

LIN Transceiver

Features

- The MCP2003B is Compliant with Local Interconnect Network (LIN) Bus Specifications 1.3, 2.0, 2.1, 2.2, SAE J2602, and ISO17987
- Supports Baud Rates up to 20 Kbaud with LIN-Compatible Output Driver
- 60V Load Dump Protected
- Very High Electromagnetic Immunity (EMI) Meets Stringent Original Equipment Manufacturers (OEM) Requirements
- Direct Capacitor Coupling Robustness without Transient Voltage Suppressor (TVS):
 - $\pm 35\text{V}$ on L_{BUS} (SAE J2962-1)
 - $\pm 85\text{V}$ on L_{BUS} (SAE J2962-1)
- High Electrostatic Discharge (ESD) Immunity without TVS:
 - $>25\text{ kV}$ on L_{BUS} (SAE J2962-1)
 - $>15\text{ kV}$ on V_{BB} (IEC 61000-4-2)
 - $>6\text{ kV}$ on L_{BUS} (IEC 61000-4-2)
- Very High Immunity to RF Disturbances Meets Stringent OEM Requirements
- Wide Supply Voltage: 5.5V – 30.0V Continuous
- Extended (E) Temperature Range: -40°C to +125°C
- High (H) Temperature Range: -40°C to +150°C
- Interfaces to PIC[®] MCU EUSART and Standard USARTs
- LIN Bus Pin:
 - Internal pull-up resistor and diode
 - Protected against battery shorts
 - Protected against loss of ground
 - High current drive: $>40\text{ mA}$
- Automatic Thermal Shutdown
- Low-Power Mode:
 - Receiver monitoring bus and transmitter off: ($\cong 5\text{ }\mu\text{A}$)

Description

This device provides a bidirectional, half-duplex communication, physical interface to automotive and industrial LIN systems to meet the LIN Bus Specification Revision 2.2, SAE J2602, and ISO 17987. The device is both short-circuit and overtemperature protected by internal circuitry. The device has been specifically designed to operate in the automotive operating environment and will survive all specified transient conditions while meeting all of the stringent quiescent current requirements.

