

PWM Fan Speed Controller with Auto-Shutdown and FanSense™ Technology

Features

- Temperature Proportional Fan Speed for Acoustic Control and Longer Fan Life
- Efficient PWM Fan Drive
- 3.0V to 5.5V Supply Range:
 - Fan Voltage Independent of TC649 Supply Voltage
 - Supports any Fan Voltage
- FanSense™ Fault Detection Circuits Protect Against Fan Failure and Aid System Testing
- Automatic Shutdown Mode for “Green” Systems
- Supports Low Cost NTC/PTC Thermistors
- Space Saving 8-Pin MSOP Package

Applications

- Power Supplies
- Computers
- File Servers
- Portable Computers
- Telecom Equipment
- UPSs, Power Amps
- General Purpose Fan Speed Control

Available Tools

- Fan Controller Demonstration Board (TC642DEMO)
- Fan Controller Evaluation Kit (TC642EV)

Package Types

General Description

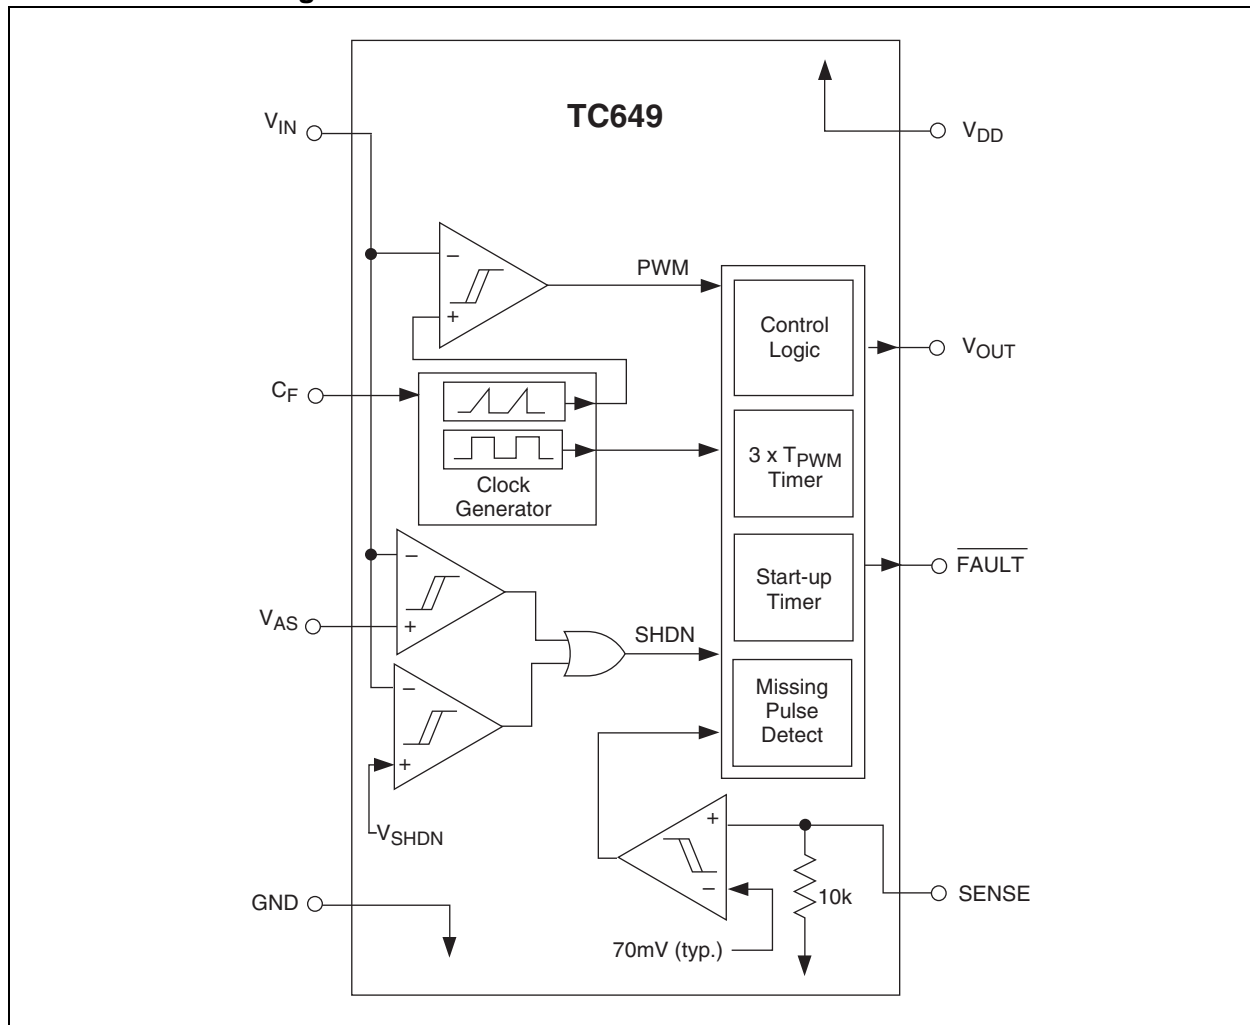

The TC649 is a switch mode, fan speed controller for use with brushless DC fans. Temperature proportional speed control is accomplished using pulse width modulation (PWM). A thermistor (or other voltage output temperature sensor) connected to the V_{IN} input furnishes the required control voltage of 1.25V to 2.65V (typical) for 0% to 100% PWM duty cycle. The TC649 automatically suspends fan operation when measured temperature (V_{IN}) is below a user programmed minimum setting (V_{AS}). An integrated Start-up Timer ensures reliable motor start-up at turn-on, coming out of shutdown mode, auto-shutdown mode or following a transient fault.

In normal fan operation, a pulse train is present at SENSE (Pin 5). The TC649 features Microchip Technology's proprietary FanSense™ technology for increasing system reliability. A missing pulse detector monitors this pin during fan operation. A stalled, open or unconnected fan causes the TC649 to trigger its Start-up Timer once. If the fault persists, the FAULT output goes low, and the device is latched in its shutdown mode. See Section 5.0, “Typical Applications”, for more information and system design guidelines.

The TC649 is available in the 8-pin PDIP, SOIC and MSOP packages and is available in the industrial and extended commercial temperature ranges.

