

## High Performance Single 150 mA LDO

### Features

- Tiny 1 mm x 1 mm UDFN, SOT23-5, and TSOT23-5 Packages
- Wide 2.5V to 6V Operating Range
- 150 mA Output Current
- Stable with 1  $\mu$ F Ceramic Output Capacitors
- Low Dropout Voltage: 155 mV @ 150 mA
- Excellent Load/Line Transient Response
- Low Quiescent Current: 29  $\mu$ A
- High PSRR: 70 dB
- Thermal-Shutdown and Current-Limit Protection

### Applications

- USB Dongles
- Wireless LANs
- PC Desktops, Laptops, and Tablets
- Battery-Powered Equipment
- Digital Still and Video Cameras
- 5V General Purpose

### General Description

The MIC5317 is a high performance 150 mA low dropout regulator that offers high power supply rejection (PSRR) in an ultra-small 1 mm x 1 mm package for stringent space requirements and demanding performance. The MIC5317 operates from an input voltage from 2.5V to 6.0V and is capable of providing the output voltages of 1.0V to 3.6V making it ideal for USB port or 6V AC adapter applications.

The MIC5317 offers 2% initial accuracy, low dropout voltage (155 mV @ 150 mA), and low ground current (typically 29  $\mu$ A). The MIC5317 can also be put into a zero off-mode current state, drawing virtually no current when disabled.

The MIC5317 is available in several advanced packages including a lead-free (RoHS-compliant) 1 mm x 1 mm UDFN that occupies only 1 mm<sup>2</sup> of PCB area, a 75% reduction in board area compared to SC-70 and 2 mm x 2 mm DFN packages. It is also available in a SOT23-5 and TSOT23-5 package.

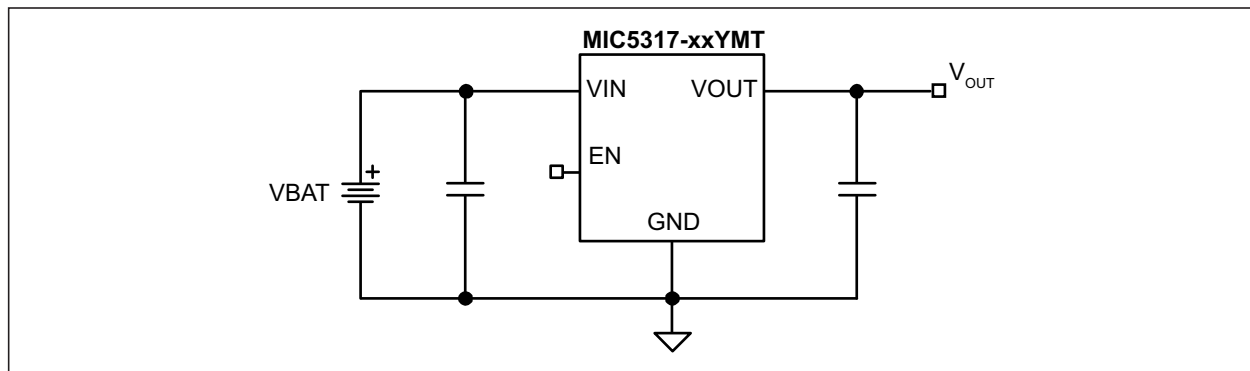

The MIC5317 has an operating junction temperature range of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

### Absolute Maximum Ratings †

Supply Voltage ( $V_{IN}$ )	0V to +7V
Enable Voltage ( $V_{EN}$ )	0V to $V_{IN}$
Power Dissipation ( $P_D$ )	Internally Limited (Note 1)
ESD Rating (HBM, Note 2)	2 kV

### Operating Ratings ††

Supply Voltage ( $V_{IN}$ )	+2.5V to +6V
Enable Voltage ( $V_{EN}$ )	0V to $V_{IN}$

**† Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

**†† Notice:** The device is not guaranteed to function outside its operating ratings.

**Note 1:** The maximum allowable power dissipation of any  $T_A$  (ambient temperature) is  $P_{D(MAX)} = (T_{J(MAX)} - T_A)/\theta_{JA}$ . Exceeding the maximum allowable power dissipation will result in excessive die temperature and the regulator will go into thermal shutdown.

**2:** Devices are ESD sensitive. Handling precautions are recommended. Human body model, 1.5 k $\Omega$  in series with 100 pF.

**Note 1:** Specification for packaged product only.

- 2:** Regulation is measured at constant junction temperature using low duty cycle pulse testing; changes in output voltage due to heating effects are covered by the thermal regulation specification.
- 3:** Dropout voltage is defined as the input-to-output differential at which the output voltage drops 2% below its nominal value measured at 1V differential. For outputs below 2.5V, dropout voltage is the input-to-output differential with the minimum input voltage 2.5V.
- 4:** Ground pin current is the regulator quiescent current. The total current drawn from the supply is the sum of the load current plus the ground pin current.