Package Types

MCP2003B
SOIC

MCP2003B
2x3 DFN*

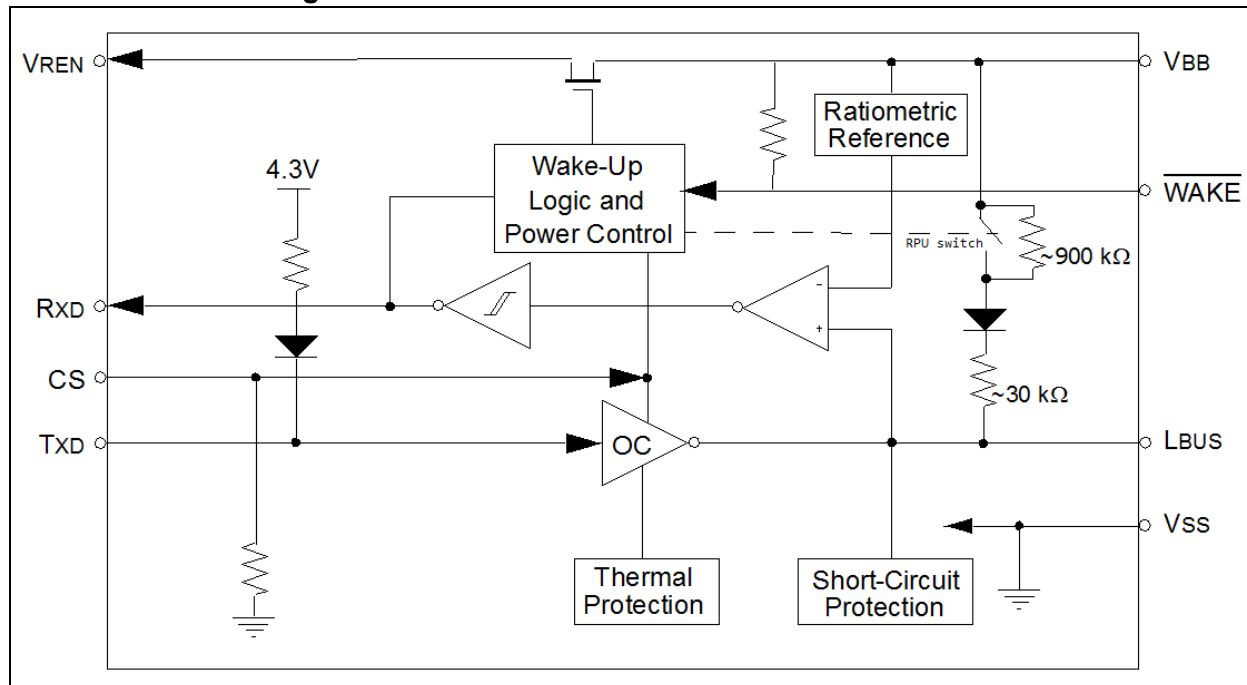

MCP2003B
3x3 DFN*

* Includes Exposed Thermal Pad (EP); see [Table 1-2](#).

MCP2003B

MCP2003B Block Diagram

1.0 DEVICE OVERVIEW

The MCP2003B devices provide a physical interface between a microcontroller and a LIN bus. These devices will translate the CMOS/TTL logic levels to LIN logic level, and vice versa. It is intended for automotive and industrial applications with serial bus speeds up to 20 Kbaud.

LIN Bus Specification Revision 2.2 requires that the transceiver of all nodes in the system is connected via the LIN pin, referenced to ground and with a maximum external termination resistance load of 510Ω from LIN bus to battery supply. The 510Ω corresponds to 1 master and 15 slave nodes.

The VREN pin can be used to drive the logic input of an external voltage regulator. This pin is high in all modes except for Power-Down mode.

1.1 External Protection

1.1.1 REVERSE BATTERY PROTECTION

An external reverse-battery-blocking diode should be used to provide polarity protection (see [Example 1-1](#)).

1.1.2 TRANSIENT VOLTAGE PROTECTION (LOAD DUMP)

An external 60V transient suppressor (TVS) diode, between VBB and ground, with a 50Ω transient protection resistor (RTP) in series with the battery supply and the VBB pin serve to protect the device from power transients (see [Example 1-1](#)) and ESD events. While this protection is optional, it is considered good engineering practice.

1.2 Internal Protection

1.2.1 ESD PROTECTION

For component-level ESD ratings, please refer to the maximum operation specifications.

1.2.2 GROUND LOSS PROTECTION

The LIN Bus specification states that the LIN pin must transition to the recessive state when ground is disconnected. Therefore, a loss of ground effectively forces the LIN line to a high-impedance level.

1.2.3 THERMAL PROTECTION

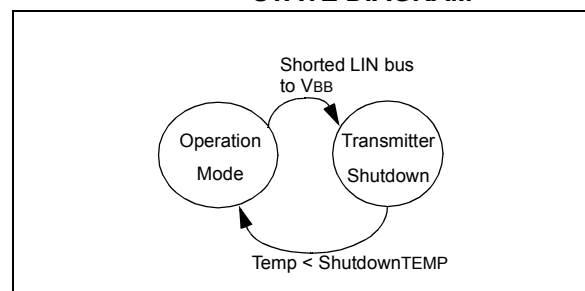

The thermal protection circuit monitors the die temperature and is able to shut down the LIN transmitter.

There are two causes for a thermal overload. A thermal shutdown can be triggered by either, or both, of the following thermal overload conditions.

- LIN bus output overload
- Increase in die temperature due to increase in environment temperature

Driving the TXD and checking the RXD pin makes it possible to determine whether there is a bus contention (Rx = low, Tx = high) or a thermal overload condition (Rx = high, Tx = low). After a thermal overload event, the device will automatically recover once the die temperature has fallen below the recovery temperature threshold (see [Figure 1-1](#)).

FIGURE 1-1: THERMAL SHUTDOWN STATE DIAGRAM

1.3 Modes of Operation

For an overview of all operational modes, refer to [Table 1-1](#).

The device will go into Power-Down mode on the falling edge of CS, or return to Operation mode if all faults are resolved.

1.3.1 POWER-DOWN MODE

In Power-Down mode, everything is off except the wake-up section. The internal 30 k Ω pull-up resistor switch is open, which enables the high ohmic pull-up resistor (900 k Ω typical). This is the lowest power mode. The receiver is off, thus its output is open-drain.