TC649

Functional Block Diagram

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings*

Supply Voltage 6V

Input Voltage, Any Pin.... (GND – 0.3V) to ($V_{DD} + 0.3V$)

Package Thermal Resistance:

PDIP ($R_{\theta JA}$) 125°C/W

SOIC ($R_{\theta JA}$) 155°C/W

MSOP ($R_{\theta JA}$) 200°C/W

Specified Temperature Range..... -40°C to +125°C

Storage Temperature Range..... -65°C to +150°C

*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL SPECIFICATIONS

Electrical Characteristics: Unless otherwise specified, $T_{MIN} \leq T_A \leq T_{MAX}$, $V_{DD} = 3.0V$ to $5.5V$.						
Symbol	Parameter	Min	Typ	Max	Units	Test Conditions
V_{DD}	Supply Voltage	3.0	—	5.5	V	
I_{DD}	Supply Current, Operating	—	0.5	1.0	mA	Pins 6, 7 Open, $C_F = 1 \mu F$, $V_{IN} = V_{C(MAX)}$

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1: PIN FUNCTION TABLE

Pin No.	Symbol	Description
1	V_{IN}	Analog Input
2	C_F	Analog Output
3	V_{AS}	Analog Input
4	GND	Ground Terminal
5	SENSE	Analog Input
6	\overline{FAULT}	Digital (Open Collector) Output
7	V_{OUT}	Digital Output
8	V_{DD}	Power Supply Input

2.1 Analog Input (V_{IN})

The thermistor network (or other temperature sensor) connects to the V_{IN} input. A voltage range of 1.25V to 2.65V (typical) on this pin drives an active duty cycle of 0% to 100% on the V_{OUT} pin. The TC649 enters shutdown mode when $V_{IN} \leq V_{SHDN}$. During shutdown, the \overline{FAULT} output is inactive, and supply current falls to 25 μ A (typical). The TC649 exits shutdown mode when $V_{IN} \geq V_{REL}$. See Section 5.0, "Typical Applications", for details.

2.2 Analog Output (C_F)

C_F is the positive terminal for the PWM ramp generator timing capacitor. The recommended C_F is 1 μ F for 30 Hz PWM operation.

2.3 Analog Input (V_{AS})

An external resistor divider connected to the V_{AS} input sets the auto-shutdown threshold. Auto-shutdown occurs when $V_{IN} \leq V_{AS}$. The fan is automatically restarted when $V_{IN} \geq (V_{AS} + V_{HAS})$. See Section 5.0, "Typical Applications", for more details.

2.4 Ground (GND)

GND denotes the ground terminal.

2.5 Analog Input (SENSE)

Pulses are detected at the SENSE pin as fan rotation chops the current through a sense resistor (R_{SENSE}). The absence of pulses indicates a fault. See Section 5.0, "Typical Applications", for more details.

2.6 Digital Output (\overline{FAULT})

The \overline{FAULT} line goes low to indicate a fault condition. When \overline{FAULT} goes low due to a fan fault condition, the device is latched in shutdown mode until deliberately cleared or until power is cycled.

2.7 Digital Output (V_{OUT})

V_{OUT} is an active high complimentary output that drives the base of an external NPN transistor (via an appropriate base resistor) or the gate of an N-channel MOSFET. This output has asymmetrical drive (see Section 1.0, "Electrical Characteristics").

2.8 Power Supply Input (V_{DD})

V_{DD} may be independent of the fan's power supply (see Section 1.0, "Electrical Characteristics").

3.0 DETAILED DESCRIPTION

3.1 PWM

The PWM circuit consists of a ramp generator and threshold detector. The frequency of the PWM is determined by the value of the capacitor connected to the C_F input. A frequency of 30 Hz is recommended for most applications ($C_F = 1 \mu F$). The PWM is also the time base for the Start-up Timer (see Section 3.3, "Start-up Timer"). The PWM voltage control range is 1.25V to 2.65V (typical) for 0% to 100% output duty cycle.

3.2 V_{OUT} Output

The V_{OUT} pin is designed to drive a low cost transistor or MOSFET as the low side power switching element in the system. Various examples of driver circuits will be shown throughout the datasheet. This output has asymmetric complementary drive and is optimized for driving NPN transistors or N-channel MOSFETs. Since the system relies on PWM rather than linear control, the power dissipation in the power switch is kept to a minimum. Generally, very small devices (TO-92 or SOT packages) will suffice.

3.3 Start-Up Timer

To ensure reliable fan start-up, the Start-up Timer turns the V_{OUT} output on for 32 cycles of the PWM whenever the fan is started from the off state. This occurs at power-up and when coming out of shutdown or auto-shutdown mode. If the PWM frequency is 30 Hz ($C_F = 1 \mu F$) the resulting start-up time will be approximately one second. If a fan fault is detected (see Section 3.5, \overline{FAULT} Output), the Diagnostic Timer is triggered once, followed by the Start-up Timer. If the fault persists, the device is shut down (see Section 3.5, \overline{FAULT} Output).

3.4 SENSE Input (FanSense™ Technology)

The SENSE input (Pin 5) is connected to a low value current sensing resistor in the ground return leg of the fan circuit. During normal fan operation, commutation occurs as each pole of the fan is energized. This causes brief interruptions in the fan current, seen as pulses across the sense resistor. If the device is not in shutdown or auto-shutdown mode, and pulses are not appearing at the SENSE input, a fault exists.

The short, rapid change in fan current (high di/dt) causes a corresponding dV/dt across the sense resistor, R_{SENSE} . The waveform on R_{SENSE} is differentiated and converted to a logic-level pulse-train by C_{SENSE} and the internal signal processing circuitry. The presence and frequency of this pulse-train is a direct indication of fan operation. See Section 5.0, "Typical Applications", for more details.

3.5 \overline{FAULT} Output

Pulses appearing at SENSE due to the PWM turning on are blanked, and the remaining pulses are filtered by a missing pulse detector. If consecutive pulses are not detected for thirty-two PWM cycles (≈ 1 Sec if $C_F = 1 \mu F$), the Diagnostic Timer is activated, and V_{OUT} is driven high continuously for three PWM cycles (≈ 100 msec if $C_F = 1 \mu F$). If a pulse is not detected within this window, the Start-up Timer is triggered (see Section 3.3, "Start-up Timer"). This should clear a transient fault condition. If the missing pulse detector times out again, the PWM is stopped and \overline{FAULT} goes low. When \overline{FAULT} is activated due to this condition, the device is latched in shutdown mode and will remain off indefinitely. The TC649 is thus prevented from attempting to drive a fan under catastrophic fault conditions.

