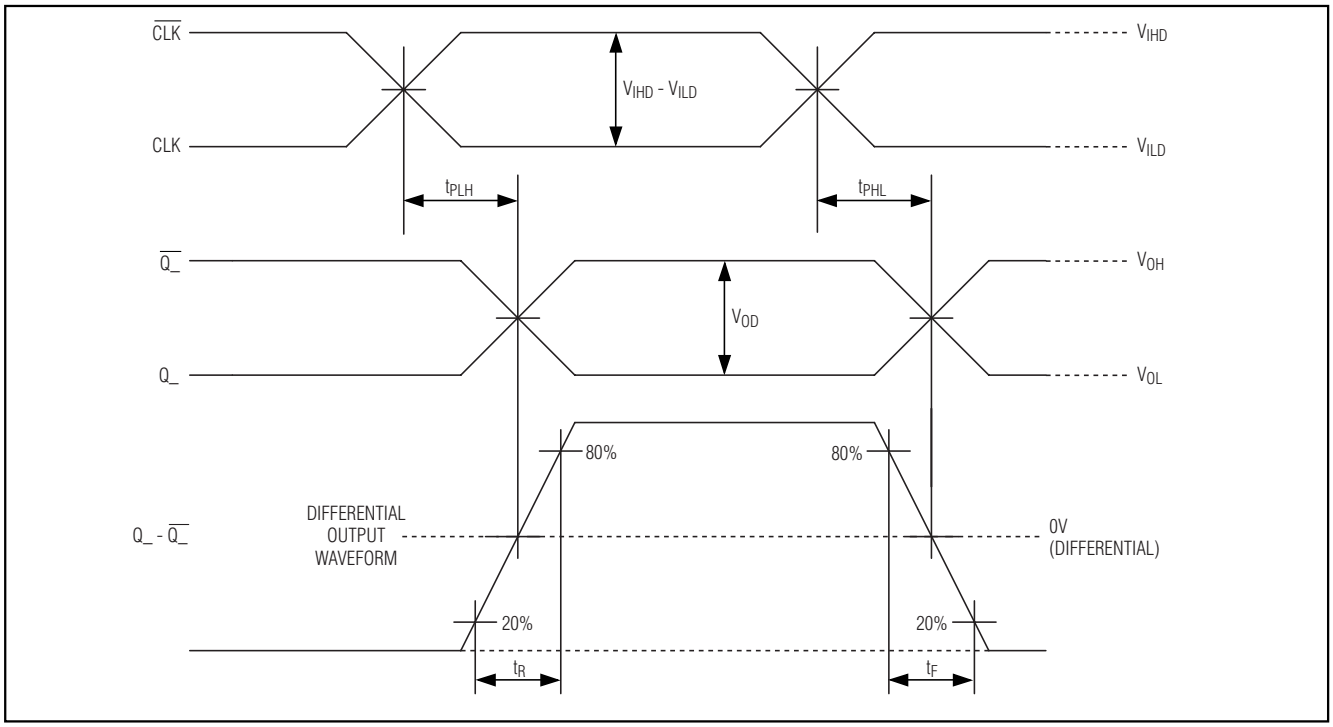

Figure 1. MAX9317 Timing Diagram

Detailed Description

The MAX9317 family of low-skew, 1-to-5 dual differential drivers are designed for clock or data distribution. Two independent 1-to-5 splitters accept a differential input signal and reproduce it on five separate differential LVDS outputs. The output drivers are guaranteed to operate at frequencies up to 1.0GHz with the LVDS output levels conforming to the EIA/TIA-644 standard.

The MAX9317/MAX9317A operate from a 2.375V to 2.625V power supply for use in 2.5V systems. The MAX9317B/MAX9317C operate from a 3.0V to 3.6V supply for 3.3V systems.

