PIC24FJ256GA412/GB412 FAMILY

16-Bit Flash Microcontrollers with Dual Partition Flash Memory, XLP, LCD, Cryptographic Engine and USB On-The-Go

Extreme Low-Power Features

- Multiple Power Management Options for Extreme Power Reduction:
  - VBAT allows for lowest power consumption on backup battery (with or without RTCC)
  - Deep Sleep allows near total power-down with the ability to wake-up on external triggers
  - Sleep and Idle modes selectively shut down peripherals and/or core for substantial power reduction and fast wake-up
  - Doze mode allows CPU to run at a lower clock speed than peripherals
- Alternate Clock modes allow On-the-Fly Switching to a Lower Clock Speed for Selective Power Reduction
- Extreme Low-Power Current Consumption for Deep Sleep:
  - WDT: 650 nA @ 2V typical
  - RTCC: 650 nA @ 32 kHz, 2V typical
  - Deep Sleep current, 60 nA typical
- 160 μA/MHz in Run mode

High-Performance CPU

- Modified Harvard Architecture
- Up to 16 MIPS Operation @ 32 MHz
- 8 MHz Internal Oscillator:
  - 96 MHz PLL option
  - Multiple clock divide options
  - Run-time self-calibration capability for maintaining better than ±0.20% accuracy
  - Fast start-up
- 17-Bit x 17-Bit Single-Cycle Hardware Fractional/Integer Multiplier
- 32-Bit by 16-Bit Hardware Divider
- 16 x 16-Bit Working Register Array
- C Compiler Optimized Instruction Set Architecture
- Two Address Generation Units for Separate Read and Write Addressing of Data Memory

Cryptographic Engine

- Performs NIST Standard Encryption/Decryption Operations without CPU Intervention
- AES Cipher Support for 128, 192 and 256-Bit Keys
- DES/3DES Cipher Support, with up to Three Unique Keys for 3DES
- Supports ECB, CBC, OFB, CTR and CFB128 modes
- Programmatically Secure OTP Array for Key Storage
- True Random Number Generation
- Battery-Backed RAM Key Storage

Analog Features

- 10/12-Bit, up to 24-Channel Analog-to-Digital (A/D) Converter:
  - Conversion rate of 500 ksps (10-bit), 200 kbps (12-bit)
  - Auto-scan and threshold compare features
  - Conversion available during Sleep
- One 10-Bit Digital-to-Analog Converter (DAC):
  - 1 Msps update rate
- Three Rail-to-Rail, Enhanced Analog Comparators with Programmable Input/Output Configuration
- Charge Time Measurement Unit (CTMU):
  - Used for capacitive touch sensing, up to 24 channels
  - Time measurement down to 100 ps resolution

Dual Partition Flash with Live Update Capability

- Capable of Holding Two Independent Software Applications, including Bootloader
- Permits Simultaneous Programming of One Partition while Executing Application Code from the Other
- Allows Run-Time Switching Between Active Partitions

Universal Serial Bus Features (PIC24FJXXXGB4XX Only)

- USB v2.0 On-The-Go (OTG) Compliant
- Dual Role Capable – Can Act as Either Host or Peripheral
- Low-Speed (1.5 Mb/s) and Full-Speed (12 Mb/s) USB Operation in Host mode
- Full-Speed USB Operation in Device mode
- High-Precision PLL for USB
- USB Device mode Operation from FRC Oscillator – No Crystal Oscillator Required
- Supports up to 32 Endpoints (16 bidirectional):
  - USB module can use any RAM locations on the device as USB endpoint buffers
- On-Chip USB Transceiver with Interface for Off-Chip USB Transceiver
- Supports Control, Interrupt, Isochronous and Bulk Transfers
- On-Chip Pull-up and Pull-Down Resistors

Special Microcontroller Features

- 20,000 Erase/Write Cycle Endurance, Typical
- Data Retention: 20 Years Minimum
- Self-Programmable under Software Control
- Supply Voltage Range of 2.0V to 3.6V
- Two On-Chip Voltage Regulators (1.8V and 1.2V) for Regular and Extreme Low-Power Operation
- Programmable Reference Clock Output
- In-Circuit Serial Programming™ (ICSP™) and In-Circuit Emulation (ICE) via 2 Pins
- JTAG Boundary Scan Support
- Fail-Safe Clock Monitor (FSCM) Operation:
  - Detects clock failure and switches to on-chip, Low-Power RC (LPRC) Oscillator
- Power-on Reset (POR), Power-up Timer (PWRT) and Oscillator Start-up Timer (OST)
- Separate Brown-out Reset (BOR) and Deep Sleep Brown-out Reset (DSBOR) Circuits
- Programmable High/Low-Voltage Detect (HLVD)
- Flexible Watchdog Timer (WDT) with its Own RC Oscillator for Reliable Operation
- Standard and Ultra Low-Power Watchdog Timers (ULPW) for Reliable Operation in Standard and Deep Sleep modes
- Temperature Range: -40°C to +85°C

Peripheral Features

- LCD Display Controller:
  - Up to 64 Segments by 8 Commons
  - Internal charge pump and low-power, internal resistor biasing
  - Operation in Sleep mode
- Up to Five External Interrupt Sources
- Peripheral Pin Select (PPS); allows Independent I/O Mapping of Many Peripherals
- Six-Channel DMA Supports All Peripheral modules:
  - Minimizes CPU overhead and increases data throughput
- Five 16-Bit Timers/Counters with Prescalers:
  - Can be paired as 32-bit timers/counters
- Using a combination of Timer, CCP, IC and OC Timers, the Device can be Configured to use up to 31 16-Bit Timers, and up to 15 32-Bit Timers
- Six Input Capture modules, each with a Dedicated 16-Bit Timer
- Six Output Compare/PWM modules, each with a Dedicated 16-Bit Timer
- Six Single Output CCPs (SCCP) and One Multiple Output CCP (MCCP) modules:
  - Independent 16/32-bit time base for each module
  - Internal time base and Period registers
  - Legacy PIC24F Capture and Compare modes (16 and 32-bit)
  - Special variable frequency pulse and Brushless DC Motor (BDCM) Output modes
- Enhanced Parallel Master/Slave Port (EPMP/EPSP)
- Hardware Real-Time Clock/Calendar (RTCC) with Timestamping:
  - Tamper detection with timestamping feature and tamper pin
  - Runs in Deep Sleep and V_{BAT} modes
- Four Three-Wire/Four-Wire SPI modules (support four Frame modes) with 8-Level FIFO Buffer
- Three I^2C modules support Multi-Master/Slave mode and 7-Bit/10-Bit Addressing
- Six UART modules:
  - Support RS-485, RS-232 and LIN/J2602
  - On-chip hardware encoder/decoder for IrDA®
  - Auto-wake-up on Auto-Baud Detect (ABD)
  - Four-level deep FIFO buffer
- Programmable 32-Bit Cyclic Redundancy Check (CRC) Generator
- Four Configurable Logic Cells (CLCs):
  - Two inputs and one output, all mappable to peripherals or I/O pins
  - AND/OR/XOR logic and D/JK flip-flop functions
- High-Current Sink/Source (18 mA/18 mA) on All I/O Pins
- Configurable Open-Drain Outputs on Digital I/O Pins
- 5.5V Tolerant Inputs on Multiple I/O Pins

Legend: **RPn** and **RPIn** represent remappable pins for Peripheral Pin Select functions.
Note 1: A pull-up resistor is connected to this pin during programming.

Table of Contents

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Website at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Website; **http://www.microchip.com**
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our website at **www.microchip.com** to receive the most current information on all of our products.

1.0 DEVICE OVERVIEW

This document contains device-specific information for the following devices:

- PIC24FJ64GA406
- PIC24FJ128GA406
- PIC24FJ256GA406
- PIC24FJ64GA410
- PIC24FJ128GA410
- PIC24FJ256GA410
- PIC24FJ64GA412
- PIC24FJ128GA412
- PIC24FJ256GA412
- PIC24FJ64GB406
- PIC24FJ128GB406
- PIC24FJ256GB406
- PIC24FJ64GB410
- PIC24FJ128GB410
- PIC24FJ256GB410
- PIC24FJ64GB412
- PIC24FJ128GB412
- PIC24FJ256GB412

The PIC24FJ256GA412/GB412 family expands the capabilities of the PIC24F family by adding a complete selection of advanced analog peripherals to its existing digital features. This combination, along with its ultra low-power features, Direct Memory Access (DMA) for peripherals, USB On-The-Go (OTG) and a built-in LCD Controller and driver, makes this family the new standard for mixed-signal PIC® microcontrollers in one economical and power-saving package.

1.1 Core Features

1.1.1 16-BIT ARCHITECTURE

Central to all PIC24F devices is the 16-bit modified Harvard architecture, first introduced with Microchip's dsPIC® Digital Signal Controllers (DSCs). The PIC24F CPU core offers a wide range of enhancements, such as:

- 16-bit data and 24-bit address paths with the ability to move information between data and memory spaces
- Linear addressing of up to 12 Mbytes (program space) and 32 Kbytes (data)
- A 16-element Working register array with built-in software stack support
- A 17 x 17 hardware multiplier with support for integer math
- Hardware support for 32 by 16-bit division
- An instruction set that supports multiple addressing modes and is optimized for high-level languages, such as 'C'
- Operational performance up to 16 MIPS

1.1.2 XLP POWER-SAVING TECHNOLOGY

The PIC24FJ256GA412/GB412 family of devices incorporates a greatly expanded range of power-saving operating modes for the ultimate in power conservation. The new modes include:

- Retention Sleep, with essential circuits being powered from a separate low-voltage regulator
- Deep Sleep without RTCC, for the lowest possible power consumption under software control
- V_{BAT} mode (with or without RTCC), to continue limited operation from a backup battery when V_{DD} is removed

Many of these new low-power modes also support the continuous operation of the low-power, on-chip Real-Time Clock/Calendar (RTCC), making it possible for an application to keep time while the device is otherwise asleep.

Aside from these new features, the PIC24FJ256GA412/GB412 devices also include all of the legacy power-saving features of previous PIC24F microcontrollers, such as:

- On-the-Fly Clock Switching, allowing the selection of a lower power clock during run time
- Doze Mode Operation, for maintaining peripheral clock speed while slowing the CPU clock
- Instruction-Based Power-Saving Modes, for quick invocation of Idle and the many Sleep modes

1.1.3 DUAL PARTITION FLASH PROGRAM MEMORY

A brand new feature to the PIC24F family is the use of Dual Partition Flash program memory technology. This allows PIC24FJ256GA412/GB412 family devices a range of new operating options not available before:

- Dual Partition Operation, which can store two different applications in their own code partition, and allows for the support of robust bootloader applications and enhanced security
- Live Update Operation, which allows the main application to continue operation while the second Flash partition is being reprogrammed – all without adding Wait states to code execution
- Direct Run-Time Programming from Data RAM, with the option of data compression in the RAM image

PIC24FJ256GA412/GB412 family devices can also operate with their two Flash partitions as one large program memory, providing space for large and complex applications.

1.1.4 OSCILLATOR OPTIONS AND FEATURES

All of the devices in the PIC24FJ256GA412/GB412 family offer five different oscillator options, allowing users a range of choices in developing application hardware. These include:

- Two Crystal modes
- Two External Clock modes
- A Phase-Locked Loop (PLL) frequency multiplier, which allows clock speeds of up to 32 MHz
- A Fast Internal Oscillator (FRC) – nominal 8 MHz output with multiple frequency divider options and automatic frequency self-calibration during run time
- A separate Low-Power Internal RC Oscillator (LPRC) – 31 kHz nominal for low-power, timing-insensitive applications.

The internal oscillator block also provides a stable reference source for the Fail-Safe Clock Monitor (FSCM). This option constantly monitors the main clock source against a reference signal provided by the internal oscillator and enables the controller to switch to the internal oscillator, allowing for continued low-speed operation or a safe application shutdown.

1.1.5 EASY MIGRATION

Regardless of the memory size, all devices share the same rich set of peripherals, allowing for a smooth migration path as applications grow and evolve. This extends the ability of applications to grow from the relatively simple, to the powerful and complex, while still selecting a Microchip device.

1.2 Cryptographic Engine

The Cryptographic Engine provides a new set of data security options. Using its own free-standing math engine, the module can independently perform NIST standard encryption and decryption of data, independently of the CPU. The Cryptographic Engine supports AES and DES/3DES encryption ciphers in up to five modes, and supports key lengths from 128 to 256 bits. Additional features include True Random Number Generation (TRNG) within the engine, multiple encryption/decryption key storage options and secure data handling that prevents data in the engine from being compromised by external reads.

1.3 USB On-The-Go (OTG)

USB On-The-Go provides on-chip functionality as a target device compatible with the USB 2.0 standard, as well as limited stand-alone functionality as a USB embedded host. By implementing USB Host Negotiation Protocol (HNP), the module can also dynamically switch between device and host operation, allowing for a much wider range of versatile USB-enabled applications on a microcontroller platform.

PIC24FJ256GA412/GB412 family devices also incorporate an integrated USB transceiver and precision oscillator, minimizing the required complexity of implementing a complete USB device, embedded host, dual role or On-The-Go application.

1.4 DMA Controller

PIC24FJ256GA412/GB412 family devices also add a Direct Memory Access (DMA) Controller to the existing PIC24F architecture. The DMA acts in concert with the CPU, allowing data to move between data memory and peripherals without the intervention of the CPU, increasing data throughput and decreasing execution time overhead. Six independently programmable channels make it possible to service multiple peripherals at virtually the same time, with each channel peripheral performing a different operation. Many types of data transfer operations are supported.

1.5 LCD Controller

The versatile on-chip LCD Controller includes many features that make the integration of displays in low-power applications easier. These include an integrated voltage regulator with charge pump and an integrated internal resistor ladder that allows contrast control in software, and display operation above device V_{DD}.

1.6 Other Special Features

- **Integrated Interrupt-on-Change:** All digital I/O ports now feature Interrupt-on-Change (IOC) functionality for convenient Change Notification interrupt generation on any I/O pin. IOC can be individually enabled or disabled on each pin, and configured for both edge detection polarity and the use of pull-ups or pull-downs.
- **Peripheral Pin Select (PPS):** The Peripheral Pin Select feature allows most digital peripherals to be mapped over a fixed set of digital I/O pins. Users may independently map the input and/or output of any one of the many digital peripherals to any one of the I/O pins.
- **Communications:** The PIC24FJ256GA412/GB412 family incorporates multiple serial communication peripherals to handle a range of application requirements. All devices have six independent UARTs with built-in IrDA® encoders/decoders. There are also three independent I^2C modules that support both Master and Slave modes of operation, and three SPI modules with I^2S and variable data width support.
- **Analog Features:** All members of the PIC24FJ256GA412/GB412 family include a 12-bit A/D Converter module, a triple comparator module and the CTMU interface. The A/D module incorporates a range of features that allow the converter to assess and make decisions on incoming data, reducing CPU overhead for routine A/D conversions.
  The comparator module includes three analog comparators that are configurable for a wide range of operations. The CTMU provides a convenient method for precision time measurement and pulse generation, and can serve as an interface for capacitive sensors.
- **Enhanced Parallel Master/Parallel Slave Port:** This module allows rapid and transparent access to the microcontroller data bus, and enables the CPU to directly address external data memory. The parallel port can function in Master or Slave mode, accommodating data widths of 4, 8 or 16 bits, and address widths of up to 23 bits in Master modes.
- **Real-Time Clock and Calendar (RTCC):** This module implements a full-featured clock and calendar with alarm functions in hardware, freeing up timer resources and program memory space for use of the core application.

1.7 Details on Individual Family Members

Devices in the PIC24FJ256GA412/GB412 family are available in 64-pin, 100-pin and 121/124-pin packages. General block diagrams for general purpose and USB devices are shown in Figure 1-1 and Figure 1-2, respectively.

The devices are differentiated from each other in five ways:

1. USB On-The-Go functionality (present only in PIC24FJXXXGB4XX devices).
2. Available I/O pins and ports (up to 53 pins on 6 ports for 64-pin devices, up to 85 pins on 7 ports for 100-pin devices and up to 102 pins on 9 ports for 121/124-pin devices).
3. Available remappable pins (29 pins on 64-pin devices and 44 pins on 100/121/124-pin devices).
4. Maximum available drivable LCD pixels (up to 248 for 64-pin devices and 512 on 100/121/124-pin devices.)
5. Analog input channels for the A/D Converter (16 channels for 64-pin devices and 24 channels for 100/121/124-pin devices).

All other features for devices in this family are identical. These are summarized in Table 1-1, Table 1-2 and Table 1-3.

A list of pin features available on the PIC24FJ256GA412/GB412 family devices, sorted by function, is shown in Table 1-4 (for general purpose devices) or Table 1-5 (for USB devices). Note that these tables show the pin location of individual peripheral features and not how they are multiplexed on the same pin. This information is provided in the pinout diagrams in the beginning of this data sheet. Multiplexed features are sorted by the priority given to a feature, with the highest priority peripheral being listed first.

TABLE 1-1: DEVICE FEATURES FOR THE PIC24FJ256GA412/GB412 FAMILY: 64-PIN

Features	PIC24FJXXXGA/GB406					
	64GA	128GA	256GA	64GB	128GB	256GB
Operating Frequency	DC – 32 MHz					
Program Memory (bytes)	64K	128K	256K	64K	128K	256K
Program Memory (instructions)	22,016	44,032	88,064	22,016	44,032	88,064
Data Memory (bytes)	8K	16K		8K	16K	
Interrupt Sources (soft vectors/ NMI traps)	113 (107/6)					
I/O Ports	Ports B, C, D, E, F, G					
Total I/O Pins	53			52		
Remappable Pins	30 (29 I/Os, 1 input only)			29 (28 I/Os, 1 input only)		
Timers:						
Total Number (16-bit)	19(1,2)					
32-Bit (from paired 16-bit timers)	9					
Input Capture w/Timer Channels	6(2)					
Output Compare/PWM Channels	6(2)					
Capture/Compare/PWM/Timer:						
Single Output (SCCP)	6(2)					
Multiple Output (MCCP)	1(2)					
Serial Communications:						
UART	6(2)					
SPI (three-wire/four-wire)	4(2)					
I^2C	3					
USB On-The-Go	No			Yes		
Cryptographic Engine	Yes					
Parallel Communications (EPMP/PSP)	Yes					
10/12-Bit Analog-to-Digital Converter (A/D) (input channels)	16					
Digital-to-Analog Converter (DAC)	1					
Analog Comparators	3					
CTMU Interface	Yes					
LCD Controller (available pixels)	248 (35 SEG x 8 COM)			240 (34 SEG x 8 COM)		
JTAG Boundary Scan	Yes					
Resets (and delays)	Core POR, VDD POR, VBAT POR, BOR, RESET Instruction, MCLR, WDT, Illegal Opcode, REPEAT Instruction, Hardware Traps, Configuration Word Mismatch (OST, PLL Lock)					
Instruction Set	77 Base Instructions, Multiple Addressing Mode Variations					
Packages	64-Pin TQFP and QFN					

Note 1: Includes the Timer modes of the SCCP and MCCP modules.

2: Some instantiations of these modules are only available through remappable pins.

TABLE 1-2: DEVICE FEATURES FOR THE PIC24FJ256GA412/GB412 FAMILY: 100-PIN

Features	PIC24FJXXXGA/GB410					
	64GA	128GA	256GA	64GB	128GB	256GB
Operating Frequency	DC – 32 MHz					
Program Memory (bytes)	64K	128K	256K	64K	128K	256K
Program Memory (instructions)	22,016	44,032	88,064	22,016	44,032	88,064
Data Memory (bytes)	8K	16K		8K	16K	
Interrupt Sources (soft vectors/ NMI traps)	113 (107/6)					
I/O Ports	Ports A, B, C, D, E, F, G					
Total I/O Pins	85			84		
Remappable Pins	44 (32 I/Os, 12 input only)					
Timers:						
Total Number (16-bit)	19(1,2)					
32-Bit (from paired 16-bit timers)	9					
Input Capture w/Timer Channels	6(2)					
Output Compare/PWM Channels	6(2)					
Capture/Compare/PWM/Timer:						
Single Output (SCCP)	6(2)					
Multiple Output (MCCP)	1(2)					
Serial Communications:						
UART	6(2)					
SPI (three-wire/four-wire)	4(2)					
I^2C	3					
USB On-The-Go	No			Yes		
Cryptographic Engine	Yes					
Parallel Communications (EPMP/PSP)	Yes					
10/12-Bit Analog-to-Digital Converter (A/D) (input channels)	24					
Digital-to-Analog Converter (DAC)	1					
Analog Comparators	3					
CTMU Interface	Yes					
LCD Controller (available pixels)	512 (64 SEG x 8 COM)					
JTAG Boundary Scan	Yes					
Resets (and delays)	Core POR, VDD POR, VBAT POR, BOR, RESET Instruction, MCLR, WDT, Illegal Opcode, REPEAT Instruction, Hardware Traps, Configuration Word Mismatch (OST, PLL Lock)					
Instruction Set	77 Base Instructions, Multiple Addressing Mode Variations					
Packages	100-Pin TQFP					

Note 1: Includes the Timer modes of the SCCP and MCCP modules.

2: Some instantiations of these modules are only available through remappable pins.

TABLE 1-3: DEVICE FEATURES FOR THE PIC24FJ256GA412/GB412 FAMILY: 121-PIN

Features	PIC24FJXXXGA/GB412					
	64GA	128GA	256GA	64GB	128GB	256GB
Operating Frequency	DC – 32 MHz					
Program Memory (bytes)	64K	128K	256K	64K	128K	256K
Program Memory (instructions)	22,016	44,032	88,064	22,016	44,032	88,064

2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT MICROCONTROLLERS

2.1 Basic Connection Requirements

Getting started with the PIC24FJ256GA412/GB412 family of 16-bit microcontrollers requires attention to a minimal set of device pin connections before proceeding with development.

The following pins must always be connected:

- All VDD and VSS pins
  (see **Section 2.2 "Power Supply Pins"**)
- All analog power pins (AVDD and AVSS), regardless of whether or not the analog device features are used
  (see **Section 2.2 "Power Supply Pins"**)
- The USB transceiver supply, VUSB3V3, regardless of whether or not the USB module is used
  (see **Section 2.2 "Power Supply Pins"**)
- $\overline{\text{MCLR}}$ pin
  (see **Section 2.3 "Master Clear (MCLR) Pin"**)
- VCAP pin
  (see **Section 2.4 "Voltage Regulator Pin (VCAP)"**)

These pins must also be connected if they are being used in the end application:

- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes
  (see **Section 2.5 "ICSP Pins"**)
- OSCI and OSCO pins when an external oscillator source is used
  (see **Section 2.6 "External Oscillator Pins"**)

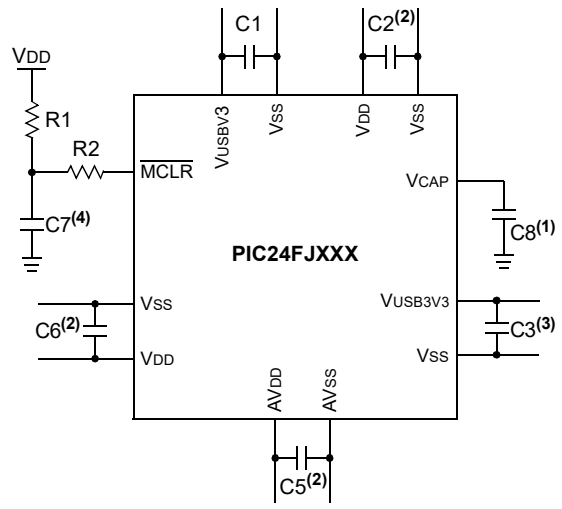
Additionally, the following pins may be required:

- Any voltage reference pins used when external voltage reference for analog modules is implemented (AVREF+/AVREF-, CVREF+/CVREF- and DVREF+)

Note:	All analog power supply and return pins must always be connected, regardless of whether any of the analog modules are being used.

The minimum mandatory connections are shown in Figure 2-1.

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTIONS



Key (all values are recommendations):

C1 through C7: 0.1 µF, 20V ceramic

C8: 10 µF, 6.3V or greater, tantalum or ceramic

R1: 10 kΩ

R2: 100Ω to 470Ω

Note 1: See **Section 2.4 "Voltage Regulator Pin (VCAP)"** for details on selecting the proper capacitor for VCAP.

2: The example shown is for a PIC24F device with five power and ground pairs (including analog and USB). Other devices may have more or less pairs; adjust the number of decoupling capacitors appropriately.

3: Implemented on PIC24FJXXXGB4XX devices only. See **Section 20.1 "Hardware Configuration"** for details on connecting the pins for USB operation.

4: C1 is optional, see **Section 2.3 "Master Clear (MCLR) Pin"** and **Section 2.5 "ICSP Pins"** for more information.

2.2 Power Supply Pins

2.2.1 DECOUPLING CAPACITORS

The use of decoupling capacitors on every pair of power supply pins is required. This includes digital supply (V_{DD} and V_{SS}) and all analog supplies (AV_{DD} and AV_{SS}).

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A 0.1 µF (100 nF), 10-20V capacitor is recommended. The capacitor should be a low-ESR device with a resonance frequency in the range of 200 MHz and higher. Ceramic capacitors are recommended.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is no greater than 0.25 inch (6 mm).
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise (upward of tens of MHz), add a second ceramic type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 µF to 0.001 µF. Place this second capacitor next to each primary decoupling capacitor. In high-speed circuit designs, consider implementing a pair of capacitances as close to the power and ground pins as possible (e.g., 0.1 µF in parallel with 0.001 µF).
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB trace inductance.

2.2.2 BULK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including microcontrollers to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

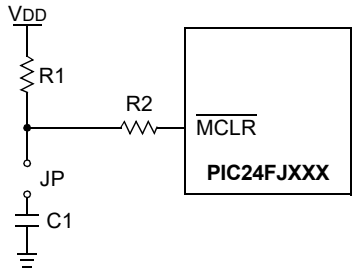
2.3 Master Clear ($\overline{MCLR}$) Pin

The $\overline{MCLR}$ pin provides two specific device functions: device Reset, and device programming and debugging. If programming and debugging are not required in the end application, a direct connection to V_{DD} may be all that is required. The addition of other components, to help increase the application's resistance to spurious Resets from voltage sags, may be beneficial. A typical configuration is shown in Figure 2-1. Other circuit designs may be implemented, depending on the application's requirements.

During programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{MCLR}$ pin. Consequently, specific voltage levels (V_{IH} and V_{IL}) and fast signal transitions must not be adversely affected. Therefore, specific values of R1 and C1 will need to be adjusted based on the application and PCB requirements. For example, it is recommended that the capacitor, C1, be isolated from the $\overline{MCLR}$ pin during programming and debugging operations by using a jumper (Figure 2-2). The jumper is replaced for normal run-time operations.

Any components associated with the $\overline{MCLR}$ pin should be placed within 0.25 inch (6 mm) of the pin.

FIGURE 2-2: EXAMPLE OF $\overline{MCLR}$ PIN CONNECTIONS



Note 1: R1 ≤ 10 kΩ is recommended. A suggested starting value is 10 kΩ. Ensure that the $\overline{MCLR}$ pin V_{IH} and V_{IL} specifications are met.

2: R2 ≤ 470Ω will limit any current flowing into $\overline{MCLR}$ from the external capacitor, C, in the event of $\overline{MCLR}$ pin breakdown, due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the $\overline{MCLR}$ pin V_{IH} and V_{IL} specifications are met.

2.4 Voltage Regulator Pin (VCAP)

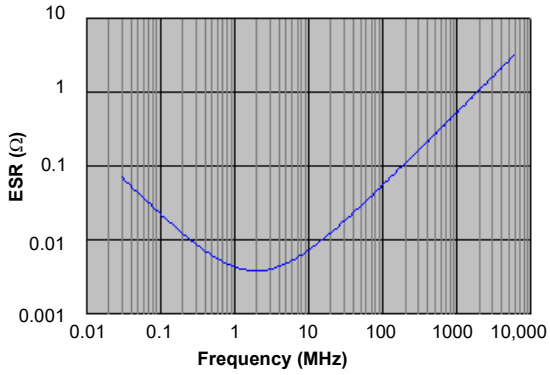
A low-ESR (< 5Ω) capacitor is required on the VCAP pin to stabilize the output voltage of the on-chip voltage regulator. The VCAP pin must not be connected to VDD and must use a capacitor of 10 µF connected to ground. The type can be ceramic or tantalum. Suitable examples of capacitors are shown in Table 2-1. Capacitors with equivalent specification can be used.

The placement of this capacitor should be close to VCAP. It is recommended that the trace length not exceed 0.25 inch (6 mm). Refer to **Section 36.0 "ctrical Characteristics"** for additional information.

Designers may use Figure 2-3 to evaluate ESR equivalence of candidate devices.

Refer to **Section 33.2 "On-Chip Voltage Regulator"** for details on connecting and using the on-chip regulator.

FIGURE 2-3: FREQUENCY vs. ESR PERFORMANCE FOR SUGGESTED VCAP



Note: Typical data measurement at +25°C, 0V DC bias.

TABLE 2-1: SUITABLE CAPACITOR EQUIVALENTS(1)

Make	Part #	Nominal Capacitance	Base Tolerance	Rated Voltage	Temp. Range
TDK	C3216X7R1C106K	10 µF	±10%	16V	-55 to +125ºC
TDK	C3216X5R1C106K	10 µF	±10%	16V	-55 to +85ºC
Panasonic	ECJ-3YX1C106K	10 µF	±10%	16V	-55 to +125ºC
Panasonic	ECJ-4YB1C106K	10 µF	±10%	16V	-55 to +85ºC
Murata	GRM32DR71C106KA01L	10 µF	±10%	16V	-55 to +125ºC
Murata	GRM31CR61C106KC31L	10 µF	±10%	16V	-55 to +85ºC

Note 1: Microchip cannot ensure the active or obsolete manufacturing status for these components. In the case a component is obsolete, substitute with a component that has similar specifications.

2.4.1 CONSIDERATIONS FOR CERAMIC CAPACITORS

In recent years, large value, low-voltage, surface-mount ceramic capacitors have become very cost effective in sizes up to a few tens of microfarad. The low-ESR, small physical size and other properties make ceramic capacitors very attractive in many types of applications.

Ceramic capacitors are suitable for use with the internal voltage regulator of this microcontroller. However, some care is needed in selecting the capacitor to ensure that it maintains sufficient capacitance over the intended operating range of the application.

Typical low-cost, 10 µF ceramic capacitors are available in X5R, X7R and Y5V dielectric ratings (other types are also available, but are less common). The initial tolerance specifications for these types of capacitors are often specified as ±10% to ±20% (X5R and X7R), or -20%/+80% (Y5V). However, the effective capacitance that these capacitors provide in an application circuit will also vary based on additional factors, such as the applied DC bias voltage and the temperature. The total in-circuit tolerance is, therefore, much wider than the initial tolerance specification.

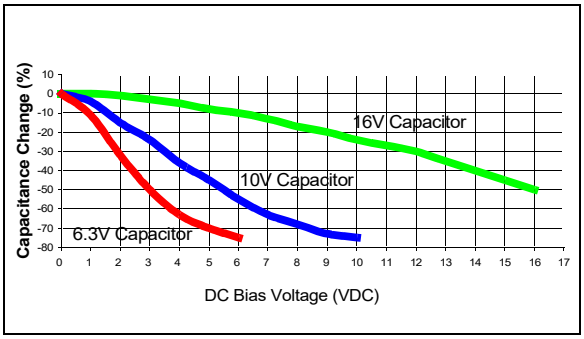
The X5R and X7R capacitors typically exhibit satisfactory temperature stability (i.e., ±15% over a wide temperature range, but consult the manufacturer's data sheets for exact specifications). However, Y5V capacitors typically have extreme temperature tolerance specifications of +22%/-82%. Due to the extreme temperature tolerance, a 10 µF nominal rated Y5V type capacitor may not deliver enough total capacitance to meet minimum internal voltage regulator stability and transient response requirements. Therefore, Y5V capacitors are not recommended for use with the internal regulator if the application must operate over a wide temperature range.

In addition to temperature tolerance, the effective capacitance of large value ceramic capacitors can vary substantially, based on the amount of DC voltage applied to the capacitor. This effect can be very significant, but is often overlooked or is not always documented.

Typical DC bias voltage vs. capacitance graph for X7R type capacitors is shown in Figure 2-4.

When selecting a ceramic capacitor to be used with the internal voltage regulator, it is suggested to select a high-voltage rating, so that the operating voltage is a small percentage of the maximum rated capacitor voltage. For example, choose a ceramic capacitor rated at 16V for the 2.5V or 1.8V core voltage. Suggested capacitors are shown in Table 2-1.

FIGURE 2-4: DC BIAS VOLTAGE vs. CAPACITANCE CHARACTERISTICS



2.5 ICSP Pins

The PGECx and PGEDx pins are used for In-Circuit Serial Programming (ICSP) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of ohms, not to exceed 100Ω.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin Voltage Input High (V_{IH}) and Voltage Input Low (V_{IL}) requirements.

For device emulation, ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins), programmed into the device, matches the physical connections for the ICSP to the Microchip debugger/emulator tool.

The $\overline{MCLR}$ connection from the ICSP header should connect directly to the $\overline{MCLR}$ pin on the device. A capacitor to ground (C1 in Figure 2-2) is optional, but if used, may interfere with ICSP operation if the value exceeds 0.01 µF. In most cases, this capacitor is not required.

For more information on available Microchip development tools connection requirements, refer to **Section 34.0 "Development Support"**.

2.6 External Oscillator Pins

Many microcontrollers have options for at least two oscillators: a high-frequency Primary Oscillator and a low-frequency Secondary Oscillator (refer to **Section 9.0 "Oscillator Configuration"** for details).

The oscillator circuit should be placed on the same side of the board as the device. Place the oscillator circuit close to the respective oscillator pins with no more than 0.5 inch (12 mm) between the circuit components and the pins. The load capacitors should be placed next to the oscillator itself, on the same side of the board.

Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed.

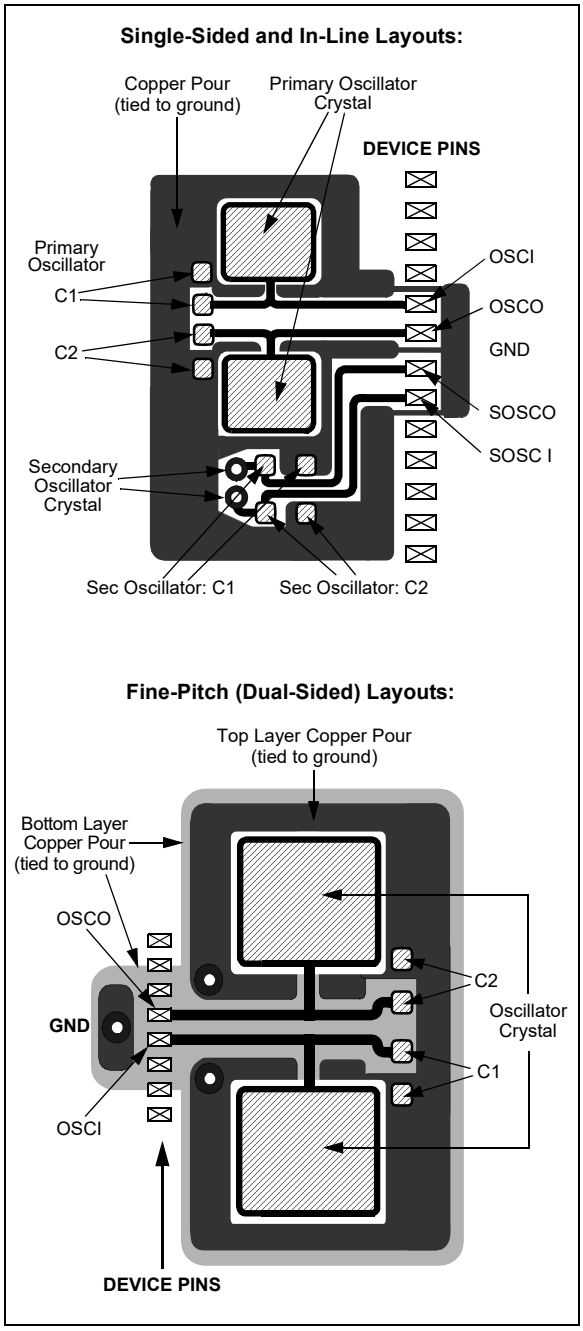
Layout suggestions are shown in Figure 2-5. In-line packages may be handled with a single-sided layout that completely encompasses the oscillator pins. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

In planning the application's routing and I/O assignments, ensure that adjacent port pins, and other signals in close proximity to the oscillator, are benign (i.e., free of high frequencies, short rise and fall times, and other similar noise).

For additional information and design guidance on oscillator circuits, please refer to these Microchip Application Notes, available at the corporate website (www.microchip.com):

- *AN943, "Practical PICmicro® Oscillator Analysis and Design"*
- *AN949, "Making Your Oscillator Work"*
- *AN1798, "Crystal Selection for Low-Power Secondary Oscillator"*

FIGURE 2-5: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT



2.7 Configuration of Analog and Digital Pins During ICSP Operations

If an ICSP compliant emulator is selected as a debugger, it automatically initializes all of the A/D input pins (ANx) as “digital” pins. This is done by clearing all bits in the ANSx registers. Refer to **Section 11.2 “Configuring Analog Port Pins (ANSx)”** for more specific information.

The bits in these registers that correspond to the A/D pins that initialized the emulator must not be changed by the user application; otherwise, communication errors will result between the debugger and the device.

If your application needs to use certain A/D pins as analog input pins during the debug session, it must set the bits corresponding to the pin(s) to be configured as analog. Do not change any other bits, particularly those corresponding to the PGECx/PGEDx pair, at any time.

When a Microchip debugger/emulator is used as a programmer, the user application must correctly configure the ANSx registers. Automatic initialization of these registers is only done during debugger operation. Failure to correctly configure the register(s) will result in all A/D pins being recognized as analog input pins, resulting in the port value being read as a logic ‘0’, which may affect user application functionality.

2.8 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic low state. Alternatively, connect a 1 kΩ to 10 kΩ resistor to Vss on unused pins and drive the output to logic low.

3.0 CPU

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the CPU, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"CPU with Extended Data Space (EDS)"** (www.microchip.com/DS39732). The information in this data sheet supersedes the information in the FRM.

The PIC24F CPU has a 16-bit (data) modified Harvard architecture with an enhanced instruction set and a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M instructions of user program memory space. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (`MOV.D`) instruction and the table instructions. Overhead-free program loop constructs are supported using the `REPEAT` instructions, which are interruptible at any point.

PIC24F devices have sixteen, 16-bit Working registers in the programmer's model. Each of the Working registers can act as a data, address or address offset register. The 16th Working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

The lower 32 Kbytes of the Data Space (DS) can be accessed linearly. The upper 32 Kbytes of the Data Space are referred to as Extended Data Space to which the extended data RAM, EPMP memory space or program memory can be mapped.

The Instruction Set Architecture (ISA) has been significantly enhanced beyond that of the PIC18, but maintains an acceptable level of backward compatibility. All PIC18 instructions and addressing modes are supported, either directly, or through simple macros. Many of the ISA enhancements have been driven by compiler efficiency needs.

The core supports Inherent (no operand), Relative, Literal and Memory Direct Addressing modes, along with three groups of addressing modes. All modes support Register Direct and various Register Indirect modes. Each group offers up to seven addressing modes. Instructions are associated with predefined addressing modes depending upon their functional requirements.

For most instructions, the core is capable of executing a data (or program data) memory read, a Working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing trinary operations (that is, A + B = C) to be executed in a single cycle.

A high-speed, 17-bit x 17-bit multiplier has been included to significantly enhance the core arithmetic capability and throughput. The multiplier supports Signed, Unsigned and Mixed mode, 16-bit x 16-bit or 8-bit x 8-bit, integer multiplication. All multiply instructions execute in a single cycle.

The 16-bit ALU has been enhanced with integer divide assist hardware that supports an iterative non-restoring divide algorithm. It operates in conjunction with the `REPEAT` instruction looping mechanism and a selection of iterative divide instructions to support 32-bit (or 16-bit), divided by 16-bit, integer signed and unsigned division. All divide operations require 19 cycles to complete but are interruptible at any cycle boundary.

The PIC24F has a vectored exception scheme with up to 8 sources of non-maskable traps and up to 118 interrupt sources. Each interrupt source can be assigned to one of seven priority levels.

A block diagram of the CPU is shown in Figure 3-1.

3.1 Programmer's Model

The programmer's model for the PIC24F is shown in Figure 3-2. All registers in the programmer's model are memory-mapped and can be manipulated directly by instructions.

A description of each register is provided in Table 3-1. All registers associated with the programmer's model are memory-mapped.