One of two things will restore operation: Cycling power off and then on again; or pulling V_{IN} below V_{SHDN} and releasing it to a level above V_{REL} . When one of these two conditions is satisfied, the normal start-up cycle is triggered and operation will resume, provided the fault has been cleared.

3.6 Auto-Shutdown Mode

If the voltage on V_{IN} becomes less than the voltage on V_{AS} , the fan is automatically shut off (auto-shutdown mode). The TC649 exits auto-shutdown mode when the voltage on V_{IN} becomes higher than the voltage on V_{AS} by V_{HAS} (the auto-shutdown hysteresis voltage, see Figure 3-1). The Start-up Timer is triggered and normal operation is resumed upon exiting auto-shutdown mode. The \overline{FAULT} output is unconditionally inactive in auto-shutdown mode.

FIGURE 3-1: TC649 Nominal Operation.

3.7 Shutdown Mode (RESET)

If an unconditional shutdown and/or device reset is desired, the TC649 may be placed in shutdown mode by forcing V_{IN} to a logic low (i.e., $V_{IN} < V_{SHDN}$) (see Figure 3-1). In this mode, all functions cease and the \overline{FAULT} output is unconditionally inactive. The TC649 should not be shut down unless all heat producing activity in the system is at a negligible level. The TC649 exits shutdown mode when V_{IN} becomes greater than V_{REL} , the release voltage.

Entering shutdown mode also performs a complete device reset. Shutdown mode resets the TC649 into its power-up state. The Start-up and Fault Timers and any current faults are cleared. \overline{FAULT} is unconditionally inactive in shutdown mode. Upon exiting shutdown mode ($V_{IN} > V_{REL}$), the Start-up Timer will be triggered and normal operation will resume, assuming no fault conditions exist and $V_{IN} > (V_{AS} + V_{HAS})$.

Note: If $V_{IN} < V_{AS}$ when the device exits shutdown mode, the fan will not restart, but will be in auto-shutdown mode.

If a fan fault has occurred and the device has latched itself into shutdown mode, performing a reset will not clear the fault unless $V_{IN} > (V_{AS} + V_{HAS})$. If V_{IN} is not greater than $V_{AS} + V_{HAS}$ upon exiting shutdown mode, the fan will not be restarted, and there will be no way to establish that the fan fault has been cleared. To ensure that a complete reset takes place, the user's circuitry must ensure that $V_{IN} > (V_{AS} + V_{HAS})$ when the device is released from shutdown mode. A recommended algorithm for management of the TC649 by a host microcontroller or other external circuitry is given in Section 5.0, "Typical Applications". A small amount of hysteresis, typically one percent of V_{DD} (50mV at $V_{DD} = 5.0V$), is designed into the V_{SHDN}/V_{REL} threshold. The levels specified for V_{SHDN} and V_{REL} in Section 1.0, "Electrical Characteristics", include this hysteresis plus adequate margin to account for normal variations in the absolute value of the threshold and hysteresis.

CAUTION: The fan will remain off as long as the V_{IN} pin is being held low or $V_{IN} < V_{AS} + V_{HAS}$.

4.0 SYSTEM BEHAVIOR

The flowcharts describing the TC649's behavioral algorithm are shown in Figure 4-1. They can be summarized as follows:

4.1 Power-Up

- (1) Assuming the device is not being held in shutdown or auto-shutdown mode ($V_{IN} > V_{AS}$)...
- (2) Turn V_{OUT} output on for 32 cycles of the PWM clock. This ensures that the fan will start from a dead stop.
- (3) During this Start-up Timer, if a fan pulse is detected, branch to Normal Operation; if none are received...
- (4) Activate the 32-cycle Start-up Timer one more time and look for fan pulse; if a fan pulse is detected, proceed to Normal Operation; if none are received...
- (5) Proceed to Fan Fault.
- (6) End.

4.2 Normal Operation

Normal Operation is an endless loop which may only be exited by entering shutdown mode, auto-shutdown mode or Fan Fault. The loop can be thought of as executing at the frequency of the oscillator and PWM.

- (1) Reset the missing pulse detector.
- (2) Is TC649 in shutdown or auto-shutdown mode? If so...
 - a. V_{OUT} duty cycle goes to zero.
 - b. \overline{FAULT} is disabled.
 - c. Exit the loop and wait for $V_{IN} > (V_{AS} + V_{HAS})$ to resume operation.
- (3) Drive V_{OUT} to a duty cycle proportional to V_{IN} on a cycle by cycle basis.
- (4) If a fan pulse is detected, branch back to the start of the loop (1).
- (5) If the missing pulse detector times out ...
- (6) Activate the 3-cycle Diagnostic Timer and look for pulses; if a fan pulse is detected, branch back to the start of the loop (1); if none are received...
- (7) Activate the 32-cycle Start-up Timer and look for pulses; if a fan pulse is detected, branch back to the start of the loop (1); if none are received...
- (8) Quit Normal Operation and go to Fan Fault.
- (9) End.

4.3 Fan Fault

Fan Fault is an infinite loop wherein the TC649 is latched in shutdown mode. This mode can only be released by a reset (i.e., V_{IN} being brought below V_{SHDN} , then above $(V_{AS} + V_{HAS})$ or by power-cycling).

- (1) While in this state, \overline{FAULT} is latched on (low) and the V_{OUT} output is disabled.
- (2) A reset sequence applied to the V_{IN} pin will exit the loop to Power-up.
- (3) End.