On CS going to a high level or a falling edge on $\overline{\text{WAKE}}$, the device will enter Ready mode as soon as internal voltage stabilizes. Refer to [Section 2.4 “AC Specifications”](#) for further information. In addition, LIN bus activity will change the device from Power-Down mode to Ready mode; The MCP2003B wakes up on a rising edge on L_{BUS} preceded by a low level lasting at least 70 μs typically. See [Figure 1-2](#) about remote wake-up. If CS is held high as the device transitions from Power-Down to Ready mode, the device will transition to either Operation or Transmitter Off mode, depending on TxD input, as soon as internal voltages stabilize.

1.3.2 READY MODE

Transitioning from POR into Ready mode is achieved when $V_{\text{BB}} > V_{\text{BBUV_RISE}}$. Upon entering Ready mode, VREN is enabled and the receiver detect circuit is powered-up. The transmitter remains disabled and the device is ready to receive data but not to transmit.

Upon V_{BB} supply pin power-on, the device will remain in Ready mode as long as CS is low. When CS transitions high, the device will either enter Operation mode if the TxD pin is held high, or the device will enter Transmitter Off mode if the TxD pin is held low.

1.3.3 OPERATION MODE

In this mode, all internal modules are operational. Note that the part cannot transmit if the pull-up resistance is missing on Rx pin. See [Section 1.5.1.1 “RxD Monitoring”](#) for details.

The device will go into Power-Down mode on the falling edge of CS and the TxD pin is held high. The device will enter Transmitter Off mode in the event of a Fault condition such as thermal overload, bus contention or TxD timer expiration.

The V_{BB} to L_{BUS} ~30 k Ω pull-up resistor (R_{SLAVE}) is connected only in Operation mode.

1.3.4 TRANSMITTER OFF MODE

Transmitter Off mode is reached whenever the transmitter is disabled due to a Fault condition. Fault conditions include thermal overload, bus contention, RxD monitoring and TxD timer expiration.

FIGURE 1-2: OPERATIONAL MODES STATE DIAGRAM – MCP2003B

TABLE 1-1: OVERVIEW OF OPERATIONAL MODES

State	Transmitter	Receiver	VREN	Operation	Comments
POR	OFF	OFF	OFF	Check CS: if low, then proceed to Ready mode; If high, transition to either TOFF or Operation mode, depending on TxD.	VBB > VBB(MIN) and Internal Supply stable. High ohmic pull-up resistor enabled (900 kΩ typical).
Ready	OFF	ON	ON	On CS high level, proceed to Operation or TOFF mode.	Bus Off state. High ohmic pull-up resistor enabled (900 kΩ typical).
Operation	ON	ON	ON	On CS low level, proceed to Power-Down. On a fault condition, proceed to TOFF mode.	Normal Operation mode. RXD has to be at a high level (>2.5V typical) while LBUS is recessive.
Power-Down	OFF	Activity Detect	OFF	On CS high level, proceed to Ready mode then proceed to either Operation or TOFF mode. Falling edge on WAKE will put the device into Ready mode. Rising edge on LIN bus will put the device into Ready mode.	Low-Power mode. High ohmic pull-up resistor enabled (900 kΩ typical).
Transmitter Off	OFF	ON	ON	On CS low level, proceed to Power-Down mode; On TxD high and no fault condition, proceed to Operation mode.	High ohmic pull-up resistor enabled (900kΩ typical).