Differential LVPECL and LVDS Input

The MAX9317 family has two input differential pairs: CLKA and $\overline{CLKA}$, and CLKB and $\overline{CLKB}$. Each differential input pair can be configured or terminated independently. The inputs are designed to be driven by either LVPECL or LVDS signals with a maximum differential voltage of V_{CC} or 3.0V, whichever is less.

The MAX9317A/MAX9317C reduce external component count by having the input 50Ω termination resistors on chip. Configure the MAX9317A/MAX9317C to receive LVPECL signals by connecting $V_{T\_}$ to V_{CC} - 2V (Figure 2(a)). Leaving the $V_{T\_}$ input floating configures the

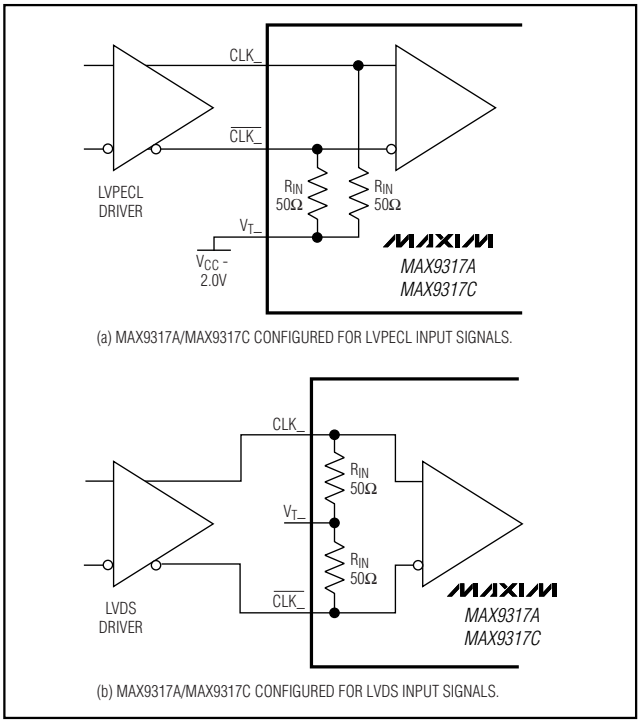

Figure 2. MAX9317A/MAX9317C Input Terminations

respective input with a differential 100Ω termination to receive LVDS signals (Figure 2(b)).

The MAX9317/MAX9317B accept LVPECL if the inputs are externally terminated with 50Ω resistors from CLKA and $\overline{CLKA}$ or CLKB and $\overline{CLKB}$ to V_{CC} - 2V. Alternatively, if the inputs are differentially terminated with 100Ω, they accept an LVDS input signal.

The LVDS input signal must adhere to the specifications given in the *Electrical Characteristics* table. Note that the signal must be at least 1.2V to be a valid logic HIGH.

Applications Information

Output Termination

Terminate the outputs with 100Ω across each differential pair (Q_ to $\overline{Q\_}$). Ensure that output currents do not exceed the current limits as specified in the *Absolute Maximum Ratings* table. Under all operating conditions, observe the device's total thermal limits.

Power-Supply Bypassing

Bypass each V_{CC} pin to ground with high-frequency surface-mount ceramic 0.1µF and 0.01µF capacitors in parallel and as close to the device as possible, with the 0.01µF capacitor closest to the device. Use multiple parallel vias to minimize parasitic inductance and reduce power-supply bounce with high-current transients.

Circuit Board Traces

Circuit board trace layout is very important to maintain the signal integrity of high-speed differential signals. Use 50Ω traces for CLK_, $\overline{CLK\_}$, Q_, and $\overline{Q\_}$. Maintaining integrity is accomplished in part by reducing signal reflections and skew, and increasing common-mode noise immunity by keeping the differential traces close together.

Signal reflections are caused by discontinuities in the 50Ω characteristic impedance of the traces. Avoid discontinuities by maintaining the distance between differential traces, and not using sharp corners or vias. Maintaining distance between the traces also increases common-mode noise immunity. Reducing signal skew is accomplished by matching the electrical length of the differential traces.