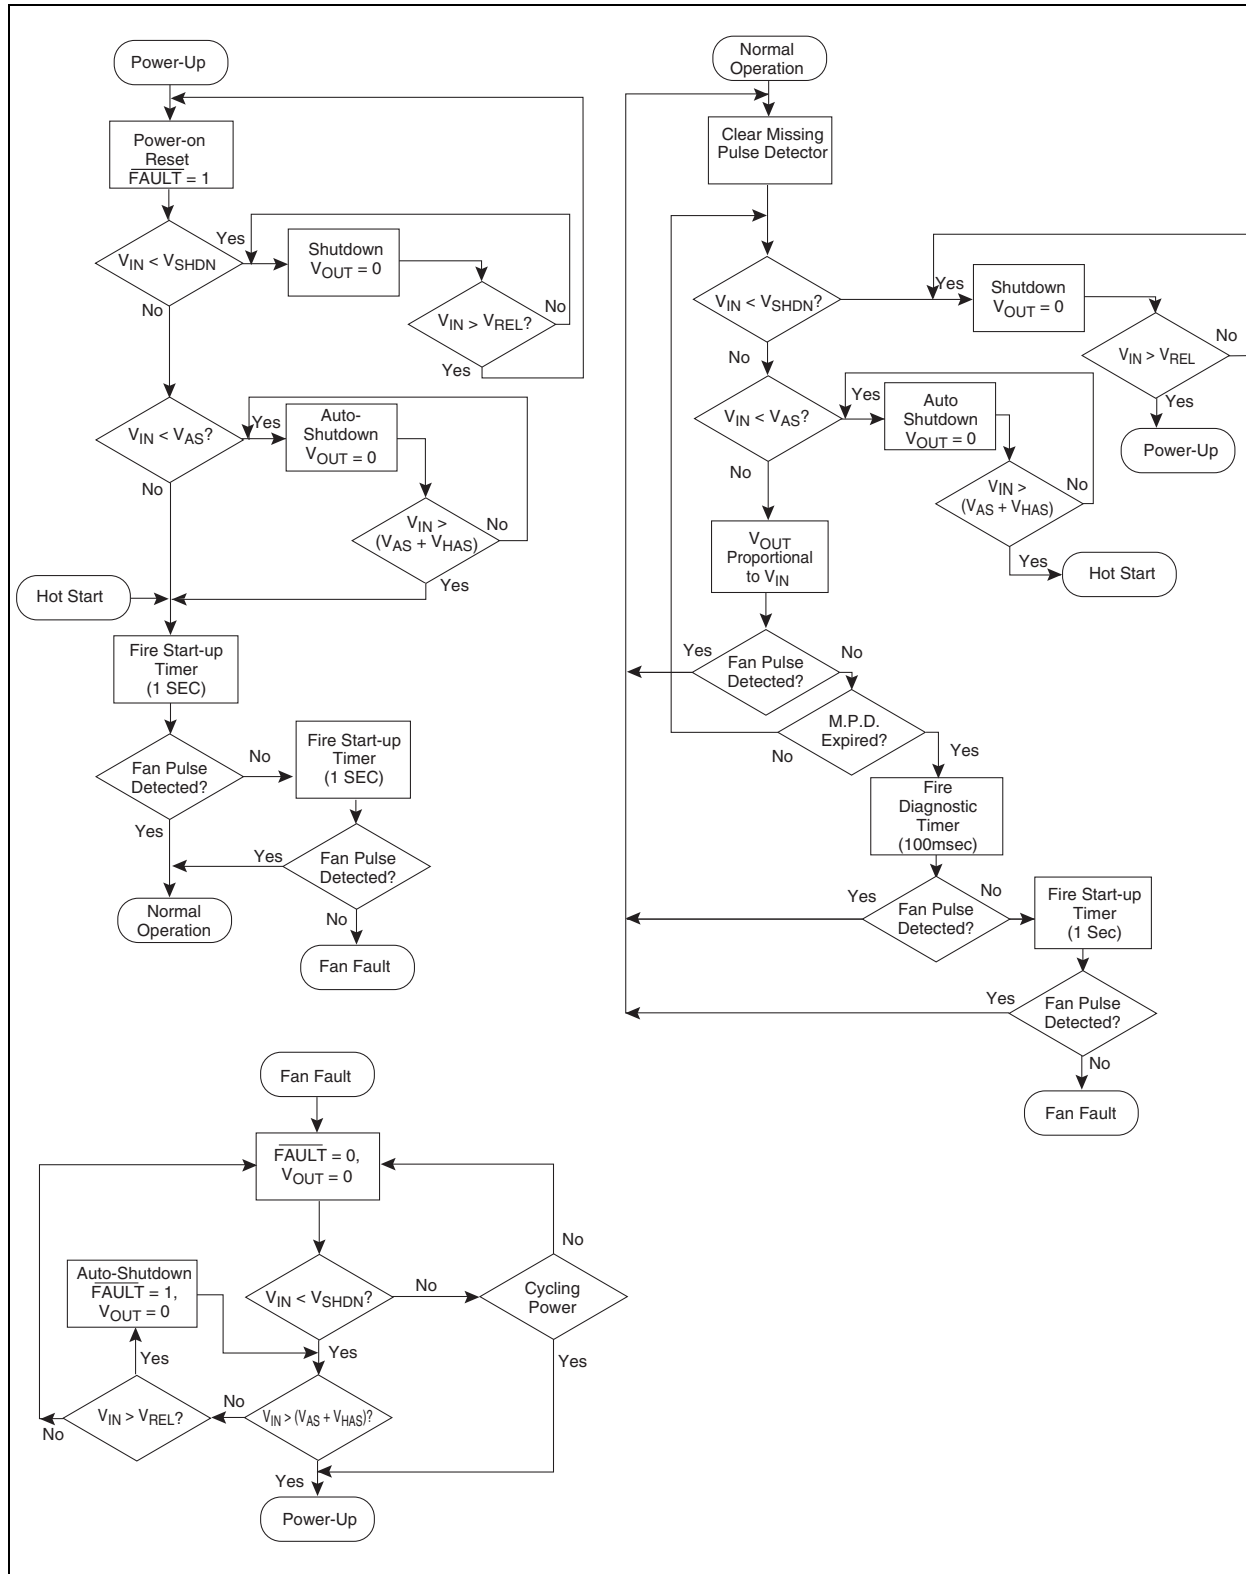

FIGURE 4-1: TC649 Behavioral Algorithm Flowchart.

5.0 TYPICAL APPLICATIONS

Designing with the TC649 involves the following:

- (1) The temperature sensor network must be configured to deliver 1.25V to 2.65V on V_{IN} for 0% to 100% of the temperature range to be regulated.
- (2) The auto-shutdown temperature must be set with a voltage divider on V_{AS} .
- (3) The output drive transistor and associated circuitry must be selected.
- (4) The SENSE network, R_{SENSE} and C_{SENSE} , must be designed for maximum efficiency while delivering adequate signal amplitude.
- (5) If shutdown capability is desired, the drive requirements of the external signal or circuit must be considered.