FIGURE 3-1: PIC24F CPU CORE BLOCK DIAGRAM

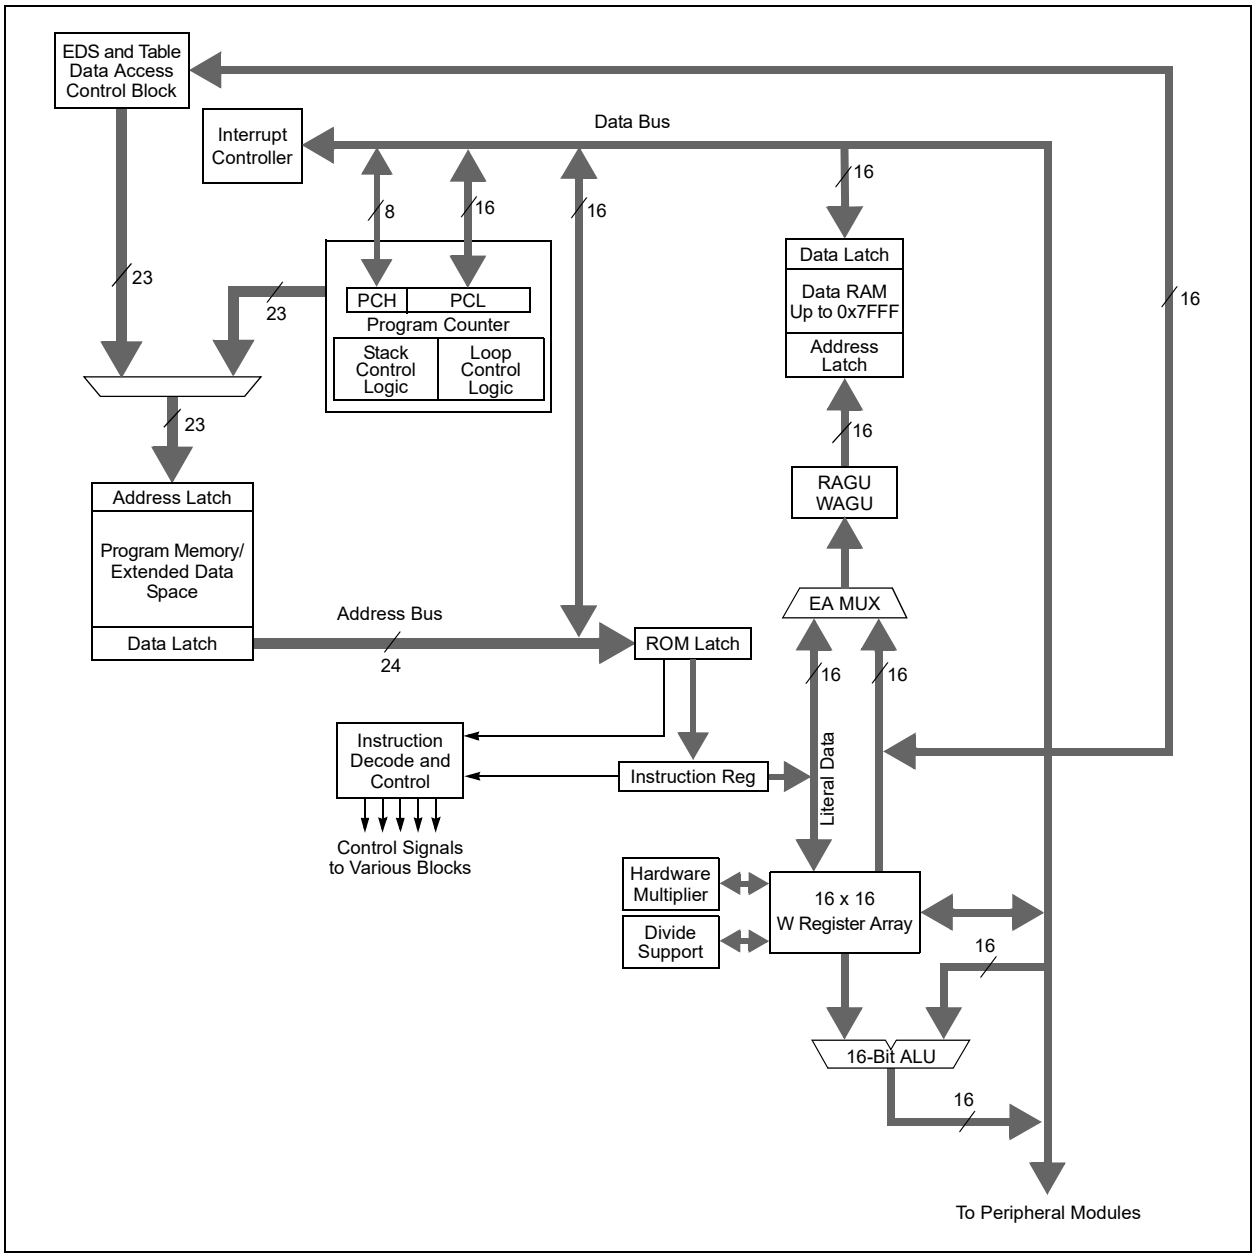


TABLE 3-1: CPU CORE REGISTERS

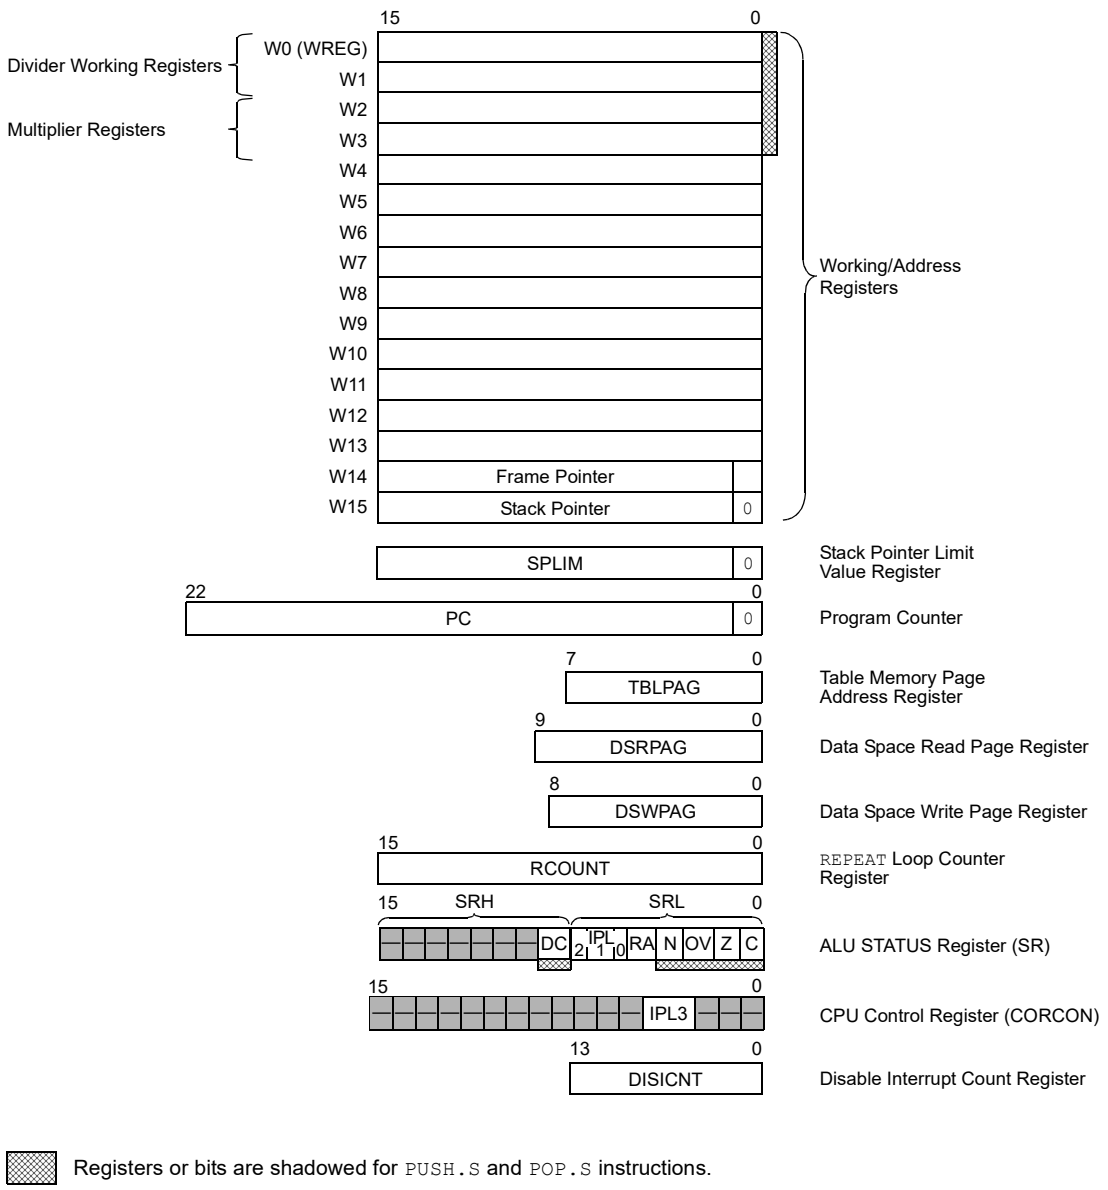
Register(s) Name	Description
W0 through W15	Working Register Array
PC	23-Bit Program Counter
SR	ALU STATUS Register
SPLIM	Stack Pointer Limit Value Register
TBLPAG	Table Memory Page Address Register
RCOUNT	REPEAT Loop Counter Register
CORCON	CPU Control Register
DISICNT	Disable Interrupt Count Register
DSRPAG	Data Space Read Page Register
DSWPAG	Data Space Write Page Register

FIGURE 3-2: PROGRAMMER'S MODEL



3.2 CPU Control Registers

REGISTER 3-1: SR: ALU STATUS REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0
—	—	—	—	—	—	—	DC
bit 15							bit 8

R/W-0(1)	R/W-0(1)	R/W-0(1)	R-0	R/W-0	R/W-0	R/W-0	R/W-0
IPL2(2)	IPL1(2)	IPL0(2)	RA	N	OV	Z	C
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-9 **Unimplemented:** Read as '0'

bit 8 **DC:** ALU Half Carry/Borrow bit
1 = A carry out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred
0 = No carry out from the 4th or 8th low-order bit of the result has occurred

bit 7-5 **IPL[2:0]:** CPU Interrupt Priority Level Status bits(1,2)
111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
110 = CPU Interrupt Priority Level is 6 (14)
101 = CPU Interrupt Priority Level is 5 (13)
100 = CPU Interrupt Priority Level is 4 (12)
011 = CPU Interrupt Priority Level is 3 (11)
010 = CPU Interrupt Priority Level is 2 (10)
001 = CPU Interrupt Priority Level is 1 (9)
000 = CPU Interrupt Priority Level is 0 (8)

bit 4 **RA:** REPEAT Loop Active bit
1 = REPEAT loop is in progress
0 = REPEAT loop is not in progress

bit 3 **N:** ALU Negative bit
1 = Result was negative
0 = Result was not negative (zero or positive)

bit 2 **OV:** ALU Overflow bit
1 = Overflow occurred for signed (two's complement) arithmetic in this arithmetic operation
0 = No overflow has occurred

bit 1 **Z:** ALU Zero bit
1 = An operation, which affects the Z bit, has set it at some time in the past
0 = The most recent operation, which affects the Z bit, has cleared it (i.e., a non-zero result)

bit 0 **C:** ALU Carry/$\overline{\text{Borrow}}$ bit
1 = A carry out from the Most Significant bit (MSb) of the result occurred
0 = No carry out from the Most Significant bit of the result occurred

Note 1: The IPLx Status bits are read-only when NSTDIS (INTCON1[15]) = 1.
2: The IPLx Status bits are concatenated with the IPL3 Status (CORCON[3]) bit to form the CPU Interrupt Priority Level (IPL). The value in parentheses indicates the IPL when IPL3 = 1.

REGISTER 3-2: CORCON: CPU CORE CONTROL REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—
bit 15							bit 8

U-0	U-0	U-0	U-0	R/C-0	r-1	U-0	U-0
—	—	—	—	IPL3(1)	—	—	—
bit 7							bit 0

Legend:	C = Clearable bit	r = Reserved bit	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-4 **Unimplemented:** Read as '0'

bit 3 **IPL3:** CPU Interrupt Priority Level Status bit(1)
1 = CPU Interrupt Priority Level is greater than 7
0 = CPU Interrupt Priority Level is 7 or less

bit 2 **Reserved:** Read as '1'

bit 1-0 **Unimplemented:** Read as '0'

Note 1: The IPL3 bit is concatenated with the IPL[2:0] bits (SR[7:5]) to form the CPU Interrupt Priority Level; see Register 3-1 for bit description.

3.3 Arithmetic Logic Unit (ALU)

The PIC24F ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU may affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array, or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

The PIC24F CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

3.3.1 MULTIPLIER

The ALU contains a high-speed, 17-bit x 17-bit multiplier. It supports unsigned, signed or mixed sign operation in several multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

3.3.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

1. 32-bit signed/16-bit signed divide
2. 32-bit unsigned/16-bit unsigned divide
3. 16-bit signed/16-bit signed divide
4. 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. The 16-bit signed and unsigned `DIV` instructions can specify any W register for both the 16-bit divisor (Wn), and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.3.3 MULTIBIT SHIFT SUPPORT

The PIC24F ALU supports both single bit and single-cycle, multibit arithmetic and logic shifts. Multibit shifts are implemented using a shifter block, capable of performing up to a 15-bit arithmetic right shift, or up to a 15-bit left shift, in a single cycle. All multibit shift instructions only support Register Direct Addressing for both the operand source and result destination.

A full summary of instructions that use the shift operation is provided in Table 3-2.

TABLE 3-2: INSTRUCTIONS THAT USE THE SINGLE BIT AND MULTIBIT SHIFT OPERATION

Instruction	Description
ASR	Arithmetic Shift Right Source register by one or more bits.
SL	Shift Left Source register by one or more bits.
LSR	Logical Shift Right Source register by one or more bits.

4.0 MEMORY ORGANIZATION

As Harvard architecture devices, PIC24F microcontrollers feature separate program and data memory spaces and buses. This architecture also allows direct access of program memory from the Data Space (DS) during code execution.

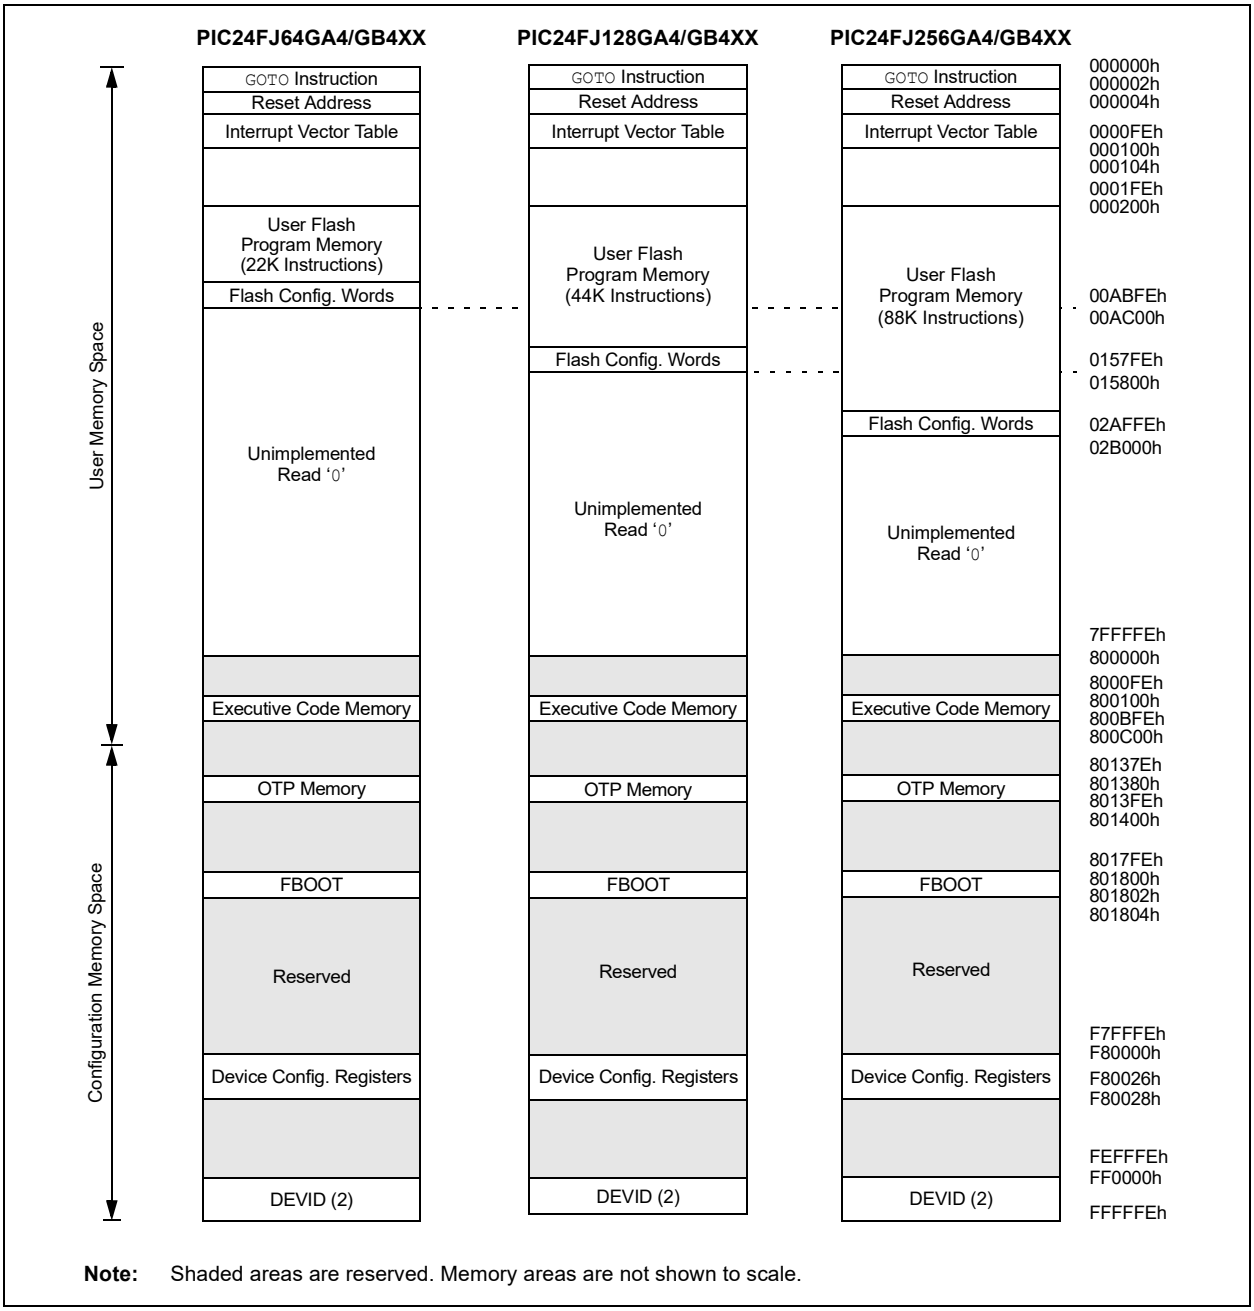
4.1 Program Memory Space

The program address memory space of the PIC24FJ256GA412/GB412 family devices is 4M instructions. The space is addressable by a 24-bit value derived from either the 23-bit Program Counter (PC) during program execution, or from table operation or Data Space remapping, as described in **Section 4.4 "Interfacing Program and Data Memory Spaces"**.

User access to the program memory space is restricted to the lower half of the address range (000000h to 7FFFFFh). The exception is the use of `TBLRD/TBLWT` operations, which use TBLPAG[7] to permit access to the Configuration bits and Device ID sections of the configuration memory space.

Memory maps for PIC24FJ256GA412/GB412 family devices are shown in Figure 4-1.

FIGURE 4-1: DEFAULT PROGRAM MEMORY MAPS FOR PIC24FJ256GA412/GB412 FAMILY



Note: Shaded areas are reserved. Memory areas are not shown to scale.

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-2).

Program memory addresses are always word-aligned on the lower word and addresses are incremented or decremented by two during code execution. This arrangement also provides compatibility with data memory space addressing and makes it possible to access data in the program memory space.

4.1.2 HARD MEMORY VECTORS

All PIC24F devices reserve the addresses between 000000h and 000200h for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user at 000000h with the actual address for the start of code at 000002h.

PIC24F devices also have two Interrupt Vector Tables (IVTs). The main IVT has a static location, from 000004h to 0000FFh. The Alternate IVT has a configurable location and is optionally enabled. A more detailed discussion of the Interrupt Vector Tables is provided in **Section 8.0 "Interrupt Controller"**.

4.1.3 SINGLE AND DUAL PARTITION MEMORY ORGANIZATION

The PIC24FJ256GA412/GB412 family of devices supports a Single Partition Flash mode and two Dual Partition Flash modes. The Dual Partition modes allow the device to be programmed with two separate applications to facilitate bootloading or to allow an application to be programmed at run-time without stalling the CPU.

In the Dual Partition modes, the device's memory is divided evenly into two physical sections, known as Partition 1 and Partition 2. Each of these partitions contains its own program memory and Configuration Words. During program execution, the code on only one of these panels is executed; this is the Active Partition. The other partition, or the Inactive Partition, is not used, but can be programmed.

The Active Partition is always mapped to logical address, 000000h, while the Inactive Partition will always be mapped to logical address, 400000h. Note that even when the code partitions are switched between active and inactive by the user, the address of the Active Partition will still be 000000h and the address of the Inactive Partition will still be at 400000h. Figure 4-3 compares the mapping of the user memory space in Single and Dual Partition devices.

FIGURE 4-2: PROGRAM MEMORY ORGANIZATION

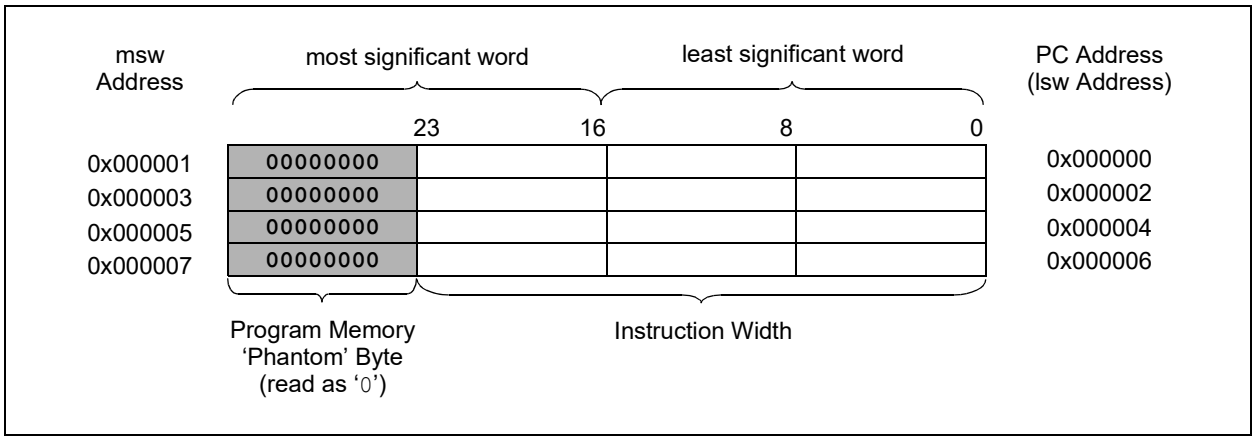


FIGURE 4-3: PROGRAM MEMORY MAPS FOR SINGLE AND DUAL PARTITION FLASH MODES

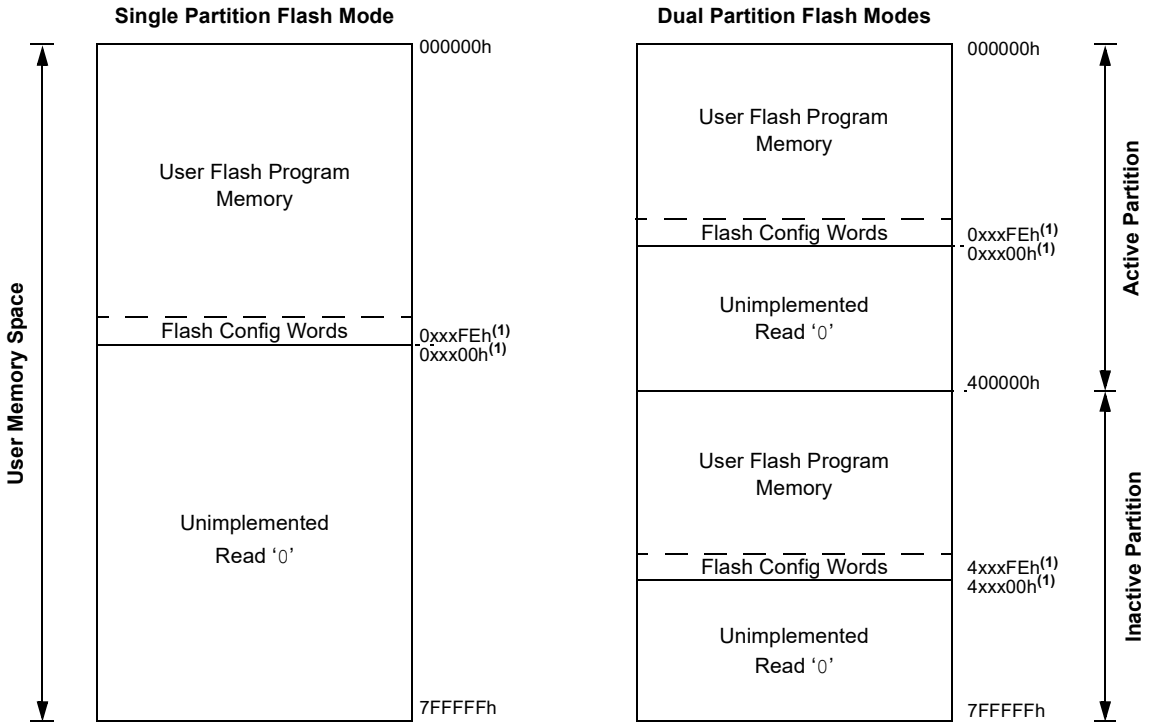


Legend: Memory areas are not shown to scale.

Note 1: Exact boundary addresses are determined by the size of the implemented program memory. See Table 4-1 for details.

TABLE 4-1: PROGRAM MEMORY SIZES AND BOUNDARIES

Device	Program Memory Upper Boundary (Instruction Words)			Write Blocks(1)	Erase Blocks(1)
	Single Partition Flash Mode	Dual Partition Flash Mode			
		Active Partition	Inactive Partition		
PIC24FJ256GX4XX	02AFFEh (88K)	0157FEh(44K)	0157FEh(44K)	1376	172
PIC24FJ128GX4XX	0157FEh(44K)	00ABFEh (22K)	00ABFEh (22K)	688	86
PIC24FJ64GX4XX	00AFFEh (22K)	0057FEh (11K)	0057FEh (11K)	352	44

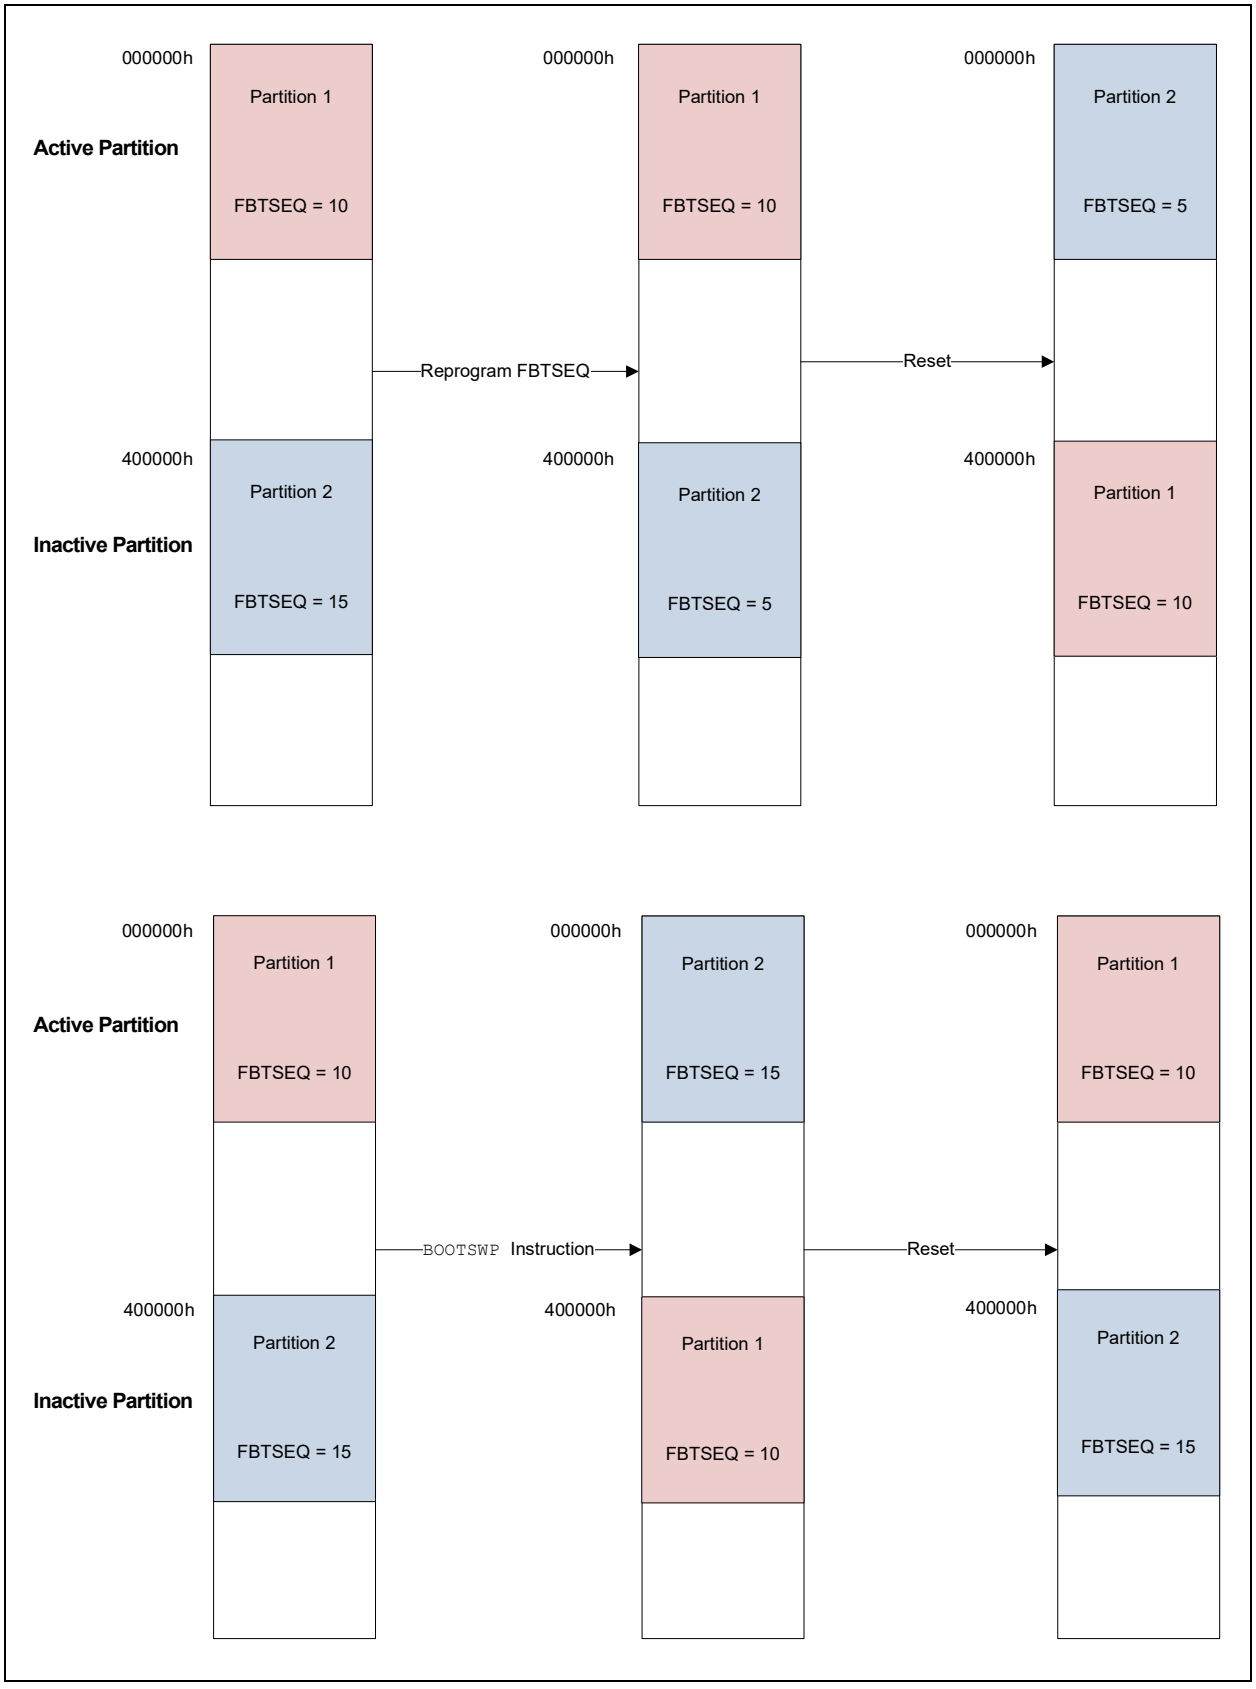
Note 1: One Write Block = 64 Instruction Words; One Erase Block = 512 Instruction Words.

The Boot Sequence Configuration Words (FBTSEQ) determine whether Partition 1 or Partition 2 will be active after Reset. If the part is operating in Dual Partition mode, the partition with the lower boot sequence number will operate as the Active Panel (FBTSEQ is unused in Single Partition mode). The partitions can be switched between Active and Inactive by reprogramming their boot sequence numbers, but the Active Partition will not change until a device Reset is performed. If both boot sequence numbers are the same, or if both are corrupted, the part will use Partition 1 as the Active Partition. If only one boot sequence number is corrupted, the device will use the partition without a corrupted boot sequence number as the Active Partition.

The user can also change which partition is active at run time using the BOOTSWP instruction. Issuing a BOOTSWP instruction does not affect which partition will be the Active Partition after a Reset. Figure 4-4 demonstrates how the relationship between Partitions 1 and 2, shown in red and blue, respectively, and the Active and Inactive Partitions are affected by reprogramming the boot sequence number or issuing a BOOTSWP instruction.

The P2ACTIV bit (NVMCON[10]) can be used to determine which physical partition is the Active Partition. If P2ACTIV = 1, Partition 2 is active; if P2ACTIV = 0, Partition 1 is active.

FIGURE 4-4: RELATIONSHIP BETWEEN PARTITIONS 1 AND 2 AND ACTIVE/INACTIVE PARTITIONS



4.1.4 FLASH CONFIGURATION WORDS

In PIC24FJ256GA412/GB412 family devices, the top nine words of on-chip program memory are reserved for configuration information. On device Reset, the configuration information is copied into the actual Configuration registers, located in configuration space.

The address range of the Flash Configuration Words for devices in the PIC24FJ256GA412/GB412 family are shown in Table 4-2. Their location in the memory map is shown with the other memory vectors in Figure 4-1. Additional details on the device Configuration Words are provided in **Section 33.0 "Special Features"**.

4.1.4.1 Dual Partition Configuration Words

In Dual Partition Flash modes, each partition has its own set of Flash Configuration Words. The full set of Configuration registers in the Active Partition is used to determine the device's configuration; the Configuration Words in the Inactive Partition are used to determine the device's configuration when that partition becomes active. However, some of the Configuration registers in the Inactive Partition (FSEC, FBSLIM and FSIGN) may be used to determine how the Active Partition is able or allowed to access the Inactive Partition.

4.1.5 ONE-TIME-PROGRAMMABLE (OTP) MEMORY

PIC24FJ256GA412/GB412 family devices provide 384 bytes of One-Time-Programmable (OTP) memory, located at addresses, 801380h through 8013FEh. This memory can be used for persistent storage of application-specific information that will not be erased by reprogramming the device. This includes many types of information, such as (but not limited to):

- Application checksums
- Code revision information
- Product information
- Serial numbers
- System manufacturing dates
- Manufacturing lot numbers

OTP memory may be programmed in any mode, including user RTSP mode, but it cannot be erased. Data are not cleared by a Chip Erase. Once programmed, the OTP memory cannot be rewritten.

Do not perform repeated write operations on the OTP.

TABLE 4-2: FLASH CONFIGURATION WORDS FOR PIC24FJ256GA412/GB412 FAMILY DEVICES

Device Family	Program Memory (Words)	Configuration Word Address Range	
		Single Partition	Dual Partition(1)
PIC24FJ64GA4XX/GB4XX	22,016	00AF80h:00AFB0h	005780h:0057FCh
PIC24FJ128GA4XX/GB4XX	44,032	015780h:0157B0h	00AB80h:00ABFCh
PIC24FJ256GA4XX/GB4XX	88,065	02AF80h:02AFB0h	015780h:0157FCh

Note 1: Addresses for the Active Partition are shown. For the Inactive Partitions, add 400000h.

4.2 Unique Device Identifier (UDID)

All PIC24FJ256GA412/GB412 family devices are individually encoded during final manufacturing with a Unique Device Identifier or UDID. This feature allows for manufacturing traceability of Microchip Technology devices in applications where this is a requirement. It may also be used by the application manufacturer for any number of things that may require unique identification, such as:

- Tracking the device
- Unique serial number
- Unique security key

The UDID comprises five 24-bit program words. When taken together, these fields form a unique 120-bit identifier.

The UDID is stored in five read-only locations, located between 801308h and 801310h in the device configuration space. Table 4-3 lists the addresses of the identifier words and shows their contents.

TABLE 4-3: UDID ADDRESSES

Name	Address	Bits 23-16	Bits 15-8	Bits 7-0
UDID1	801308	UDID Word 1		
UDID2	80130A	UDID Word 2		
UDID3	80130C	UDID Word 3		
UDID4	80130E	UDID Word 4		
UDID5	801310	UDID Word 5		

4.3 Data Memory Space

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Data Memory with Extended Data Space (EDS)"** (www.microchip.com/DS39733). The information in this data sheet supersedes the information in the FRM.

The PIC24F core has a 16-bit wide data memory space, addressable as a single linear range. The Data Space (DS) is accessed using two Address Generation Units (AGUs), one each for read and write operations. The Data Space memory map is shown in Figure 4-5.

The 16-bit wide data addresses in the data memory space point to bytes within the Data Space. This gives a DS address range of 64 Kbytes or 32K words. The lower half (0000h to 7FFFh) is used for implemented (on-chip) memory addresses.

The upper half of data memory address space (8000h to FFFFh) is used as a window into the Extended Data Space (EDS). This allows the microcontroller to directly access a greater range of data beyond the standard 16-bit address range. EDS is discussed in detail in **Section 4.3.5 "Extended Data Space (EDS)"**.

Devices with 64 Kbytes of program memory implement 8 Kbytes of data RAM in the lower half of the DS, from 0800h to 27FFh. All other devices in this family implement 16 Kbytes of data RAM, from 0800h to 47FFh. The lower half of the DS is compatible with previous PIC24F microcontrollers without EDS.

4.3.1 DATA SPACE WIDTH

The data memory space is organized in byte-addressable, 16-bit wide blocks. Data are aligned in data memory and registers as 16-bit words, but all Data Space Effective Addresses (EAs) resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

FIGURE 4-5: DATA SPACE MEMORY MAP FOR PIC24FJ256GA412/GB412 FAMILY DEVICES

	Program Memory	
	64-Kbyte	128-Kbyte 256-Kbyte
Data RAM (Kbyte)	8	16
Upper Boundary	27FFh	47FFh

Note: Memory areas are not shown to scale.

4.3.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC® MCUs and improve Data Space memory usage efficiency, the PIC24F instruction set supports both word and byte operations. As a consequence of byte accessibility, all EA calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] will result in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word, which contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel, byte-wide entities with shared (word) address decode, but separate write lines. Data byte writes only write to the corresponding side of the array or register which matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap will be generated. If the error occurred on a read, the instruction underway is completed; if it occurred on a write, the instruction will be executed but the write will not occur. In either case, a trap is then executed, allowing the system and/or user to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the LSB. The Most Significant Byte (MSB) is not modified.

A Sign-Extend (`SE`) instruction is provided to allow users to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, users can clear the MSB of any W register by executing a Zero-Extend (`ZE`) instruction on the appropriate address.

Although most instructions are capable of operating on word or byte data sizes, it should be noted that some instructions operate only on words.

4.3.3 NEAR DATA SPACE

The 8-Kbyte area between 0000h and 1FFFh is referred to as the Near Data Space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. The remainder of the Data Space is addressable indirectly. Additionally, the whole Data Space is addressable using `MOV` instructions, which support Memory Direct Addressing with a 16-bit address field.

4.3.4 SPECIAL FUNCTION REGISTER (SFR) SPACE

The first 2 Kbytes of the Near Data Space, from 0000h to 07FFh, are primarily occupied with Special Function Registers (SFRs). These are used by the PIC24F core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control and are generally grouped together by module. A diagram of the SFR space, showing where the SFRs are actually implemented, is shown in Table 4-4. Each implemented area indicates a 32-byte region where at least one address is implemented as an SFR. A complete list of implemented SFRs, including their addresses, is shown in Tables 4-5 through 4-12.