## 4.0 APPLICATION INFORMATION

MIC5317 is a low-noise 150 mA LDO. The MIC5317 regulator is fully protected from damage due to fault conditions, offering linear current limiting and thermal shutdown. The MIC5317 is not suitable for RF transmitter systems.

### 4.1 Input Capacitor

The MIC5317 is a high-performance, high-bandwidth device. An input capacitor of 1  $\mu\text{F}$  is required from the input to ground to provide stability. Low-ESR ceramic capacitors provide optimal performance at a minimum of space. Additional high-frequency capacitors, such as small-valued NPO dielectric-type capacitors, help filter out high-frequency noise and are good practice in any RF-based circuit. X5R or X7R dielectrics are recommended for the input capacitor. Y5V dielectrics lose most of their capacitance over temperature and are therefore, not recommended.

### 4.2 Output Capacitor

The MIC5317 requires an output capacitor of 1  $\mu\text{F}$  or greater to maintain stability. The design is optimized for use with low-ESR ceramic chip capacitors. High-ESR capacitors are not recommended because they may cause high-frequency oscillation. The output capacitor can be increased, but performance has been optimized for a 1  $\mu\text{F}$  ceramic output capacitor and does not improve significantly with larger capacitance.

X7R/X5R dielectric-type ceramic capacitors are recommended because of their temperature performance. X7R-type capacitors change capacitance by 15% over their operating temperature range and are the most stable type of ceramic capacitors. Z5U and Y5V dielectric capacitors change value by as much as 50% and 60%, respectively, over their operating temperature ranges. To use a ceramic-chip capacitor with Y5V dielectric, the value must be much higher than an X7R ceramic capacitor to ensure the same minimum capacitance over the equivalent operating temperature range.

### 4.3 No-Load Stability

Unlike many other voltage regulators, the MIC5317 will remain stable and in regulation with no load. This is especially important in CMOS RAM keep-alive applications.

### 4.4 Enable/Shutdown

The MIC5317 comes with an active-high enable pin that allows the regulator to be disabled. Forcing the enable pin low disables the regulator and sends it into a “zero” off-mode current state. In this state, current consumed by the regulator goes nearly to zero. Forcing the enable pin high enables the output voltage. The

active-high enable pin uses CMOS technology and the enable pin cannot be left floating. A floating enable pin may cause an indeterminate state on the output.

## 4.5 Thermal Considerations

The MIC5317 is designed to provide 150 mA of continuous current in a very small package. Maximum ambient operating temperature can be calculated based on the output current and the voltage drop across the part. For example if the input voltage is 3.6V, the output voltage is 2.8V, and the output current = 150 mA. The actual power dissipation of the regulator circuit can be determined using [Equation 4-1](#).

### EQUATION 4-1:

$$P_D = (V_{IN} - V_{OUT1}) \times I_{OUT} + V_{IN} \times I_{GND}$$

Because this device is CMOS and the ground current is typically <100  $\mu\text{A}$  over the load range, the power dissipation contributed by the ground current is <1% and can be ignored for [Equation 4-2](#).

### EQUATION 4-2:

$$P_D = (3.6V - 2.8V) \times 150mA = 0.120W$$

To determine the maximum ambient operating temperature of the package, use the junction-to-ambient thermal resistance of the device and Equation 4-3.

### EQUATION 4-3:

$$P_{D(MAX)} = \left( \frac{T_{J(MAX)} - T_A}{\theta_{JA}} \right)$$

$T_{J(MAX)} = 125^\circ\text{C}$ , the maximum junction temperature of the die,  $\theta_{JA}$  thermal resistance =  $240^\circ\text{C/W}$  for the YMT package and  $253^\circ\text{C/W}$  for the SOT23-5 and TSOT23-5 packages.

Substituting  $P_D$  for  $P_{D(MAX)}$  and solving for the ambient operating temperature will give the maximum operating conditions for the regulator circuit. The junction-to-ambient thermal resistance for the minimum footprint is  $240^\circ\text{C/W}$ .

The maximum power dissipation must not be exceeded for proper operation.

For example, when operating the MIC5317-2.8YMT at an input voltage of 3.6V and 150 mA load with a minimum footprint layout, the maximum ambient operating temperature ( $T_A$ ) can be determined as shown in [Equation 4-4](#):

**EQUATION 4-4:**

$$0.120W = (125^{\circ}C - T_A)/(240^{\circ}C/W)$$

$$T_A = 96^{\circ}C$$

Therefore the maximum ambient operating temperature of 96°C is allowed in a 1 mm × 1 mm UDFN package. For a full discussion of heat sinking and thermal effects on voltage regulators, refer to the “Regulator Thermals” section of Microchip’s [Designing with Low-Dropout Voltage Regulators](#) handbook.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