The TC642 demonstration and prototyping board (TC642DEMO) and the TC642 Evaluation Kit (TC642EV) provide working examples of TC649 circuits and prototyping aids. The TC642DEMO is a printed circuit board optimized for small size and ease of inclusion into system prototypes. The TC642EV is a larger board intended for benchtop development and analysis. At the very least, anyone contemplating a design using the TC649 should consult the documentation for both TC642EV (DS21403) and TC642DEMO (DS21401). Figure 5-1 shows the base schematic for the TC642DEMO.

FIGURE 5-1: Typical Application Circuit.

5.1 Temperature Sensor Design

The temperature signal connected to V_{IN} must output a voltage in the range of 1.25V to 2.65V (typical) for 0% to 100% of the temperature range of interest. The circuit in Figure 5-2 illustrates a convenient way to provide this signal.

FIGURE 5-2: Temperature Sensing Circuit.

Figure 5-2 shows a simple temperature dependent voltage divider circuit. RT_1 is a conventional NTC thermistor, while R_1 and R_2 are standard resistors. The supply voltage, V_{DD} , is divided between R_2 and the parallel combination of RT_1 and R_1 . For convenience, the parallel combination of RT_1 and R_1 will be referred to as R_{TEMP} . The resistance of the thermistor at various temperatures is obtained from the manufacturer's specifications. Thermistors are often referred to in terms of their resistance at 25°C.

Generally, the thermistor shown in Figure 5-2 is a non-linear device with a negative temperature coefficient (also called an NTC thermistor). In Figure 5-2, R_1 is used to linearize the thermistor temperature response and R_2 is used to produce a positive temperature coefficient at the V_{IN} node. As an added benefit, this configuration produces an output voltage delta of 1.4V, which is well within the range of the $V_{C(SPAN)}$ specification of the TC649. A 100 kΩ NTC thermistor is selected for this application in order to keep I_{DIV} at a minimum.

For the voltage range at V_{IN} to be equal to 1.25V to 2.65V, the temperature range of this configuration is 0°C to 50°C. If a different temperature range is required from this circuit, R_1 should be chosen to equal the resistance value of the thermistor at the center of this new temperature range. It is suggested that a maximum temperature range of 50°C be used with this circuit due to thermistor linearity limitations. With this change, R_2 is adjusted according to the following equations:

EQUATION

$$\frac{V_{DD} \times R_2}{R_{TEMP}(T_1) + R_2} = V(T_1)$$

$$\frac{V_{DD} \times R_2}{R_{TEMP}(T_2) + R_2} = V(T_2)$$

Where T_1 and T_2 define the temperature range of the circuit. R_{TEMP} is the parallel equivalent of the thermistor and R_1 at those temperatures.

More information about thermistors may be obtained from AN679, "Temperature Sensing Technologies", and AN685, "Thermistors in Single Supply Temperature Sensing Circuit", which can be downloaded from Microchip's website at www.microchip.com.

5.2 Auto-Shutdown Temperature Design

A voltage divider on V_{AS} sets the temperature at which the part is automatically shut down if the sensed temperature at V_{IN} drops below the set temperature at V_{AS} (i.e. $V_{IN} < V_{AS}$). As with the V_{IN} input, 1.25V to 2.65V (typ.) corresponds to the temperature range of interest from T_1 to T_2 , respectively. Assuming that the temperature sensor network designed above is linearly related to temperature, the shutdown temperature T_{AS} is related to T_2 and T_1 by:

EQUATION

$$\frac{2.65V - 1.25V}{T_2 - T_1} = \frac{V_{AS} - 1.25}{T_{AS} - T_1}$$

$$V_{AS} = \left(\frac{1.4V}{T_2 - T_1} \right) (T_{AS} - T_1) + 1.25$$

For example, if 1.25V and 2.65V at V_{IN} corresponds to a temperature range of $T_1 = 0^\circ\text{C}$ to $T_2 = 125^\circ\text{C}$, and the auto-shutdown temperature desired is 25°C, then V_{AS} voltage is:

EQUATION

$$V_{AS} = \frac{1.4V}{(125 - 0)} (25 - 0) + 1.25 = 1.53V$$

The V_{AS} voltage may be set using a simple resistor divider, as is shown in Figure 5-3.

FIGURE 5-3: V_{AS} Circuit.

Per Section 1.0, “Electrical Characteristics”, the leakage current at the V_{AS} pin is no more than $1\ \mu\text{A}$. It is conservative to design for a divider current, I_{DIV} , of $100\ \mu\text{A}$. If $V_{DD} = 5.0\text{V}$ then:

EQUATION

$$I_{DIV} = 1e^{-4}\text{A} \quad \frac{5.0\text{V}}{R_1 + R_2}, \text{ therefore}$$

$$R_1 + R_2 = \frac{5.0\text{V}}{1e^{-4}\text{A}} = 50,000\Omega = 50\text{ k}\Omega$$

We can further specify R_1 and R_2 by the condition that the divider voltage is equal to our desired V_{AS} . This yields the following:

EQUATION

$$V_{AS} = \frac{V_{DD} \times R_2}{R_1 + R_2}$$

Solving for the relationship between R_1 and R_2 results in:

EQUATION

$$R_1 = R_2 \times \frac{V_{DD} - V_{AS}}{V_{AS}} = R_2 \times \frac{5 - 1.53}{1.53}$$

In the case of this example, $R_1 = (2.27) R_2$. Substituting this relationship back into the V_{AS} equation above yields the resistor values:

$$R_2 = 15.3\text{ k}\Omega, \text{ and}$$

$$R_1 = 34.7\text{ k}\Omega$$

In this case, the standard values of $34.8\text{ k}\Omega$ and $15.4\text{ k}\Omega$ are very close to the calculated values and would be more than adequate.

5.3 Operations at Low Duty Cycle

One boundary condition which may impact the selection of the minimum fan speed is the irregular activation of the Diagnostic Timer due to the TC649 “missing” fan commutation pulses at low speeds. This is a natural consequence of low PWM duty cycles (typically 25% or less). Recall that the SENSE function detects commutation of the fan as disturbances in the current through R_{SENSE} . These can only occur when the fan is energized (i.e., V_{OUT} is “on”). At very low duty cycles, the V_{OUT} output is “off” most of the time. The fan may be rotating normally, but the commutation events are occurring during the PWM’s off-time.