TABLE 4-4: IMPLEMENTED REGIONS OF SFR DATA SPACE

	SFR Space Address							
	xx00	**xx20**	**xx40**	**xx60**	**xx80**	**xxA0**	**xxC0**	**xxE0**
000h	Core		—		Interrupts			—
100h	System	EPMP	CRC(1)	PMD	Timers	—	CTM	RTCC
200h	Capture	Compare		MCCP				CMP/DAC
300h	SCCP				UART			UART/SPI
400h	SPI		CLC		I^2C		DMA	
500h	DMA	Crypto Engine		USB(2)			LCD	
600h	LCD	—	I/O					
700h	I/O	A/D	NVM	—	PPS			—

Legend: — = Block is largely or entirely unimplemented.

Note 1: This region includes system control registers (Reference Oscillator).

2: Implemented in PIC24FJXXXGBXXX devices only.

Legend: x = unknown or indeterminate value. Reset and address values are in hexadecimal.

Note 1: The Reset value shown is for POR only. The value on other Reset states is dependent on the state of memory write/erase operations or partition swap at the time of Reset.

4.3.5 EXTENDED DATA SPACE (EDS)

The Extended Data Space (EDS) allows PIC24F devices to address a much larger range of data than would otherwise be possible with a 16-bit address range. EDS includes any additional internal data memory not directly accessible by the lower 32-Kbyte data address space and any external memory through the Enhanced Parallel Master Port (EPMP).

In addition, EDS also allows read access to the program memory space. This feature is called Program Space Visibility (PSV) and is discussed in detail in **Section 4.4.3 "Reading Data from Program Memory Using EDS"**.

Figure 4-6 displays the entire EDS space. The EDS is organized as pages, called EDS pages, with one page equal to the size of the EDS window (32 Kbytes). A particular EDS page is selected through the Data Space Read Page register (DSRPAG) or Data Space Write Page register (DSWPAG). For PSV, only the DSRPAG register is used. The combination of the DSRPAG register value and the 16-bit wide data address forms a 24-bit Effective Address (EA).

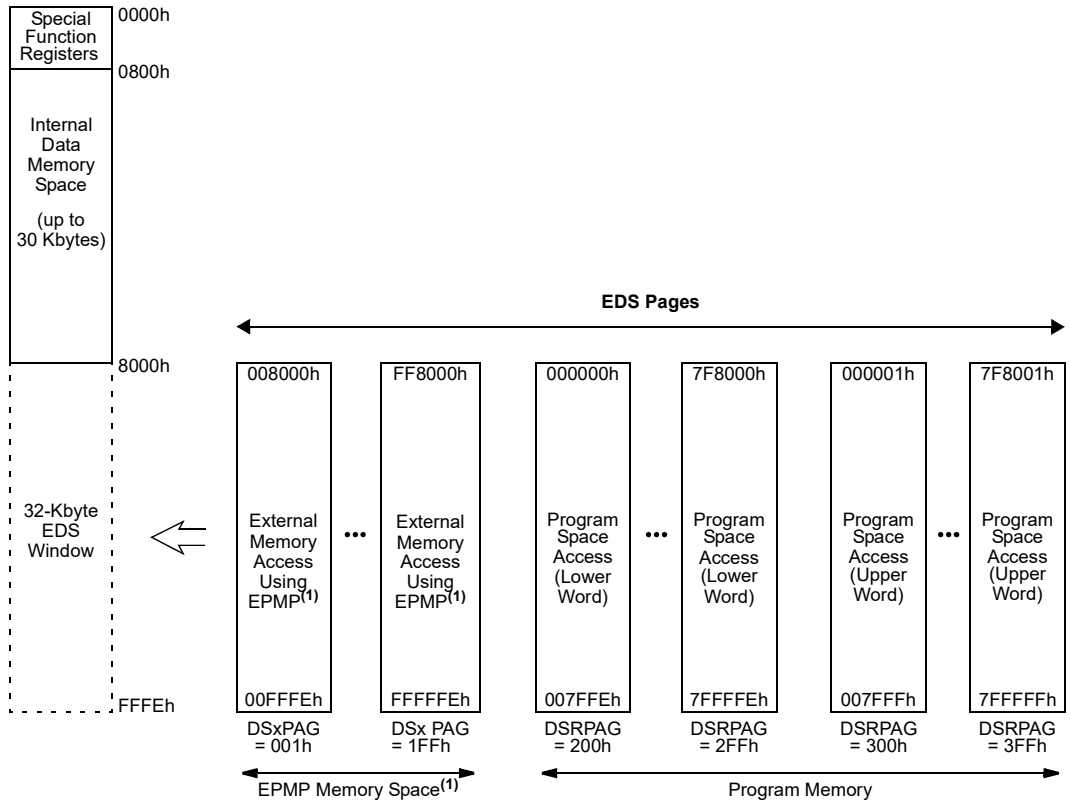
The data addressing range of PIC24FJ256GA412/GB412 family devices depends on the version of the Enhanced Parallel Master Port (EPMP) implemented on a particular device; this is, in turn, a function of the device pin count. Table 4-13 lists the total memory accessible by each of the devices in this family. For more details on accessing external memory using EPMP, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Enhanced Parallel Master Port (EPMP)"** (www.microchip.com/DS39730).

TABLE 4-13: TOTAL ACCESSIBLE DATA MEMORY

Family	Internal RAM	External RAM Access Using EPMP
PIC24FJXXXGX406	8 Kbytes	Up to 64 Kbytes
PIC24FJXXXGX410	16 Kbytes	Up to 16 Mbytes
PIC24FJXXXGX412	16 Kbytes	Up to 16 Mbytes

Note: Accessing Page 0 in the EDS window will generate an address error trap as Page 0 is the base data memory (data locations, 0800h to 7FFFh, in the lower Data Space).

FIGURE 4-6: EXTENDED DATA SPACE



Note 1: The range of addressable memory available is dependent on the device pin count and EPMP implementation.

4.3.5.1 Data Read from EDS

In order to read the data from the EDS space, first, an Address Pointer is set up by loading the required EDS page number into the DSRPAG register and assigning the offset address to one of the W registers. Once the above assignment is done, the EDS window is enabled by setting bit 15 of the Working register assigned with the offset address; then, the contents of the pointed EDS location can be read.

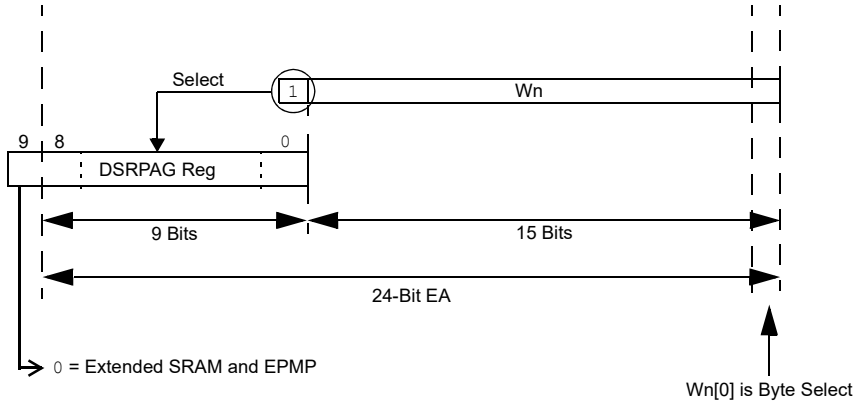
Figure 4-7 illustrates how the EDS space address is generated for read operations.

When the Most Significant bit (MSb) of EA is '1' and DSRPAG[9] = 0, the lower 9 bits of DSRPAG are concatenated to the lower 15 bits of the EA to form a 24-bit EDS space address for read operations.

Example 4-1 shows how to read a byte, word and double-word from EDS.

Note:	All read operations from EDS space have an overhead of one instruction cycle. Therefore, a minimum of two instruction cycles is required to complete an EDS read. EDS reads under the REPEAT instruction; the first two accesses take three cycles and the subsequent accesses take one cycle.

FIGURE 4-7: EDS ADDRESS GENERATION FOR READ OPERATIONS



EXAMPLE 4-1: EDS READ CODE IN ASSEMBLY

```
; Set the EDS page from where the data to be read
    mov         #0x0002, w0
    mov         w0, DSRPAG      ;page 2 is selected for read
    mov         #0x0800, w1     ;select the location (0x800) to be read
    bset        w1, #15         ;set the MSB of the base address, enable EDS mode

;Read a byte from the selected location
    mov.b       [w1++], w2      ;read Low byte
    mov.b       [w1++], w3      ;read High byte

;Read a word from the selected location
    mov         [w1], w2        ;

;Read Double - word from the selected location
    mov.d       [w1], w2        ;two word read, stored in w2 and w3
```

4.3.5.2 Data Write into EDS

In order to write data to EDS space, such as in EDS reads, an Address Pointer is set up by loading the required EDS page number into the DSWPAG register and assigning the offset address to one of the W registers. Once the above assignment is done, then the EDS window is enabled by setting bit 15 of the Working register assigned with the offset address and the accessed location can be written.

Figure 4-8 illustrates how the EDS space address is generated for write operations.

When the MSb of EA is '1', the lower 9 bits of DSWPAG are concatenated to the lower 15 bits of EA to form a 24-bit EDS address for write operations. Example 4-2 shows how to write a byte, word and double-word to EDS.

The DS Page registers (DSRPAG/DSWPAG) do not update automatically while crossing a page boundary when the rollover happens from 0xFFFF to 0x8000.

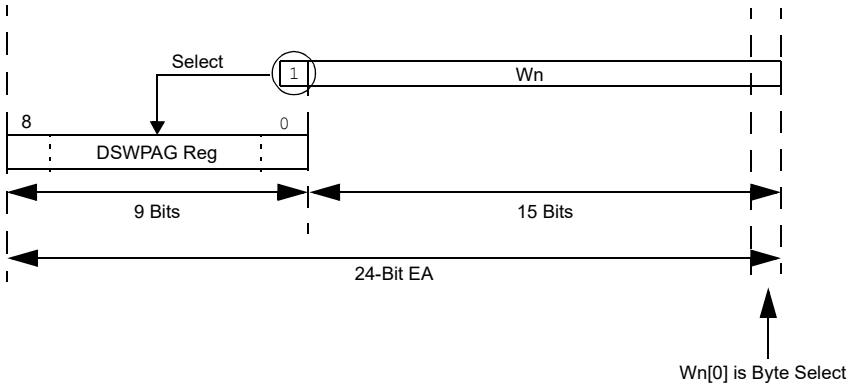
While developing code in assembly, care must be taken to update the DS Page registers when an Address Pointer crosses the page boundary. The 'C' compiler keeps track of the addressing, and increments or decrements the DS Page registers accordingly, while accessing contiguous data memory locations.

Note 1: All write operations to EDS are executed in a single cycle.

2: Use of Read/Modify/Write operation on any EDS location under a `REPEAT` instruction is not supported. For example, `BCLR`, `BSW`, `BTG`, `RLC f`, `RLNC f`, `RRC f`, `RRNC f`, `ADD f`, `SUB f`, `SUBR f`, `AND f`, `IOR f`, `XOR f`, `ASR f`, `ASL f`.

3: Use the DSRPAG register while performing Read/Modify/Write operations.

FIGURE 4-8: EDS ADDRESS GENERATION FOR WRITE OPERATIONS



EXAMPLE 4-2: EDS WRITE CODE IN ASSEMBLY

```
; Set the EDS page where the data to be written
    mov     #0x0002, w0
    mov     w0, DSWPAG      ;page 2 is selected for write
    mov     #0x0800, w1     ;select the location (0x800) to be written
    bset    w1, #15         ;set the MSB of the base address, enable EDS mode

;Write a byte to the selected location
    mov     #0x00A5, w2
    mov     #0x003C, w3
    mov.b   w2, [w1++]      ;write Low byte
    mov.b   w3, [w1++]      ;write High byte

;Write a word to the selected location
    mov     #0x1234, w2     ;
    mov     w2, [w1]        ;

;Write a Double - word to the selected location
    mov     #0x1122, w2
    mov     #0x4455, w3
    mov.d   w2, [w1]        ;2 EDS writes
```

TABLE 4-14: EDS MEMORY ADDRESS WITH DIFFERENT PAGES AND ADDRESSES

DSRPAG (Data Space Read Register)	DSWPAG (Data Space Write Register)	Source/Destination Address While Indirect Addressing	24-Bit EA Pointing to EDS	Comment
x(1)	x(1)	0000h to 1FFFh	000000h to 001FFFh	Near Data Space(2)
		2000h to 7FFFh	002000h to 007FFFh	
001h	001h	8000h to FFFFh	008000h to 00FFFEh	EPMP Memory Space
002h	002h		010000h to 017FFEh	
003h • • • • • 1FFh	003h • • • • • 1FFh		018000h to 0187FEh • • • • FF8000h to FFFFFEh	
000h	000h		Invalid Address	Address Error Trap(3)

Note 1: If the source/destination address is below 8000h, the DSRPAG and DSWPAG registers are not considered.

2: This Data Space can also be accessed by Direct Addressing.

3: When the source/destination address is above 8000h and DSRPAG/DSWPAG are '0', an address error trap will occur.

4.3.6 SOFTWARE STACK

Apart from its use as a Working register, the W15 register in PIC24F devices is also used as a Software Stack Pointer (SSP). The pointer always points to the first available free word and grows from lower to higher addresses. It predecrements for stack pops and post-increments for stack pushes, as shown in Figure 4-9. Note that for a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, ensuring that the MSB is always clear.

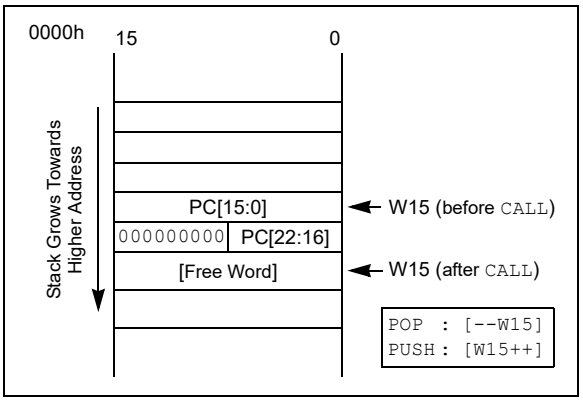
Note:	A PC push during exception processing will concatenate the SRL register to the MSB of the PC prior to the push.

The Stack Pointer Limit Value register (SPLIM), associated with the Stack Pointer, sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM[0] is forced to '0' as all stack operations must be word-aligned. Whenever an EA is generated using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal, and a push operation is performed, a stack error trap will not occur. The stack error trap will occur on a subsequent push operation. Thus, for example, if it is desirable to cause a stack error trap when the stack grows beyond address, 2000h in RAM, initialize the SPLIM with the value, 1FFEh.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0800h. This prevents the stack from interfering with the SFR space.

A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

FIGURE 4-9: CALL STACK FRAME



4.4 Interfacing Program and Data Memory Spaces

The PIC24F architecture uses a 24-bit wide program space and 16-bit wide Data Space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use these data successfully, they must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the PIC24F architecture provides two methods by which program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the Data Space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This makes the method ideal for accessing data tables that need to be updated from time to time. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. It can only access the least significant word of the program word.

4.4.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Memory Page Address (TBLPAG) register is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the MSBs of TBLPAG are used to determine if the operation occurs in the user memory (TBLPAG[7] = 0) or the configuration memory (TBLPAG[7] = 1).

For remapping operations, the 10-bit Extended Data Space Read (DSRPAG) register is used to define a 16K word page in the program space. When the Most Significant bit (MSb) of the EA is '1', and the MSb (bit 9) of DSRPAG is '1', the lower 8 bits of DSRPAG are concatenated with the lower 15 bits of the EA to form a 23-bit program space address. The DSRPAG[8] bit decides whether the lower word (when the bit is '0') or the higher word (when the bit is '1') of program memory is mapped. Unlike table operations, this strictly limits remapping operations to the user memory area.

Table 4-15 and Figure 4-10 show how the program EA is created for table operations, and remapping accesses from the data EA. Here, P[23:0] refer to a program space word, whereas D[15:0] refer to a Data Space word.

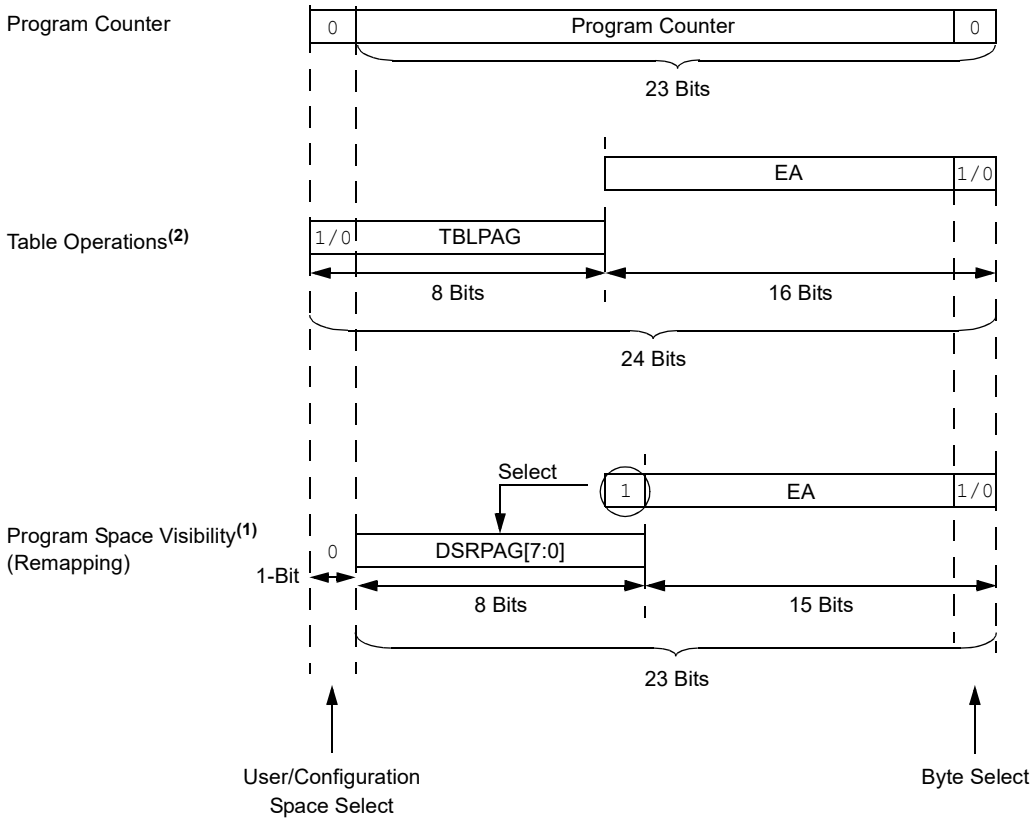
TABLE 4-15: PROGRAM SPACE ADDRESS CONSTRUCTION

Access Type	Access Space	Program Space Address				
		[23]	[22:16]	[15]	[14:1]	[0]
Instruction Access (Code Execution)	User	0	PC[22:1]			0
		0xx xxxx xxxx xxxx xxxx xxx0				
TBLRD/TBLWT (Byte/Word Read/Write)	User	TBLPAG[7:0]		Data EA[15:0]		
		0xxx xxxx		xxxx xxxx xxxx xxxx		
	Configuration	TBLPAG[7:0]		Data EA[15:0]		
		1xxx xxxx		xxxx xxxx xxxx xxxx		
Program Space Visibility (Block Remap/Read)	User	0	DSRPAG[7:0](2)		Data EA[14:0](1)	
		0	xxxx xxxx		xxx xxxx xxxx xxxx	

Note 1: Data EA[15] is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is DSRPAG[0].

2: DSRPAG[9] is always '1' in this case. DSRPAG[8] decides whether the lower word or higher word of program memory is read. When DSRPAG[8] is '0', the lower word is read and when it is '1', the higher word is read.

FIGURE 4-10: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION



Note 1: DSRPAG[8] acts as word select. DSRPAG[9] should always be '1' to map program memory to data memory.

2: The instructions, TBLRDH/TBLWTH/TBLRDL/TBLWTL, decide if the higher or lower word of program memory is accessed. TBLRDH/TBLWTH instructions access the higher word and TBLRDL/TBLWTL instructions access the lower word. Table Read operations are permitted in the configuration memory space.

4.4.2 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the program space without going through Data Space. The TBLRDH and TBLWTH instructions are the only method to read or write the upper eight bits of a program space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two, 16-bit word-wide address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space which contains the least significant data word, and TBLRDH and TBLWTH access the space which contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

1. TBLRDL (Table Read Low): In Word mode, it maps the lower word of the program space location (P[15:0]) to a data address (D[15:0]).

   In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when byte select is '1'; the lower byte is selected when it is '0'.

2. TBLRDH (Table Read High): In Word mode, it maps the entire upper word of a program address (P[23:16]) to a data address. Note that D[15:8], the 'phantom' byte, will always be '0'.

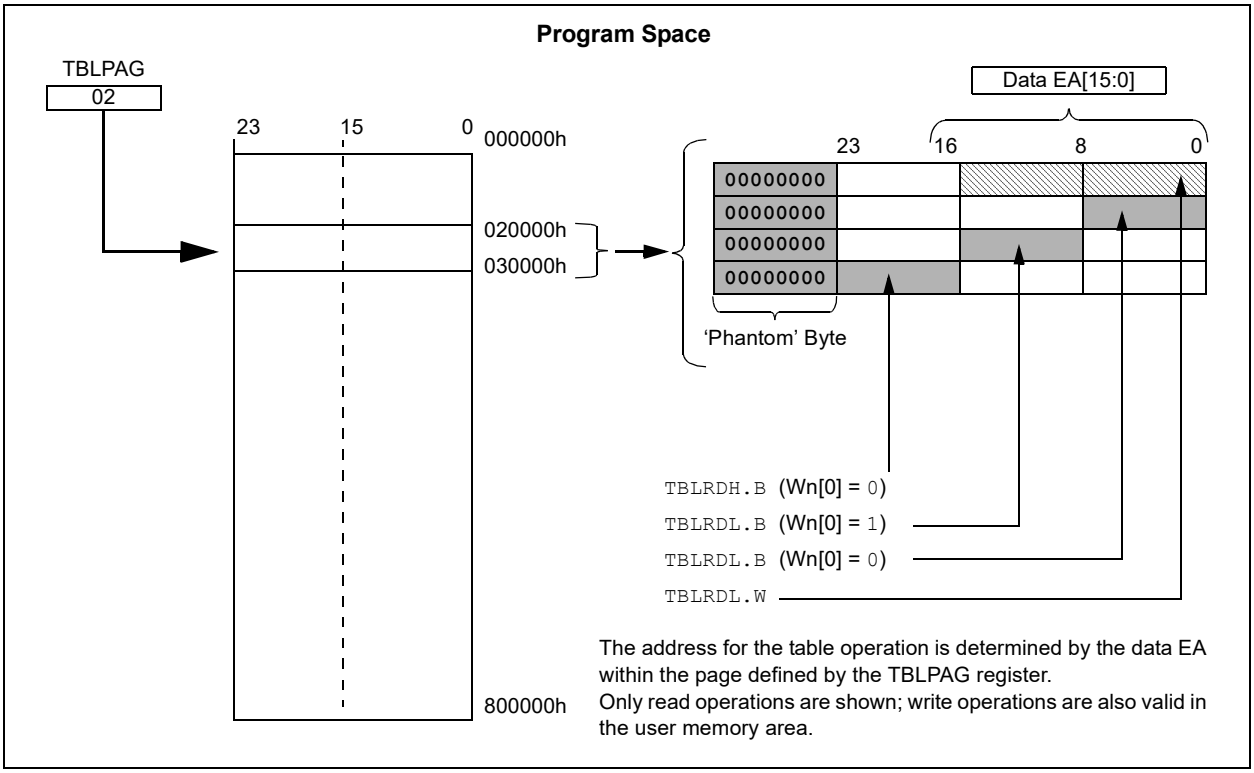
   In Byte mode, it maps the upper or lower byte of the program word to D[7:0] of the data address, as above. Note that the data will always be '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are described in **Section 6.0 "Flash Program Memory"**.

For all table operations, the area of program memory space to be accessed is determined by the Table Memory Page Address (TBLPAG) register. TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When TBLPAG[7] = 0, the table page is located in the user memory space. When TBLPAG[7] = 1, the page is located in configuration space.

Note:	Only Table Read operations will execute in the configuration memory space where Device IDs are located. Table Write operations are not allowed.

FIGURE 4-11: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS



The address for the table operation is determined by the data EA within the page defined by the TBLPAG register.
Only read operations are shown; write operations are also valid in the user memory area.

4.4.3 READING DATA FROM PROGRAM MEMORY USING EDS

The upper 32 Kbytes of Data Space may optionally be mapped into any 16K word page of the program space. This provides transparent access of stored constant data from the Data Space without the need to use special instructions (i.e., TBLRDL/H).

Program space access through the Data Space occurs when the MSb of EA is '1' and the DSRPAG[9] is also '1'. The lower eight bits of DSRPAG are concatenated to the Wn[14:0] bits to form a 23-bit EA to access program memory. The DSRPAG[8] decides which word should be addressed; when the bit is '0', the lower word and when '1', the upper word of the program memory is accessed.

The entire program memory is divided into 512 EDS pages, from 200h to 3FFh, each consisting of 16K words of data. Pages, 200h to 2FFh, correspond to the lower words of the program memory, while 300h to 3FFh correspond to the upper words of the program memory.

Using this EDS technique, the entire program memory can be accessed. Previously, the access to the upper word of the program memory was not supported.

Table 4-16 provides the corresponding 23-bit EDS address for program memory with EDS page and source addresses.

For operations that use PSV, and are executed outside a REPEAT loop, the MOV and MOV.D instructions will require one instruction cycle in addition to the specified execution time. All other instructions will require two instruction cycles in addition to the specified execution time.

For operations that use PSV, which are executed inside a REPEAT loop, there will be some instances that require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction accessing data, using PSV, to execute in a single cycle.

TABLE 4-16: EDS PROGRAM ADDRESS WITH DIFFERENT PAGES AND ADDRESSES

DSRPAG (Data Space Read Register)	Source Address While Indirect Addressing	23-Bit EA Pointing to EDS	Comment
200h • • • 2FFh	8000h to FFFFh	000000h to 007FFEh • • • 7F8000h to 7FFFFEh	Lower words of 4M program instructions; (8 Mbytes) for read operations only
300h • • • 3FFh		000001h to 007FFFh • • • 7F8001h to 7FFFFFh	Upper words of 4M program instructions (4 Mbytes remaining, 4 Mbytes are phantom bytes); for read operations only
000h		Invalid Address	Address error trap(1)

Note 1: When the source/destination address is above 8000h and DSRPAG/DSWPAG are '0', an address error trap will occur.

EXAMPLE 4-3: EDS READ CODE FROM PROGRAM MEMORY IN ASSEMBLY

```
; Set the EDS page from where the data to be read
    mov     #0x0202, w0
    mov     w0, DSRPAG                ;page 0x202, consisting lower words, is selected for read
    mov     #0x000A, w1               ;select the location (0x0A) to be read
    bset    w1, #15                   ;set the MSB of the base address, enable EDS mode
;Read a byte from the selected location
    mov.b   [w1++], w2                ;read Low byte
    mov.b   [w1++], w3                ;read High byte
;Read a word from the selected location
    mov     [w1], w2                  ;
;Read Double - word from the selected location
    mov.d   [w1], w2                  ;two word read, stored in w2 and w3
```

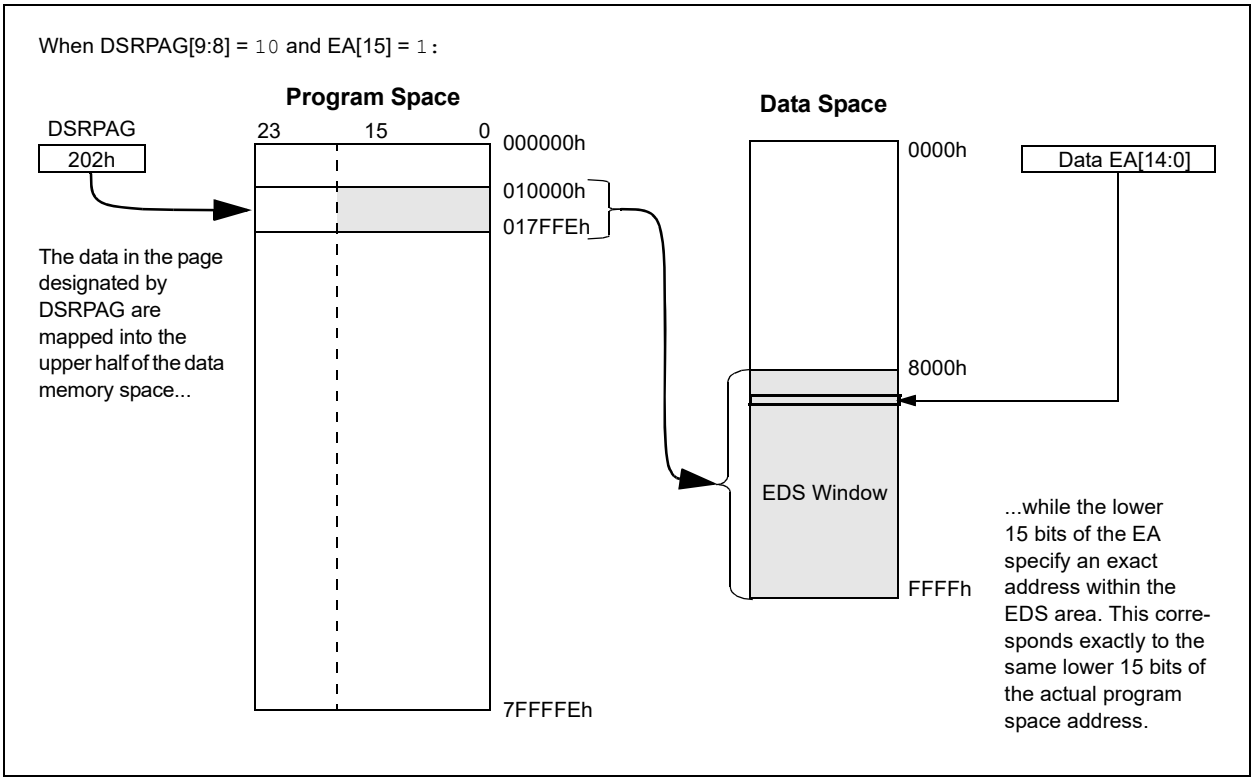

FIGURE 4-13: PROGRAM SPACE VISIBILITY OPERATION TO ACCESS UPPER WORD

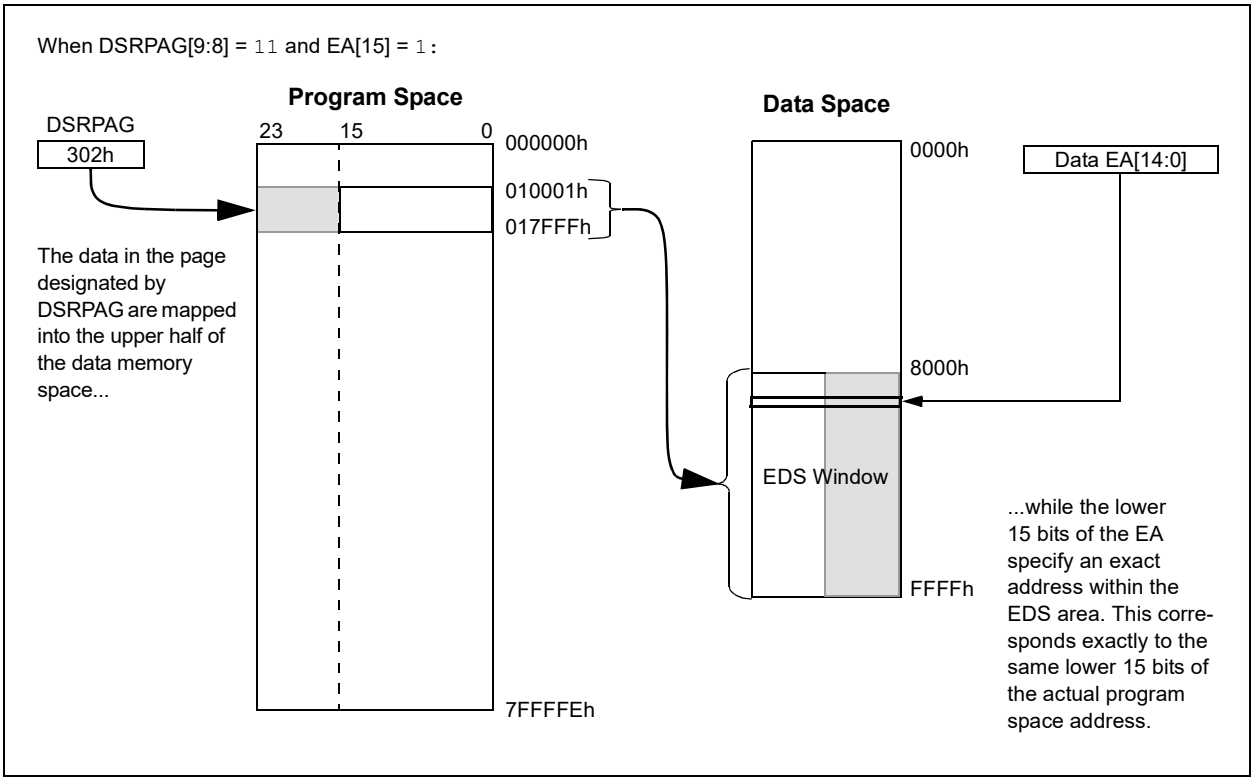


NOTES:

5.0 DIRECT MEMORY ACCESS CONTROLLER (DMA)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Direct Memory Access Controller (DMA)"** (www.microchip.com/DS30009742). The information in this data sheet supersedes the information in the FRM.

The Direct Memory Access Controller (DMA) is designed to service high data throughput peripherals operating on the SFR bus, allowing them to access data memory directly and alleviating the need for CPU-intensive management. By allowing these data-intensive peripherals to share their own data path, the main data bus is also deloaded, resulting in additional power savings.

The DMA Controller functions both as a peripheral and a direct extension of the CPU. It is located on the microcontroller data bus between the CPU and DMA-enabled peripherals, with direct access to SRAM. This partitions the SFR bus into two buses, allowing the DMA Controller access to the DMA-capable peripherals located on the new DMA SFR bus. The controller serves as a master device on the DMA SFR bus, controlling data flow from DMA-capable peripherals.

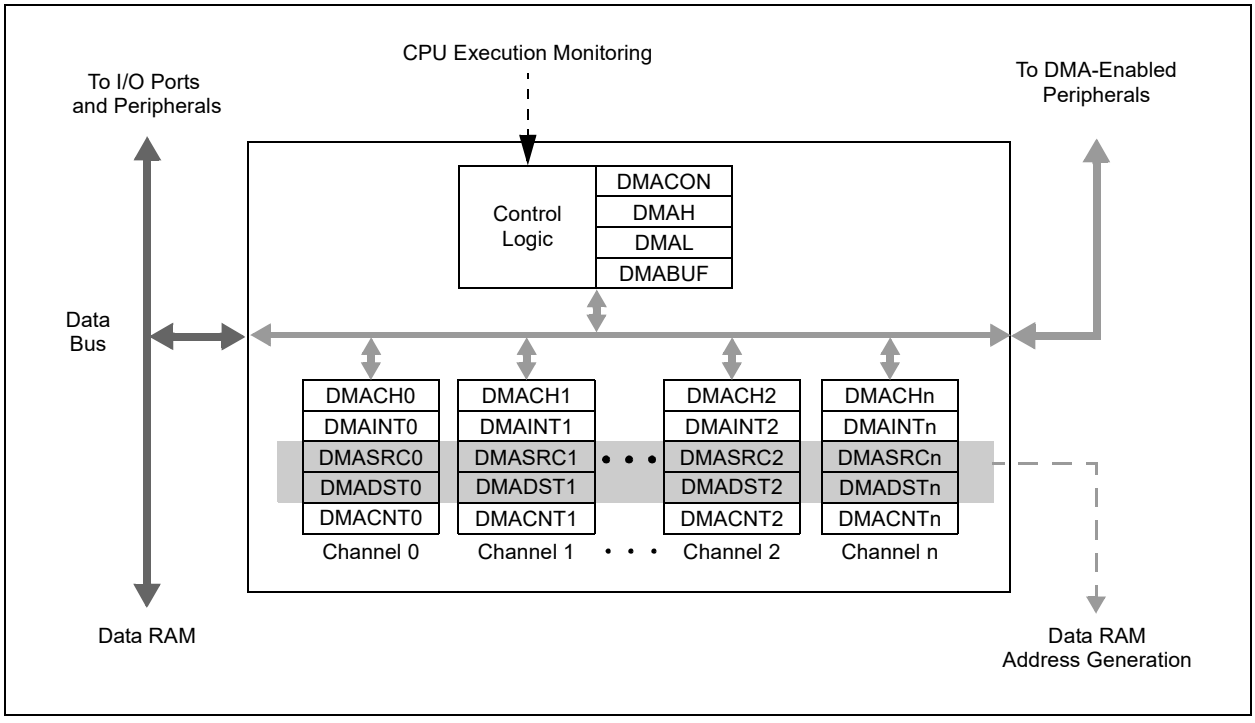
The controller also monitors CPU instruction processing directly, allowing it to be aware of when the CPU requires access to peripherals on the DMA bus and automatically relinquishing control to the CPU as needed. This increases the effective bandwidth for handling data without DMA operations causing a processor Stall. This makes the controller essentially transparent to the user.

The DMA Controller has these features:

- Six Multiple Independent and Independently Programmable Channels
- Concurrent Operation with the CPU (no DMA caused Wait states)
- DMA Bus Arbitration
- Five Programmable Address modes
- Four Programmable Transfer modes
- Four Flexible Internal Data Transfer modes
- Byte or Word Support for Data Transfer
- 16-Bit Source and Destination Address Register for Each Channel, Dynamically Updated and Reloadable
- 16-Bit Transaction Count Register, Dynamically Updated and Reloadable
- Upper and Lower Address Limit Registers
- Counter Half-Full Level Interrupt
- Software Triggered Transfer
- Null Write mode for Symmetric Buffer Operations

A simplified block diagram of the DMA Controller is shown if Figure 5-1.

FIGURE 5-1: DMA FUNCTIONAL BLOCK DIAGRAM



5.1 Summary of DMA Operations

The DMA Controller is capable of moving data between addresses according to a number of different parameters. Each of these parameters can be independently configured for any transaction. In addition, any or all of the DMA channels can independently perform a different transaction at the same time. Transactions are classified by these parameters:

- Source and destination (SFRs and data RAM)
- Data size (byte or word)
- Trigger source
- Transfer mode (One-Shot, Repeated or Continuous)
- Addressing modes (Fixed Address or Address Blocks with or without Address Increment/Decrement)

In addition, the DMA Controller provides channel priority arbitration for all channels.

5.1.1 SOURCE AND DESTINATION

Using the DMA Controller, data may be moved between any two addresses in the Data Space. The SFR space (0000h to 07FFh) or the data RAM space (0800h to FFFFh) can serve as either the source or the destination. Data can be moved between these areas in either direction or between addresses in either area. The four different combinations are shown in Figure 5-2.

If it is necessary to protect areas of data RAM, the DMA Controller allows the user to set upper and lower address boundaries for operations in the Data Space above the SFR space. The boundaries are set by the DMAH and DMAL Limit registers. If a DMA channel attempts an operation outside of the address boundaries, the transaction is terminated and an interrupt is generated.

5.1.2 DATA SIZE

The DMA Controller can handle both 8-bit and 16-bit transactions. Size is user-selectable using the SIZE bit (DMACHn[1]). By default, each channel is configured for word-size transactions. When byte-size transactions are chosen, the LSb of the source and/or destination address determines if the data represent the upper or lower byte of the data RAM location.

5.1.3 TRIGGER SOURCE

The DMA Controller can use 63 of the device's interrupt sources to initiate a transaction. The DMA trigger sources occur in reverse order than their natural interrupt priority and are shown in Table 5-1.

Since the source and destination addresses for any transaction can be programmed independently of the trigger source, the DMA Controller can use any trigger to perform an operation on any peripheral. This also allows DMA channels to be cascaded to perform more complex transfer operations.

5.1.4 TRANSFER MODE

The DMA Controller supports four types of data transfers, based on the volume of data to be moved for each trigger.

- One-Shot: A single transaction occurs for each trigger.
- Continuous: A series of back-to-back transactions occur for each trigger; the number of transactions is determined by the DMACNTn transaction counter.
- Repeated One-Shot: A single transaction is performed repeatedly, once per trigger, until the DMA channel is disabled.
- Repeated Continuous: A series of transactions are performed repeatedly, one cycle per trigger, until the DMA channel is disabled.

All transfer modes allow the option to have the source and destination addresses, and counter value, automatically reloaded after the completion of a transaction; Repeated mode transfers do this automatically.