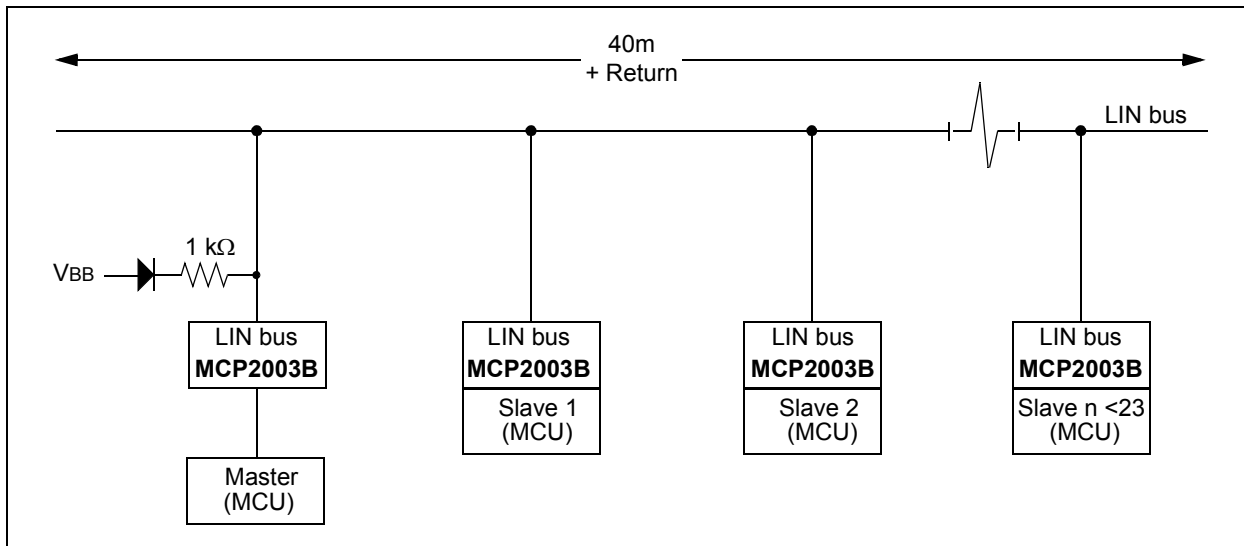

MCP2003B

1.4 Typical Applications

EXAMPLE 1-1: TYPICAL MCP2003B APPLICATION

EXAMPLE 1-2: TYPICAL LIN NETWORK CONFIGURATION

1.5 Pin Descriptions

TABLE 1-2: PINOUT DESCRIPTIONS

Pin Name	8-Lead SOIC	2x3 DFN	3x3 DFN	Normal Operation
RxD	1	1	1	Receive Data Output (OD), HV tolerant
CS	2	2	2	Chip Select (TTL), HV tolerant
$\overline{\text{WAKE}}$	3	3	3	Wake-up, HV tolerant
TxD	4	4	4	Transmit Data Input (TTL), HV tolerant
VSS	5	5	5	Ground
LBUS	6	6	6	LIN Bus (bidirectional)
VBB	7	7	7	Battery Positive
VREN	8	8	8	Voltage Regulator Enable Output
EP	—	9	9	Exposed Thermal Pad. Do not electrically connect or connect to Vss.

Legend: TTL = TTL Input Buffer; OD = Open-Drain Output

1.5.1 RECEIVE DATA OUTPUT (RxD)

The Receive Data Output pin is an open-drain (OD) output and follows the state of the LIN pin, except in Power-Down mode.

1.5.1.1 RxD Monitoring

The RxD pin is internally monitored. It has to be at a high level ($> 2.5\text{V}$ typical) while LBUS is recessive in Operation mode. Otherwise, an internal fault will be created and the device will transition to Transmitter Off mode.

Note: A voltage regulator sensing circuit is connected to RxD. This sensing circuit internally monitors the RxD pin when LBUS is recessive ($\text{RxD} = 1$). It will not allow the device to switch (or stay) in Operation Mode if the RxD pin is left open. The RxD pin must be connected to a valid supply through a pull-up resistor as RxD is an open drain pin.

1.5.2 CHIP SELECT (CS)

This is the Chip Select Input pin. An internal pull-down resistor will keep the CS pin low. This is done to ensure that no disruptive data will be present on the bus while the microcontroller is executing a Power-on Reset and an I/O initialization sequence. The pin must detect a high level to activate the transmitter. An internal Low-Pass filter, with a typical time constant of $10\ \mu\text{s}$, prevents unwanted wake-up (or transition to Power-Down mode) on glitches.

If $\text{CS} = 0$ when the VBB supply is turned on, the device goes to Ready mode as soon as internal voltages stabilize, and stays there as long as the CS pin is held low (0). In Ready mode, the receiver is on and the LIN transmitter driver is off.

If $\text{CS} = 1$ when the VBB supply is turned on, the device will proceed to Operation mode, or TXOFF (refer to [Figure 1-2](#)), as soon as internal voltages stabilize.

This pin may also be used as a local wake-up input (refer to [Example 1-1](#)). In this implementation, the microcontroller I/O controlling the CS should be converted to a high-impedance input allowing the internal pull-down resistor to keep CS low. An external switch, or other source, can then wake-up both the transceiver and the microcontroller (if powered). Refer to [Section 1.3 “Modes of Operation”](#), for detailed operation of CS.

Note: It is not recommended to tie CS high, as this can result in the device entering Operation mode before the microcontroller is initialized and may result in unintentional LIN traffic. The CS pin is internally pulled down to ground with $190\ \text{k}\Omega$ when CS is less than V_{IL} , and $2\ \text{M}\Omega$ when CS is greater than V_{IH} . The current on CS is limited to about $2\ \mu\text{A}$ when CS is greater than V_{IH} .