The phase relationship between the fan’s commutation and the PWM edges tends to “walk around” as the system operates. At certain points, the TC649 may fail to capture a pulse within the 32-cycle missing pulse detector window. If this happens, the 3-cycle Diagnostic Timer will be activated, the V_{OUT} output will be active continuously for three cycles and, if the fan is operating normally, a pulse will be detected. If all is well, the system will return to normal operation. There is no harm in this behavior, but it may be audible to the user as the fan accelerates briefly when the Diagnostic Timer fires. For this reason, it is recommended that V_{AS} be set no lower than 1.8V .

5.4 FanSense™ Network (R_{SENSE} and C_{SENSE})

The FanSense network, comprised of R_{SENSE} and C_{SENSE} , allows the TC649 to detect commutation of the fan motor (FanSense™ technology). This network can be thought of as a differentiator and threshold detector. The function of R_{SENSE} is to convert the fan current into a voltage. C_{SENSE} serves to AC-couple this voltage signal and provide a ground-referenced input to the SENSE pin. Designing a proper SENSE network is simply a matter of scaling R_{SENSE} to provide the necessary amount of gain (i.e., the current-to-voltage conversion ratio). A $0.1\ \mu\text{F}$ ceramic capacitor is recommended for C_{SENSE} . Smaller values require larger sense resistors, and higher value capacitors are bulkier and more expensive. Using a $0.1\ \mu\text{F}$ capacitor results in reasonable values for R_{SENSE} . Figure 5-4 illustrates a typical SENSE network. Figure 5-5 shows the waveforms observed using a typical SENSE network.

FIGURE 5-4: SENSE Network.

FIGURE 5-5: SENSE Waveforms.

Table 5-1 lists the recommended values of R_{SENSE} based on the nominal operating current of the fan. Note that the current draw specified by the fan manufacturer may be a worst-case rating for near-stall conditions and may not be the fan's nominal operating current. The values in Table 5-1 refer to actual average operating current. If the fan current falls between two of the values listed, use the higher resistor value. The end result of employing Table 5-1 is that the signal developed across the sense resistor is approximately 450 mV in amplitude.

TABLE 5-1: R_{SENSE} VS. FAN CURRENT

Nominal Fan Current (mA)	R_{SENSE} (Ω)
50	9.1
100	4.7
150	3.0
200	2.4
250	2.0
300	1.8
350	1.5
400	1.3
450	1.2
500	1.0

5.5 Output Drive Transistor Selection

The TC649 is designed to drive an external transistor or MOSFET for modulating power to the fan. This is shown as Q_1 in Figures 5-1, 5-4, 5-6, 5-7, 5-8 and 5-9. The V_{OUT} pin has a minimum source current of 5 mA and a minimum sink current of 1 mA. Bipolar transistors or MOSFETs may be used as the power switching element as shown in Figure 5-6. When high current gain is needed to drive larger fans, two transistors may be used in a Darlington configuration. These circuit topologies are shown in Figure 5-6: (a) shows a single NPN transistor used as the switching element; (b) illustrates the Darlington pair; and (c) shows an N-channel MOSFET.

One major advantage of the TC649's PWM control scheme versus linear speed control is that the power dissipation in the pass element is kept very low. Generally, low cost devices in very small packages, such as TO-92 or SOT, can be used effectively. For fans with nominal operating currents of no more than 200 mA, a single transistor usually suffices. Above 200 mA, the Darlington or MOSFET solution is recommended. For the fan sensing function to work correctly, it is imperative that the pass transistor be fully saturated when "on".

Table 5-2 gives examples of some commonly available transistors and MOSFETs. This table should be used as a guide only since there are many transistors and MOSFETs which will work just as well as those listed. The critical issues when choosing a device to use as Q1 are: (1) the breakdown voltage ($V_{(BR)CEO}$ or V_{DS} (MOSFET)) must be large enough to withstand the highest voltage applied to the fan (**Note:** This will occur when the fan is off); (2) 5 mA of base drive current must

be enough to saturate the transistor when conducting the full fan current (transistor must have sufficient gain); (3) the V_{OUT} voltage must be high enough to sufficiently drive the gate of the MOSFET to minimize the $R_{DS(on)}$ of the device; (4) rated fan current draw must be within the transistor's/MOSFET's current handling capability; and (5) power dissipation must be kept within the limits of the chosen device.

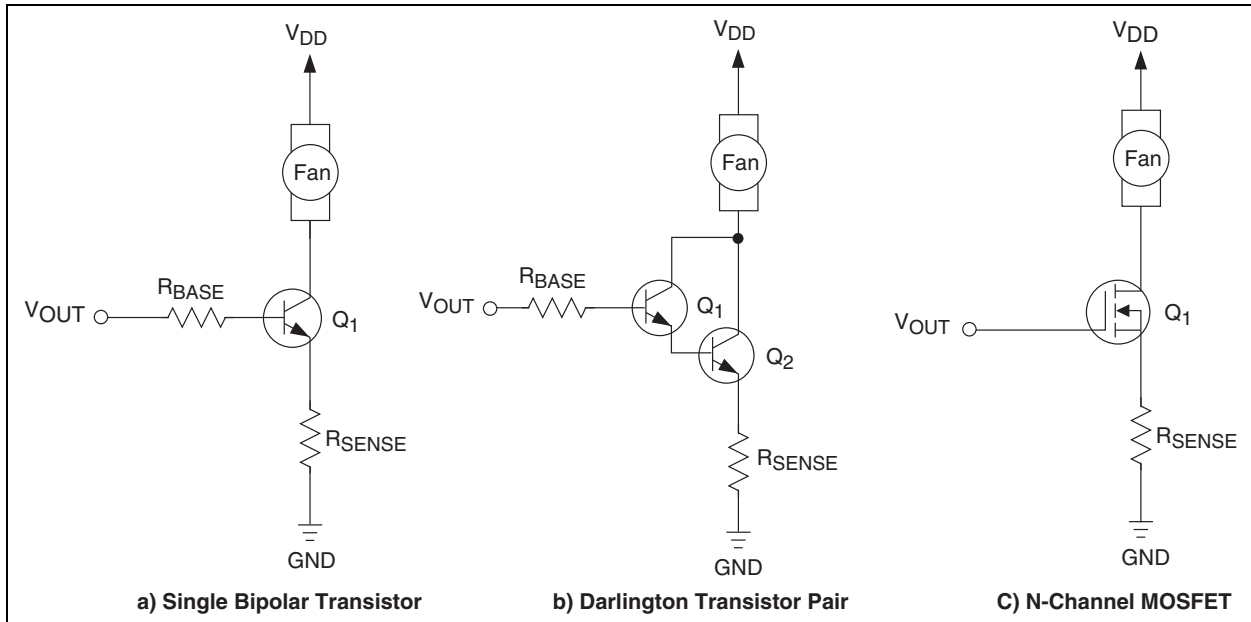

FIGURE 5-6: Output Drive Transistor Circuit Topologies.