5.1.5 ADDRESSING MODES

The DMA Controller also supports transfers between single addresses or address ranges. The four basic options are:

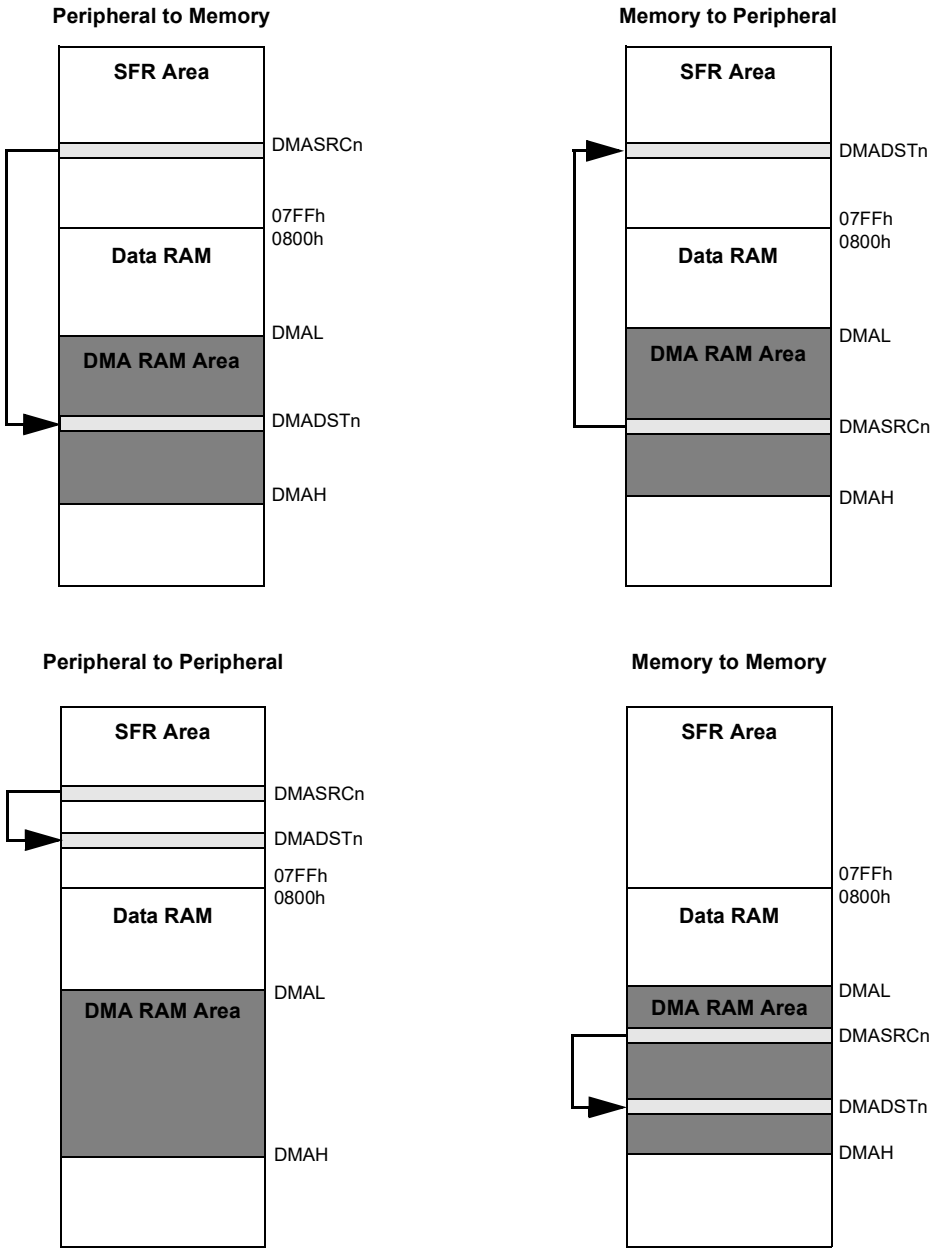
- Fixed-to-Fixed: Between two constant addresses
- Fixed-to-Block: From a constant source address to a range of destination addresses
- Block-to-Fixed: From a range of source addresses to a single, constant destination address
- Block-to-Block: From a range of source addresses to a range of destination addresses

The option to select auto-increment or auto-decrement of source and/or destination addresses is available for Block Addressing modes.

In addition to the four basic modes, the DMA Controller also supports Peripheral Indirect Addressing (PIA) mode, where the source or destination address is generated jointly by the DMA Controller and a PIA-capable peripheral. When enabled, the DMA channel provides a base source and/or destination address, while the peripheral provides a fixed range offset address.

For PIC24FJ256GA412/GB412 family devices, the 12-bit A/D Converter module is the only PIA-capable peripheral. Details for its use in PIA mode are provided in **Section 27.0 "12-Bit A/D Converter with Threshold Detect"**.

FIGURE 5-2: TYPES OF DMA DATA TRANSFERS



Note: Relative sizes of memory areas are not shown to scale.

5.1.6 CHANNEL PRIORITY

Each DMA channel functions independently of the others, but also competes with the others for access to the data and DMA buses. When access collisions occur, the DMA Controller arbitrates between the channels using a user-selectable priority scheme. Two schemes are available:

- Round Robin: When two or more channels collide, the lower numbered channel receives priority on the first collision. On subsequent collisions, the higher numbered channels each receive priority based on their channel number.
- Fixed: When two or more channels collide, the lowest numbered channel always receives priority, regardless of past history; however, any channel being actively processed is not available for an immediate retrigger. If a higher priority channel is continually requesting service, it will be scheduled for service after the next lower priority channel with a pending request.

5.2 Typical Setup

To set up a DMA channel for a basic data transfer:

1. Enable the DMA Controller (DMAEN = 1) and select an appropriate channel priority scheme by setting or clearing PRSSEL.
2. Program DMAH and DMAL with appropriate upper and lower address boundaries for data RAM operations.
3. Select the DMA channel to be used and disable its operation (CHEN = 0).
4. Program the appropriate source and destination addresses for the transaction into the channel's DMASRCn and DMADSTn registers. For PIA Addressing mode, use the base address value.
5. Program the DMACNTn register for the number of triggers per transfer (One-Shot or Continuous modes) or the number of words (bytes) to be transferred (Repeated modes).
6. Set or clear the SIZE bit to select the data size.
7. Program the TRMODE[1:0] bits to select the Data Transfer mode.
8. Program the SAMODE[1:0] and DAMODE[1:0] bits to select the addressing mode.
9. Enable the DMA channel by setting CHEN.
10. Enable the trigger source interrupt.

5.3 Peripheral Module Disable

Unlike other peripheral modules, the channels of the DMA Controller cannot be individually powered down using the Peripheral Module Disable (PMD) registers. Instead, the channels are controlled as two groups. The DMA0MD bit (PMD7[4]) selectively controls DMACH0 through DMACH3. The DMA1MD bit (PMD7[5]) controls DMACH4 and DMACH5. Setting both bits effectively disables the DMA Controller.

5.4 Registers

The DMA Controller uses a number of registers to control its operation. The number of registers depends on the number of channels implemented for a particular device.

There are always four module-level registers (one control and three buffer/address):

- DMACON: DMA Engine Control Register (Register 5-1)
- DMAH and DMAL: DMA High and Low Address Limit Registers
- DMABUF: DMA Transfer Data Buffer

Each of the DMA channels implements five registers (two control and three buffer/address):

- DMACHn: DMA Channel n Control Register (Register 5-2)
- DMAINTn: DMA Channel n Interrupt Register (Register 5-3)
- DMASRCn: DMA Data Source Address Pointer for Channel n Register
- DMADSTn: DMA Data Destination Source for Channel n Register
- DMACNTn: DMA Transaction Counter for Channel n Register

For PIC24FJ256GA412/GB412 family devices, there are a total of 34 registers.

REGISTER 5-1: DMACON: DMA ENGINE CONTROL REGISTER

R/W-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
DMAEN	—	—	—	—	—	—	—

bit 12 **Reserved:** Maintain as '0'

bit 11 **Unimplemented:** Read as '0'

bit 10 **NULLW:** Null Write Mode bit
1 = A dummy write is initiated to DMASRCn for every write to DMADSTn
0 = No dummy write is initiated

bit 9 **RELOAD:** Address and Count Reload bit(1)
1 = DMASRCn, DMADSTn and DMACNTn registers are reloaded to their previous values upon the start of the next operation
0 = DMASRCn, DMADSTn and DMACNTn are not reloaded on the start of the next operation(2)

bit 8 **CHREQ:** DMA Channel Software Request bit(3)
1 = A DMA request is initiated by software; automatically cleared upon completion of a DMA transfer
0 = No DMA request is pending

bit 7-6 **SAMODE[1:0]:** Source Address Mode Selection bits
11 = DMASRCn is used in Peripheral Indirect Addressing and remains unchanged
10 = DMASRCn is decremented based on the SIZE bit after a transfer completion
01 = DMASRCn is incremented based on the SIZE bit after a transfer completion
00 = DMASRCn remains unchanged after a transfer completion

bit 5-4 **DAMODE[1:0]:** Destination Address Mode Selection bits
11 = DMADSTn is used in Peripheral Indirect Addressing and remains unchanged
10 = DMADSTn is decremented based on the SIZE bit after a transfer completion
01 = DMADSTn is incremented based on the SIZE bit after a transfer completion
00 = DMADSTn remains unchanged after a transfer completion

bit 3-2 **TRMODE[1:0]:** Transfer Mode Selection bits
11 = Repeated Continuous mode
10 = Continuous mode
01 = Repeated One-Shot mode
00 = One-Shot mode

bit 1 **SIZE:** Data Size Selection bit
1 = Byte (8-bit)
0 = Word (16-bit)

bit 0 **CHEN:** DMA Channel Enable bit
1 = The corresponding channel is enabled
0 = The corresponding channel is disabled

Note 1: Only the original DMACNTn is required to be stored to recover the original DMASRCn and DMADSTn values.
2: DMACNTn will always be reloaded in Repeated mode transfers, regardless of the state of the RELOAD bit.
3: The number of transfers executed while CHREQ is set depends on the configuration of TRMODE[1:0].

bit 15 **DBUFWF:** DMA Buffered Data Write Flag bit(1)
- 1 = The content of the DMA buffer has not been written to the location specified in DMADSTn or DMASRCn in Null Write mode
- 0 = The content of the DMA buffer has been written to the location specified in DMADSTn or DMASRCn in Null Write mode

bit 14-8 **CHSEL[6:0]:** DMA Channel Trigger Selection bits

See Table 5-1 for a complete list.

bit 7 **HIGHIF:** DMA High Address Limit Interrupt Flag bit(1,2)
- 1 = The DMA channel has attempted to access an address higher than DMAH or the upper limit of the data RAM space
- 0 = The DMA channel has not invoked the high address limit interrupt

bit 6 **LOWIF:** DMA Low Address Limit Interrupt Flag bit(1,2)
- 1 = The DMA channel has attempted to access the DMA SFR address lower than DMAL, but above the SFR range (07FFh)
- 0 = The DMA channel has not invoked the low address limit interrupt

bit 5 **DONEIF:** DMA Complete Operation Interrupt Flag bit(1)

If CHEN = 1:
- 1 = The previous DMA session has ended with completion
- 0 = The current DMA session has not yet completed

If CHEN = 0:
- 1 = The previous DMA session has ended with completion
- 0 = The previous DMA session has ended without completion

bit 4 **HALFIF:** DMA 50% Watermark Level Interrupt Flag bit(1)
- 1 = DMACNTn has reached the halfway point to 0000h
- 0 = DMACNTn has not reached the halfway point

bit 3 **OVRUNIF:** DMA Channel Overrun Flag bit(1)
- 1 = The DMA channel is triggered while it is still completing the operation based on the previous trigger
- 0 = The overrun condition has not occurred

bit 2-1 **Unimplemented:** Read as '0'

bit 0 **HALFEN:** Halfway Completion Watermark bit
- 1 = Interrupts are invoked when DMACNTn has reached its halfway point and at completion
- 0 = An interrupt is invoked only at the completion of the transfer

Note 1: Setting these flags in software does not generate an interrupt.

2: Testing for address limit violations (DMASRCn or DMADSTn is either greater than DMAH or less than DMAL) is NOT done before the actual access.

6.0 FLASH PROGRAM MEMORY

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24F Family Reference Manual"*, **"Dual Partition Flash Program Memory"** (www.microchip.com/DS70005156). The information in this data sheet supersedes the information in the FRM.

The PIC24FJ256GA412/GB412 family of devices contains internal Flash program memory for storing and executing application code. The program memory is readable, writable and erasable. The Flash memory can be programmed in three ways:

- In-Circuit Serial Programming™ (ICSP™)
- Run-Time Self-Programming (RTSP)
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)

ICSP allows a PIC24FJ256GA412/GB412 family device to be serially programmed while in the end application circuit. This is simply done with two lines for the programming clock and programming data (named PGECx and PGEDx, respectively), and three other lines for power (V_{DD}), ground (V_{SS}) and Master Clear ($\overline{MCLR}$). This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using `TBLRD` (Table Read) and `TBLWT` (Table Write) instructions. With RTSP, the user may write program memory data in blocks of 64 instructions (192 bytes) at a time and erase program memory in blocks of 512 instructions (1536 bytes) at a time.

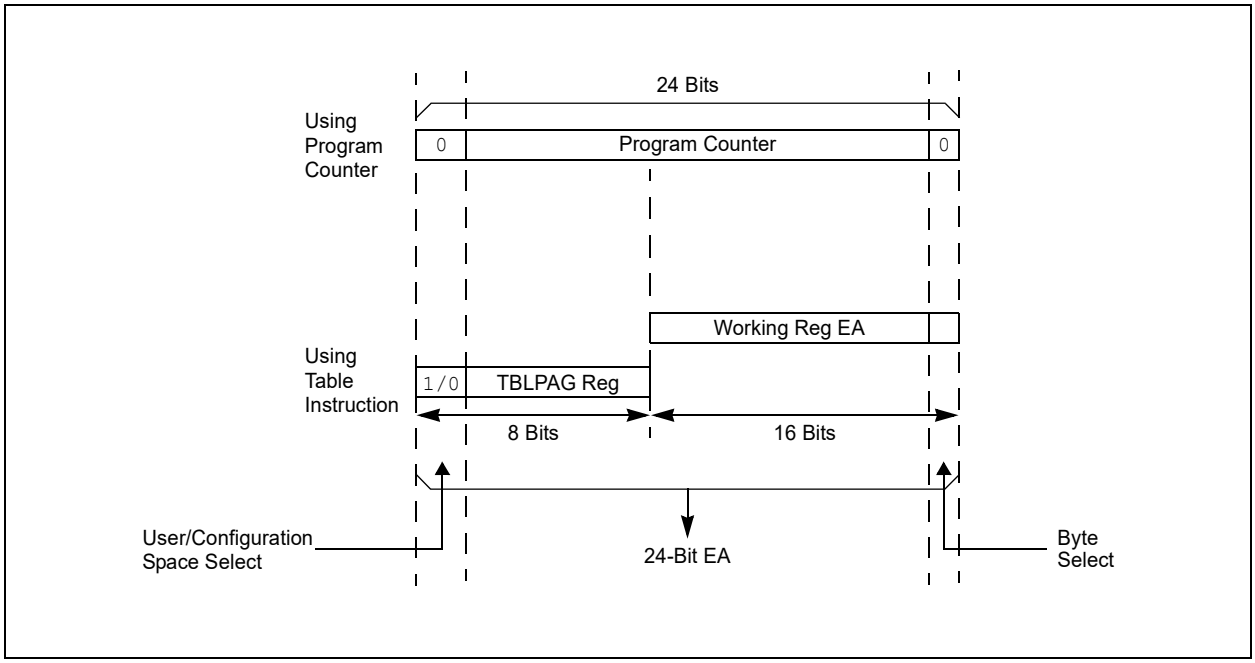
6.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the Table Read and Table Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using the TBLPAG[7:0] bits and the Effective Address (EA) from a W register, specified in the table instruction, as shown in Figure 6-1.

The `TBLRDL` and the `TBLWTL` instructions are used to read or write to bits[15:0] of program memory. `TBLRDL` and `TBLWTL` can access program memory in both Word and Byte modes.

The `TBLRDH` and `TBLWTH` instructions are used to read or write to bits[23:16] of program memory. `TBLRDH` and `TBLWTH` can also access program memory in Word or Byte mode.

FIGURE 6-1: ADDRESSING FOR TABLE REGISTERS



6.2 RTSP Operation

The PIC24F Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user to erase blocks of eight rows (512 instructions) at a time and to program one row at a time. It is also possible to program two words.

The 8-row erase blocks and single row write blocks are edge-aligned, from the beginning of program memory on boundaries of 1536 bytes and 192 bytes, respectively.

When data are written to program memory using `TBLWT` instructions, the data are not written directly to memory. Instead, data written using Table Writes are stored in holding latches until the programming sequence is executed.

Any number of `TBLWT` instructions can be executed and a write will be successfully performed. However, 64 `TBLWT` instructions are required to write the full row of memory.

To ensure that no data are corrupted during a write, any unused address should be programmed with FFFFFFh. This is because the holding latches reset to an unknown state, so if the addresses are left in the Reset state, they may overwrite the locations on rows which were not rewritten.

The basic sequence for RTSP programming is:

- Set up a Table Pointer to point to the programming latches
- Perform a series of `TBLWT` instructions to load the buffers
- Set the NVM Address registers to point to the destination

Programming is performed by setting the control bits in the NVMCON register.

Data can be loaded in any order and the holding registers can be written to multiple times before performing a write operation. Subsequent writes, however, will wipe out any previous writes.

Note:	Writing to a location multiple times without erasing is *not* recommended.

All of the Table Write operations are single-word writes (two instruction cycles), because only the buffers are written. A programming cycle is required for programming each row.

6.3 JTAG Operation

The PIC24F family supports JTAG boundary scan. Boundary scan can improve the manufacturing process by verifying pin to PCB connectivity.

6.4 Enhanced In-Circuit Serial Programming

Enhanced In-Circuit Serial Programming uses an on-board bootloader, known as the Program Executive (PE), to manage the programming process. Using an SPI data frame format, the Program Executive can erase, program and verify program memory. For more information on Enhanced ICSP, see the device programming specification.

6.5 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. During a programming or erase operation, the processor stalls (waits) until the operation is finished. Setting the WR bit (NVMCON[15]) starts the operation and the WR bit is automatically cleared when the operation is finished. In Dual Partition modes, programming or erasing the Inactive Partition does not stall the processor; the code in the Active Partition continues to execute during the programming operation.

For more information on programming the device, please refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Dual Partition Flash Program Memory"** (www.microchip.com/DS70005156).

6.6 Control Registers

There are four SFRs used to read and write the program Flash memory:

- NVMCON
- NVMKEY
- NVMADRL
- NVMADRH

The NVMCON register (Register 6-1) controls which blocks are to be erased, which memory type is to be programmed and when the programming cycle starts.

NVMKEY is a write-only register that is used for write protection. To start a programming or erase sequence, the user must consecutively write 55h and AAh to the NVMKEY register. For more information, refer to **Section 6.5 "Programming Operations"**.

The NVMADRL and NVMADRH registers contain the lower word and upper byte of the destination address of the NVM write or erase operation. Some operations (e.g., chip erase, Inactive Partition erase) operate on fixed locations and do not require an address value.

REGISTER 6-1: NVMCON: FLASH MEMORY CONTROL REGISTER

HC/R/S-0[1]	R/W-0[1]	HSC/R-0[1]	R/W-0	HSC/R/C-0[2]	R-0	U-0	U-0

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown
C = Clearable bit	HC = Hardware Clearable bit		

bit 15 **WR:** Write Control bit[1]
- 1 = Initiates a Flash memory program or erase operation; the operation is self-timed and the bit is cleared by hardware once the operation is complete
- 0 = Program or erase operation is complete and inactive

bit 14 **WREN:** Write Enable bit[1]
- 1 = Enables Flash program/erase operations
- 0 = Inhibits Flash program/erase operations

bit 13 **WRERR:** Write Sequence Error Flag bit[1]
- 1 = An improper program or erase sequence attempt, or termination has occurred (bit is set automatically on any set attempt of the WR bit)
- 0 = The program or erase operation completed normally

bit 12 **NVMSIDL:** NVM Power-Down in Idle Enable bit
- 1 = Removes power from program memory when device enters Idle mode
- 0 = Keeps program memory powered in Standby mode when device enters Idle mode

bit 11 **SFTSWP:** Soft Swap Status bit[2]

In Dual Partition Flash Modes (BTMOD[1:0] = 10 or 0x):
- 1 = Partitions have been successfully swapped using the BOOTSWP instruction
- 0 = Awaiting successful partition swap using the BOOTSWP instruction

In Single Partition Flash Mode (BTMOD[1:0] = 11):
Unimplemented, read as '0'.

bit 10 **P2ACTIV:** Dual Active Partition Status bit

In Dual Partition Flash Modes (BTMOD[1:0] = 10 or 0x):
- 1 = Partition 2 Flash is the Active Partition
- 0 = Partition 1 Flash is the Active Partition

In Single Partition Flash Mode (BTMOD[1:0] = 11):
Unimplemented, read as '0'.

bit 9-4 **Unimplemented:** Read as '0'

Note 1: These bits can only be reset on a Power-on Reset.
2: Clearable in software, as well as on device Resets.
3: All other combinations of NVMOP[3:0] are unimplemented in this device family.
4: Available only in Dual Partition modes (BTMOD[1:0] = 10 or 0x).

REGISTER 6-1: NVMCON: FLASH MEMORY CONTROL REGISTER (CONTINUED)

bit 3-0 **NVMOP[3:0]:** NVM Operation Select bits(1,3)

1110 = Chip erase operation, ERASE = 1 (does not erase Device ID, OTP or Program Executive)
0100 = Erase Inactive Partition, ERASE = 1 (user memory and Configuration Words)(4)
0011 = Memory page erase operation, ERASE = 1 (program or executive memory)
0010 = Memory row program operation, ERASE = 0
0001 = Memory double-word program operation, ERASE = 0

Note 1: These bits can only be reset on a Power-on Reset.
2: Clearable in software, as well as on device Resets.
3: All other combinations of NVMOP[3:0] are unimplemented in this device family.
4: Available only in Dual Partition modes (BTMOD[1:0] = 10 or 0x).

7.0 RESETS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Reset"** (www.microchip.com/DS39712). The information in this data sheet supersedes the information in the FRM.

The Reset module combines all Reset sources and controls the device Master Reset Signal, $\overline{SYSRST}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- $\overline{MCLR}$: Master Clear Pin Reset
- SWR: RESET Instruction
- WDT: Watchdog Timer Reset
- BOR: Brown-out Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Opcode Reset
- UWR: Uninitialized W Register Reset

A simplified block diagram of the Reset module is shown in Figure 7-1.

Any active source of Reset will make the $\overline{SYSRST}$ signal active. Many registers associated with the CPU and peripherals are forced to a known Reset state. Most registers are unaffected by a Reset; their status is unknown on POR and unchanged by all other Resets.

Note: Refer to the specific peripheral or CPU section of this data sheet for register Reset states.

All types of device Reset will set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 7-1). In addition, Reset events occurring while an extreme power-saving feature is in use (such as VBAT) will set one or more status bits in the RCON2 register (Register 7-2). A POR will clear all bits, except for the BOR and POR (RCON[1:0]) bits, which are set. The user may set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software will not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this data sheet.

Note: The status bits in the RCON registers should be cleared after they are read so that the next RCON register values after a device Reset will be meaningful.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **TRAPR:** Trap Reset Flag bit(1)
1 = A Trap Conflict Reset has occurred
0 = A Trap Conflict Reset has not occurred

bit 14 **IOPUWR:** Illegal Opcode or Uninitialized W Access Reset Flag bit(1)
1 = An illegal opcode detection, an illegal address mode or Uninitialized W register is used as an Address Pointer and caused a Reset
0 = An illegal opcode or Uninitialized W Register Reset has not occurred

bit 13 **Unimplemented:** Read as '0'

bit 12 **RETEN:** Retention Mode Enable bit(2)
1 = Retention mode is enabled while device is in Sleep modes (1.2V regulator supplies to the core)
0 = Retention mode is disabled; normal voltage levels are present

bit 11 **Unimplemented:** Read as '0'

bit 10 **DPSLP:** Deep Sleep Flag bit(1)
1 = Device has been in Deep Sleep mode
0 = Device has not been in Deep Sleep mode

bit 9 **CM:** Configuration Word Mismatch Reset Flag bit(1)
1 = A Configuration Word Mismatch Reset has occurred
0 = A Configuration Word Mismatch Reset has not occurred

bit 8 **PMSLP:** Program Memory Power During Sleep bit(3)
1 = Program memory bias voltage remains powered during Sleep
0 = Program memory bias voltage is powered down during Sleep

bit 7 **EXTR:** External Reset ($\overline{MCLR}$) Pin bit(1)
1 = A Master Clear (pin) Reset has occurred
0 = A Master Clear (pin) Reset has not occurred

bit 6 **SWR:** Software Reset (Instruction) Flag bit(1)
1 = A RESET instruction has been executed
0 = A RESET instruction has not been executed

Note 1: All of the Reset status bits may be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

2: If the $\overline{LPCFG}$ Configuration bit is '1' (unprogrammed), the retention regulator is disabled and the RETEN bit has no effect.

3: Re-enabling the regulator after it enters Standby mode will add a delay, TVREG, when waking up from Sleep. Applications that do not use the voltage regulator should set this bit to prevent this delay from occurring.

4: If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

REGISTER 7-1: RCON: RESET CONTROL REGISTER (CONTINUED)

bit 5 **SWDTEN:** Software Enable/Disable of WDT bit(4)
1 = WDT is enabled
0 = WDT is disabled

bit 4 **WDTO:** Watchdog Timer Time-out Flag bit(1)
1 = WDT time-out has occurred
0 = WDT time-out has not occurred

0 = A VDD Power-on Reset has not occurred

bit 1 **VBPOR:** VBPOR Flag bit(1,3)
1 = A VBAT POR has occurred (no battery connected to VBAT pin or VBAT power below Deep Sleep Semaphore register retention level is set by hardware)
0 = A VBAT POR has not occurred

bit 0 **VBAT:** VBAT Flag bit(1)
1 = A POR exit has occurred while power was applied to VBAT pin (set by hardware)
0 = A POR exit from VBAT has not occurred

Note 1: This bit is set in hardware only; it can only be cleared in software.
2: This bit indicates a VDD Power-on Reset. Setting the POR bit (RCON[0]) indicates a VCORE Power-on Reset.
3: This bit is set when the device is originally powered up, even if power is present on VBAT.

TABLE 7-1: RESET FLAG BIT OPERATION

Flag Bit	Setting Event	Clearing Event
TRAPR (RCON[15])	Trap Conflict Event	POR
IOPUWR (RCON[14])	Illegal Opcode or Uninitialized W Register Access	POR
CM (RCON[9])	Configuration Mismatch Reset	POR
EXTR (RCON[7])	$\overline{MCLR}$ Reset	POR
SWR (RCON[6])	RESET Instruction	POR
WDTO (RCON[4])	WDT Time-out	CLRWDT, PWRSAV Instruction, POR
SLEEP (RCON[3])	PWRSAV #0 Instruction	POR
DPSLP (RCON[10])	PWRSAV #0 Instruction while DSEN bit is set	POR
IDLE (RCON[2])	PWRSAV #1 Instruction	POR
BOR (RCON[1])	POR, BOR	—
POR (RCON[0])	POR	—

Note: All Reset flag bits may be set or cleared by the user software.

7.1 Special Function Register Reset States

Most of the Special Function Registers (SFRs) associated with the PIC24F CPU and peripherals are reset to a particular value at a device Reset. The SFRs are grouped by their peripheral or CPU function and their Reset values are specified in each section of this manual.

The Reset value for each SFR does not depend on the type of Reset, with the exception of four registers. The Reset value for the Reset Control register, RCON, will depend on the type of device Reset. The Reset value for the Oscillator Control register, OSCCON, will depend on the type of Reset and the programmed values of the FNOSC[2:0] bits in the Oscillator Select Configuration Word (FOSCSEL) (see Table 7-2). The NVMCON register is only affected by a POR.

7.2 Device Reset Times

The Reset times for various types of device Reset are summarized in Table 7-3. Note that the Master Reset Signal, $\overline{\text{SYSRST}}$, is released after the POR delay time expires.

The time at which the device actually begins to execute code will also depend on the system oscillator delays, which include the Oscillator Start-up Timer (OST) and the PLL lock time. The OST and PLL lock times occur in parallel with the applicable $\overline{\text{SYSRST}}$ delay times.

The Fail-Safe Clock Monitor (FSCM) delay determines the time at which the FSCM begins to monitor the system clock source after the $\overline{\text{SYSRST}}$ signal is released.

7.3 Brown-out Reset (BOR)

PIC24FJ256GA412/GB412 family devices implement a BOR circuit that provides the user with several configuration and power-saving options. The BOR is controlled by the BOREN (FPOR[0]) Configuration bit. When BOR is enabled, any drop of V_{DD} below the BOR trip point results in a device BOR. The BOR trip point, V_{BOR}, is characterized (Parameter DC17B) in **Section 36.1 "DC Characteristics"**.

7.4 Clock Source Selection at Reset

If clock switching is enabled, the system clock source at device Reset is chosen, as shown in Table 7-2. If clock switching is disabled, the system clock source is always selected according to the Oscillator Configuration bits. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Oscillator"** (www.microchip.com/DS39700).

TABLE 7-2: OSCILLATOR SELECTION vs. TYPE OF RESET (CLOCK SWITCHING ENABLED)

Reset Type	Clock Source Determinant
POR	FNOSC[2:0] Configuration bits (FOSCSEL[2:0])
BOR	
$\overline{\text{MCLR}}$	COSC[2:0] Control bits (OSCCON[14:12])
WDTO	
SWR	

TABLE 7-3: RESET DELAY TIMES FOR VARIOUS DEVICE RESETS

Reset Type	Clock Source	$\overline{\text{SYSRST}}$ Delay	System Clock Delay	Notes
POR	EC	TPOR + TSTARTUP + TRST	—	1, 2, 3
	ECPLL	TPOR + TSTARTUP + TRST	TLOCK	1, 2, 3, 5
	XT, HS, SOSC	TPOR + TSTARTUP + TRST	TOST	1, 2, 3, 4
	XTPLL, HSPLL	TPOR + TSTARTUP + TRST	TOST + TLOCK	1, 2, 3, 4, 5
	FRC, FRCDIV	TPOR + TSTARTUP + TRST	TFRC	1, 2, 3, 6, 7
	FRCPLL	TPOR + TSTARTUP + TRST	TFRC + TLOCK	1, 2, 3, 5, 6
	LPRC	TPOR + TSTARTUP + TRST	TLPRC	1, 2, 3, 6
BOR	EC	TSTARTUP + TRST	—	2, 3
	ECPLL	TSTARTUP + TRST	TLOCK	2, 3, 5
	XT, HS, SOSC	TSTARTUP + TRST	TOST	2, 3, 4
	XTPLL, HSPLL	TSTARTUP + TRST	TOST + TLOCK	2, 3, 4, 5
	FRC, FRCDIV	TSTARTUP + TRST	TFRC	2, 3, 6, 7
	FRCPLL	TSTARTUP + TRST	TFRC + TLOCK	2, 3, 5, 6
	LPRC	TSTARTUP + TRST	TLPRC	2, 3, 6
$\overline{\text{MCLR}}$	Any Clock	TRST	—	3
WDT	Any Clock	TRST	—	3
Software	Any clock	TRST	—	3
Illegal Opcode	Any Clock	TRST	—	3
Uninitialized W	Any Clock	TRST	—	3
Trap Conflict	Any Clock	TRST	—	3

Note 1: TPOR = Power-on Reset Delay (10 µs nominal).

2: TSTARTUP = TVREG.

3: TRST = Internal State Reset Time (2 µs nominal).

4: TOST = Oscillator Start-up Timer (OST). A 10-bit counter counts 1024 oscillator periods before releasing the oscillator clock to the system.

5: TLOCK = PLL Lock Time.

6: TFRC and TLPRC = RC Oscillator Start-up Times.

7: If Two-Speed Start-up is enabled, regardless of the Primary Oscillator selected, the device starts with FRC so the system clock delay is just TFRC, and in such cases, FRC start-up time is valid; it switches to the Primary Oscillator after its respective clock delay.

7.4.1 POR AND LONG OSCILLATOR START-UP TIMES

The oscillator start-up circuitry and its associated delay timers are not linked to the device Reset delays that occur at power-up. Some crystal circuits (especially low-frequency crystals) will have a relatively long start-up time. Therefore, one or more of the following conditions is possible after $\overline{\text{SYSRST}}$ is released:

- The oscillator circuit has not begun to oscillate.
- The Oscillator Start-up Timer has not expired (if a crystal oscillator is used).
- The PLL has not achieved a lock (if PLL is used).

The device will not begin to execute code until a valid clock source has been released to the system. Therefore, the oscillator and PLL start-up delays must be considered when the Reset delay time must be known.

7.4.2 FAIL-SAFE CLOCK MONITOR (FSCM) AND DEVICE RESETS

If the FSCM is enabled, it will begin to monitor the system clock source when $\overline{\text{SYSRST}}$ is released. If a valid clock source is not available at this time, the device will automatically switch to the FRC Oscillator and the user can switch to the desired crystal oscillator in the Trap Service Routine (TSR).

8.0 INTERRUPT CONTROLLER

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Interrupts"** (www.microchip.com/DS70000600). The information in this data sheet supersedes the information in the FRM.

The PIC24F interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the PIC24F CPU. It has the following features:

- Up to Eight Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with up to 118 Vectors
- Unique Vector for Each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Alternate Interrupt Vector Table (AIVT) for Debug Support
- Fixed Interrupt Entry and Return Latencies

8.1 Interrupt Vector Table

The Interrupt Vector Table (IVT) is shown in Figure 8-1. The IVT resides in program memory, starting at location, 000004h. The IVT contains 126 vectors, consisting of eight non-maskable trap vectors, plus up to 118 source interrupts. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority; this is linked to their position in the vector table. All other things being equal, lower addresses have a higher natural priority. For example, the interrupt associated with Vector 0 will take priority over interrupts at any other vector address.

PIC24FJ256GA412/GB412 family devices implement non-maskable traps and unique interrupts. These are summarized in Table 8-1 and Table 8-2.

8.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 8-1. The ALTIVT (INTCON2[8]) control bit provides access to the AIVT. If the ALTIVT bit is set, all interrupt and exception processes will use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

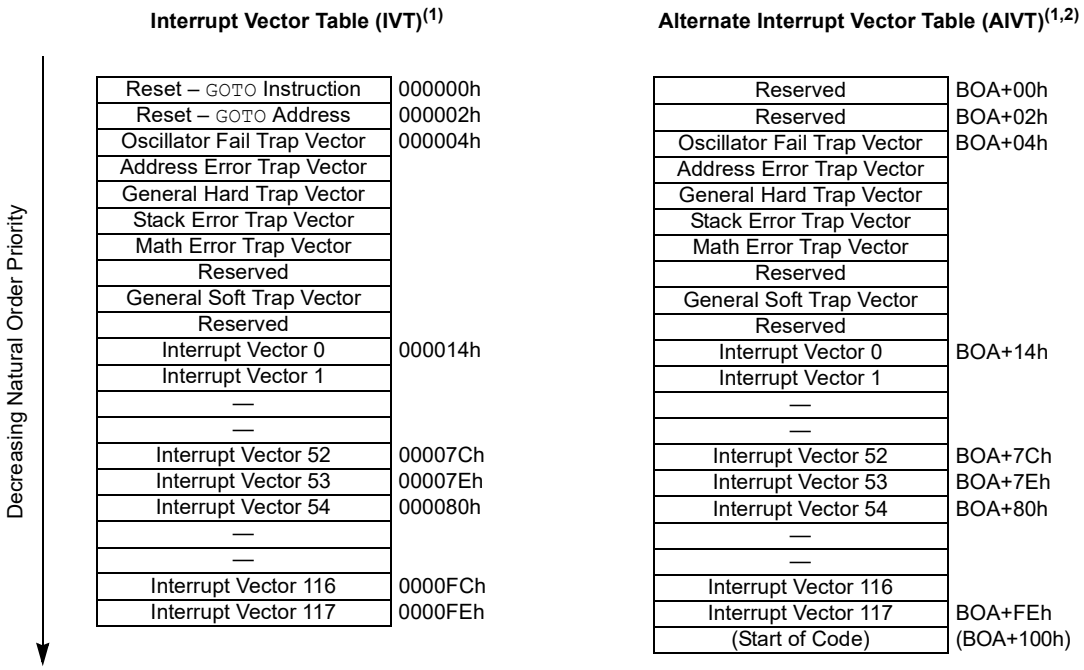
The AIVT supports emulation and debugging efforts by providing a means to switch between an application, and a support environment, without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

8.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The PIC24F devices clear their registers in response to a Reset, which forces the PC to zero. The microcontroller then begins program execution at location, 000000h. The user programs a `GOTO` instruction at the Reset address, which redirects program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a `RESET` instruction.

FIGURE 8-1: PIC24F INTERRUPT VECTOR TABLES



Legend: BOA: Base Offset Address for AIVT, which is the starting address of the last page of the Boot Segment. All addresses are in hexadecimal.

Note 1: See Table 8-2 for the interrupt vector list.

2: AIVT is only available when a Boot Segment is implemented.

TABLE 8-1: TRAP VECTOR DETAILS

Trap Description	MPLAB® XC16 Trap ISR Name	Vector #	IVT or AIVT Address Offset	Trap Bit Location			
				Generic Flag	Source Flag	Enable	Priority

8.3 Interrupt Control and Status Registers

The PIC24FJ256GA412/GB412 family of devices implements a total of 50 registers for the interrupt controller:

- INTCON1
- INTCON2
- INTCON4
- IFS0 through IFS7
- IEC0 through IEC7
- IPC0 through ICP29
- INTTREG

Global interrupt control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit, as well as the control and status flags for the processor trap sources. The INTCON2 register controls global interrupt generation, the external interrupt request signal behavior and the use of the Alternate Interrupt Vector Table (AIVT). INTCON2 and INTCON4 also contain status flags for various hardware trap events.

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or an external signal and is cleared via software.

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number (VECNUM[6:0]) and the Interrupt Priority Level (ILR[3:0]) bit fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the order of their vector numbers, as shown in Table 8-2. For example, the INT0 (External Interrupt 0) is shown as having a vector number and a natural order priority of 0. Thus, the INT0IF status bit is found in IFS0[0], the INT0IE enable bit in IEC0[0] and the INT0IP[2:0] priority bits in the first position of IPC0 (IPC0[2:0]).

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. The ALU STATUS Register (SR) contains the IPL[2:0] bits (SR[7:5]). These indicate the current CPU Interrupt Priority Level. The user can change the current CPU priority level by writing to the IPLx bits.

The CORCON register contains the IPL3 bit, which together with the IPL[2:0] bits, indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

The interrupt controller has the Interrupt Controller Test register, INTTREG, which displays the status of the interrupt controller. When an interrupt request occurs, its associated vector number and the new Interrupt Priority Level are latched into INTTREG. This information can be used to determine a specific interrupt source if a generic ISR is used for multiple vectors (such as when ISR remapping is used in bootloader applications) or to check if another interrupt is pending while in an ISR.

All Interrupt registers are described in Register 8-3 through Register 8-52 in the succeeding pages.

REGISTER 8-1: SR: ALU STATUS REGISTER (IN CPU)

U-0	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0
—	—	—	—	—	—	—	DC(1)
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0
IPL2(2,3)	IPL1(2,3)	IPL0(2,3)	RA(1)	N(1)	OV(1)	Z(1)	C(1)
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-9 **Unimplemented:** Read as '0'

bit 7-5 **IPL[2:0]:** CPU Interrupt Priority Level Status bits(2,3)

111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
110 = CPU Interrupt Priority Level is 6 (14)
101 = CPU Interrupt Priority Level is 5 (13)
100 = CPU Interrupt Priority Level is 4 (12)
011 = CPU Interrupt Priority Level is 3 (11)
010 = CPU Interrupt Priority Level is 2 (10)
001 = CPU Interrupt Priority Level is 1 (9)
000 = CPU Interrupt Priority Level is 0 (8)

Note 1: See Register 3-1 for the description of the remaining bits (bits 8, 4, 3, 2, 1 and 0) that are not dedicated to interrupt control functions.

2: The IPLx bits are concatenated with the IPL3 (CORCON[3]) bit to form the CPU Interrupt Priority Level. The value in parentheses indicates the Interrupt Priority Level if IPL3 = 1.

3: The IPLx Status bits are read-only when NSTDIS (INTCON1[15]) = 1.

REGISTER 8-2: CORCON: CPU CONTROL REGISTER

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0
—	—	—	—	—	—	—	—
bit 15							bit 8

bit 15 **CPUIRQ:** Interrupt Request from Interrupt Controller CPU bit
1 = An interrupt request has occurred but has not yet been Acknowledged by the CPU; this happens when the CPU priority is higher than the interrupt priority
0 = No interrupt request is unacknowledged

bit 14 **Reserved:** Maintain as '0'

bit 13 **VHOLD:** Vector Number Capture Configuration bit
1 = VECNUM[6:0] bits contain the value of the highest priority pending interrupt
0 = VECNUM[6:0] bits contain the value of the last Acknowledged interrupt (i.e., the last interrupt that has occurred with higher priority than the CPU, even if other interrupts are pending)

bit 12 **Unimplemented:** Read as '0'

bit 11-8 **ILR[3:0]:** New CPU Interrupt Priority Level bits
1111 = CPU Interrupt Priority Level is 15
•
•
•
0001 = CPU Interrupt Priority Level is 1
0000 = CPU Interrupt Priority Level is 0

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **VECNUM[6:0]:** Vector Number of Pending Interrupt or Last Acknowledged Interrupt bits
When VHOLD = 1:
Indicates the vector number (from 0 to 118) of the last interrupt to occur.
When VHOLD = 0:
Indicates the vector number (from 0 to 118) of the interrupt request currently being handled.