1.5.3 WAKE-UP INPUT ($\overline{\text{WAKE}}$)

The $\overline{\text{WAKE}}$ pin has an internal $800\ \text{k}\Omega$ pull-up to VBB. A falling edge on the $\overline{\text{WAKE}}$ pin causes the device to wake from Power-Down mode. Upon waking, the MCP2003B will enter Ready mode.

1.5.4 TRANSMIT DATA INPUT (TxD)

The Transmit Data Input pin has an internal pull-up. The LIN pin is low (dominant) when TxD is low, and high (recessive) when TxD is high.

For extra bus security, TxD is internally forced to '1' whenever the transmitter is disabled, regardless of external TxD voltage.

1.5.4.1 TXD Dominant Timeout

If TXD is driven low for longer than approximately 25 ms, the LBUS pin is switched to Recessive mode and the part enters TOFF Mode. This is to prevent the LIN node from permanently driving the LIN Bus dominant. The transmitter is reenabled on TXD rising edge.

1.5.5 GROUND (Vss)

This is the Ground pin.

1.5.6 LIN BUS (LBUS)

The bidirectional LIN Bus pin (LBUS) is controlled by the TXD input. LBUS has a current limited open collector output. To reduce EMI, the edges during the signal changes are slope controlled and include corner rounding control for both falling and rising edges.

The internal LIN receiver observes the activities on the LIN bus, and matches the output signal RXD to follow the state of the LBUS pin.

1.5.6.1 Bus Dominant Timer

The Bus Dominant Timer is an internal timer that deactivates the LBUS transmitter after approximately 25 ms of dominant state on the LBUS pin. The timer is reset on any recessive LBUS state.

The LIN bus transmitter will be reenabled after a recessive state on the LBUS pin as long as CS is high. Disabling can be caused by the LIN bus being externally held dominant, or by TXD being driven low.

1.5.7 BATTERY (VBB)

This is the Battery Positive Supply Voltage pin.

1.5.8 VOLTAGE REGULATOR ENABLE OUTPUT (VREN)

This is the External Voltage Regulator Enable pin. Open-drain output is pulled high to VBB in all modes except Power-Down.

1.5.9 EXPOSED THERMAL PAD (EP)

Do not electrically connect, or connect to Vss.

2.0 ELECTRICAL CHARACTERISTICS

2.1 Absolute Maximum Ratings†

V _{IN} DC Voltage on RXD, TXD, CS	-0.3 to +50V
V _{IN} DC Voltage on $\overline{\text{WAKE}}$ and VREN	-0.3 to +V _{BB}
V _{BB} Battery Voltage, continuous, non-operating ⁽¹⁾	-0.3 to +50V
V _{BB} Battery Voltage, non-operating (LIN bus recessive) ⁽²⁾	-0.3 to +60V
V _{BB} Battery Voltage, transient ISO 7637 Test 1	-200V
V _{BB} Battery Voltage, transient ISO 7637 Test 2a	+150V
V _{BB} Battery Voltage, transient ISO 7637 Test 3a	-300V
V _{BB} Battery Voltage, transient ISO 7637 Test 3b	+200V

2.2 Nomenclature Used in This Document

Some terms and names used in this data sheet deviate from those referred to in the LIN specifications. Equivalent values are shown in [Table 2-1](#).

TABLE 2-1: EQUIVALENT VALUES

LIN specifications Name	Term used in the following tables	Definition
VBAT	<i>not used</i>	ECU operating voltage
VSUP	VBB	Supply voltage at device pin
IBUS_LIM	ISC	Current Limit of driver
VBUSREC	VIH(LBUS)	Recessive state
VBUSDOM	VIL(LBUS)	Dominant state