TABLE 5-2: TRANSISTORS AND MOSFETS FOR Q1 ($V_{DD} = 5V$)

Device	Package	Max. $V_{BE(sat)}/V_{GS}$ (V)	Min. H_{FE}	V_{CEO}/V_{DS} (V)	Fan Current (mA)	Suggested R_{BASE} (Ω)
MMBT2222A	SOT-23	1.2	50	40	150	800

MPS6602	TO-92	1.2	50	40	500	301
SI2302	SOT-23	2.5	NA	20	500	Note 1
MGSF1N02E	SOT-23	2.5	NA	20	500	Note 1
SI4410	SO-8	4.5	NA	30	1000	Note 1
SI2308	SOT-23	4.5	NA	60	500	Note 1

Note 1: A series gate resistor may be used in order to control the MOSFET turn-on and turn-off times.

TC649

A base-current limiting resistor is required with bipolar transistors (Figure 5-7). The correct value for this resistor can be determined as follows:

$$V_{OH} = V_{RSENSE} + V_{BE(SAT)} + V_{RBASE}$$

$$V_{RSENSE} = I_{FAN} \times R_{SENSE}$$

$$V_{RBASE} = R_{BASE} \times I_{BASE}$$

$$I_{BASE} = I_{FAN} / h_{FE}$$

V_{OH} is specified as 80% of V_{DD} in Section 1.0, "Electrical Characteristics"; $V_{BE(SAT)}$ is given in the chosen transistor data sheet. It is now possible to solve for R_{BASE} .

EQUATION

$$R_{BASE} = \frac{V_{OH} - V_{BE(SAT)} - V_{RSENSE}}{I_{BASE}}$$

Some applications benefit from the fan being powered from a negative supply to keep motor noise out of the positive supply rails. This can be accomplished as shown in Figure 5-8, with zener diode D_1 offsetting the -12V power supply voltage, holding transistor Q_1 off when V_{OUT} is low. When V_{OUT} is high, the voltage at the anode of D_1 increases by V_{OUT} , causing Q_1 to turn on. Operation is otherwise the same as in the case of fan operation from +12V.

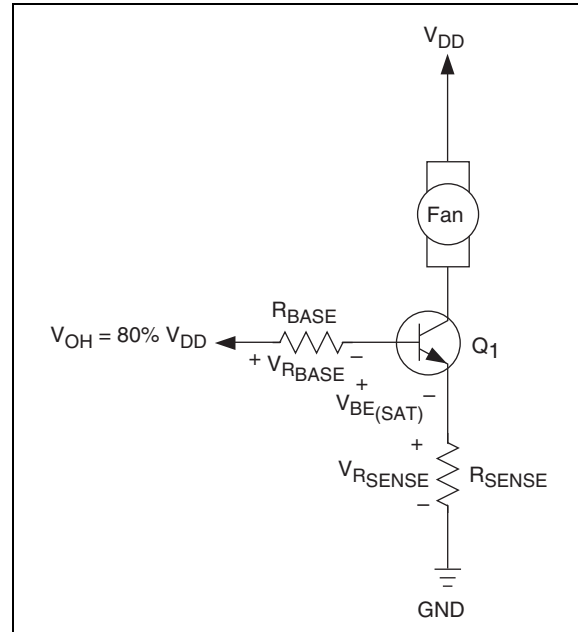

FIGURE 5-7: Circuit For Determining R_{BASE} .