8.4 Interrupt Setup Procedures

8.4.1 INITIALIZATION

To configure an interrupt source:

1. Set the NSTDIS (INTCON1[15]) control bit if nested interrupts are not desired.
2. Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits, for all enabled interrupt sources, may be programmed to the same non-zero value.

Note: At a device Reset, the IPCx registers are initialized such that all user interrupt sources are assigned to Priority Level 4.

3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

8.4.2 INTERRUPT SERVICE ROUTINE (ISR)

The method that is used to declare an Interrupt Service Routine (ISR) and initialize the IVT with the correct vector address will depend on the programming language (i.e., 'C' or assembler), and the language development toolsuite that is used to develop the application. In general, the user must clear the interrupt flag in the appropriate IFSx register for the source of the interrupt that the ISR handles; otherwise, the ISR will be re-entered immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a `RETFIE` instruction to unstack the saved PC value, SRL value and old CPU priority level.

8.4.3 TRAP SERVICE ROUTINE (TSR)

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

8.4.4 INTERRUPT DISABLE

All user interrupts can be disabled using the following procedure:

1. Push the current SR value onto the software stack using the `PUSH` instruction.
2. Force the CPU to Priority Level 7 by inclusive ORing the value, 0Eh, with SRL.

To enable user interrupts, the `POP` instruction may be used to restore the previous SR value.

Note that only user interrupts with a priority level of 7 or less can be disabled. Trap sources (Levels 8-15) cannot be disabled.

The `DISI` instruction provides a convenient way to disable interrupts of Priority Levels 1-6 for a fixed period of time. Level 7 interrupt sources are not disabled by the `DISI` instruction.

NOTES:

9.0 OSCILLATOR CONFIGURATION

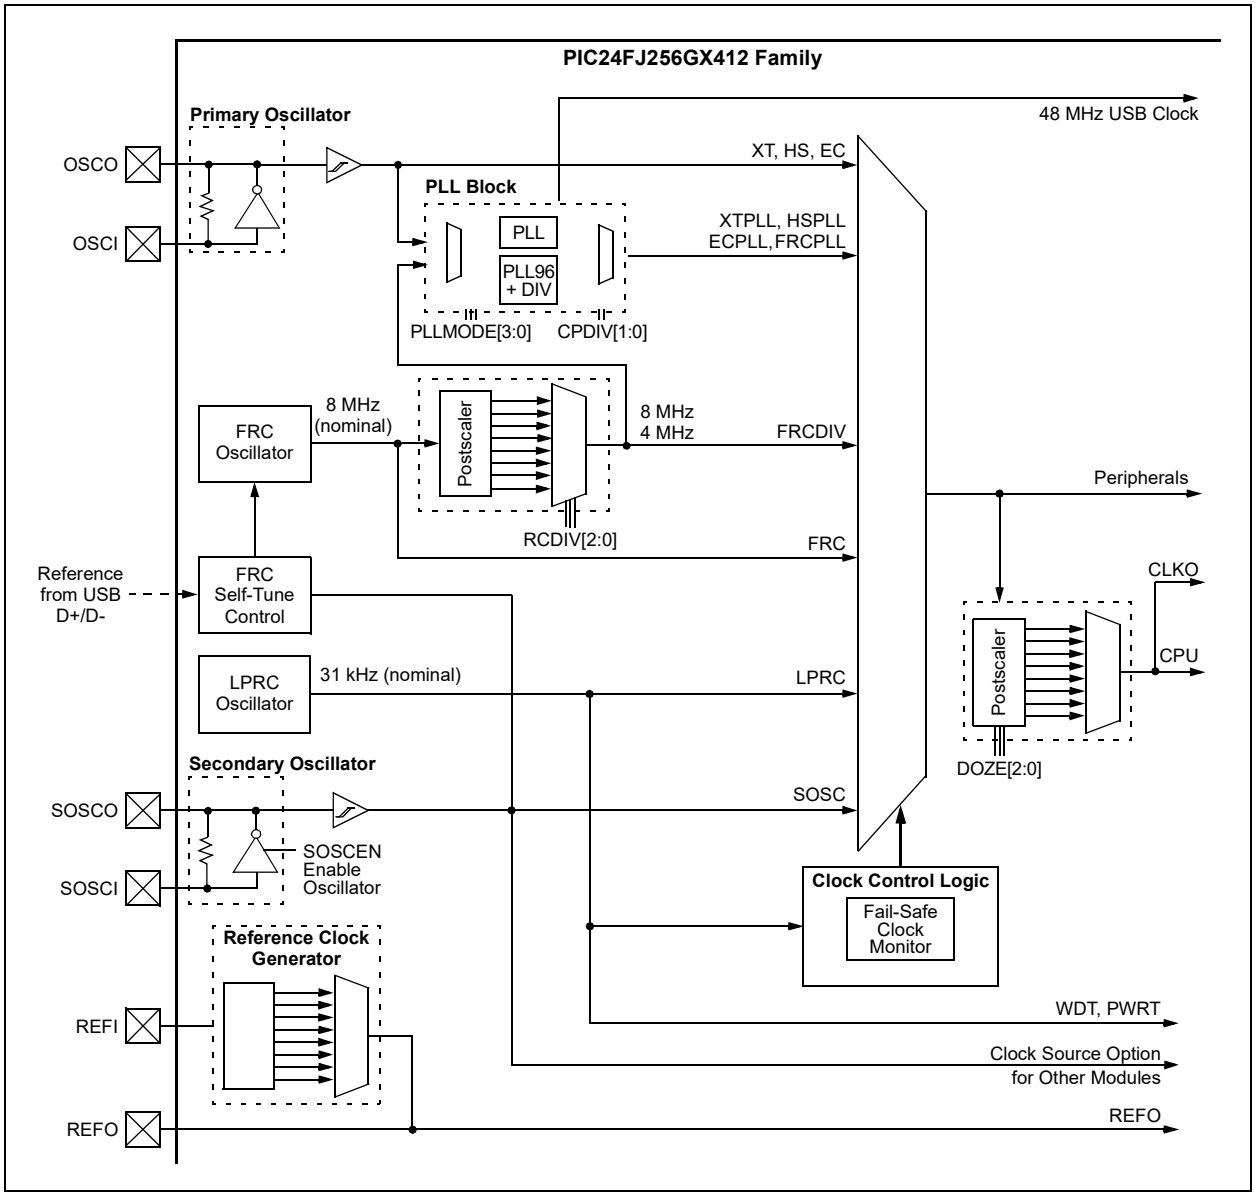
Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Oscillator"** (www.microchip.com/DS39700). The information in this data sheet supersedes the information in the FRM.

The oscillator system for PIC24FJ256GA412/GB412 family devices has the following features:

- A Total of Four External and Internal Oscillator Options as Clock Sources, providing 11 Different Clock Modes
- An On-Chip PLL Block to provide a Wide Range of Precise Frequency Options for the System Clock, plus a Stable 48 MHz Clock for USB Devices
- Software-Controllable Switching between Various Clock Sources
- Software-Controllable Postscaler for Selective Clocking of CPU for System Power Savings
- A Fail-Safe Clock Monitor (FSCM) that Detects Clock Failure and Permits Safe Application Recovery or Shutdown
- A Separate and Independently Configurable Reference Clock for Synchronizing External Hardware

A simplified diagram of the oscillator system is shown in Figure 9-1.

FIGURE 9-1: PIC24FJ256GA412/GB412 FAMILY GENERAL CLOCK DIAGRAM



9.1 CPU Clocking Scheme

The system clock source can be provided by one of four sources:

- Primary Oscillator (POSC) on the OSCI and OSCO pins
- Secondary Oscillator (SOSC) on the SOSCI and SOSCO pins
- Fast Internal RC (FRC) Oscillator
- Low-Power Internal RC (LPRC) Oscillator

The Primary Oscillator and FRC sources have the option of using the internal USB PLL block, which generates both the USB module clock and a separate system clock from the 96 MHZ PLL. Refer to **Section 9.6 "PLL Block"** for additional information.

The internal FRC provides an 8 MHz clock source. It can optionally be reduced by the programmable clock divider to provide a range of system clock frequencies.

The selected clock source generates the processor and peripheral clock sources. The processor clock source is divided by two to produce the internal instruction cycle clock, FCY. In this document, the instruction cycle clock is also denoted by FOSC/2. The internal instruction cycle clock, FOSC/2, can be provided on the OSCO I/O pin for some operating modes of the Primary Oscillator.

9.2 Initial Configuration on POR

The oscillator source (and operating mode) that is used at a device Power-on Reset event is selected using Configuration bit settings. The Oscillator Configuration bit settings are located in the Configuration registers in the program memory (refer to **Section 33.1 "Configuration Bits"** for further details). The Primary Oscillator Configuration bits, POSCMOD[1:0] (FOSC[1:0]), and the Initial Oscillator Select Configuration bits, FNOSC[2:0] (FOSCSEL[2:0]), select the oscillator source that is used at a Power-on Reset. The FRC Primary Oscillator with Postscaler (FRCDIV) is the default (unprogrammed) selection. The Secondary Oscillator (SOSC), or one of the internal oscillators, may be chosen by programming these bit locations.

The Configuration bits allow users to choose between the various clock modes, as shown in Table 9-1.

9.2.1 CLOCK SWITCHING MODE CONFIGURATION BITS

The FCKSM[1:0] Configuration bits (FOSC[7:6]) are used to jointly configure device clock switching and the Fail-Safe Clock Monitor (FSCM). Clock switching is enabled only when FCKSM1 is programmed ('0'). The FSCM is enabled only when FCKSM[1:0] are both programmed ('00').

TABLE 9-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

Oscillator Mode	Oscillator Source	POSCMOD[1:0]	FNOSC[2:0]	Notes
Fast RC Oscillator with Postscaler (FRCDIV)	Internal	11	111	1, 2
(Reserved)	Internal	xx	110	1
Low-Power RC Oscillator (LPRC)	Internal	11	101	1
Secondary (Timer1) Oscillator (SOSC)	Secondary	11	100	1
Primary Oscillator (XT) with PLL Module (XTPLL)	Primary	01	011	
Primary Oscillator (EC) with PLL Module (ECPLL)	Primary	00	011	
Primary Oscillator (HS)	Primary	10	010	
Primary Oscillator (XT)	Primary	01	010	
Primary Oscillator (EC)	Primary	00	010	
Fast RC Oscillator with PLL Module (FRCPLL)	Internal	11	001	1
Fast RC Oscillator (FRC)	Internal	11	000	1

Note 1: OSCO pin function is determined by the OSCIOFCN Configuration bit.

2: This is the default oscillator mode for an unprogrammed (erased) device.

9.3 Control Registers

The operation of the oscillator is controlled by three Special Function Registers:

- OSCCON
- CLKDIV
- OSCTUN

The OSCCON register (Register 9-1) is the main control register for the oscillator. It controls clock source switching and allows the monitoring of clock sources. OSCCON is protected by a write lock to prevent inadvertent clock switches. See **Section 9.4 "Clock Switching Operation"** for more information.

The CLKDIV register (Register 9-2) controls the features associated with Doze mode, as well as the postscaler for the FRC Oscillator.

The OSCTUN register (Register 9-3) allows the user to fine-tune the FRC Oscillator over a range of approximately ±1.5%. It also controls the FRC self-tuning features, described in **Section 9.5 "FRC Active Clock Tuning"**.

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER

CLKLOCK	IOLOCK(2)	LOCK	—	CF	POSCEN	SOSCEN	OSWEN
bit 7							bit 0

Legend:	CO = Clearable Only bit	SO = Settable Only bit	
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **Unimplemented:** Read as '0'

bit 14-12 **COSC[2:0]:** Current Oscillator Selection bits
111 = Fast RC Oscillator with Postscaler (FRCDIV)
110 = Reserved
101 = Low-Power RC Oscillator (LPRC)
100 = Secondary Oscillator (SOSC)
011 = Primary Oscillator with PLL module (XTPLL, HSPLL, ECPLL)
010 = Primary Oscillator (XT, HS, EC)
001 = Fast RC Oscillator with Postscaler and PLL module (FRCPLL)(4)
000 = Fast RC Oscillator (FRC)

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **NOSC[2:0]:** New Oscillator Selection bits(1)
111 = Fast RC Oscillator with Postscaler (FRCDIV)
110 = Reserved
101 = Low-Power RC Oscillator (LPRC)
100 = Secondary Oscillator (SOSC)
011 = Primary Oscillator with PLL module (XTPLL, HSPLL, ECPLL)
010 = Primary Oscillator (XT, HS, EC)
001 = Fast RC Oscillator with Postscaler and PLL module (FRCPLL)(4)
000 = Fast RC Oscillator (FRC)

Note 1: Reset values for these bits are determined by the FNOSCx Configuration bits.

2: The state of the IOLOCK bit can only be changed once an unlocking sequence has been executed. In addition, if the IOL1WAY Configuration bit is '1' once the IOLOCK bit is set, it cannot be cleared.

3: This bit also resets to '0' during any valid clock switch or whenever a non-PLL Clock mode is selected.

4: The default divisor of the postscaler is 2, which will generate a 4 MHz clock to the PLL module.

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER (CONTINUED)

bit 7 **CLKLOCK:** Clock Selection Lock Enable bit
If FSCM is enabled (FCKSM1 = 1):
1 = Clock and PLL selections are locked
0 = Clock and PLL selections are not locked and may be modified by setting the OSWEN bit
If FSCM is disabled (FCKSM1 = 0):
Clock and PLL selections are never locked and may be modified by setting the OSWEN bit.

bit 6 **IOLOCK:** I/O Lock Enable bit(2)
1 = I/O lock is active
0 = I/O lock is not active

bit 5 **LOCK:** PLL Lock Status bit(3)
1 = PLL module is in lock or PLL module start-up timer is satisfied
0 = PLL module is out of lock, PLL start-up timer is running or PLL is disabled

bit 4 **Unimplemented:** Read as '0'

bit 3 **CF:** Clock Fail Detect bit
1 = FSCM has detected a clock failure
0 = No clock failure has been detected

bit 2 **POSCEN:** Primary Oscillator Sleep Enable bit
1 = Primary Oscillator continues to operate during Sleep mode
0 = Primary Oscillator is disabled during Sleep mode

bit 1 **SOSCEN:** 32 kHz Secondary Oscillator (SOSC) Enable bit
1 = Enables Secondary Oscillator
0 = Disables Secondary Oscillator

bit 0 **OSWEN:** Oscillator Switch Enable bit
1 = Initiates an oscillator switch to a clock source specified by the NOSC[2:0] bits
0 = Oscillator switch is complete

Note 1: Reset values for these bits are determined by the FNOSCx Configuration bits.
2: The state of the IOLOCK bit can only be changed once an unlocking sequence has been executed. In addition, if the IOL1WAY Configuration bit is '1' once the IOLOCK bit is set, it cannot be cleared.
3: This bit also resets to '0' during any valid clock switch or whenever a non-PLL Clock mode is selected.
4: The default divisor of the postscaler is 2, which will generate a 4 MHz clock to the PLL module.

bit 15 **STEN:** FRC Self-Tune Enable bit
1 = FRC self-tuning is enabled; TUNx bits are controlled by hardware
0 = FRC self-tuning is disabled; application may optionally control TUNx bits

bit 14 **Unimplemented:** Read as '0'

bit 13 **STSIDL:** FRC Self-Tune Stop in Idle bit
1 = Self-tuning stops during Idle mode
0 = Self-tuning continues during Idle mode

bit 12 **STSRC:** FRC Self-Tune Reference Clock Source bit(1)
1 = FRC is tuned to approximately match the USB host clock tolerance
0 = FRC is tuned to approximately match the 32.768 kHz SOSC tolerance

bit 11 **STLOCK:** FRC Self-Tune Lock Status bit
1 = FRC accuracy is currently within ±0.2% of the STSRC reference accuracy
0 = FRC accuracy may not be within ±0.2% of the STSRC reference accuracy

bit 10 **STLPOL:** FRC Self-Tune Lock Interrupt Polarity bit
1 = A self-tune lock interrupt is generated when STLOCK is '0'
0 = A self-tune lock interrupt is generated when STLOCK is '1'

bit 9 **STOR:** FRC Self-Tune Out of Range Status bit
1 = STSRC reference clock error is beyond the range of TUN[5:0]; no tuning is performed
0 = STSRC reference clock is within the tunable range; tuning is performed

bit 8 **STORPOL:** FRC Self-Tune Out of Range Interrupt Polarity bit
1 = A self-tune out of range interrupt is generated when STOR is '0'
0 = A self-tune out of range interrupt is generated when STOR is '1'

bit 7-6 **Unimplemented:** Read as '0'

bit 5-0 **TUN[5:0]:** FRC Oscillator Tuning bits(2)
011111 = Maximum frequency deviation
011110 =
• • •
000001 =
000000 = Center frequency, oscillator is running at factory calibrated frequency
111111 =
• • •
100001 =
100000 = Minimum frequency deviation

Note 1: Use of either clock tuning reference source has specific application requirements. See **Section 9.5 "FRC Active Clock Tuning"** for details.

2: These bits are read-only when STEN = 1.

9.4 Clock Switching Operation

With few limitations, applications are free to switch between any of the four clock sources (POSC, SOSC, FRC and LPRC) under software control and at any time. To limit the possible side effects that could result from this flexibility, PIC24F devices have a safeguard lock built into the switching process.

Note:	The Primary Oscillator mode has three different submodes (XT, HS and EC) which are determined by the POSCMODx Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch between the different primary submodes without reprogramming the device.

9.4.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSMx Configuration bits in the FOSC Configuration Word must be programmed. (Refer to **Section 33.1 "Configuration Bits"** for further details.) If the bits are unmodified, the clock switching function and Fail-Safe Clock Monitor function are disabled; this is the default setting.

The NOSCx control bits (OSCCON[10:8]) do not control the clock selection when clock switching is disabled. However, the COSC[2:0] bits (OSCCON[14:12]) will reflect the clock source selected by the FNOSCx Configuration bits.

The OSWEN control bit (OSCCON[0]) has no effect when clock switching is disabled; it is held at '0' at all times.

9.4.2 OSCILLATOR SWITCHING SEQUENCE

At a minimum, performing a clock switch requires this basic sequence:

1. If desired, read the COSC[2:0] bits (OSCCON[14:12]) to determine the current oscillator source.
2. Perform the unlock sequence to allow a write to the OSCCON register high byte.
3. Write the appropriate value to the NOSCx bits (OSCCON[10:8]) for the new oscillator source.
4. Perform the unlock sequence to allow a write to the OSCCON register low byte.
5. Set the OSWEN bit to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically as follows:

1. The clock switching hardware compares the COSCx bits with the new value of the NOSCx bits. If they are the same, then the clock switch is a redundant operation. In this case, the OSWEN bit is cleared automatically and the clock switch is aborted.
2. If a valid clock switch has been initiated, the LOCK (OSCCON[5]) and CF (OSCCON[3]) bits are cleared.
3. The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware will wait until the OST expires. If the new source is using the PLL, then the hardware waits until a PLL lock is detected (LOCK = 1).
4. The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
5. The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSCx bits value is transferred to the COSCx bits.
6. The old clock source is turned off at this time, with the exception of LPRC (if WDT or FSCM is enabled) or SOSC (if SOSCEN remains set).

Note 1:	The processor will continue to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.
2:	Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.

A recommended code sequence for a clock switch includes the following:

1. Disable interrupts during the OSCCON register unlock and write sequence.
2. Execute the unlock sequence for the OSCCON high byte by writing 78h and 9Ah to OSCCON[15:8] in two back-to-back instructions.
3. Write the new oscillator source to the NOSCx bits in the instruction immediately following the unlock sequence.
4. Execute the unlock sequence for the OSCCON low byte by writing 46h and 57h to OSCCON[7:0] in two back-to-back instructions.
5. Set the OSWEN bit in the instruction immediately following the unlock sequence.
6. Continue to execute code that is not clock-sensitive (optional).
7. Invoke an appropriate amount of software delay (cycle counting) to allow the selected oscillator and/or PLL to start and stabilize.
8. Check to see if OSWEN is '0'. If it is, the switch was successful. If OSWEN is still set, then check the LOCK bit to determine the cause of the failure.

The core sequence for unlocking the OSCCON register and initiating a clock switch is shown in Example 9-1.

EXAMPLE 9-1: BASIC CODE SEQUENCE FOR CLOCK SWITCHING

```
;Place the new oscillator selection in W0
;OSCCONH (high byte) Unlock Sequence

MOV.b       w2, [w1]
MOV.b       w3, [w1]
;Start oscillator switch operation
BSET        OSCCON,#0
```

9.5 FRC Active Clock Tuning

PIC24FJ256GA412/GB412 family devices include an automatic mechanism to calibrate the FRC during run time. This system uses active clock tuning from a source of known accuracy to maintain the FRC within a very narrow margin of its nominal 8 MHz frequency. This allows for a frequency accuracy that is well within the requirements of the *"USB 2.0 Specification"*, regarding full-speed USB devices.

Note:	The self-tune feature maintains sufficient accuracy for operation in USB Device mode. For applications that function as a USB host, a high-accuracy clock source (±0.05%) is still required.

The self-tune system is controlled by the bits in the upper half of the OSCTUN register. Setting the STEN bit (OSCTUN[15]) enables the self-tuning feature, allowing the hardware to calibrate to a source selected by the STSRC bit (OSCTUN[12]). When STSRC = 1, the system uses the Start-of-Frame (SOF) packets from an external USB host for its source. When STSRC = 0, the system uses the crystal-controlled SOSC for its calibration source. Regardless of the source, the system uses the TUN[5:0] bits (OSCTUN[5:0]) to change the FRC Oscillator's frequency. Frequency monitoring and adjustment is dynamic, occurring continuously during run time. While the system is active, the TUNx bits cannot be written to by software.

Note:	To use the USB as a reference clock tuning source (STSRC = 1), the microcontroller must be configured for USB device operation and connected to a non-suspended USB host or hub port. If the SOSC is to be used as the reference clock tuning source (STSRC = 0), the SOSC must also be enabled for clock tuning to occur.

The self-tune system can generate a hardware interrupt, FSTIF. The interrupt can result from a drift of the FRC from the reference by greater than 0.2%, in either direction, or whenever the frequency deviation is beyond the ability of the TUNx bits to correct (i.e., greater than 1.5%). The STLOCK and STOR status bits (OSCTUN[11,9]) are used to indicate these conditions.

The STLPOL and STORPOL bits (OSCTUN[10,8]) configure the FSTIF interrupt to occur in the presence or the absence of the conditions. It is the user's responsibility to monitor both the STLOCK and STOR bits to determine the exact cause of the interrupt.

Note:	The STLPOL and STORPOL bits should be ignored when the self-tune system is disabled (STEN = 0).

9.6 PLL Block

PIC24FJ256GA412/GB412 family devices include a versatile PLL block as part of the clock generation system. This allows for economical high-speed operation up to FOSCMAX (32 MHz) without the need of an external HS crystal for most applications. It also provides the option to generate a high-precision 48 MHz clock for USB operation, without regard for the system clock frequency. The PLL block is shown in Figure 9-2.

The PLL block has two separate branches:

- A Fixed PLL branch that multiplies the input clock frequency by a factor of 4, 6 or 8. The output frequency is provided as the system clock, as well as an input for the reference clock.
- A 96 MHz PLL that multiplies the input frequency to 96 MHz. The PLL is able to generate a system clock output of 4 MHz, 8 MHz, 16 MHz or 32 MHz. In USB devices, this branch also generates the 48 MHz full-speed USB clock. The 96 MHz output is provided directly as an input for the reference clock.

The PLL block uses either the Primary Oscillator or the FRC as its input source, as selected by the COSC[2:0] or NOSC[2:0] oscillator select bits. For both PLL branches, the minimum input frequency is 4 MHz. For the FRC, the only valid input options are 4 MHz or 8 MHz. The input from the Primary Oscillator can range from up to 48 MHz, in 4 MHz increments.

The fixed PLL multiplier is selected by the PLLMODE[3:0] Configuration bits. As it does not automatically sense the input frequency, the user must select a frequency that will not result in an output frequency greater than 32 MHz.

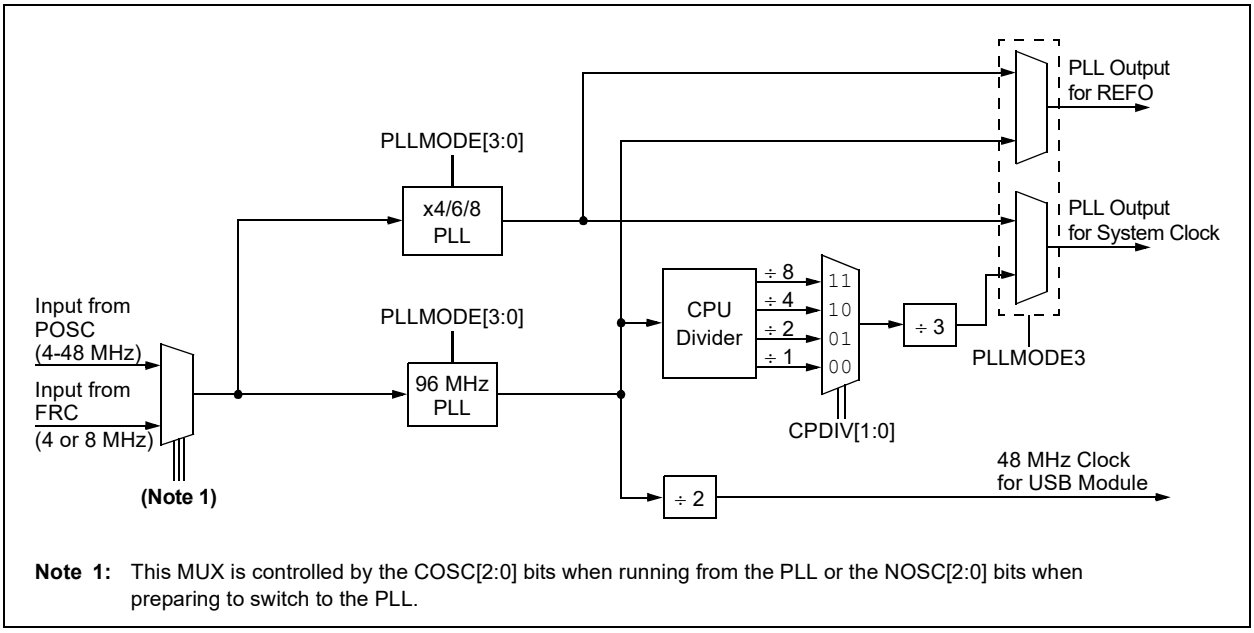
The 96 MHz PLL branch does not automatically sense the incoming oscillator frequency. The user must manually configure the PLL for the input frequency in order to generate the 96 MHz output, using the PLLMODE[3:0] Configuration bits. This limits the choices for input frequencies to a total of eight possibilities, shown in Table 9-2. The CPDIV[1:0] bits independently select the system clock speed; available clock options are listed in Table 9-3.

TABLE 9-2: VALID OSCILLATOR INPUTS FOR 96 MHz PLL

Input Oscillator Frequency	Clock Mode	PLL Multiplier (PLLMODE[3:0])
48 MHz	ECPLL	2 (0111)
32 MHz	HSPLL, ECPLL	3 (0110)
24 MHz	HSPLL, ECPLL	4 (0101)
20 MHz	HSPLL, ECPLL	4.8 (0100)
16 MHz	HSPLL, ECPLL	6 (0011)
12 MHz	HSPLL, ECPLL	8 (0010)
8 MHz	ECPLL, XTPLL, FRCPLL(1)	12 (0001)
4 MHz	ECPLL, XTPLL, FRCPLL(1)	24 (0000)

Note 1: This requires the use of the FRC self-tune feature to maintain required clock accuracy.

FIGURE 9-2: PLL SYSTEM BLOCK



Note 1: This MUX is controlled by the COSC[2:0] bits when running from the PLL or the NOSC[2:0] bits when preparing to switch to the PLL.

TABLE 9-3: SYSTEM CLOCK OPTIONS WITH 96 MHz PLL

MCU Clock Division (CPDIV[1:0])	Microcontroller Clock Frequency
None (00)	32 MHz
÷2 (01)	16 MHz
÷4 (10)(1)	8 MHz
÷8 (11)(1)	4 MHz

Note 1: This is not compatible with USB operation. The USB module must be disabled to use this system clock option.

9.6.1 CONSIDERATIONS FOR USB OPERATION

The 96 MHz PLL branch allows for the generation of a USB clock signal that meets the timing requirements of the USB specification. However, some limitations, including the use of a crystal-controlled clock source during Host operation, must also be met to meet the timing requirements. When using the USB On-The-Go module in PIC24FJ256GB412 family devices, users must always observe these rules in configuring the system clock:

- Only the Crystal Oscillator modes listed in Table 9-2 can be used for USB operation. There is no provision to provide a separate external clock source to the USB module.
- The selected clock source (EC, HS or XT) must meet the USB clock tolerance requirements.
- When the FRCPLL Oscillator mode is used for USB applications, the FRC self-tune system should be used as well. While the FRC is accurate, the only two ways to ensure the level of accuracy required by the *"USB 2.0 Specification",* throughout the application's operating range, are either the self-tune system or manually changing the TUN[5:0] bits.
- The user must always ensure that the FRC source is configured to provide a frequency of 4 MHz or 8 MHz (RCDIV[2:0] = 001 or 000) and that the 96 MHz PLL is configured appropriately.
- All other oscillator modes are available; however, USB operation is not possible when these modes are selected. They may still be useful in cases where other power levels of operation are desirable and the USB module is not needed (e.g., the application is Sleeping and waiting for a bus attachment).

9.7 Secondary Oscillator

9.7.1 BASIC SOSC OPERATION

PIC24FJ256GA412/GB412 family devices do not have to set the SOSCEN bit to use the Secondary Oscillator. Any module requiring the SOSC (such as RTCC, Timer1 or DSWDT) will automatically turn on the SOSC when the clock signal is needed. The SOSC, however, has a long start-up time (as long as one second).To avoid delays for peripheral start-up, the SOSC can be manually started using the SOSCEN bit.

To use the Secondary Oscillator, the SOSCSEL Configuration bit (FOSC[3]) must be set to '1'. Programming the SOSCSEL bit to '0' configures the SOSC pins for Digital mode, enabling digital I/O functionality on the pins.

9.7.2 CRYSTAL SELECTION

The 32.768 kHz crystal used for the SOSC must have the following specifications in order to properly start up and run at the correct frequency:

- 12.5 pF loading capacitance
- 1.0 pF shunt capacitance
- A typical ESR of 50 kΩ; 70 kΩ maximum

In addition, the two external crystal loading capacitors should be in the range of 22-27 pF, which will be based on the PC board layout. The capacitors should be C0G, 5% tolerance and rated 25V or greater.

The accuracy and duty cycle of the SOSC can be measured on the REFO pin and is recommended to be in the range of 40-60% and accurate to ±0.65 Hz.

Note:	Do not enable the LCD Segment pin, SEG17, on RD0 when using the 64-pin package if the SOSC is used for time-sensitive applications. Avoid high-frequency traces adjacent to the SOSCO and SOSCI pins as this can cause errors in the SOSC frequency and/or duty cycle.

9.8 Reference Clock

In addition to the CLKO output (FOSC/2), available in certain oscillator modes, the device clock in the PIC24FJ256GA412/GB412 family devices can also be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock submultiples to drive external devices in the application.

This reference clock output is controlled by the REFOCONL register (Register 9-4). Setting the ROEN bit (REFOCON[15]) makes the clock signal available on the REFO pin. The ROSEL[3:0] bits (REFOCONL[3:0]) determine which clock source is used for the reference clock output.

The REFOCONH and REFOTRIML registers (Register 9-5 and Register 9-6) select the divider from the selected clock input source from a wide range of options. The RODIV[14:0] bits (REFOCONH[14:0]) enable the selection of integer clock divider options, from 1:1 to 1:65,534. The ROTRIM[8:0] bits (REFOTRIML[15:7]) allow the user to add a fractional submultiple of the clock input to the RODIVx value.

The ROSWEN bit (REFOCONL[9]) indicates that the clock divider is currently being switched. In order to change the values of the RODIVx or ROTRIMx bits:

1. Verify that ROSWEN is clear
2. Write the updated values to the ROTRIMx and RODIVx bits.
3. Set the ROSWEN bit, then wait until it is clear before assuming that the REFO clock is valid.

The ROSLP bit (REFOCONL[11]) determines if the reference source is available on REFO when the device is in Sleep mode.To use the reference clock output in Sleep mode, the ROSLP bit must be set and the clock selected by the ROSELx bits must be enabled for operation during Sleep mode, if possible. Clearing the ROSELx bits allows the reference output frequency to change as the system clock changes during any clock switches. The ROOUT bit enables/disables the reference clock output on the REFO pin.

The ROACTIV bit (REFOCONL[8]) indicates that the module is active; it can be cleared by disabling the module (ROEN = 0). The user must not change the reference clock source, or adjust the trim or divider when the ROACTIV bit indicates that the module is active. To avoid glitches, the user should not disable the module until the ROACTIV bit is '1'.

9.8.1 REMAPPABLE OUTPUT

For PIC24FJ256GA412/GB412 family devices, the reference clock output is not available as a dedicated pin function. Instead, it is made available as an optional remappable digital output. If the reference clock output is required for an external consumer, it must be mapped to an available output pin. See **Section 11.5.3.2 "Output Mapping"** for more information.

When REFO is mapped to RP29 (RB15 pin), a reference clock frequency of up to 32 MHz may be used. The drive strength on this pin is also compatible with the fixed REFO pin on previous PIC24F devices. If REFO is mapped to any other output pin, the maximum reference clock frequency is limited to 16 MHz, with a lower drive strength.

NOTES:

10.0 POWER-SAVING FEATURES

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Power-Saving Features with Deep Sleep"** (www.microchip.com/DS39727). The information in this data sheet supersedes the information in the FRM.

The PIC24FJ256GA412/GB412 family of devices provides the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked reduces consumed power.

PIC24FJ256GA412/GB412 family devices manage power consumption with five strategies:

- Instruction-Based Power Reduction Modes
- Hardware-Based Power Reduction Features
- Clock Frequency Control
- Software Controlled Doze Mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption, while still maintaining critical application features, such as timing-sensitive communications.

10.1 Overview of Power-Saving Modes

In addition to full-power operation, otherwise known as Run mode, the PIC24FJ256GA412/GB412 family of devices offers three Instruction-Based Power-Saving modes and one Hardware-Based mode:

- Idle
- Sleep (Sleep and Low-Voltage Sleep)
- Deep Sleep (without retention)
- VBAT (with and without RTCC)

All four modes can be activated by powering down different functional areas of the microcontroller, allowing progressive reductions of operating and Idle power consumption. In addition, three of the modes can be tailored for more power reduction at a trade-off of some operating features. Table 10-1 lists all of the operating modes in order of increasing power savings. Table 10-2 summarizes how the microcontroller exits the different

TABLE 10-1: OPERATING MODES FOR PIC24FJ256GA412/GB412 FAMILY DEVICES

Mode	Entry	Active Systems				
		Core	Peripherals	Data RAM Retention	RTCC(1)	DSGPR0/ DSGPR1 Retention
Run (default)	N/A	Y	Y	Y	Y	Y
Idle	Instruction	N	Y	Y	Y	Y
Sleep:						
Sleep	Instruction	N	S(2)	Y	Y	Y
Low-Voltage Sleep	Instruction + RETEN bit	N	S(2)	Y	Y	Y
Deep Sleep:						
Deep Sleep	Instruction + DSEN bit	N	N	N	Y	Y
VBAT:						
with RTCC	Hardware	N	N	N	Y	Y

Note 1: If RTCC is otherwise enabled in firmware.

2: A select peripheral can operate during this mode from LPRC or some external clock.

TABLE 10-2: EXITING POWER-SAVING MODES

Mode	Exit Conditions								Code Execution Resumes
	Interrupts		Resets			RTCC Alarm	WDT	VDD Restore(2)	
	All	INT0	All	POR	$\overline{MCLR}$				
Idle	Y	Y	Y	Y	Y	Y	Y	N/A	Next instruction
Sleep (all modes)	Y	Y	Y	Y	Y	Y	Y	N/A	
Deep Sleep	N	Y	N	Y	Y	Y	Y(1)	N/A	Reset vector
VBAT	N	N	N	N	N	N	N	Y	Reset vector

Note 1: Deep Sleep WDT.

2: A POR or POR-like Reset results whenever VDD is removed and restored in any mode.

10.1.1 INSTRUCTION-BASED POWER-SAVING MODES

Three of the power-saving modes are entered through the execution of the PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. Deep Sleep mode stops clock operation, code execution and all peripherals, except RTCC and DSWDT. It also freezes I/O states and removes power to Flash memory, and may remove power to SRAM.

The assembly syntax of the PWRSAV instruction is shown in Example 10-1. Sleep and Idle modes are entered directly with a single assembler command. Deep Sleep requires an additional sequence to unlock and enable the entry into Deep Sleep, which is described in **Section 10.4.1 "Entering Deep Sleep Mode"**.

> **Note:** SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to "wake-up".

The features enabled with the low-voltage/retention regulator result in some changes to the way that Sleep and Deep Sleep modes behave. See **Section 10.3 "Sleep Mode"** and **Section 10.4 "Deep Sleep Mode"** for additional information.

10.1.1.1 Interrupts Coincident with Power Save Instructions

Any interrupt that coincides with the execution of a PWRSAV instruction will be held off until entry into Sleep or Idle mode has completed. The device will then wake-up from Sleep or Idle mode.

For Deep Sleep mode, interrupts that coincide with the execution of the PWRSAV instruction may be lost. The microcontroller resets on leaving Deep Sleep and the interrupt will be lost.

Interrupts that occur during the Deep Sleep unlock sequence will prevent Deep Sleep from being enabled. For this reason, it is recommended to disable all interrupts during the Deep Sleep unlock sequence.

EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

```
// Syntax to enter Sleep mode:
PWRSAV     #SLEEP_MODE        ; Put the device into SLEEP mode
//
//Syntax to enter Idle mode:
PWRSAV     #IDLE_MODE         ; Put the device into IDLE mode
//
// Syntax to enter Deep Sleep mode:
// First use the unlock sequence to set the DSEN bit (see Example 10-2)
PWRSAV     #SLEEP_MODE        ; Put the device into Deep SLEEP mode once DSEN is set
```

10.1.2 HARDWARE-BASED POWER-SAVING MODE

The hardware-based VBAT mode does not require any action by the user during code development. Instead, it is a hardware design feature that allows the microcontroller to retain critical data (using the DSGPRx registers) and maintain the RTCC when VDD is removed from the application. This is accomplished by supplying a backup power source to a specific power pin. VBAT mode is described in more detail in **Section 10.5 "VBAT Mode"**.

10.1.3 LOW-VOLTAGE/RETENTION REGULATOR

PIC24FJ256GA412/GB412 family devices incorporate a second on-chip voltage regulator, designed to provide power to select microcontroller features at 1.2V, nominal. This regulator allows features, such as data RAM and the WDT, to be maintained in power-saving modes where they would otherwise be inactive, or maintain them at a lower power than would otherwise be the case.

The low-voltage/retention regulator is only available when Sleep mode is invoked. It is controlled by the LPCFG Configuration bit (FPOR[2]) and in firmware by the RETEN bit (RCON[12]). LPCFG must be programmed (= 0) and the RETEN bit must be set (= 1) for the regulator to be enabled.

10.2 Idle Mode

Idle mode provides these features:

- The CPU will stop executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see **Section 10.8 "Selective Peripheral Module Control"**).
- If the WDT or FSCM is enabled, the LPRC will also remain active.

The device will wake from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle, the clock is reapplied to the CPU and instruction execution begins immediately, starting with the instruction following the PWRSAV instruction or the first instruction in the Interrupt Service Routine (ISR).

10.3 Sleep Mode

Sleep mode includes these features:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption will be reduced to a minimum provided that no I/O pin is sourcing current.
- The I/O pin directions and states are frozen.
- The Fail-Safe Clock Monitor does not operate during Sleep mode since the system clock source is disabled.
- The LPRC clock will continue to run in Sleep mode if the WDT or RTCC, with LPRC as the clock source, is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals may continue to operate in Sleep mode. This includes items, such as the Input Change Notification (ICN) on the I/O ports or peripherals that use an external clock input. Any peripheral that requires the system clock source for its operation will be disabled in Sleep mode.

The device will wake-up from Sleep mode on any of these events:

- On any interrupt source that is individually enabled
- On any form of device Reset
- On a WDT time-out

On wake-up from Sleep, the processor will restart with the same clock source that was active when Sleep mode was entered.

10.3.1 LOW-VOLTAGE/RETENTION SLEEP MODE

Low-Voltage/Retention Sleep mode functions as Sleep mode with the same features and wake-up triggers. The difference is that the low-voltage/retention regulator allows Core Digital Logic Voltage (VCORE) to drop to 1.2V nominal. This permits an incremental reduction of power consumption over what would be required if VCORE was maintained at a 1.8V (minimum) level.

Low-Voltage Sleep mode requires a longer wake-up time than Sleep mode, due to the additional time required to bring VCORE back to 1.8V (known as TREG). In addition, the use of the low-voltage/retention regulator limits the amount of current that can be sourced to any active peripherals, such as the RTCC/LCD, etc.

10.4 Deep Sleep Mode

Deep Sleep mode provides the lowest levels of power consumption available from the Instruction-Based modes.