2.3 DC Specifications

DC Specifications		Electrical Characteristics: Unless otherwise indicated, all limits are specified for VBB = 5.5V to 30.0V Extended (E): TA = -40°C to +125°C High (H): TA = -40°C to +150°C				
Parameter	Sym.	Min.	Typ.	Max.	Units	Conditions
Power						
VBB Quiescent Operating Current	IBBQ	—	65	150	μA	Operating Mode, bus recessive
		—	—	160	μA	VBB > 18V
VBB Transmitter-off Current	IBBTO	—	60	120	μA	Transmitter off, bus recessive
		—	—	130	μA	VBB > 18V
VBB Power-Down Current	IBBPD	—	6	15	μA	
		—	—	20	μA	VBB > 18V
		—	14	20	μA	LIN bus shorted to GND VLIN = 0V, VBB < 12V
VBB Current with VSS Floating	IBBNOGND	-1	—	1	mA	VBB = 12V, GND to VBB, VLIN = 0-27V
VBB Undervoltage Threshold (switching from Operation mode to TOFF and VREN OFF)	VBBUV_FALL	3.8	4	4.4	V	VBB falling (Note 3)
VBB Undervoltage Recovery Threshold (switching from POR to Ready mode)	VBBUV_RISE	5.5	5.6	6.0	V	VBB rising (Note 3)
Microcontroller Interface						
High-Level Input Voltage (TXD)	VIH	2.0	—	30	V	
Low-Level Input Voltage (TXD)	VIL	-0.3	—	0.8	V	
High-Level Input Current (TXD)	IIH	-5	—	—	μA	Input voltage = 4.0V

Note 1: Internal current limited. 2.0 ms maximum recovery time (RLBUS = 0Ω, Tx = 0.4 VREG, VLBUS = VBB).

2: Node has to sustain the current that can flow under this condition; bus must be operational under this condition.

3: Characterized; not 100% tested.

2.3 DC Specifications (Continued)

DC Specifications		Electrical Characteristics: Unless otherwise indicated, all limits are specified for V _{BB} = 5.5V to 30.0V Extended (E): T _A = -40°C to +125°C High (H): T _A = -40°C to +150°C				
Parameter	Sym.	Min.	Typ.	Max.	Units	Conditions
Low-Level Input Current (TXD)	I _{IL}	-12	—	—	μA	Input voltage = 0.5V
High-Level Voltage (VREN)	V _{HVREN}	-0.3	—	V _{BB} + 0.3	V	
High-Level Output Current (VREN)	I _{HVREN}	-40	—	-5	mA	Output voltage = V _{BB} - 0.5V
		-120	—	-20		Output voltage = V _{BB} - 2.0V
High-Level Input Voltage (CS)	V _{IH}	2.0	—	30	V	Through a current limiting resistor
Low-Level Input Voltage (CS)	V _{IL}	-0.3	—	0.8	V	
High-Level Input Current (CS)	I _{IH}	—	—	10.0	μA	Input voltage = 4.0V
Low-Level Input Current (CS)	I _{IL}	—	—	7.0	μA	Input voltage = 0.5V
Low-Level Input Voltage (WAKE)	V _{IL}	V _{BB} - 4.0V	—	—	V	
High-Level Input Current (WAKE)	I _{IH}	-12	—	—	μA	
		-15	—	—	μA	V _{BB} > 18V
Low-Level Input Current (WAKE)	I _{IL}	-30	—	—	μA	
		-45	—	—	μA	V _{BB} > 18V
Low-Level Output Voltage (RXD)	V _{OL}	—	—	0.4	V	I _{IN} = 2 mA
Input Threshold Level (RXD)	V _{TH} (RXD)	—	2.5	—	V	RXD > V _{TH} ; LBUS recessive in Operating mode
High-Level Output Current (RXD)	I _{OH}	-1	—	-1	μA	V _{LIN} = V _{BB} , V _{RXD} = 5.5V
Bus Interface						
High-Level Input Voltage	V _{IH} (LBUS)	0.6 V _{BB}	—	—	V	Recessive state
Low-Level Input Voltage	V _{IL} (LBUS)	-8	—	0.4 V _{BB}	V	Dominant state
Input Hysteresis	V _{HYS}	—	—	0.175 V _{BB}	V	V _{IH} (LBUS) - V _{IL} (LBUS)
Low-Level Output Current	I _{OL} (LBUS)	40	—	200	mA	Output voltage = 0.2 V _{BB} , V _{BB} = 12V
		16.5	—	—	mA	Output voltage = 0.2 V _{BB} , V _{BB} = 18V
High-Level Output Current	I _{OH} (LBUS)	—	—	20	μA	
Short-Circuit Current Limit	I _{SC}	50	—	200	mA	(Note 1)
High-Level Output Voltage	V _{OH} (LBUS)	0.8 V _{BB}	—	V _{BB}	V	
Driver Dominant Voltage	V _{LOSUP}	—	—	1.2	V	R _{LOAD} = 500Ω
Input Leakage Current (at the receiver during dominant bus level)	I _{BUS_PAS_DO M}	-1	-0.4	—	mA	Driver off, V _{BUS} = 0V, V _{BB} = 12V

Note 1: Internal current limited. 2.0 ms maximum recovery time (R_{LBUS} = 0Ω, T_X = 0.4 V_{REG}, V_{LBUS} = V_{BB}).