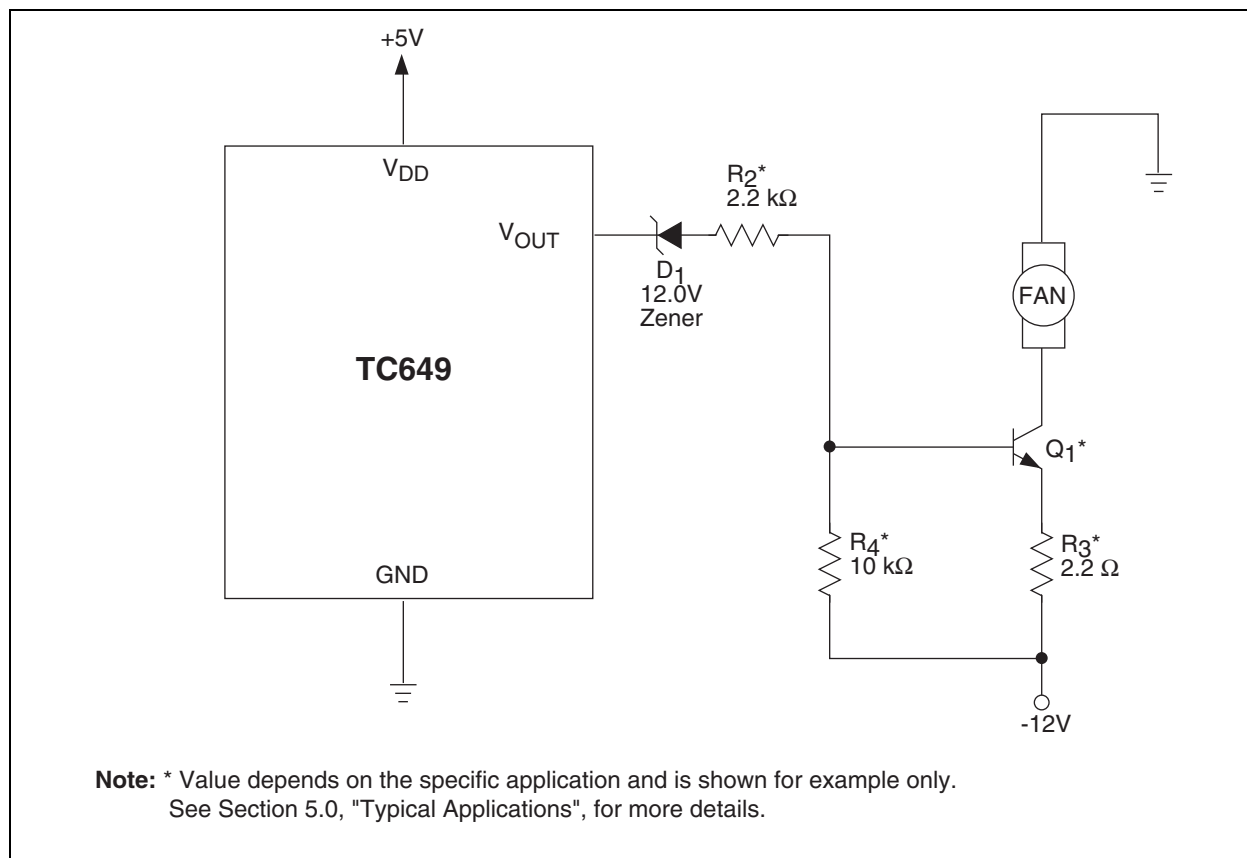

FIGURE 5-8: Powering the Fan from a -12V Supply.

5.6 Latch-up Considerations

As with any CMOS IC, the potential exists for latch-up if signals are applied to the device which are outside the power supply range. This is of particular concern during power-up if the external circuitry (such as the sensor network, V_{AS} divider or shutdown circuit) are powered by a supply different from that of the TC649. Care should be taken to ensure that the TC649's V_{DD} supply powers up first. If possible, the networks attached to V_{IN} and V_{AS} should connect to the V_{DD} supply at the same physical location as the IC itself. Even if the IC and any external networks are powered by the same supply, physical separation of the connecting points can result in enough parasitic capacitance and/or inductance in the power supply connections to delay one power supply "routing" versus another.

5.7 Power Supply Routing and Bypassing

Noise present on the V_{IN} and V_{AS} inputs may cause erroneous operation of the FAULT output. As a result, these inputs should be bypassed with a $0.01\ \mu\text{F}$ capacitor mounted as close to the package as possible. This is especially true of V_{IN} , which is usually drive from

a high impedance source (such as a thermistor). Additionally, the V_{DD} input should be bypassed with a $1\ \mu\text{F}$ capacitor with grounds being kept as short as possible. To keep fan noise off the TC649 ground pin, individual ground returns for the TC649 and the low side of the fan current sense resistor should be used.

Design Example

Step 1. Calculate R_1 and R_2 based on using an NTC having a resistance of $10\ \text{k}\Omega$ at T_{MIN} (25°C) and $4.65\ \text{k}\Omega$ at T_{MAX} (45°C) (see Figure 5-9).

$$R_1 = 20.5\ \text{k}\Omega$$

$$R_2 = 3.83\ \text{k}\Omega$$

Step 2. Set auto-shutdown Level.

$$V_{AS} = 1.8\text{V}.$$

Limit the divider current to $100\ \mu\text{A}$

$$R_5 = 33\ \text{k}\Omega$$

$$R_6 = 18\ \text{k}\Omega$$

Step 3. Design the output circuit.

Maximum fan motor current = $250\ \text{mA}$.

Q_1 beta is chosen at 50 from which

$$R_7 = 800\ \Omega.$$

FIGURE 5-9: Design Example.

5.8 TC649 as a Microcontroller Peripheral

In a system containing a microcontroller or other host intelligence, the TC649 can be effectively managed as a CPU peripheral. Routine fan control functions can be performed by the TC649 without processor intervention. The microcontroller receives temperature data from one or more points throughout the system. It calculates a fan operating speed based on an algorithm specifically designed for the application at hand. The processor controls fan speed using complementary port bits I/O1 through I/O3. Resistors R₁ through R₆

(5% tolerance) form a crude 3-bit DAC that translates this 3-bit code from the processor's outputs into a 1.6V DC control signal. A monolithic DAC or digital pot may be used instead of the circuit shown in Figure 5-10.

With V_{AS} set at 1.8V, the TC649 enters auto-shutdown when the processor's output code is 000[B]. Output codes 001[B] to 111[B] operate the fan from roughly 40% to 100% of full speed. An open-drain output from the processor (I/O0) can be used to reset the TC649 following detection of a fault condition. The FAULT output can be connected to the processor's interrupt input or to another I/O pin for polled operation.

FIGURE 5-10: TC649 as a Microcontroller Peripheral.

6.0 PACKAGING INFORMATION

6.1 Package Marking Information

8-Lead PDIP (300 mil)

Example:

8-Lead SOIC (150 mil)

Example:

8-Lead MSOP

Example:

Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

8-Lead Plastic Dual In-line (P) – 300 mil (PDIP)

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

7.0 REVISION HISTORY

Revision D (December 2012)

Added a note to each package outline drawing.

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

TO: Technical Publications Manager Total Pages Sent _____

RE: Reader Response

From: Name _____

Company _____

Address _____

City / State / ZIP / Country _____

Telephone: (_____) _____ - _____ FAX: (_____) _____ - _____

Application (optional):

Would you like a reply? ☐ Y ☐ N

Device:

Literature Number: DS21449D

Questions:

1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

3. Do you find the organization of this document easy to follow? If not, why?

4. What additions to the document do you think would enhance the structure and subject?

5. What deletions from the document could be made without affecting the overall usefulness?

6. Is there any incorrect or misleading information (what and where)?

7. How would you improve this document?

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>		<u>X</u>	<u>/XX</u>
Device		Temperature Range	Package
Device:		TC649: PWM Fan Speed Controller w/Auto Shutdown and Fault Detection	
Temperature Range:		V = 0°C to +85°C E = -40°C to +85°C	
Package:		PA = Plastic DIP (300 mil Body), 8-lead * OA = Plastic SOIC, (150 mil Body), 8-lead UA = Plastic Micro Small Outline (MSOP), 8-lead * PDIP package is only offered in the V temp range.	
		Examples: a) TC649VOA: PWM Fan Speed Controller w/ Auto-Shutdown and Fault Detection, SOIC package. b) TC649VUA: PWM Fan Speed Controller w/ Auto-Shutdown and Fault Detection, MSOP package. c) TC649VPA: PWM Fan Speed Controller w/ Auto-Shutdown and Fault Detection, PDIP package. d) TC649EOATR: PWM Fan Speed Controller w/ Auto-Shutdown and Fault Detection, SOIC package, Tape and Reel.	

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

New Customer Notification System

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
= ISO/TS 16949 =

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