Deep Sleep modes have these features:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption will be reduced to a minimum.
- The I/O pin directions and states are frozen.
- The Fail-Safe Clock Monitor does not operate during Sleep mode since the system clock source is disabled.
- The LPRC clock will continue to run in Deep Sleep mode if the WDT, or RTCC with LPRC as the clock source, is enabled.
- The dedicated Deep Sleep WDT and BOR systems, if enabled, are used.
- The RTCC and its clock source continue to run, if enabled. All other peripherals are disabled.

Entry into Deep Sleep mode is completely under software control. Exit from the Deep Sleep modes can be triggered from any of the following events:

- POR event
- $\overline{\text{MCLR}}$ event
- RTCC alarm (if the RTCC is present)
- External Interrupt 0
- Deep Sleep Watchdog Timer (DSWDT) time-out

10.4.1 ENTERING DEEP SLEEP MODE

Deep Sleep mode is entered by setting the DSEN bit in the DSCON register using the repeat sequence in Example 10-2, and then executing a Sleep command (`PWRSAV #SLEEP_MODE`). The DSEN bit is automatically cleared when exiting Deep Sleep mode.

Note:	To re-enter Deep Sleep after a Deep Sleep wake-up, allow a delay of at least 3 TCY after clearing the RELEASE bit.

The sequence to enter Deep Sleep mode is:

1. If the application requires the Deep Sleep WDT, enable it and configure its clock source. For more information on Deep Sleep WDT, see **Section 10.4.5 "Deep Sleep WDT"**.
2. If the application requires Deep Sleep BOR, enable it by programming the DSBOREN Configuration bit (FDS[6]).
3. If the application requires wake-up from Deep Sleep on RTCC alarm, enable and configure the RTCC module. For more information on RTCC, see **Section 24.0 "Real-Time Clock and Calendar (RTCC) with Timestamp"**.
4. If needed, save any critical application context data by writing them to the DSGPR0 and DSGPR1 registers (optional).
5. Enable Deep Sleep mode by setting the DSEN bit (DSCON[15]).

Note:	A repeat sequence is required to set the DSEN bit. The repeat sequence (repeating the instruction twice) is required to write to any of the Deep Sleep registers (DSCON, DSWAKE, DSGPR0, DSGPR1). This is required to prevent the user from entering Deep Sleep by mistake. Any write to these registers has to be done twice to actually complete the write (see Example 10-2).

6. Enter Deep Sleep mode by issuing a `PWRSAV #0` instruction.

Any time the DSEN bit is set, all bits in the DSWAKE register will be automatically cleared.

EXAMPLE 10-2: THE REPEAT SEQUENCE

```
Example 1:
MOV   #0x8000, W2   ;enable DS
MOV   W2, DSCON
MOV   W2, DSCON     ;second write required to
                    ;actually write to DSCON

Example 2:
CLR   DSCON
CLR   DSCON
BSET  DSCON, #15
BSET  DSCON, #15
```

10.4.2 EXITING DEEP SLEEP MODES

Deep Sleep modes exit on any one of the following events:

- POR event on V_{DD} supply. If there is no DSBOR circuit to re-arm the V_{DD} supply POR circuit, the external V_{DD} supply must be lowered to the natural arming voltage of the POR circuit.
- DSWDT time-out. When the DSWDT timer times out, the device exits Deep Sleep.
- RTCC alarm (if RTCEN = 1).
- Assertion ('0') of the $\overline{MCLR}$ pin.
- Assertion of the INT0 pin (if the interrupt was enabled before Deep Sleep mode was entered). The polarity configuration is used to determine the assertion level ('0' or '1') of the pin that will cause an exit from Deep Sleep mode. Exiting from Deep Sleep mode requires a change on the INT0 pin while in Deep Sleep mode.

Note: Any interrupt pending when entering Deep Sleep mode is cleared.

Exiting Deep Sleep generally does not retain the state of the device and is equivalent to a Power-on Reset (POR) of the device. Exceptions to this include the RTCC (if present), which remains operational through the wake-up, the DSGPRx registers and DSWDT.

Wake-up events that occur from the time Deep Sleep exits, until the time the POR sequence completes, are not ignored. The DSWAKE register will capture ALL wake-up events, from setting DSEN to clearing RELEASE.

The sequence for exiting Deep Sleep mode is:

1. After a wake-up event, the device exits Deep Sleep and performs a POR. The DSEN bit is cleared automatically. Code execution resumes at the Reset vector.
2. To determine if the device exited Deep Sleep, read the Deep Sleep bit, DPSLP (RCON[10]). This bit will be set if there was an exit from Deep Sleep mode. If the bit is set, clear it.
3. Determine the wake-up source by reading the DSWAKE register.
4. Determine if a DSBOR event occurred during Deep Sleep mode by reading the DSBOR bit (DSCON[1]).
5. If application context data have been saved, read them back from the DSGPR0 and DSGPR1 registers.
6. Clear the RELEASE bit (DSCON[0]).

10.4.3 SAVING CONTEXT DATA WITH THE DSGPRx REGISTERS

As exiting Deep Sleep mode causes a POR, most Special Function Registers reset to their default POR values. In addition, because V_{CORE} power is not supplied in Deep Sleep mode, information in data RAM may be lost when exiting this mode.

Applications which require critical data to be saved prior to Deep Sleep may use the Deep Sleep General Purpose registers, DSGPR0 and DSGPR1, or data EEPROM (if available). Unlike other SFRs, the contents of these registers are preserved while the device is in Deep Sleep mode. After exiting Deep Sleep, software can restore the data by reading the registers and clearing the RELEASE bit (DSCON[0]).

10.4.4 I/O PINS IN DEEP SLEEP MODES

During Deep Sleep, the general purpose I/O pins retain their previous states and the Secondary Oscillator (SOSC) will remain running, if enabled. Pins that are configured as inputs (TRISx bit is set), prior to entry into Deep Sleep, remain high-impedance during Deep Sleep. Pins that are configured as outputs (TRISx bit is clear), prior to entry into Deep Sleep, remain as output pins during Deep Sleep. While in this mode, they continue to drive the output level determined by their corresponding LATx bit at the time of entry into Deep Sleep.

Once the device wakes back up, all I/O pins continue to maintain their previous states, even after the device has finished the POR sequence and is executing application code again. Pins configured as inputs during Deep Sleep remain high-impedance and pins configured as outputs continue to drive their previous value. After waking up, the TRISx and LATx registers, and the SOSCEN bit (OSCCON[1]), are reset. If firmware modifies any of these bits or registers, the I/O will not immediately go to the newly configured states. Once the firmware clears the RELEASE bit (DSCON[0]), the I/O pins are “released”. This causes the I/O pins to take the states configured by their respective TRISx and LATx bit values.

This means that keeping the SOSC running after waking up requires the SOSCEN bit to be set before clearing RELEASE.

If the Deep Sleep BOR (DSBOR) is enabled, and a DSBOR or a true POR event occurs during Deep Sleep, the I/O pins will be immediately released, similar to clearing the RELEASE bit. All previous state information will be lost, including the general purpose DSGPR0 and DSGPR1 contents.

If a $\overline{\text{MCLR}}$ Reset event occurs during Deep Sleep, the DSGPRx, DSCON and DSWAKE registers will remain valid, and the RELEASE bit will remain set. The state of the SOSC will also be retained. The I/O pins, however, will be reset to their $\overline{\text{MCLR}}$ Reset state. Since RELEASE is still set, changes to the SOSCEN bit (OSCCON[1]) cannot take effect until the RELEASE bit is cleared.

In all other Deep Sleep wake-up cases, application firmware must clear the RELEASE bit in order to reconfigure the I/O pins.

10.4.5 DEEP SLEEP WDT

To enable the DSWDT in Deep Sleep mode, program the Configuration bit, DSWDTEN (FDS[7]). The device WDT need not be enabled for the DSWDT to function. Entry into Deep Sleep modes automatically resets the DSWDT.

The DSWDT clock source is selected by the DSWDTOSC Configuration bit (FDS[5]). The postscaler options are programmed by the DSWDTPS[4:0] Configuration bits (FDS[4:0]). The minimum time-out period that can be achieved is 1 ms and the maximum is 25.7 days. For more details on DSWDT configuration options, refer to **Section 33.0 “Special Features”**.

10.4.5.1 Switching Clocks in Deep Sleep Mode

Both the RTCC and the DSWDT may run from either SOSC or the LPRC clock source. This allows both the RTCC and DSWDT to run without requiring both the LPRC and SOSC to be enabled together, reducing power consumption.

Running the RTCC from LPRC will result in a loss of accuracy in the RTCC, of approximately 5 to 10%. If a more accurate RTCC is required, it must be run from the SOSC clock source. The RTCC clock source is selected with the CLKSEL[1:0] bits (RTCCON2L[1:0]).

Under certain circumstances, it is possible for the DSWDT clock source to be off when entering Deep Sleep mode. In this case, the clock source is turned on automatically (if DSWDT is enabled) without the need for software intervention. However, this can cause a delay in the start of the DSWDT counters. In order to avoid this delay when using SOSC as a clock source, the application can activate SOSC prior to entering Deep Sleep mode.

10.4.6 CHECKING AND CLEARING THE STATUS OF DEEP SLEEP

Upon entry into Deep Sleep mode, the status bit, DPSLP (RCON[10]), becomes set and must be cleared by the software.

On power-up, the software should read this status bit to determine if the Reset was due to an exit from Deep Sleep mode and clear the bit if it is set. Of the four possible combinations of DPSLP and POR bit states, three cases can be considered:

- Both the DPSLP and POR bits are cleared. In this case, the Reset was due to some event other than a Deep Sleep mode exit.
- The DPSLP bit is clear, but the POR bit is set; this is a normal POR.
- Both the DPSLP and POR bits are set. This means that Deep Sleep mode was entered, the device was powered down and Deep Sleep mode was exited.

10.4.7 POWER-ON RESETS (PORs)

V_{DD} voltage is monitored to produce PORs. Since exiting from Deep Sleep mode functionally looks like a POR, the technique described in **Section 10.4.6 “Checking and Clearing the Status of Deep Sleep”** should be used to distinguish between Deep Sleep and a true POR event. When a true POR occurs, the entire device, including all Deep Sleep logic (Deep Sleep registers, RTCC, DSWDT, etc.), is reset.

10.5 VBAT Mode

This mode represents the lowest power state that the microcontroller can achieve and still resume operation. VBAT mode is automatically triggered when the microcontroller's main power supply on VDD fails. When this happens, the microcontroller's on-chip power switch connects to a backup power source, such as a battery, supplied to the VBAT pin. This maintains a few key systems at an extremely low-power draw until VDD is restored.

The power supplied on VBAT only runs two systems: the RTCC and the Deep Sleep Semaphore registers (DSGPR0 and DSGPR1). To maintain these systems during a sudden loss of VDD, it is essential to connect a power source, other than VDD or AVDD, to the VBAT pin.

When the RTCC is enabled, it continues to operate with the same clock source (SOSC or LPRC) that was selected prior to entering VBAT mode. There is no provision to switch to a lower power clock source after the mode switch.

Since the loss of VDD is usually an unforeseen event, it is recommended that the contents of the Deep Sleep Semaphore registers be loaded with the data to be retained at an early point in code execution.

10.5.1 WAKE-UP FROM VBAT MODES

When VDD is restored to a device in VBAT mode, it automatically wakes. Wake-up occurs with a POR, after which, the device starts executing code from the Reset vector. All SFRs, except the Deep Sleep Semaphore registers, are reset to their POR values. Wake-up timing is similar to that for a normal POR.

To differentiate a wake-up from VBAT mode from other POR states, check the VBAT status bit (RCON2[0]). If this bit is set while the device is starting to execute the code from the Reset vector, it indicates that there has been an exit from VBAT mode. The application must clear the VBAT bit to ensure that future VBAT wake-up events are captured.

If a POR occurs without a power source connected to the VBAT pin, the VBPOR bit (RCON2[1]) is set. If this bit is set on a POR, it indicates that a battery needs to be connected to the VBAT pin.

In addition, if the VBAT power source falls below the level needed for Deep Sleep semaphore operation while in VBAT mode (e.g., the battery has been drained), the VBPOR bit will be set. VBPOR is also set when the microcontroller is powered up the very first time, even if power is supplied to VBAT.

10.5.2 I/O PINS DURING VBAT MODES

All I/O pins switch to Input mode during VBAT mode. The only exceptions are the SOSCI and SOSCO pins, which maintain their states if the Secondary Oscillator is being used as the RTCC clock source. It is the user's responsibility to restore the I/O pins to their proper states, using the TRISx and LATx bits, once VDD has been restored.

10.5.3 SAVING CONTEXT DATA WITH THE DSGPRx REGISTERS

As with Deep Sleep mode (i.e., without the low-voltage/retention regulator), all SFRs are reset to their POR values after VDD has been restored. Only the Deep Sleep Semaphore registers are preserved. Applications which require critical data to be saved should save it in DSGPR0 and DSGPR1.

Note:	If the VBAT mode is not used, it is recommended to connect the VBAT pin to VDD.

The POR should be enabled for the reliable operation of the VBAT.

- 0 = A VBAT POR has not occurred

bit 0 **VBAT:** VBAT Flag bit(1)
- 1 = A POR exit has occurred while power was applied to the VBAT pin (set by hardware)
- 0 = A POR exit from VBAT has not occurred

Note 1: This bit is set in hardware only; it can only be cleared in software.

2: This indicates a VDD POR. Setting the POR bit (RCON[0]) indicates a VCORE POR.

3: This bit is set when the device is originally powered up, even if power is present on VBAT.

10.6 Clock Frequency and Clock Switching

In Run and Idle modes, all PIC24FJ devices allow for a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits. The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 9.0 "Oscillator Configuration"**.

10.7 Doze Mode

Generally, changing clock speed and invoking one of the power-saving modes are the preferred strategies for reducing power consumption. There may be circumstances, however, where this is not practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed may introduce communication errors, while using a power-saving mode may stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV[11]). The ratio between peripheral and core clock speed is determined by the DOZE[2:0] bits (CLKDIV[14:12]). There are eight possible configurations, from 1:1 to 1:128, with 1:8 being the default.

It is also possible to use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU Idles, waiting for something to invoke an interrupt routine. Enabling the automatic return to full-speed CPU operation on interrupts is enabled by setting the ROI bit (CLKDIV[15]). By default, interrupt events have no effect on Doze mode operation.

10.8 Selective Peripheral Module Control

Idle and Doze modes allow users to substantially reduce power consumption by slowing or stopping the CPU clock. Even so, peripheral modules still remain clocked, and thus, consume power. There may be cases where the application needs what these modes do not provide: the allocation of power resources to the CPU processing with minimal power consumption from the peripherals.

PIC24F devices address this requirement by allowing peripheral modules to be selectively disabled, reducing or eliminating their power consumption. This can be done with two control bits:

- The Peripheral Enable bit, generically named, "XXXEN", located in the module's main control SFR.
- The Peripheral Module Disable (PMD) bit, located in one of the PMDx registers (Register 10-4 through Register 10-11).

Both bits have similar functions in enabling or disabling its associated module. Setting the PMDx bit for a module disables all clock sources to that module, reducing its power consumption to an absolute minimum. In this state, the control and status registers associated with the peripheral will also be disabled, so writes to those registers will have no effect and read values will be invalid. Many peripheral modules have a corresponding PMDx bit.

In contrast, disabling a module by clearing its XXXEN bit disables its functionality, but leaves its registers available to be read and written to. Power consumption is reduced, but not by as much as when the PMDx bits are used. Most peripheral modules have an enable bit; exceptions include capture, compare and RTCC.

To achieve more selective power savings, peripheral modules can also be selectively disabled when the device enters Idle mode. This is done through the control bit of the generic name format, "XXXIDL". By default, all modules that can operate during Idle mode will do so. Using the disable on Idle feature disables the module while in Idle mode, allowing further reduction of power consumption during Idle mode, enhancing power savings for extremely critical power applications.

11.0 I/O PORTS

Note:	This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"I/O Ports with Interrupt-on-Change (IOC)"** (www.microchip.com/DS70005186). The information in this data sheet supersedes the information in the FRM.

All of the device pins (except VDD, VSS, MCLR and OSCI/CLKI) are shared between the peripherals and the Parallel I/O ports. All I/O input ports feature Schmitt Trigger (ST) inputs for improved noise immunity.

11.1 Parallel I/O (PIO) Ports

A Parallel I/O port that shares a pin with a peripheral is, in general, subservient to the peripheral. The peripheral's output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents "loop through", in which a port's digital output can drive the input of a peripheral that shares the same pin. Figure 11-1 shows how ports are shared with other peripherals and the associated I/O pin to which they are connected.

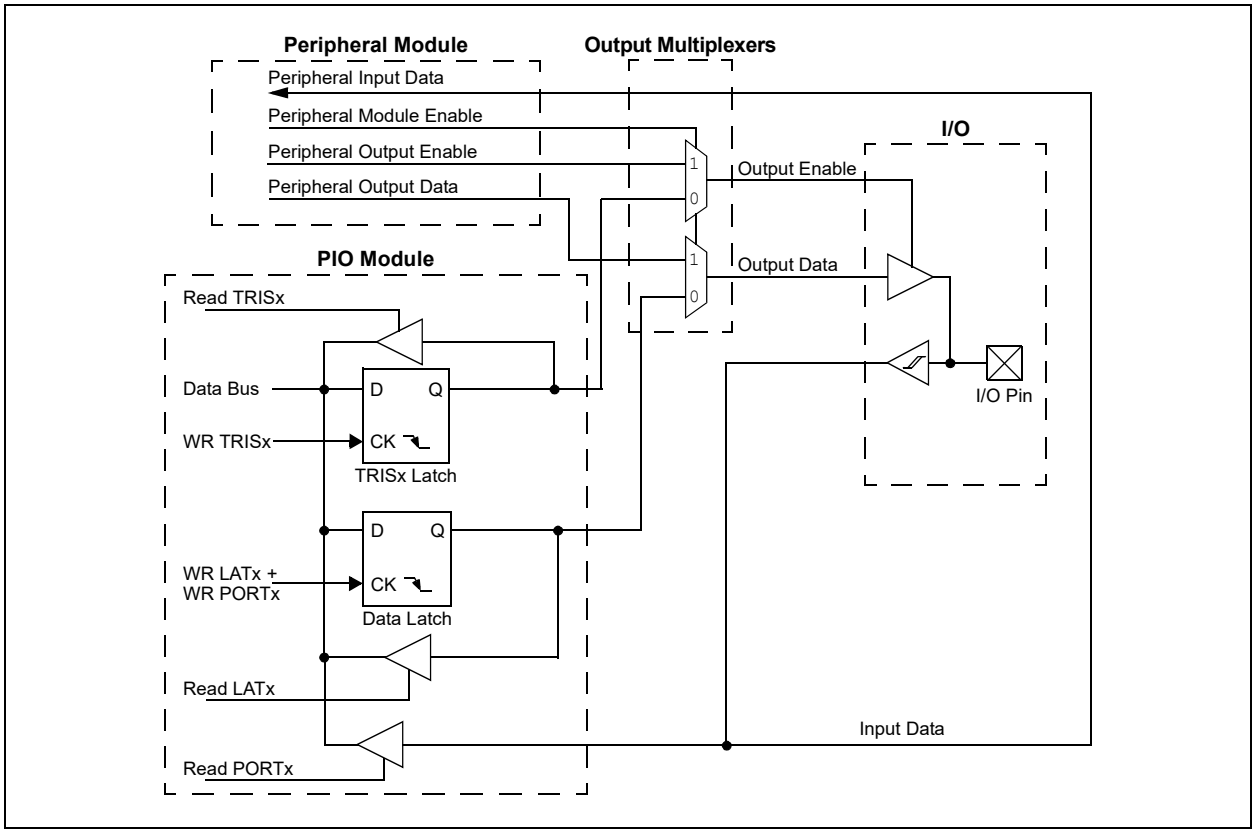
When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin may be read, but the output driver for the parallel port bit will be disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin may be driven by a port.

All port pins have three registers directly associated with their operation as digital I/Os and one register associated with their operation as analog inputs. The Data Direction register (TRIS) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the Output Latch register (LAT), read the latch; writes to the latch, write the latch. Reads from the PORT register, read the port pins; writes to the port pins, write the latch.

Any bit and its associated data and control registers that are not valid for a particular device will be disabled. That means the corresponding LAT and TRIS registers, and the port pin, will read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is regarded as a dedicated port because there is no other competing source of inputs.

FIGURE 11-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE



11.1.1 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a NOP.

11.1.2 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx and TRISx registers for data control, each port pin can also be individually configured for either a digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired digital only pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

11.2 Configuring Analog Port Pins (ANSx)

The ANSx and TRISx registers control the operation of the pins with analog function. Each port pin with analog function is associated with one of the ANSx bits, which decides if the pin function should be analog or digital. Refer to Table 11-1 for detailed behavior of the pin for different ANSx and TRISx bit settings.

When reading the PORTx register, all pins configured as analog input channels will read as cleared (a low level).

11.2.1 ANALOG INPUT PINS AND VOLTAGE CONSIDERATIONS

The voltage tolerance of pins used as device inputs is dependent on the pin's input function. Most input pins are able to handle DC voltages of up to 5.5V, a level typical for digital logic circuits. However, several pins can only tolerate voltages up to VDD. Voltage excursions beyond VDD on these pins should always be avoided.

Information on voltage tolerance is provided in the pinout diagrams in the beginning of this data sheet. For more information, refer to **Section 36.0 "Electrical Characteristics"** for more details.

TABLE 11-1: CONFIGURING ANALOG/DIGITAL FUNCTION OF AN I/O PIN

Pin Function	ANSx Setting	TRISx Setting	Comments
Analog Input	1	1	It is recommended to keep ANSx = 1.
Analog Output	1	1	It is recommended to keep ANSx = 1.
Digital Input	0	1	Firmware must wait at least one instruction cycle after configuring a pin as a digital input before a valid input value can be read.
Digital Output	0	0	Make sure to disable the analog output function on the pin if any is present.

Note 1: Port register maps show full pin count devices. Please refer to Table 1-4 and Table 1-5 for pin count-specific port I/O implementation.

11.4 Interrupt-on-Change (IOC)

The interrupt-on-change function of the I/O ports allows the PIC24FJ256GA412/GB412 family of devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on any of the input port pins. This feature is capable of detecting input Change-of-States, even in Sleep mode when the clocks are disabled.

Interrupt-on-change functionality is globally enabled by setting the IOCON bit in the PADCON register (Register 11-1). Functionality is then enabled for a particular pin by setting the IOCPx and/or IOCNx register bit for that pin. Setting a value of '1' in the IOCPx register enables interrupts for low-to-high transitions, while setting a value of '1' in the IOCNx register enables interrupts for high-to-low transitions. Setting a value of '1' in both register bits will enable interrupts for either case (e.g., a pulse on the pin will generate two interrupts).

When an interrupt request is generated for a pin, the corresponding status flag bit in the IOCFx register will be set, indicating that a Change-of-State occurred on that pin. The IOCFx register bit will remain set until cleared by writing a zero to it. When any IOCFx flag bit in a given port is set, the corresponding IOCPxF bit in the IOCSTAT register (Register 11-2) will also be set. This flag indicates that a change was detected on one of the bits on the given port. The IOCPxF flag will be cleared when all IOCFx[15:0] bits are cleared.

Multiple individual status flags can be cleared by writing a zero to one or more bits using a Read-Modify-Write operation. If another edge is detected on a pin whose status bit is being cleared during the Read-Modify-Write sequence, the associated change flag will still be set at the end of the Read-Modify-Write sequence.

The user should use the instruction sequence (or equivalent) shown in Example 11-1 to clear the Interrupt-on-Change Status registers.

At the end of this sequence, the W0 register will contain a zero for each bit for which the port pin had a change detected. In this way, any indication of a pin changing will not be lost.

Due to the asynchronous and real-time nature of the interrupt-on-change, the value read on the port pins may not indicate the state of the port when the change was detected, as a second change can occur during the interval between clearing the flag and reading the port. It is up to the user code to handle this case if it is a possibility in their application. To keep this interval to a minimum, it is recommended that any code modifying the IOCFx registers be run either in the interrupt handler or with interrupts disabled.

11.4.1 PULL-UPS AND PULL-DOWNS

Each IOC pin has both a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source connected to the pin, while the pull-downs act as a current sink connected to the pin. These eliminate the need for external resistors when push button or keypad devices are connected.

The pull-ups and pull-downs are separately enabled using the IOCPUx registers (for pull-ups) and the IOCPDx registers (for pull-downs). Each IOC pin has individual control bits for its pull-up and pull-down. Setting a control bit enables the weak pull-up or pull-down for the corresponding pin.

Note:	Pull-ups and pull-downs on pins should always be disabled whenever the pin is configured as a digital output.

EXAMPLE 11-1: IOC STATUS READ/CLEAR IN ASSEMBLY

```
MOV   0xFFFF, W0   ; Initial mask value 0xFFFF -] W0
XOR   IOCFx, W0    ; W0 has '1' for each bit set in IOCFx
AND   IOCFx        ; IOCFx & W0 -]IOCFx
```

EXAMPLE 11-2: PORT READ/WRITE IN ASSEMBLY

```
MOV   0xFF00, W0   ; Configure PORTB[15:8] as inputs
MOV   W0, TRISB    ; and PORTB[7:0] as outputs
NOP                ; Delay 1 cycle
BTSS  PORTB, #13   ; Next Instruction
```

EXAMPLE 11-3: PORT READ/WRITE IN 'C'

```
TRISB = 0xFF00;              // Configure PORTB[15:8] as inputs and PORTB[7:0] as outputs
Nop();                       // Delay 1 cycle
If (PORTBbits.RB13){ };      // Next Instruction
```

Note 1: These ports are not available on 64-pin or 100-pin devices.
2: This port is not available on 64-pin devices.

11.5 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. In an application that needs to use more than one peripheral multiplexed on a single pin, inconvenient work arounds in application code, or a complete redesign, may be the only option.

The Peripheral Pin Select (PPS) feature provides an alternative to these choices by enabling the user's peripheral set selection and its placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the microcontroller to their entire application, rather than trimming the application to fit the device.

The Peripheral Pin Select feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of any one of many digital peripherals to any one of these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

11.5.1 AVAILABLE PINS

The PPS feature is used with a range of up to 44 pins, depending on the particular device and its pin count. Pins that support the Peripheral Pin Select feature include the designation, "RPn" or "RPIn", in their full pin designation, where "n" is the remappable pin number. "RP" is used to designate pins that support both remappable input and output functions, while "RPI" indicates pins that support remappable input functions only.

PIC24FJ256GA412/GB412 family devices support a larger number of remappable input only pins than remappable input/output pins. In this device family, there are up to 32 remappable input/output pins, depending on the pin count of the particular device selected. These pins are numbered: RP0 through RP31. See Table 1-4 and Table 1-5 for a summary of pinout options in each package offering.

11.5.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer related peripherals (input capture and output compare) and external interrupt inputs. Also included are the outputs of the comparator module, since these are discrete digital signals.

PPS is not available for analog peripherals or these digital peripherals:

- I^2C (input and output)
- RTCC Alarm and Power Gate Outputs
- EPMP Signals (input and output)
- INT0

A key difference between pin select and non-pin select peripherals is that pin select peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-pin select peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

11.5.2.1 Peripheral Pin Select Function Priority

Pin-selectable peripheral outputs (e.g., output compare, UART transmit) will take priority over general purpose digital functions on a pin, such as EPMP and port I/O. Specialized digital outputs will take priority over PPS outputs on the same pin. The pin diagrams list peripheral outputs in the order of priority. Refer to them for priority concerns on a particular pin.

Unlike PIC24F devices with fixed peripherals, pin-selectable peripheral inputs will never take ownership of a pin. The pin's output buffer will be controlled by the TRISx setting or by a fixed peripheral on the pin. If the pin is configured in Digital mode, then the PPS input will operate correctly. If an analog function is enabled on the pin, the PPS input will be disabled.

11.5.3 CONTROLLING PERIPHERAL PIN SELECT

PPS features are controlled through two sets of Special Function Registers (SFRs): one to map peripheral inputs and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on if an input or an output is being mapped.

11.5.3.1 Input Mapping

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral; that is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPINRx registers (Register 11-3 through Register 11-22) are used to configure peripheral input mapping. Each register contains two sets of 6-bit fields, with each set associated with one of the pin-selectable peripherals. Programming a given peripheral's bit field with an appropriate 6-bit value maps the RPn/RPIn pin with that value to that peripheral.

Table 11-11 summarizes the remappable inputs available with Peripheral Pin Select. For any given device, the valid range of values for any of the bit fields corresponds to the maximum number of Peripheral Pin Selections supported by the device.

Note:	Unless otherwise noted, all remappable inputs utilize Schmitt Trigger buffers.

TABLE 11-11: SELECTABLE INPUT SOURCES (MAPS INPUT TO FUNCTION)

Input Name	Function Name	Register	Function Mapping Bits
CCP Clock Input A	TCKIA	RPINR12[5:0]	TCKIAR[5:0]
CCP Clock Input B	TCKIB	RPINR12[13:8]	TCKIBR[5:0]
CLC Input A	CLCINA	RPINR25[5:0]	CLCINAR[5:0]
CLC Input B	CLCINB	RPINR25[13:8]	CLCINBR[5:0]
External Interrupt 1	INT1	RPINR0[13:8]	INT1R[5:0]
External Interrupt 2	INT2	RPINR1[5:0]	INT2R[5:0]
External Interrupt 3	INT3	RPINR1[13:8]	INT3R[5:0]
External Interrupt 4	INT4	RPINR2[5:0]	INT4R[5:0]
Generic Timer External input	TMRCK	RPINR23[13:8]	TXCKR[5:0]
Input Capture 1	IC1	RPINR7[5:0]	IC1R[5:0]
Input Capture 2	IC2	RPINR7[13:8]	IC2R[5:0]
Input Capture 3	IC3	RPINR8[5:0]	IC3R[5:0]
Output Compare Fault A	OCFA	RPINR11[5:0]	OCFAR[5:0]
Output Compare Fault B	OCFB	RPINR11[13:8]	OCFBR[5:0]
Output Compare Trigger 1	OCTRIG1	RPINR0[5:0]	OCTRIG1R[5:0]
Output Compare Trigger 1	OCTRIG2	RPINR2[13:8]	OCTRIG2R[5:0]
SPI1 Clock Input	SCK1IN	RPINR20[13:8]	SCK1R[5:0]
SPI1 Data Input	SDI1	RPINR20[5:0]	SDI1R[5:0]
SPI1 Slave Select	SS1IN	RPINR21[5:0]	SS1R[5:0]
SPI2 Clock Input	SCK2IN	RPINR22[13:8]	SCK2R[5:0]
SPI2 Data Input	SDI2	RPINR22[5:0]	SDI2R[5:0]
SPI2 Slave Select	SS2IN	RPINR23[5:0]	SS2R[5:0]
SPI3 Clock Input	SCK3IN	RPINR28[13:8]	SCK3R[5:0]
SPI3 Data Input	SDI3	RPINR28[5:0]	SDI3R[5:0]
SPI3 Slave Select	SS3IN	RPINR29[5:0]	SS3R[5:0]
Timer2 External Clock	T2CK	RPINR3[5:0]	T2CKR[5:0]
Timer3 External Clock	T3CK	RPINR3[13:8]	T3CKR[5:0]
Timer4 External Clock	T4CK	RPINR4[5:0]	T4CKR[5:0]
Timer5 External Clock	T5CK	RPINR4[13:8]	T5CKR[5:0]
UART1 Clear-to-Send	$\overline{\text{U1CTS}}$	RPINR18[13:8]	U1CTSR[5:0]
UART1 Receive	U1RX	RPINR18[5:0]	U1RXR[5:0]
UART2 Clear-to-Send	$\overline{\text{U2CTS}}$	RPINR19[13:8]	U2CTSR[5:0]
UART2 Receive	U2RX	RPINR19[5:0]	U2RXR[5:0]
UART3 Clear-to-Send	$\overline{\text{U3CTS}}$	RPINR21[13:8]	U3CTSR[5:0]
UART3 Receive	U3RX	RPINR17[13:8]	U3RXR[5:0]
UART4 Clear-to-Send	$\overline{\text{U4CTS}}$	RPINR27[13:8]	U4CTSR[5:0]
UART4 Receive	U4RX	RPINR27[5:0]	U4RXR[5:0]

11.5.3.2 Output Mapping

In contrast to inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Each register contains two 6-bit fields, with each field being associated with one RPn pin (see Register 11-23 through Register 11-38). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see Table 11-12).

Because of the mapping technique, the list of peripherals for output mapping also includes a null value of '000000'. This permits any given pin to remain disconnected from the output of any of the pin-selectable peripherals.

TABLE 11-12: SELECTABLE OUTPUT SOURCES (MAPS FUNCTION TO OUTPUT)

Output Function Number(1)	Function	Output Name
0	NULL(2)	Null
1	C1OUT	Comparator 1 Output
2	C2OUT	Comparator 2 Output
3	U1TX	UART1 Transmit
4	$\overline{\text{U1RTS}}$(3)	UART1 Request-to-Send
5	U2TX	UART2 Transmit
6	$\overline{\text{U2RTS}}$(3)	UART2 Request-to-Send
7	SDO1	SPI1 Data Output
8	SCK1OUT	SPI1 Clock Output
9	SS1OUT	SPI1 Slave Select Output
10	SDO2	SPI2 Data Output
11	SCK2OUT	SPI2 Clock Output
12	SS2OUT	SPI2 Slave Select Output
13	OC1	Output Compare 1
14	OC2	Output Compare 2
15	OC3	Output Compare 3
16	OCM4	SCCP Output Compare 4
17	OCM5	SCCP Output Compare 5
18	OCM6	SCCP Output Compare 6
19	U3TX	UART3 Transmit
20	$\overline{\text{U3RTS}}$	UART3 Request-to-Send
21	U4TX	UART4 Transmit
22	$\overline{\text{U4RTS}}$(3)	UART4 Request-to-Send
23	SDO3	SPI3 Data Output
24	SCK3OUT	SPI3 Clock Output
25	SS3OUT	SPI3 Slave Select Output
26	C3OUT	Comparator 3 Output
27	OCM7	SCCP Output Compare 7
28	REFO(4)	Reference Clock Output
29	CLC1OUT	CLC1 Output
30	CLC2OUT	CLC2 Output

Note 1: Setting the RPORx register with the listed value assigns that output function to the associated RPn pin.

2: The NULL function is assigned to all RPn outputs at device Reset and disables the RPn output function.

3: IrDA® BCLK functionality uses this output.

4: Map to RP29 (RB15) to maintain the high output driver found in previous PIC24F devices.

11.5.3.3 Mapping Limitations

The control schema of the Peripheral Pin Select is extremely flexible. Other than systematic blocks that prevent signal contention caused by two physical pins being configured as the same functional input or two functional outputs configured as the same pin, there are no hardware enforced lockouts. The flexibility extends to the point of allowing a single input to drive multiple peripherals or a single functional output to drive multiple output pins.

11.5.3.4 Mapping Exceptions for PIC24FJ256GA412/GB412 Family Devices

Although the PPS registers theoretically allow for up to 44 remappable I/O pins, not all of these are implemented in all devices. For PIC24FJ256GA412/GB412 family devices, the maximum number of remappable pins available is 44, which includes 12 input only pins. The differences in available remappable pins are summarized in Table 11-13.

When developing applications that use remappable pins, users should also keep these things in mind:

- For the RPINRx registers, bit combinations corresponding to an unimplemented pin for a particular device are treated as invalid; the corresponding module will not have an input mapped to it.
- For RPORx registers, the bit fields corresponding to an unimplemented pin will also be unimplemented; writing to these fields will have no effect.

11.5.4 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC24F devices include three features to prevent alterations to the peripheral map:

- Control register lock sequence
- Continuous state monitoring
- Configuration bit remapping lock

11.5.4.1 Control Register Lock

Under normal operation, writes to the RPINRx and RPORx registers are not allowed. Attempted writes will appear to execute normally, but the contents of the registers will remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK bit (OSCCON[6]). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear IOLOCK, a specific command sequence must be executed:

1. Write 46h to OSCCON[7:0].
2. Write 57h to OSCCON[7:0].
3. Clear (or set) IOLOCK as a single operation.

Unlike the similar sequence with the oscillator's LOCK bit, IOLOCK remains in one state until changed. This allows all of the Peripheral Pin Selects to be configured with a single unlock sequence, followed by an update to all control registers, then locked with a second lock sequence.

11.5.4.2 Continuous State Monitoring

In addition to being protected from direct writes, the contents of the RPINRx and RPORx registers are constantly monitored in hardware by shadow registers. If an unexpected change in any of the registers occurs (such as cell disturbances caused by ESD or other external events), a Configuration Mismatch Reset will be triggered.

11.5.4.3 Configuration Bit Pin Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPINRx and RPORx registers. The IOL1WAY (FOSC[5]) Configuration bit blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure will not execute and the Peripheral Pin Select Control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session. Programming IOL1WAY allows users unlimited access (with the proper use of the unlock sequence) to the Peripheral Pin Select registers.

TABLE 11-13: REMAPPABLE PIN EXCEPTIONS FOR PIC24FJ256GA412/GB412 FAMILY DEVICES

Device	RP Pins (I/O)		RPI Pins	
	Total	Unimplemented	Total	Unimplemented
PIC24FJXXXGA406	29	RP5, RP15, RP31	1	RPI32-36, RPI38-43
PIC24FJXXXGB406	28	RP5, RP15, RP30, RP31	1	RPI32-36, RPI38-43

11.5.5 CONSIDERATIONS FOR PERIPHERAL PIN SELECTION

The ability to control Peripheral Pin Selection introduces several considerations into application design that could be overlooked. This is particularly true for several common peripherals that are available only as remappable peripherals.

The main consideration is that the Peripheral Pin Selects are not available on default pins in the device's default (Reset) state. Since all RPINRx registers reset to '111111' and all RPORx registers reset to '000000', all Peripheral Pin Select inputs are tied to Vss, and all Peripheral Pin Select outputs are disconnected.

This situation requires the user to initialize the device with the proper peripheral configuration before any other application code is executed. Since the IOLOCK bit resets in the unlocked state, it is not necessary to execute the unlock sequence after the device has come out of Reset. For application safety, however, it is best to set IOLOCK and lock the configuration after writing to the control registers.

Because the unlock sequence is timing-critical, it must be executed as an assembly language routine in the same manner as changes to the oscillator configuration. If the bulk of the application is written in 'C', or another high-level language, the unlock sequence should be performed by writing in-line assembly.

Choosing the configuration requires the review of all Peripheral Pin Selects and their pin assignments, especially those that will not be used in the application. In all cases, unused pin-selectable peripherals should be disabled completely. Unused peripherals should have their inputs assigned to an unused RPn/RPIn pin function. I/O pins with unused RPn functions should be configured with the null peripheral output.

The assignment of a peripheral to a particular pin does not automatically perform any other configuration of the pin's I/O circuitry. In theory, this means adding a pin-selectable output to a pin may mean inadvertently driving an existing peripheral input when the output is driven. Users must be familiar with the behavior of other fixed peripherals that share a remappable pin and know when to enable or disable them. To be safe, fixed digital peripherals that share the same pin should be disabled when not in use.

Along these lines, configuring a remappable pin for a specific peripheral does not automatically turn that feature on. The peripheral must be specifically configured for operation and enabled as if it were tied to a fixed pin. Where this happens in the application code (immediately following a device Reset and peripheral configuration or inside the main application routine) depends on the peripheral and its use in the application.

A final consideration is that Peripheral Pin Select functions neither override analog inputs nor reconfigure pins with analog functions for digital I/O. If a pin is configured as an analog input on device Reset, it must be explicitly reconfigured as a digital I/O when used with a Peripheral Pin Select.

Example 11-4 shows a configuration for bidirectional communication with flow control using UART1. The following input and output functions are used:

- Input Functions: U1RX, $\overline{\text{U1CTS}}$
- Output Functions: U1TX, $\overline{\text{U1RTS}}$

EXAMPLE 11-4: CONFIGURING UART1 INPUT AND OUTPUT FUNCTIONS

```
// Unlock Registers
__builtin_write_OSCCONL(OSCCON & 0xbf);

// Configure Input Functions (Table 11-11)
    // Assign U1RX To Pin RP0
    RPINR18bits.U1RXR = 0;

    // Assign U1CTS To Pin RP1
    RPINR18bits.U1CTSR = 1;

// Configure Output Functions (Table 11-12)
    // Assign U1TX To Pin RP2
    RPOR1bits.RP2R = 3;

    // Assign U1RTS To Pin RP3
    RPOR1bits.RP3R = 4;

// Lock Registers
asm volatile    ("MOV   #OSCCON, w1    \n"
                 "MOV    #0x46, w2     \n"
                 "MOV    #0x57, w3     \n"
                 "MOV.b  w2, [w1]      \n"
                 "MOV.b  w3, [w1]      \n"
                 "BSET   OSCCON, #6");

// or use the XC16 built-in macro:
// __builtin_write_OSCCONL(OSCCON | 0x40);
```

11.5.6 PERIPHERAL PIN SELECT REGISTERS

The PIC24FJ256GA412/GB412 family of devices implements a total of 36 registers for remappable peripheral configuration:

- Input Remappable Peripheral Registers (20)
- Output Remappable Peripheral Registers (16)

Note: Input and output register values can only be changed if IOLOCK (OSCCON[6]) = 0. See **Section 11.5.4.1 "Control Register Lock"** for a specific command sequence.

12.0 TIMER1

Note:	This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Timers"** (www.microchip.com/DS39704). The information in this data sheet supersedes the information in the FRM.