2: Node has to sustain the current that can flow under this condition; bus must be operational under this condition.

3: Characterized; not 100% tested.

2.5 Thermal Specifications

Parameter	Symbol	Typ.	Max.	Units	Test Conditions
Recovery Temperature	θ_{RECOVERY}	+160	—	°C	
Shutdown Temperature	θ_{SHUTDOWN}	+180	—	°C	
Short-Circuit Recovery Time	t_{THERM}	1.5	5.0	ms	
Thermal Package Resistances					
Thermal Resistance, 2x3 8L-DFN	θ_{JA}	75	—	°C/W	
Thermal Resistance, 3x3 8L-DFN	θ_{JA}	56.7	—	°C/W	
Thermal Resistance, 8L-SOIC	θ_{JA}	149.5	—	°C/W	

Note 1: The maximum power dissipation is a function of T_{JMAX} , θ_{JA} and ambient temperature T_{A} . The maximum allowable power dissipation at an ambient temperature is $P_{\text{D}} = (T_{\text{JMAX}} - T_{\text{A}}) \theta_{\text{JA}}$. If this dissipation is exceeded, the die temperature will rise above 150°C and the device will go into thermal shutdown.

2.6 Typical Performance Curves

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, $V_{BB} = 5.5V$ to $18.0V$, Extended (E): $T_A = -40^{\circ}C$ to $+125^{\circ}C$ and High (H): $T_A = -40^{\circ}C$ to $+150^{\circ}C$.

3.0 PACKAGING INFORMATION

3.1 Package Marking Information

8-Lead DFN (2x3)

Device	Code
MCP2003B-E/MC	ADP
MCP2003BT-E/MC	ADP
MCP2003B-H/MC	ADR
MCP2003BT-H/MC	ADR

Examples:

8-Lead DFN (3x3)

Device	Code
MCP2003B-E/MF	DAEC
MCP2003BT-E/MF	DAEC
MCP2003B-H/MF	DAEE
MCP2003BT-H/MF	DAEE

Examples:

8-Lead SOIC (150 mil)

Examples:

Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

MCP2003B

8-Lead Plastic Dual Flat, No Lead Package (MC) – 2x3x0.9 mm Body [DFN]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

NOTES:

APPENDIX A: REVISION HISTORY

Revision C (April 2016)

The following is the list of modifications:

- Updated [MCP2003B Block Diagram](#).
- Updated [Section 1.3.1, Power-Down Mode](#).
- Updated [Figure 1-2](#).
- Updated [Table 1-1](#).
- Added VBBUV_FALL, VBBUV_RISE and updated IBBPD.

Revision B (December 2015)

The following is the list of modifications:

- Included Features and Electrical Characteristics for the SAE J2962-1.
- Minor typographical changes.

Revision A (November 2015)

- Original release of this document.

MCP2003B

<u>PART NO.</u>		<u>X</u>	<u>/XX</u>
Device		Temperature Range	Package
Device: MCP2003B: LIN Transceiver MCP2003BT: LIN Transceiver (Tape and Reel)			
Temperature Range: E = -40°C to +125°C (Extended) H = -40°C to +150°C (High)			
Package: MC = 8-Lead Plastic Dual Flat, No Lead Package – 2x3x0.9 mm Body (DFN) MF = 8-Lead Plastic Dual Flat, No Lead Package – 3x3x0.9 mm Body (DFN) SN = 8-Lead Plastic Small Outline – Narrow 3.90 mm Body (SOIC)			
		Examples: a) MCP2003B-E/MC: Extended Temperature, 8LD 2x3 DFN package b) MCP2003B-E/MF: Extended Temperature, 8LD 3x3 DFN package c) MCP2003B-E/SN: Extended Temperature, 8LD SOIC package d) MCP2003BT-H/MC: Tape and Reel, High Temperature, 8LD 2x3 DFN package e) MCP2003BT-H/MF: Tape and Reel, High Temperature, 8LD 3x3 DFN package f) MCP2003BT-H/SN: Tape and Reel, High Temperature, 8LD SOIC package	

MCP2003B

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