The Timer1 module is a 16-bit timer, which serves as a free-running, interval timer/counter. It can operate in three modes:

- 16-Bit Timer
- 16-Bit Synchronous Counter
- 16-Bit Asynchronous Counter

Timer1 also supports these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation during CPU Idle and Sleep Modes
- Interrupt on 16-Bit Period Register Match or Falling Edge of External Gate Signal

Figure 12-1 shows a block diagram of the 16-bit timer module.

To configure Timer1 for operation:

1. Set the TON bit (= 1).
2. Select the timer prescaler ratio using the TCKPS[1:0] bits.
3. Set the Clock and Gating modes using the TCS, TECS[1:0] and TGATE bits.
4. Set or clear the TSYNC bit to configure synchronous or asynchronous operation.
5. Load the timer period value into the PR1 register.
6. If interrupts are required, set the Timer1 Interrupt Enable bit, T1IE. Use the Timer1 Interrupt Priority bits, T1IP[2:0], to set the interrupt priority.

1 = Extended clock selected by the TECS[1:0] bits
0 = Internal clock (FOSC/2)

bit 0 **Unimplemented:** Read as '0'

Note 1: Changing the value of T1CON while the timer is running (TON = 1) causes the timer prescale counter to reset and is not recommended.

2: The TMRCK input must also be assigned to an available RPn or RPIn pin. See **Section 11.5 "Peripheral Pin Select (PPS)"** for more information.

NOTES:

13.0 TIMER2/3 AND TIMER4/5

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Timers"** (www.microchip.com/DS39704). The information in this data sheet supersedes the information in the FRM.

The Timer2/3 and Timer4/5 modules are 32-bit timers, which can also be configured as four independent, 16-bit timers with selectable operating modes.

As 32-bit timers, Timer2/3 and Timer4/5 can each operate in three modes:

- Two Independent 16-Bit Timers with all 16-Bit Operating Modes (except Asynchronous Counter mode)
- Single 32-Bit Timer
- Single 32-Bit Synchronous Counter

They also support these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation during Idle and Sleep Modes
- Interrupt on a 32-Bit Period Register Match
- A/D Event Trigger (only on Timer2/3 in 32-bit mode and Timer3 in 16-bit mode)

Individually, all four of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed above, except for the A/D Event Trigger. This trigger is implemented only on Timer2/3 in 32-bit mode and Timer3 in 16-bit mode. The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON, T3CON, T4CON and T5CON registers. T2CON and T4CON are shown in generic form in Register 13-1; T3CON and T5CON are shown in Register 13-2.

For 32-bit timer/counter operation, Timer2 and Timer4 are the least significant word; Timer3 and Timer5 are the most significant word of the 32-bit timers.

Note: For 32-bit operation, T3CON and T5CON control bits are ignored. Only T2CON and T4CON control bits are used for setup and control. Timer2 and Timer4 clock and gate inputs are utilized for the 32-bit timer modules, but an interrupt is generated with the Timer3 or Timer5 interrupt flags.

To configure Timer2/3 or Timer4/5 for 32-bit operation:

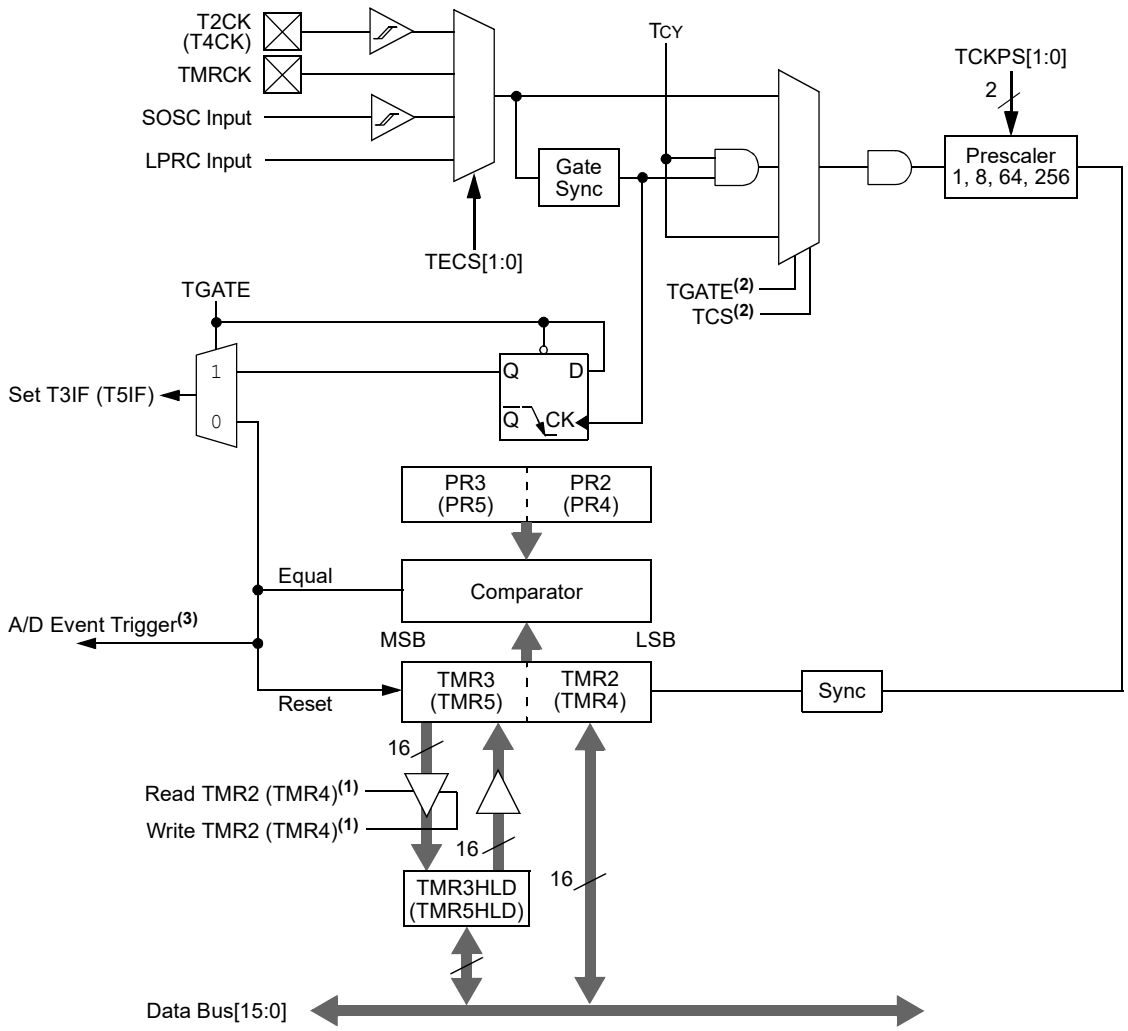
1. Set the T32 or T45 bit (T2CON[3] or T4CON[3] = 1).
2. Select the prescaler ratio for Timer2 or Timer4 using the TCKPS[1:0] bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits. If TCS is set to an external clock, RPINRx (TxCK) must be configured to an available RPn/RPIn pin. For more information, see **Section 11.5 "Peripheral Pin Select (PPS)"**.
4. Load the timer period value. PR3 (or PR5) will contain the most significant word (msw) of the value, while PR2 (or PR4) contains the least significant word (lsw).
5. If interrupts are required, set the interrupt enable bit, T3IE or T5IE. Use the priority bits, T3IP[2:0] or T5IP[2:0], to set the interrupt priority. Note that while Timer2 or Timer4 controls the timer, the interrupt appears as a Timer3 or Timer5 interrupt.
6. Set the TON bit (= 1).

The timer value, at any point, is stored in the register pair, TMR[3:2] (or TMR[5:4]). TMR3 (TMR5) always contains the most significant word of the count, while TMR2 (TMR4) contains the least significant word.

To configure any of the timers for individual 16-bit operation:

1. Clear the T32 bit corresponding to that timer (T2CON[3] for Timer2 and Timer3 or T4CON[3] for Timer4 and Timer5).
2. Select the timer prescaler ratio using the TCKPS[1:0] bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits. See **Section 11.5 "Peripheral Pin Select (PPS)"** for more information.
4. Load the timer period value into the PRx register.
5. If interrupts are required, set the interrupt enable bit, TxIE. Use the priority bits, TxIP[2:0], to set the interrupt priority.
6. Set the TON (TxCON[15] = 1) bit.

FIGURE 13-1: TIMER2/3 AND TIMER4/5 (32-BIT) BLOCK DIAGRAM

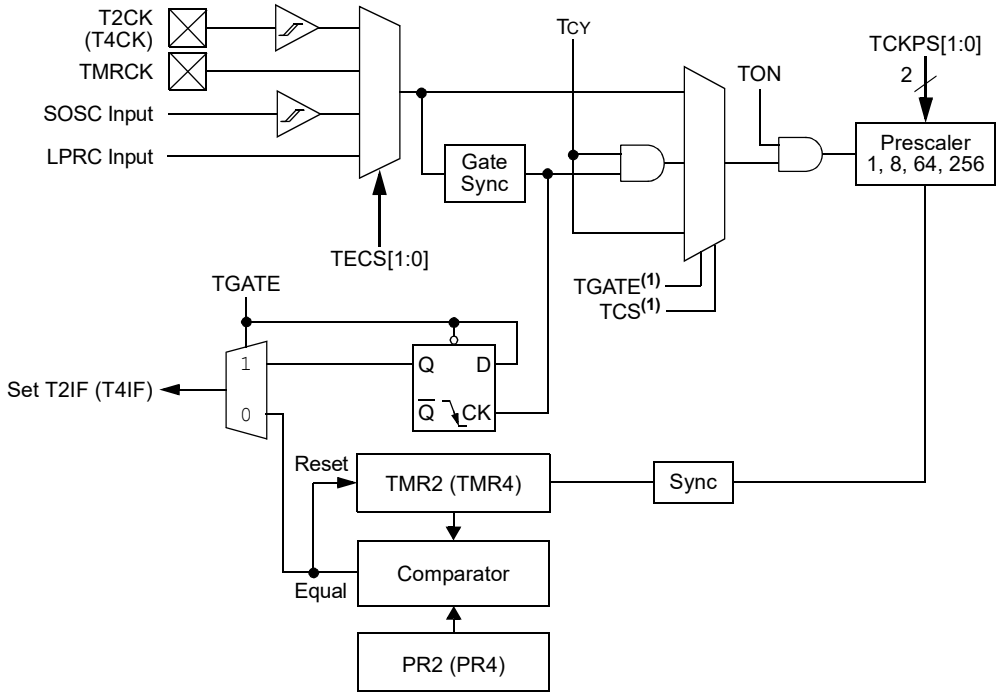


Note 1: The 32-Bit Timer Configuration bit, T32, must be set for 32-bit timer/counter operation. All control bits are respective to the T2CON and T4CON registers.

2: The timer clock input must be assigned to an available RPn/RPIn pin before use. See **Section 11.5 "Peripheral Pin Select (PPS)"** for more information.

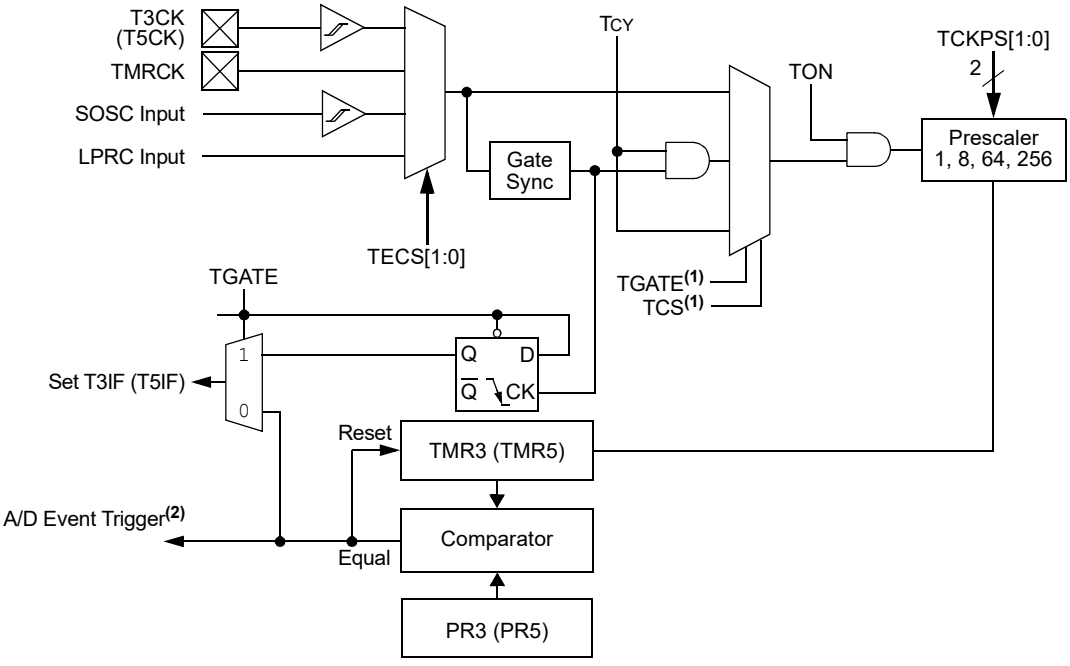
3: The A/D event trigger is available only on Timer2/3 in 32-bit mode and Timer3 in 16-bit mode.

FIGURE 13-2: TIMER2 AND TIMER4 (16-BIT SYNCHRONOUS) BLOCK DIAGRAM



Note 1: The timer clock input must be assigned to an available RPn/RPIn pin before use. See **Section 11.5 "Peripheral Pin Select (PPS)"** for more information.

FIGURE 13-3: TIMER3 AND TIMER5 (16-BIT ASYNCHRONOUS) BLOCK DIAGRAM



Note 1: The timer clock input must be assigned to an available RPn/RPIn pin before use. See **Section 11.5 "Peripheral Pin Select (PPS)"** for more information.

2: The A/D event trigger is available only on Timer3.

2: When 32-bit operation is enabled (T2CON[3] or T4CON[3] = 1), these bits have no effect on Timery operation; all timer functions are set through T2CON and T4CON.

3: If TCS = 1 and TECS[1:0] = x1, the selected external timer input (TyCK) must be configured to an available RPn/RPIn pin. For more information, see **Section 11.5 "Peripheral Pin Select (PPS)"**.

14.0 CAPTURE/COMPARE/PWM/ TIMER MODULES (MCCP AND SCCP)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the MCCP/SCCP modules, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Capture/Compare/PWM/ Timer (MCCP and SCCP)"** (www.microchip.com/DS30003035). The information in this data sheet supersedes the information in the FRM.

PIC24FJ256GA412/GB412 family devices include several Capture/Compare/PWM/Timer base modules, which provide the functionality of three different peripherals of earlier PIC24F devices. The module can operate in one of three major modes:

- General Purpose Timer
- Input Capture
- Output Compare/PWM

The module is provided in two different forms, distinguished by the number of PWM outputs that the module can generate. Single output modules (SCCPs) provide only one PWM output. Multiple output modules (MCCPs) can provide up to six outputs and an extended range of power control features, depending on the pin count of the particular device. All other features of the modules are identical.

The SCCP and MCCP modules can be operated only in one of the three major modes at any time. The other modes are not available unless the module is reconfigured for the new mode.

A conceptual block diagram for the module is shown in Figure 14-1. All three modes share a time base generator and a common Timer register pair (CCPxTMRH/L); other shared hardware components are added as a particular mode requires.

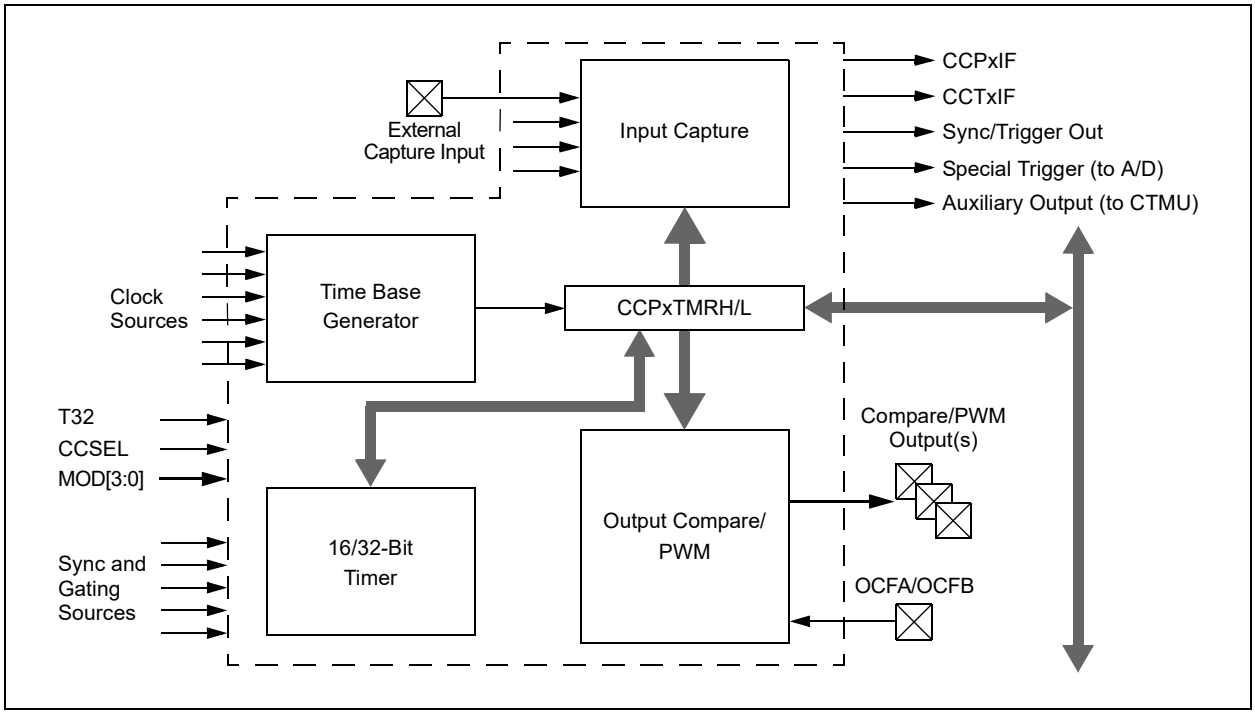
Each module has a total of seven control and status registers:

- CCPxCON1L (Register 14-1)
- CCPxCON1H (Register 14-2)
- CCPxCON2L (Register 14-3)
- CCPxCON2H (Register 14-4)
- CCPxCON3L (Register 14-5)
- CCPxCON3H (Register 14-6)
- CCPxSTATL (Register 14-7)

Each module also includes eight buffer/counter registers that serve as Timer Value registers or data holding buffers:

- CCPxTMRH/CCPxTMRL (CCPx Timer High/Low Counters)
- CCPxPRH/CCPxPRL (CCPx Timer Period High/Low)
- CCPxRAH/CCPxRAL (CCPx Primary Output Compare Data High/Low Buffers)
- CCPxRBH/CCPxRBL (CCPx Secondary Output Compare Data High/Low Buffers)
- CCPxBUFH/CCPxBUFL (CCPx Input Capture

FIGURE 14-1: MCCPx/SCCPx CONCEPTUAL BLOCK DIAGRAM

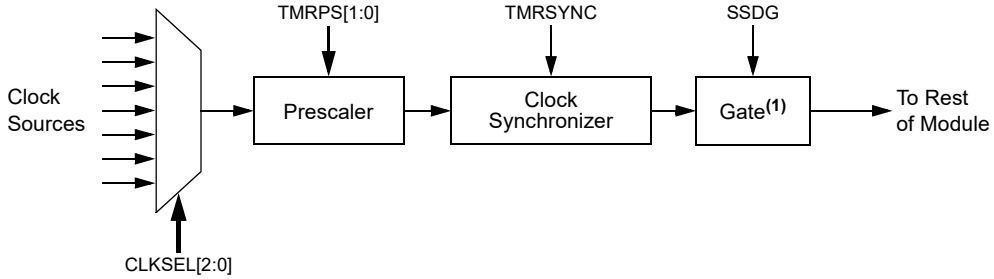


14.1 Time Base Generator

The Timer Clock Generator (TCG) generates a clock for the module's internal time base, using one of the clock signals already available on the microcontroller. This is used as the time reference for the module in its three major modes. The internal time base is shown in Figure 14-2.

There are eight inputs available to the clock generator, which are selected using the CLKSEL[2:0] bits (CCPxCON1L[10:8]). Available sources include the FRC and LPRC, the Secondary Oscillator and the TCKI external clock inputs. The system clock is the default source (CLKSEL[2:0] = 000).

FIGURE 14-2: TIMER CLOCK GENERATOR



Note 1: Gating is available in Timer modes only.

14.2 General Purpose Timer

Timer mode is selected when CCSEL = 0 and MOD[3:0] = 0000. The timer can function as a 32-bit timer or a dual 16-bit timer, depending on the setting of the T32 bit (Table 14-1).

TABLE 14-1: TIMER OPERATION MODE

T32 (CCPxCON1L[5])	Operating Mode
0	Dual Timer Mode (16-bit)
1	Timer Mode (32-bit)

Dual 16-Bit Timer mode provides a simple timer function with two independent 16-bit timer/counters. The primary timer uses CCPxTMRL and CCPxPRL. Only the primary timer can interact with other modules on the device. It generates the MCCPx sync out signals for use by other MCCP modules. It can also use the SYNC[4:0] bits signal generated by other modules.

The secondary timer uses CCPxTMRH and CCPxPRH. It is intended to be used only as a periodic interrupt source for scheduling CPU events. It does not generate an output sync/trigger signal like the primary time base. In Dual Timer mode, the CCPx Secondary Timer Period register, CCPxPRH, generates the MCCP compare event (CCPxIF) used by many other modules on the device.

The 32-Bit Timer mode uses the CCPxTMRL and CCPxTMRH registers, together, as a single 32-bit timer. When CCPxTMRL overflows, CCPxTMRH increments by one. This mode provides a simple timer function when it is important to track long time periods. Note that the T32 bit (CCPxCON1L[5]) should be set before the CCPxTMRL or CCPxPRH registers are written to initialize the 32-bit timer.

14.2.1 SYNC AND TRIGGER OPERATION

In both 16-bit and 32-bit modes, the timer can also function in either synchronization ("sync") or trigger operation. Both use the SYNC[4:0] bits (CCPxCON1H[4:0]) to determine the input signal source. The difference is how that signal affects the timer.

In sync operation, the timer Reset or clear occurs when the input selected by SYNC[4:0] is asserted. The timer immediately begins to count again from zero unless it is held for some other reason. Sync operation is used whenever the TRIGEN bit (CCPxCON1H[7]) is cleared. SYNC[4:0] can have any value except '11111'.

In trigger operation, the timer is held in Reset until the input selected by SYNC[4:0] is asserted; when it occurs, the timer starts counting. Trigger operation is used whenever the TRIGEN bit is set. In Trigger mode, the timer will continue running after a trigger event as long as the CCPTRIG bit (CCPxSTATL[7]) is set. To clear CCPTRIG, the TRCLR bit (CCPxSTATL[5]) must be set to clear the trigger event, reset the timer and hold it at zero until another trigger event occurs. On PIC24FJ256GA412/GB412 family devices, trigger operation can only be used when the system clock is the time base source (CLKSEL[2:0] = 000).

FIGURE 14-3: DUAL 16-BIT TIMER MODE

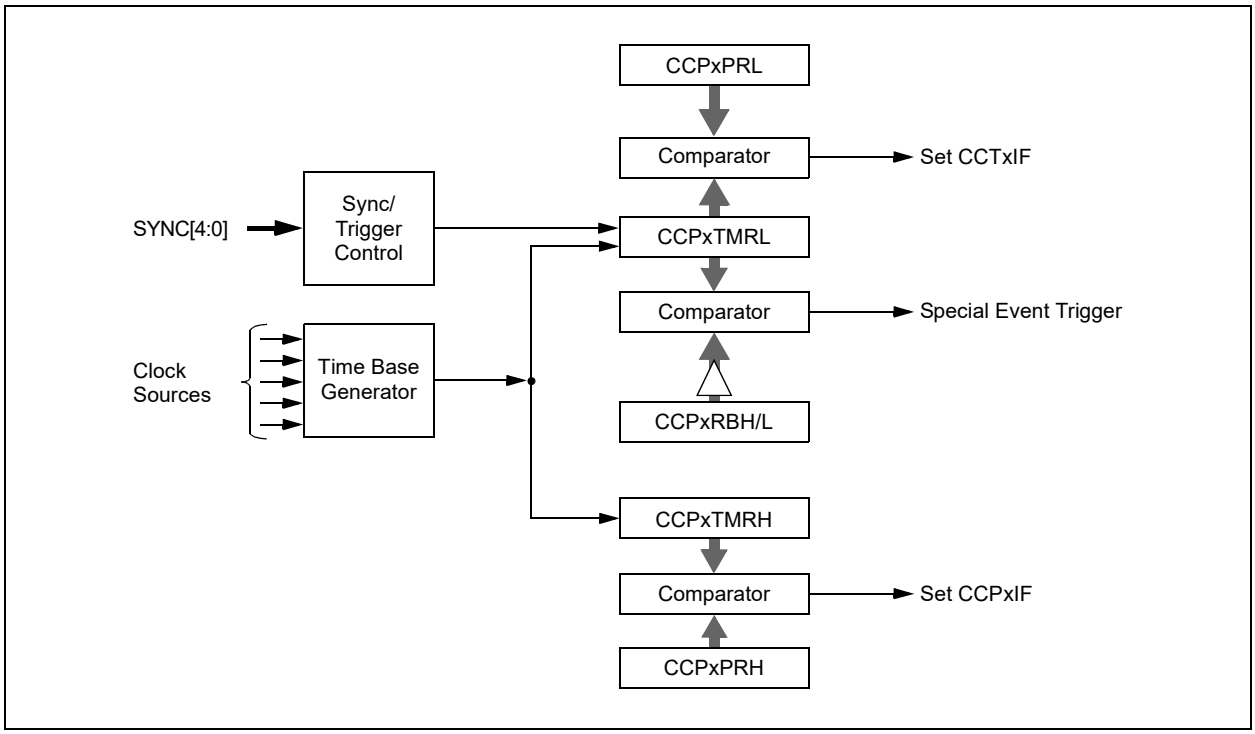


FIGURE 14-4: 32-BIT TIMER MODE

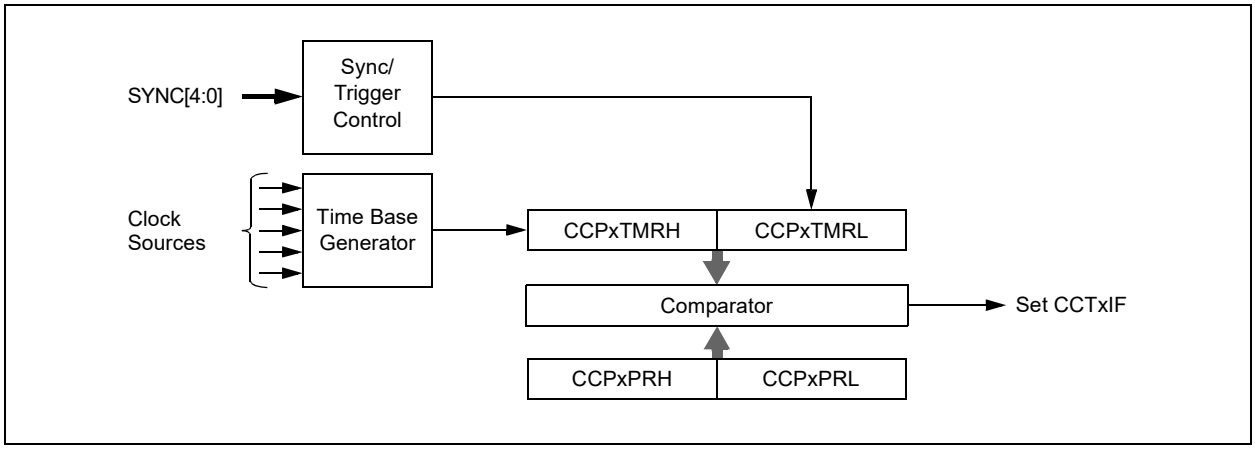


14.3 Output Compare Mode

Output Compare mode compares the Timer register value with the value of one or two Compare registers, depending on its mode of operation. The Output Compare x module, on compare match events, has the ability to generate a single output transition or a train of output pulses. Like most PIC® MCU peripherals, the Output Compare x module can also generate interrupts on a compare match event.

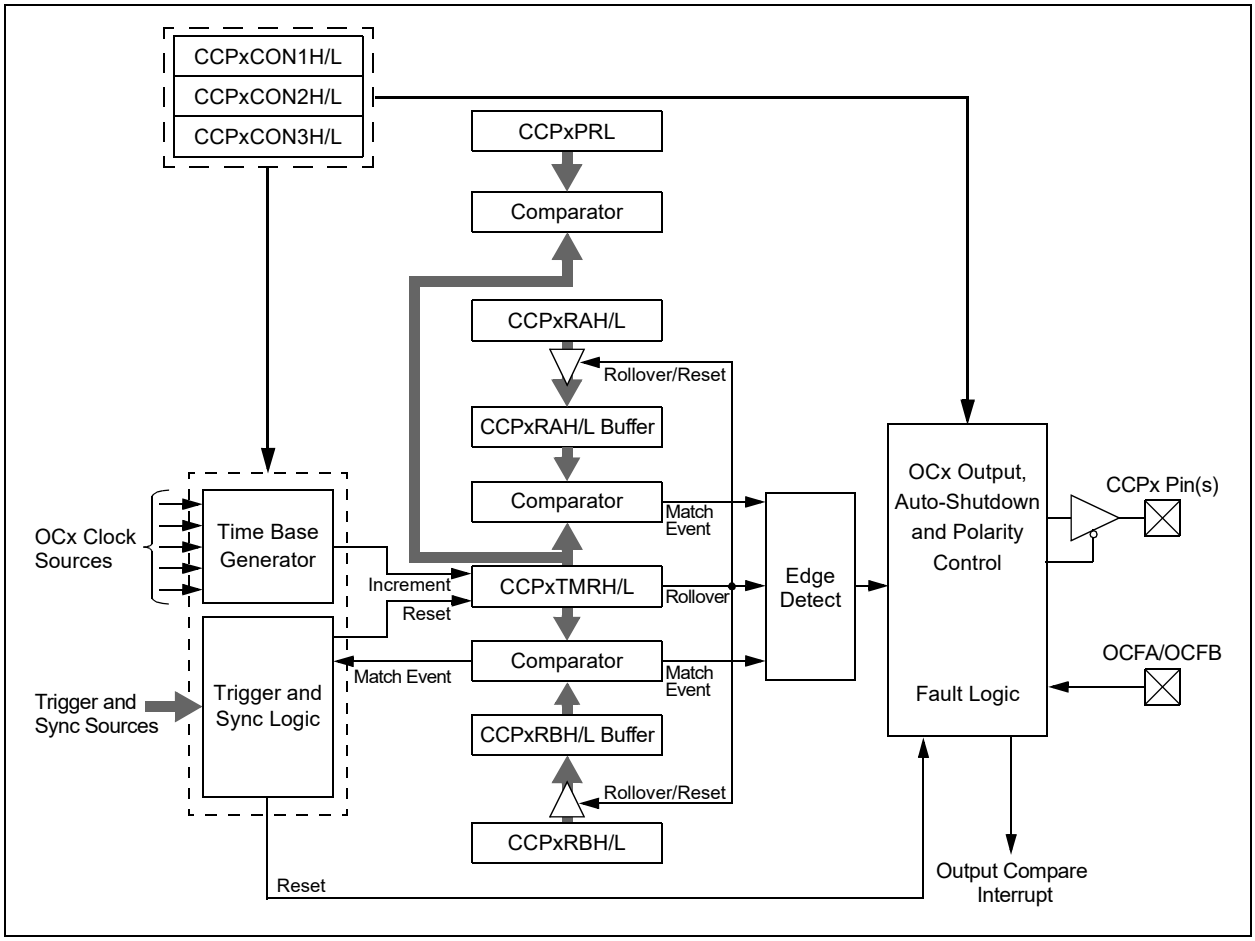
Table 14-2 shows the various modes available in Output Compare modes.

TABLE 14-2: OUTPUT COMPARE/PWM MODES

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode	
0001	0	Output High on Compare (16-bit)	Single Edge Mode
0001	1	Output High on Compare (32-bit)	
0010	0	Output Low on Compare (16-bit)	
0010	1	Output Low on Compare (32-bit)	
0011	0	Output Toggle on Compare (16-bit)	
0011	1	Output Toggle on Compare (32-bit)	
0100	0	Dual Edge Compare (16-bit)	Dual Edge Mode
0101	0	Dual Edge Compare (16-bit buffered)	PWM Mode
0110	0	Center-Aligned Pulse (16-bit buffered)(1)	Center PWM
0111	0	Variable Frequency Pulse (16-bit)	
0111	1	Variable Frequency Pulse (32-bit)	

Note 1: Only MCCP supports center aligned PWM mode.

FIGURE 14-5: OUTPUT COMPARE x BLOCK DIAGRAM



14.4 Input Capture Mode

Input Capture mode is used to capture a timer value from an independent timer base upon an event on an input pin or other internal trigger source. The input capture features are useful in applications requiring frequency (time period) and pulse measurement. Figure 14-6 depicts a simplified block diagram of Input Capture mode.

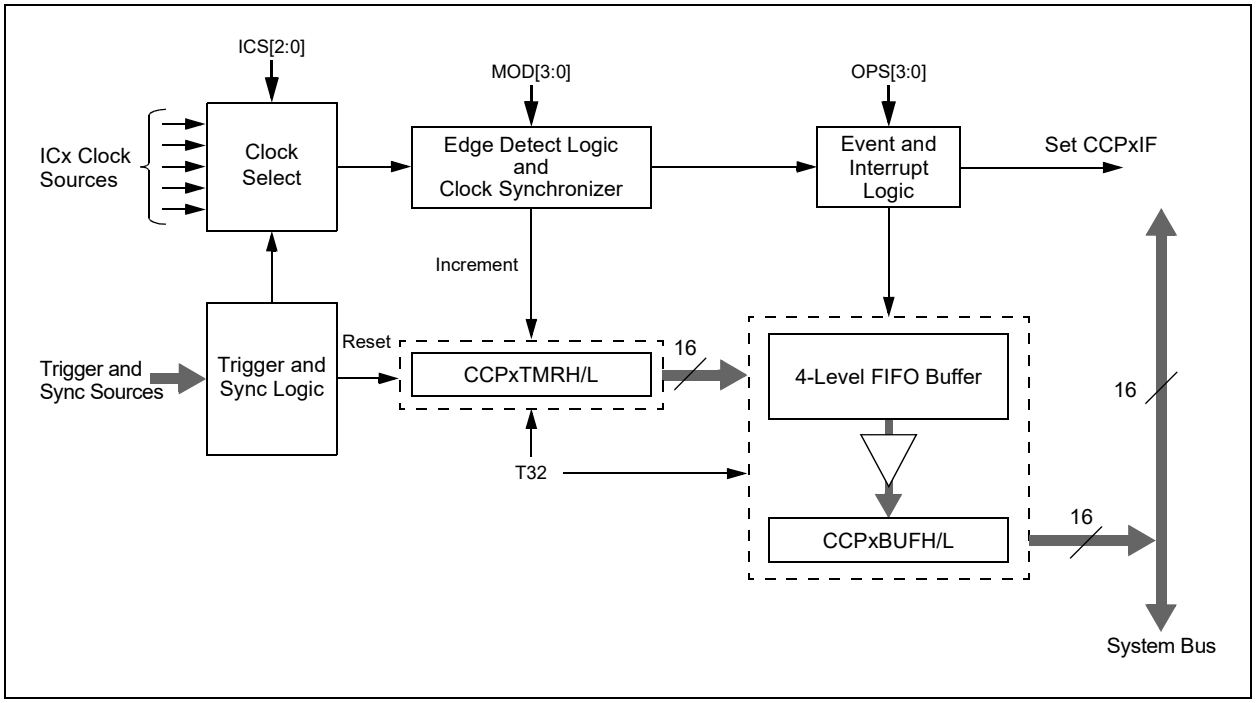
Input Capture mode uses a dedicated 16/32-bit, synchronous, up counting timer for the capture function. The timer value is written to the FIFO when a capture event occurs. The internal value may be read (with a synchronization delay) using the CCPxTMRH/L register.

To use Input Capture mode, the CCSEL bit (CCPxCON1L[4]) must be set. The T32 and the MOD[3:0] bits are used to select the proper Capture mode, as shown in Table 14-3.

TABLE 14-3: INPUT CAPTURE MODES

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode
0000	0	Edge Detect (16-bit capture)
0000	1	Edge Detect (32-bit capture)
0001	0	Every Rising (16-bit capture)
0001	1	Every Rising (32-bit capture)
0010	0	Every Falling (16-bit capture)
0010	1	Every Falling (32-bit capture)
0011	0	Every Rise/Fall (16-bit capture)
0011	1	Every Rise/Fall (32-bit capture)
0100	0	Every 4th Rising (16-bit capture)
0100	1	Every 4th Rising (32-bit capture)
0101	0	Every 16th Rising (16-bit capture)
0101	1	Every 16th Rising (32-bit capture)

FIGURE 14-6: INPUT CAPTURE x BLOCK DIAGRAM



14.5 Auxiliary Output

The MCCPx and SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other MCCP or SCCP modules, or other digital peripherals, to provide these types of functions:

- Time Base Synchronization
- Peripheral Trigger and Clock Inputs
- Signal Gating

The type of output signal is selected using the AUXOUT[1:0] control bits (CCPxCON2H[4:3]). The type of output signal is also dependent on the module operating mode.

On the PIC24FJ256GA412/GB412 family of devices, only the CTMU discharge trigger has access to the auxiliary output signal.

TABLE 14-4: AUXILIARY OUTPUT

AUXOUT[1:0]	CCSEL	MOD[3:0]	Comments	Signal Description
00	x	xxxx	Auxiliary output disabled	No Output
01	0	0000	Time Base modes	Time Base Period Reset or Rollover
10				Special Event Trigger Output
11				No Output
01	0	0001 through 1111	Output Compare modes	Time Base Period Reset or Rollover
10				Output Compare Event Signal
11				Output Compare Signal
01	1	xxxx	Input Capture modes	Time Base Period Reset or Rollover
10				Reflects the Value of the ICDIS bit
11				Input Capture Event Signal

NOTES:

15.0 INPUT CAPTURE WITH DEDICATED TIMERS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Input Capture with Dedicated Timer"** (www.microchip.com/DS70000352). The information in this data sheet supersedes the information in the FRM.

Devices in the PIC24FJ256GA412/GB412 family contain six independent input capture modules. Each of the modules offers a wide range of configuration and operating options for capturing external pulse events and generating interrupts.

Key features of the input capture module include:

- Hardware-Configurable for 32-Bit Operation in All Modes by Cascading Two Adjacent Modules
- Synchronous and Trigger modes of Output compare Operation, with up to 30 User-Selectable Sync/Trigger Sources Available
- A 4-Level FIFO Buffer for Capturing and Holding Timer Values for Several Events
- Configurable Interrupt Generation
- Up to Six Clock Sources Available for Each Module, Driving a Separate Internal 16-Bit Counter

The module is controlled through two registers: ICxCON1 (Register 15-1) and ICxCON2 (Register 15-2). A general block diagram of the module is shown in Figure 15-1.

15.1 General Operating Modes

15.1.1 SYNCHRONOUS AND TRIGGER MODES

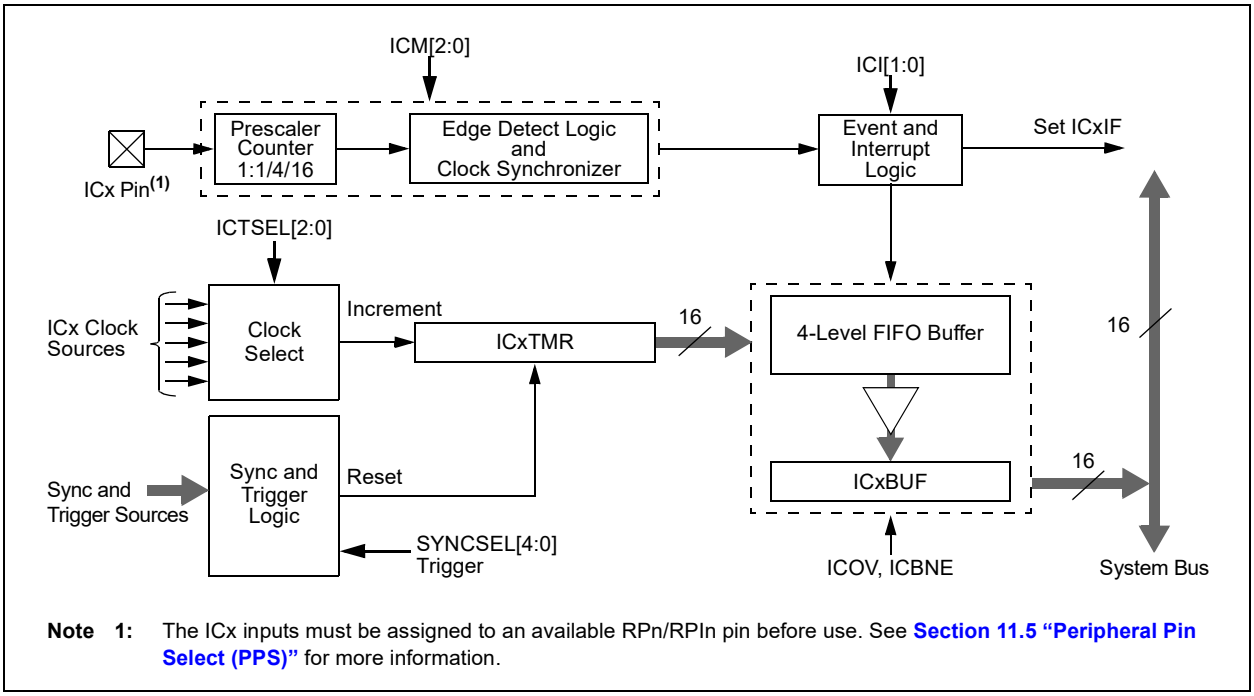
When the input capture module operates in a Free-Running mode, the internal 16-bit counter, ICxTMR, counts up continuously, wrapping around from FFFFh to 0000h on each overflow. Its period is synchronized to the selected external clock source. When a capture event occurs, the current 16-bit value of the internal counter is written to the FIFO buffer.

In Synchronous mode, the module begins capturing events on the ICx pin as soon as its selected clock source is enabled. Whenever an event occurs on the selected sync source, the internal counter is reset. In Trigger mode, the module waits for a sync event from another internal module to occur before allowing the internal counter to run.

Standard, free-running operation is selected by setting the SYNCSEL[4:0] bits (ICxCON2[4:0]) to '00000' and clearing the ICTRIG bit (ICxCON2[7]). Synchronous and Trigger modes are selected any time the SYNCSELx bits are set to any value except '00000'. The ICTRIG bit selects either Synchronous or Trigger mode; setting the bit selects Trigger mode operation. In both modes, the SYNCSELx bits determine the sync/trigger source.

When the SYNCSELx bits are set to '00000' and ICTRIG is set, the module operates in Software Trigger mode. In this case, capture operations are started by manually setting the TRIGSTAT bit (ICxCON2[6]).

FIGURE 15-1: INPUT CAPTURE x BLOCK DIAGRAM



Note 1: The ICx inputs must be assigned to an available RPn/RPIn pin before use. See **Section 11.5 "Peripheral Pin Select (PPS)"** for more information.

15.1.2 CASCADED (32-BIT) MODE

By default, each module operates independently with its own 16-bit timer. To increase resolution, adjacent even and odd modules can be configured to function as a single 32-bit module. (For example, Modules 1 and 2 are paired, as are Modules 3 and 4, and so on.) The odd numbered module, Input Capture x (ICx), provides the Least Significant 16 bits of the 32-bit register pairs and the even numbered module, Input Capture y (ICy), provides the Most Significant 16 bits. Wrap arounds of the ICx registers cause an increment of their corresponding ICy registers.

Cascaded operation is configured in hardware by setting the IC32 bits (ICxCON2[8]) for both modules.

15.2 Capture Operations

The input capture module can be configured to capture timer values and generate interrupts on rising edges on ICx or all transitions on ICx. Captures can be configured to occur on all rising edges or just some (every 4th or 16th). Interrupts can be independently configured to generate on each event or a subset of events.

To set up the module for capture operations:

1. Configure the ICx input for one of the available Peripheral Pin Select pins.
2. If Synchronous mode is to be used, disable the sync source before proceeding.
3. Make sure that any previous data have been removed from the FIFO by reading ICxBUF until the ICBNE bit (ICxCON1[3]) is cleared.
4. Set the SYNCSELx bits (ICxCON2[4:0]) to the desired sync/trigger source.
5. Set the ICTSELx bits (ICxCON1[12:10]) for the desired clock source.
6. Set the ICIx bits (ICxCON1[6:5]) to the desired interrupt frequency
7. Select Synchronous or Trigger mode operation:
   a) Check that the SYNCSELx bits are not set to '00000'.
   b) For Synchronous mode, clear the ICTRIG bit (ICxCON2[7]).
   c) For Trigger mode, set ICTRIG and clear the TRIGSTAT bit (ICxCON2[6]).
8. Set the ICMx bits (ICxCON1[2:0]) to the desired operational mode.
9. Enable the selected sync/trigger source.

For 32-bit cascaded operations, the setup procedure is slightly different:

1. Set the IC32 bits for both modules (ICyCON2[8]) and (ICxCON2[8]), enabling the even numbered module first. This ensures that the modules will start functioning in unison.
2. Set the ICTSELx and SYNCSELx bits for both modules to select the same sync/trigger and time base source. Set the even module first, then the odd module. Both modules must use the same ICTSELx and SYNCSELx bit settings.
3. Clear the ICTRIG bit of the even module (ICyCON2[7]). This forces the module to run in Synchronous mode with the odd module, regardless of its trigger setting.
4. Use the odd module's ICIx bits (ICxCON1[6:5]) to set the desired interrupt frequency.
5. Use the ICTRIG bit of the odd module (ICxCON2[7]) to configure Trigger or Synchronous mode operation.

Note:	For Synchronous mode operation, enable the sync source as the last step. Both input capture modules are held in Reset until the sync source is enabled.

6. Use the ICMx bits of the odd module (ICxCON1[2:0]) to set the desired Capture mode.

The module is ready to capture events when the time base and the sync/trigger source are enabled. When the ICBNE bit (ICxCON1[3]) becomes set, at least one capture value is available in the FIFO. Read input capture values from the FIFO until the ICBNE clears to '0'.

For 32-bit operation, read both the ICxBUF and ICyBUF for the full 32-bit timer value (ICxBUF for the lsw, ICyBUF for the msw). At least one capture value is available in the FIFO buffer when the odd module's ICBNE bit (ICxCON1[3]) becomes set. Continue to read the buffer registers until ICBNE is cleared (performed automatically by hardware).

NOTES:

16.0 OUTPUT COMPARE WITH DEDICATED TIMERS

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Output Compare with Dedicated Timer"** (www.microchip.com/DS70005159). The information in this data sheet supersedes the information in the FRM.

Devices in the PIC24FJ256GA412/GB412 family all feature six independent output compare modules. Each of these modules offers a wide range of configuration and operating options for generating pulse trains on internal device events, and can produce Pulse-Width Modulated (PWM) waveforms for driving power applications.

Key features of the output compare module include:

- Hardware-Configurable for 32-Bit Operation in All Modes by Cascading Two Adjacent Modules
- Synchronous and Trigger Modes of Output Compare Operation, with up to 31 User-Selectable Trigger/Sync Sources Available
- Two Separate Period Registers (a main register, OCxR, and a secondary register, OCxRS) for Greater Flexibility in Generating Pulses of Varying Widths
- Configurable for Single Pulse or Continuous Pulse Generation on an Output Event, or Continuous PWM Waveform Generation
- Up to Six Clock Sources Available for Each Module, Driving a Separate Internal 16-Bit Counter

16.1 General Operating Modes

16.1.1 SYNCHRONOUS AND TRIGGER MODES

When the output compare module operates in a Free-Running mode, the internal 16-bit counter, OCxTMR, runs counts up continuously, wrapping around from 0xFFFF to 0x0000 on each overflow. Its period is synchronized to the selected external clock source. Compare or PWM events are generated each time a match between the internal counter and one of the Period registers occurs.

In Synchronous mode, the module begins performing its compare or PWM operation as soon as its selected clock source is enabled. Whenever an event occurs on the selected sync source, the module's internal counter is reset. In Trigger mode, the module waits for a sync event from another internal module to occur before allowing the counter to run.

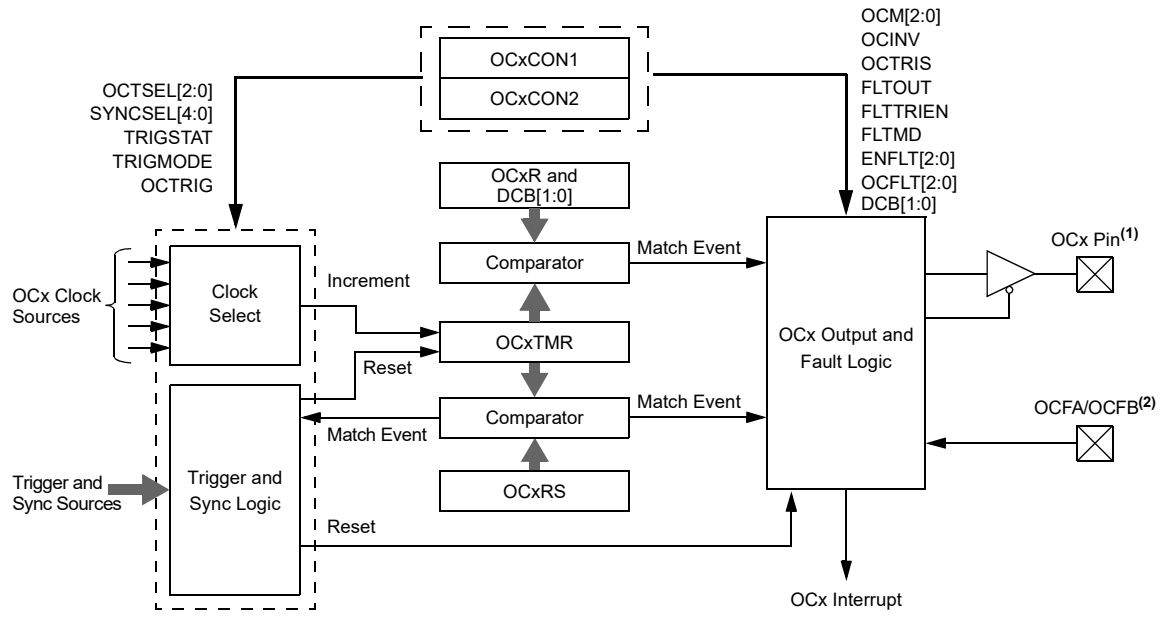
Free-Running mode is selected by default or any time that the SYNCSEL[4:0] bits (OCxCON2[4:0]) are set to '00000'. Synchronous or Trigger modes are selected any time the SYNCSELx bits are set to any value except '00000'. The OCTRIG bit (OCxCON2[7]) selects either Synchronous or Trigger mode; setting the bit selects Trigger mode operation. In both modes, the SYNCSELx bits determine the sync/trigger source.

16.1.2 CASCADED (32-BIT) MODE

By default, each module operates independently with its own set of 16-bit Timer and Duty Cycle registers. To increase resolution, adjacent even and odd modules can be configured to function as a single 32-bit module. (For example, Modules 1 and 2 are paired, as are Modules 3 and 4, and so on.) The odd numbered module, Output Compare x (OCx), provides the Least Significant 16 bits of the 32-bit register pairs and the even numbered module, Output Compare y (OCy), provides the Most Significant 16 bits. Wrap arounds of the OCx registers cause an increment of their corresponding OCy registers.

Cascaded operation is configured in hardware by setting the OC32 bit (OCxCON2[8]) for both modules. For more information on cascading, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Output Compare with Dedicated Timer"** (www.microchip.com/DS70005159).

FIGURE 16-1: OUTPUT COMPARE x BLOCK DIAGRAM (16-BIT MODE)



Note 1: The OCx outputs must be assigned to an available RPn pin before use. For more information, see **Section 11.5 "Peripheral Pin Select (PPS)"**.

2: The OCFA/OCFB Fault inputs must be assigned to an available RPn/RPIn pin before use. For more information, see **Section 11.5 "Peripheral Pin Select (PPS)"**.

16.2 Compare Operations

In Compare mode (Figure 16-1), the output compare module can be configured for single-shot or continuous pulse generation. It can also repeatedly toggle an output pin on each timer event.

To set up the module for compare operations:

1. Configure the OCx output for one of the available Peripheral Pin Select pins.
2. Calculate the required values for the OCxR and (for Double Compare modes) OCxRS Duty Cycle registers:
   a) Determine the instruction clock cycle time. Take into account the frequency of the external clock to the timer source (if one is used) and the timer prescaler settings.
   b) Calculate the time to the rising edge of the output pulse relative to the timer start value (0000h).
   c) Calculate the time to the falling edge of the pulse based on the desired pulse width and the time to the rising edge of the pulse.
3. Write the rising edge value to OCxR and the falling edge value to OCxRS.
4. Set the Timer Period register, PRy, to a value equal to or greater than the value in OCxRS.
5. Set the OCM[2:0] bits for the appropriate compare operation ('0xx').
6. For Trigger mode operations, set OCTRIG to enable Trigger mode. Set or clear TRIGMODE to configure trigger operation and TRIGSTAT to select a hardware or software trigger. For Synchronous mode, clear OCTRIG.
7. Set the SYNCSEL[4:0] bits to configure the trigger or synchronization source. If free-running timer operation is required, set the SYNCSELx bits to '00000' (no sync/trigger source).
8. Select the time base source with the OCTSEL[2:0] bits. If necessary, set the TON bits for the selected timer, which enables the compare time base to count. Synchronous mode operation starts as soon as the time base is enabled; Trigger mode operation starts after a trigger source event occurs.

For 32-bit cascaded operation, these steps are also necessary:

1. Set the OC32 bits for both registers (OCyCON2[8]) and (OCxCON2[8]). Enable the even numbered module first to ensure the modules will start functioning in unison.
2. Clear the OCTRIG bit of the even module (OCyCON2[7]), so the module will run in Synchronous mode.
3. Configure the desired output and Fault settings for OCy.
4. Force the output pin for OCx to the output state by clearing the OCTRIS bit.
5. If Trigger mode operation is required, configure the trigger options in OCx by using the OCTRIG (OCxCON2[7]), TRIGMODE (OCxCON1[3]) and SYNCSELx (OCxCON2[4:0]) bits.
6. Configure the desired Compare or PWM mode of operation (OCM[2:0]) for OCy first, then for OCx.

Depending on the output mode selected, the module holds the OCx pin in its default state and forces a transition to the opposite state when OCxR matches the timer. In Double Compare modes, OCx is forced back to its default state when a match with OCxRS occurs. The OCxIF interrupt flag is set after an OCxR match in Single Compare modes and after each OCxRS match in Double Compare modes.

Single-shot pulse events only occur once, but may be repeated by simply rewriting the value of the OCxCON1 register. Continuous pulse events continue indefinitely until terminated.

16.3 Pulse-Width Modulation (PWM) Mode

In PWM mode, the output compare module can be configured for edge-aligned or center-aligned pulse waveform generation. All PWM operations are double-buffered (buffer registers are internal to the module and are not mapped into SFR space).

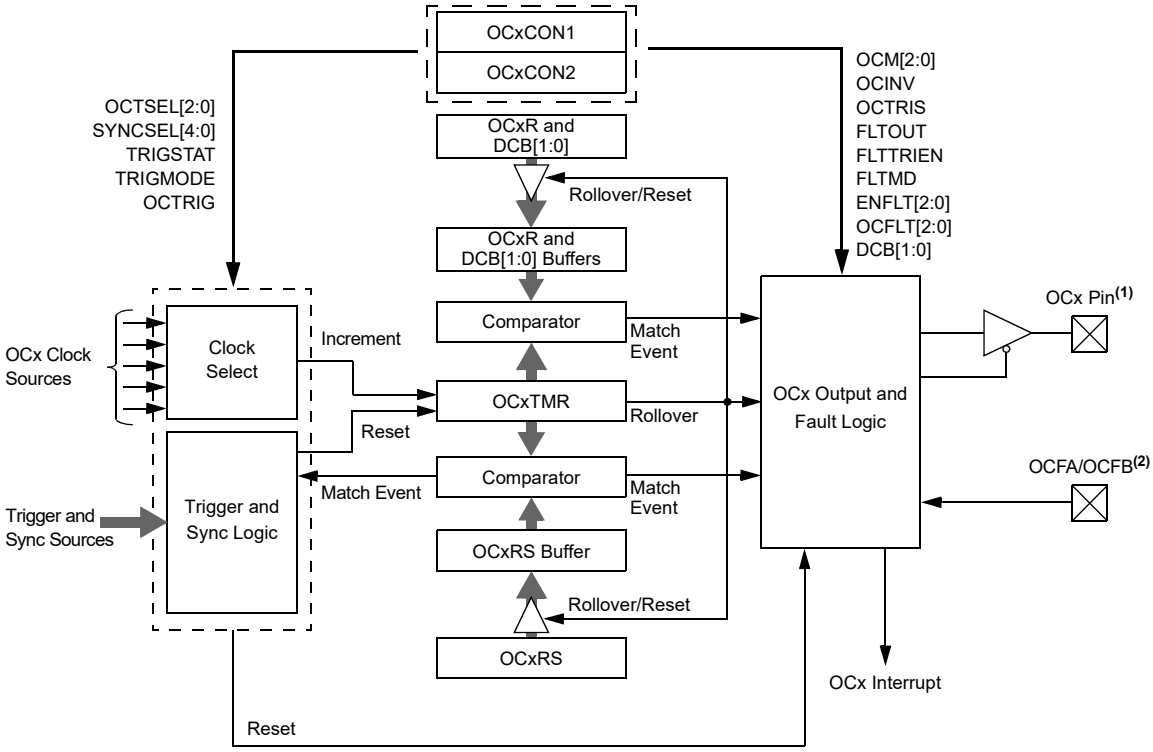
To configure the output compare module for PWM operation:

1. Configure the OCx output for one of the available Peripheral Pin Select pins.
2. Calculate the desired duty cycles and load them into the OCxR register.
3. Calculate the desired period and load it into the OCxRS register.
4. Select the current OCx as the synchronization source by writing '0x1F' to the SYNCSEL[4:0] bits (OCxCON2[4:0]) and '0' to the OCTRIG bit (OCxCON2[7]).
5. Select a clock source by writing to the OCTSEL[2:0] bits (OCxCON1[12:10]).
6. Enable interrupts, if required, for the timer and output compare modules. The output compare interrupt is required for PWM Fault pin utilization.
7. Select the desired PWM mode in the OCM[2:0] bits (OCxCON1[2:0]).
8. Appropriate Fault inputs may be enabled by using the ENFLT[2:0] bits as described in Register 16-1.
9. If a timer is selected as a clock source, set the selected timer prescale value. The selected timer's prescaler output is used as the clock input for the OCx timer and not the selected timer output.

Note: This peripheral contains input and output functions that may need to be configured by the Peripheral Pin Select. For more information, see **Section 11.5 "Peripheral Pin Select (PPS)"**.

Note: Make sure the I/O ports are in Digital mode and the TRISx bits are configured for Output mode for the peripheral pin selected.

FIGURE 16-2: OUTPUT COMPARE x BLOCK DIAGRAM (DOUBLE-BUFFERED, 16-BIT PWM MODE)



Note 1: The OCx outputs must be assigned to an available RPn pin before use. For more information, see **Section 11.5 "Peripheral Pin Select (PPS)"**.

2: The OCFA/OCFB Fault inputs must be assigned to an available RPn/RPIn pin before use. For more information, see **Section 11.5 "Peripheral Pin Select (PPS)"**.

16.3.1 PWM PERIOD

The PWM period is specified by writing to PRy, the Timery Period register. The PWM period can be calculated using Equation 16-1.

EQUATION 16-1: CALCULATING THE PWM PERIOD(1)

$$\text{PWM Period} = [(\text{PRy}) + 1] \cdot T_{CY} \cdot (\text{Timer Prescale Value})$$

where: $\text{PWM Frequency} = 1/[\text{PWM Period}]$

Note 1: Based on $T_{CY} = T_{OSC} * 2$; Doze mode and PLL are disabled.

Note: A PRy value of N will produce a PWM period of N + 1 time base count cycles. For example, a value of seven written into the PRy register, will yield a period consisting of eight time base cycles.

16.3.2 PWM DUTY CYCLE

The PWM duty cycle is specified by writing to the OCxRS and OCxR registers. The OCxRS and OCxR registers can be written to at any time, but the duty cycle value is not latched until a match between PRy and TMRy occurs (i.e., the period is complete). This provides a double buffer for the PWM duty cycle and is essential for glitchless PWM operation.

Some important boundary parameters of the PWM duty cycle include:

- If OCxR, OCxRS and PRy are all loaded with 0000h, the OCx pin will remain low (0% duty cycle).
- If OCxRS is greater than PRy, the pin will remain high (100% duty cycle).

See Example 16-1 for PWM mode timing details. Table 16-1 and Table 16-2 show example PWM frequencies and resolutions for a device operating at 4 MIPS and 10 MIPS, respectively.

EQUATION 16-2: CALCULATION FOR MAXIMUM PWM RESOLUTION(1)

$$\text{Maximum PWM Resolution (bits)} = \frac{\log_{10}\left(\frac{F_{CY}}{\text{FPWM} \bullet (\text{Timer Prescale Value})}\right)}{\log_{10}(2)} \text{ bits}$$

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

EXAMPLE 16-1: PWM PERIOD AND DUTY CYCLE CALCULATIONS(1)

1. Find the Timer Period register value for a desired PWM frequency of 52.08 kHz, where FOSC = 8 MHz with PLL (32 MHz device clock rate) and a Timer2 prescaler setting of 1:1.

   TCY = 2 • TOSC = 62.5 ns

   PWM Period = 1/PWM Frequency = 1/52.08 kHz = 19.2 ms

   PWM Period = (PR2 + 1) • TCY • (Timer2 Prescale Value)

   19.2 µs = (PR2 + 1) • 62.5 ns • 1

   PR2 = 306

2. Find the maximum resolution of the duty cycle that can be used with a 52.08 kHz frequency and a 32 MHz device clock rate:

   PWM Resolution = $\log_{10}(F_{CY}/F_{PWM})/\log_{10}2)$ bits

   = $(\log_{10}(16\text{ MHz}/52.08\text{ kHz})/\log_{10}2)$ bits

   = 8.3 bits

Note 1: Based on TCY = 2 * TOSC; Doze mode and PLL are disabled.

TABLE 16-1: EXAMPLE PWM FREQUENCIES AND RESOLUTIONS AT 4 MIPS (FCY = 4 MHz)(1)

PWM Frequency	7.6 Hz	61 Hz	122 Hz	977 Hz	3.9 kHz	31.3 kHz	125 kHz

NOTES:

17.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note: This data sheet summarizes the features of the PIC24FJ256GA412/GB412 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Serial Peripheral Interface (SPI) with Audio Codec Support"** (www.microchip.com/DS70005136), which is available from the Microchip website (www.microchip.com). The information in this data sheet supersedes the information in the FRM.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, shift registers, display drivers, A/D Converters, etc. The SPI module is compatible with the Motorola® SPI and SIOP interfaces. All devices in the PIC24FJ256GA412/GB412 family include three SPI modules.

The module supports operation in two buffer modes: Standard and Enhanced. Variable length data can be transmitted and received, from 2 to 32 bits.

In Standard mode, data are shifted through a single serial buffer.

In Enhanced Buffer mode, two 128-bit FIFO buffers are used for the SPIx Transmit Buffer (SPIxTXB) and the SPIx Receive Buffer (SPIxRXB). SPIxBUF provides access to both the receive and transmit FIFOs. The data transmission and reception in the SPIxSR buffer is identical to that in the Standard Buffer mode. The FIFO depth depends on the data width chosen by the Serial Word Length Select (MODE[32,16]) bits in the SPIx Control Register 1 Low (SPIxCON1L). If the MODEx field selects 32-bit data lengths, the FIFO is 4-deep; if the MODEx selects 16-bit data lengths, the FIFO is 8-deep or if MODEx selects 8-bit data lengths, the FIFO is 16 deep.

Note: Do not perform Read-Modify-Write operations (such as bit-oriented instructions) on the SPIxBUF register in either Standard or Enhanced Buffer mode.

The module also supports a basic framed SPI protocol while operating in either Master or Slave mode. A total of four framed SPI configurations are supported.

The module also supports Audio modes. Four different Audio modes are available.

- I^2S mode
- Left Justified
- Right Justified
- PCM/DSP

In each of these modes, the serial clock is free-running and audio data are always transferred.

If an audio protocol data transfer takes place between two devices, then usually one device is the master and the other is the slave. However, audio data can be transferred between two slaves. Because the audio protocols require free-running clocks, the master can be a third party controller. In either case, the master generates two free-running clocks: SCKx and LRC (Left, Right Channel Clock/$\overline{SS}$x/FSYNC).

The SPI serial interface consists of four pins:

- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output
- $\overline{SS}$x: Active-Low Slave Select or Frame Synchronization I/O Pulse

The SPI module can be configured to operate using two, three or four pins. In the 3-pin mode, $\overline{SS}$x is not used. In the 2-pin mode, both SDOx and $\overline{SS}$x are not used.

The SPI module has the ability to generate three interrupts reflecting the events that occur during the data communication. The following types of interrupts can be generated:

1. Receive interrupts are signalled by SPIxRXIF. This event occurs when:
   - RX watermark interrupt
   - SPIROV = 1
   - SPIRBF = 1
   - SPIRBE = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.
2. Transmit interrupts are signalled by SPIxTXIF. This event occurs when:
   - TX watermark interrupt
   - SPITUR = 1
   - SPITBF = 1
   - SPITBE = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.
3. General interrupts are signalled by SPIxIF. This event occurs when
   - FRMERR = 1
   - SPIBUSY = 1
   - SRMT = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.

Block diagrams of the module in Standard and Enhanced modes are shown in Figure 17-1 and Figure 17-2.

Note: In this section, the SPI modules are referred to together as SPIx, or separately as SPI1, SPI2 or SPI3. Special Function Registers will follow a similar notation. For example, SPIxCON1 and SPIxCON2 refer to the control registers for any of the three SPI modules.

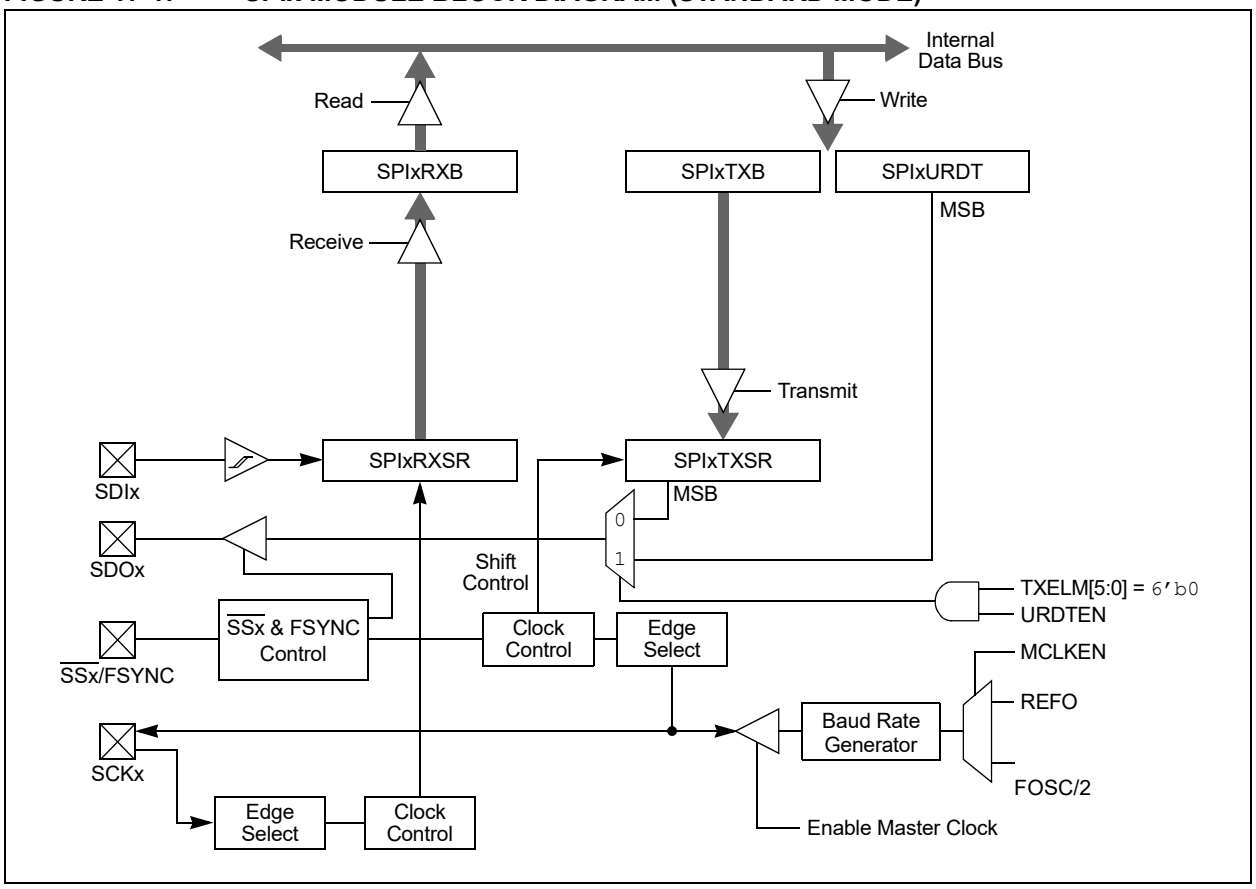
To set up the SPIx module for the Standard Master mode of operation:

1. If using interrupts:
   a) Clear the interrupt flag bits in the respective IFSx register.
   b) Set the interrupt enable bits in the respective IECx register.
   c) Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
2. Write the desired settings to the SPIxCON1L and SPIxCON1H registers with the MSTEN bit (SPIxCON1L[5]) = 1.
3. Clear the SPIROV bit (SPIxSTATL[6]).
4. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
5. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

To set up the SPIx module for the Standard Slave mode of operation:

1. Clear the SPIxBUF registers.
2. If using interrupts:
   a) Clear the SPIxBUFL and SPIxBUFH registers.
   b) Set the interrupt enable bits in the respective IECx register.
   c) Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = 0.
4. Clear the SMP bit.
5. If the CKE bit (SPIxCON1L[8]) is set, then the SSEN bit (SPIxCON1L[7]) must be set to enable the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTATL[6]).
7. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

FIGURE 17-1: SPIx MODULE BLOCK DIAGRAM (STANDARD MODE)



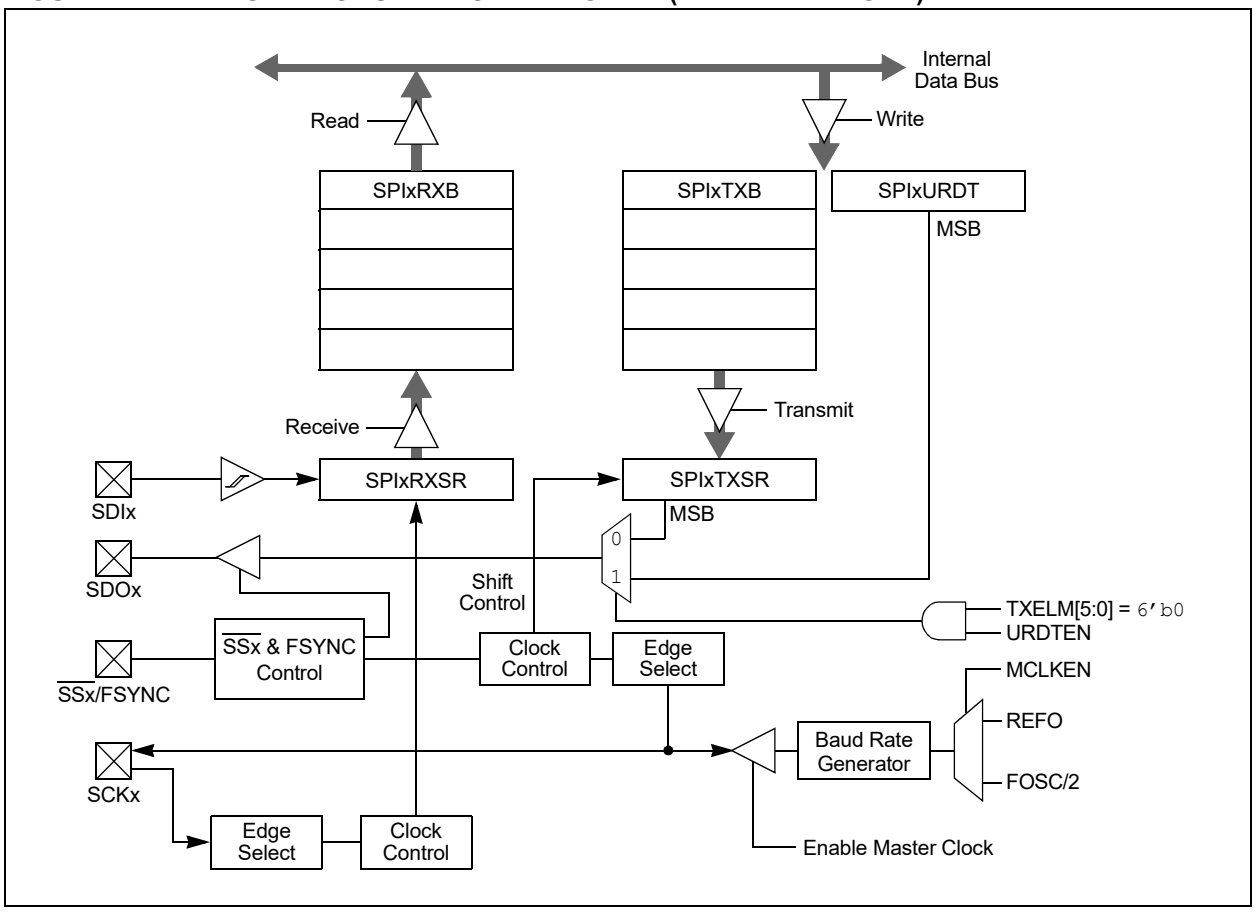
To set up the SPIx module for the Enhanced Buffer Master mode of operation:

1. If using interrupts:
   a) Clear the interrupt flag bits in the respective IFSx register.
   b) Set the interrupt enable bits in the respective IECx register.
   c) Write the SPIxIP bits in the respective IPCx register.
2. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with MSTEN (SPIxCON1L[5]) = `1`.
3. Clear the SPIROV bit (SPIxSTATL[6]).
4. Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
5. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
6. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

To set up the SPIx module for the Enhanced Buffer Slave mode of operation:

1. Clear the SPIxBUFL and SPIxBUFH registers.
2. If using interrupts:
   a) Clear the interrupt flag bits in the respective IFSx register.
   b) Set the interrupt enable bits in the respective IECx register.
   c) Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = `0`.
4. Clear the SMP bit.
5. If the CKE bit is set, then the SSEN bit must be set, thus enabling the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTATL[6]).
7. Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
8. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

FIGURE 17-2: SPIx MODULE BLOCK DIAGRAM (ENHANCED MODE)



To set up the SPIx module for Audio mode:

1. Clear the SPIxBUFL and SPIxBUFH registers.
2. If using interrupts:
   a) Clear the interrupt flag bits in the respective IFSx register.
   b) Set the interrupt enable bits in the respective IECx register.
   a) Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with AUDEN (SPIxCON1H[15]) = 1.
4. Clear the SPIROV bit (SPIxSTATL[6]).
5. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
6. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

0	1		16-Bit Data, 16-Bit FIFO, 32-Bit Channel/64-Bit Frame
0	0		16-Bit FIFO, 16-Bit Channel/32-Bit Frame

Note 1: When AUDEN (SPIxCON1H[15]) = 1, this module functions as if CKE = 0, regardless of its actual value.
2: When FRMEN = 1, SSEN is not used.
3: MCLKEN can only be written when the SPIEN bit = 0.
4: This channel is not meaningful for DSP/PCM mode as LRC follows FRMSYPW.

REGISTER 17-1: SPIxCON1L: SPIx CONTROL REGISTER 1 LOW (CONTINUED)

bit 9 **SMP:** SPIx Data Input Sample Phase bit
Master Mode:
1 = Input data are sampled at the end of data output time
0 = Input data are sampled at the middle of data output time
Slave Mode:
Input data are always sampled at the middle of data output time, regardless of the SMP setting.

bit 8 **CKE:** SPIx Clock Edge Select bit(1)
1 = Transmit happens on transition from active clock state to Idle clock state
0 = Transmit happens on transition from Idle clock state to active clock state

bit 7 **SSEN:** Slave Select Enable bit (Slave mode)(2)
1 = $\overline{SSx}$ pin is used by the macro in Slave mode; $\overline{SSx}$ pin is used as the slave select input
0 = $\overline{SSx}$ pin is not used by the macro ($\overline{SSx}$ pin will be controlled by the port I/O)

bit 6 **CKP:** Clock Polarity Select bit
1 = Idle state for clock is a high level; active state is a low level
0 = Idle state for clock is a low level; active state is a high level

bit 5 **MSTEN:** Master Mode Enable bit
1 = Master mode
0 = Slave mode

bit 4 **DISSDI:** Disable SDIx Input Port bit
1 = SDIx pin is not used by the module; pin is controlled by port function
0 = SDIx pin is controlled by the module

bit 3 **DISSCK:** Disable SCKx Output Port bit
1 = SCKx pin is not used by the module; pin is controlled by port function
0 = SCKx pin is controlled by the module

bit 2 **MCLKEN:** Master Clock Enable bit(3)
1 = REFO is used by the BRG
0 = FOSC/2 is used by the BRG

bit 1 **SPIFE:** Frame Sync Pulse Edge Select bit
1 = Frame Sync pulse (Idle-to-active edge) coincides with the first bit clock
0 = Frame Sync pulse (Idle-to-active edge) precedes the first bit clock

bit 0 **ENHBUF:** Enhanced Buffer Enable bit
1 = Enhanced Buffer mode is enabled
0 = Enhanced Buffer mode is disabled

Note 1: When AUDEN (SPIxCON1H[15]) = 1, this module functions as if CKE = 0, regardless of its actual value.
2: When FRMEN = 1, SSEN is not used.
3: MCLKEN can only be written when the SPIEN bit = 0.
4: This channel is not meaningful for DSP/PCM mode as LRC follows FRMSYPW.

- 1 = Framed SPIx support is enabled ($\overline{SSx}$ pin is used as the FSYNC input/output)
- 0 = Framed SPIx support is disabled

Note 1: AUDEN can only be written when the SPIEN bit = 0.
2: AUDMONO can only be written when the SPIEN bit = 0 and is only valid for AUDEN = 1.
3: URDTEN is only valid when IGNTUR = 1.
4: AUDMOD[1:0] can only be written when the SPIEN bit = 0 and is only valid when AUDEN = 1. When NOT in PCM/DSP mode, this module functions as if FRMSYPW = 1, regardless of its actual value.

REGISTER 17-2: SPIxCON1H: SPIx CONTROL REGISTER 1 HIGH (CONTINUED)

bit 6 **FRMSYNC:** Frame Sync Pulse Direction Control bit
1 = Frame Sync pulse input (slave)
0 = Frame Sync pulse output (master)

bit 5 **FRMPOL:** Frame Sync/Slave Select Polarity bit
1 = Frame Sync pulse/slave select is active-high
0 = Frame Sync pulse/slave select is active-low

bit 4 **MSSEN:** Master Mode Slave Select Enable bit
1 = SPIx slave select support is enabled with polarity determined by FRMPOL ($\overline{SSx}$ pin is automatically driven during transmission in Master mode)
0 = Slave select SPIx support is disabled ($\overline{SSx}$ pin will be controlled by port IO)

bit 3 **FRMSYPW:** Frame Sync Pulse-Width bit
1 = Frame Sync pulse is one serial word length wide (as defined by MODE[32,16]/WLENGTH[4:0])
0 = Frame Sync pulse is one clock (SCK) wide

bit 2-0 **FRMCNT[2:0]:** Frame Sync Pulse Counter bits
Controls the number of serial words transmitted per Sync pulse.
111 = Reserved
110 = Reserved
101 = Generates a Frame Sync pulse on every 32 serial words
100 = Generates a Frame Sync pulse on every 16 serial words
011 = Generates a Frame Sync pulse on every 8 serial words
010 = Generates a Frame Sync pulse on every 4 serial words
001 = Generates a Frame Sync pulse on every 2 serial words (value used by audio protocols)
000 = Generates a Frame Sync pulse on each serial word

Note 1: AUDEN can only be written when the SPIEN bit = 0.
2: AUDMONO can only be written when the SPIEN bit = 0 and is only valid for AUDEN = 1.
3: URDTEN is only valid when IGNTUR = 1.
4: AUDMOD[1:0] can only be written when the SPIEN bit = 0 and is only valid when AUDEN = 1. When NOT in PCM/DSP mode, this module functions as if FRMSYPW = 1, regardless of its actual value.

EQUATION 17-1: RELATIONSHIP BETWEEN DEVICE AND SPIx CLOCK SPEED

$$\text{Baud Rate} = \frac{F_{PB}}{(2 * (\text{SPIxBRG} + 1))}$$

Where:

F_{PB} is the Peripheral Bus Clock Frequency.

18.0 INTER-INTEGRATED CIRCUIT (I^2C)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Inter-Integrated Circuit (I^2C)"** (www.microchip.com/DS70000195). The information in this data sheet supersedes the information in the FRM.

The Inter-Integrated Circuit (I^2C) module is a serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, display drivers, A/D Converters, etc.

The I^2C module supports these features:

- Independent Master and Slave Logic
- 7-Bit and 10-Bit Device Addresses
- General Call Address as Defined in the I^2C Protocol
- Clock Stretching to Provide Delays for the Processor to Respond to a Slave Data Request
- Both 100 kHz and 400 kHz Bus Specifications
- Configurable Address Masking
- Multi-Master Modes to Prevent Loss of Messages in Arbitration
- Bus Repeater mode, Allowing the Acceptance of All Messages as a Slave, Regardless of the Address
- Automatic SCL

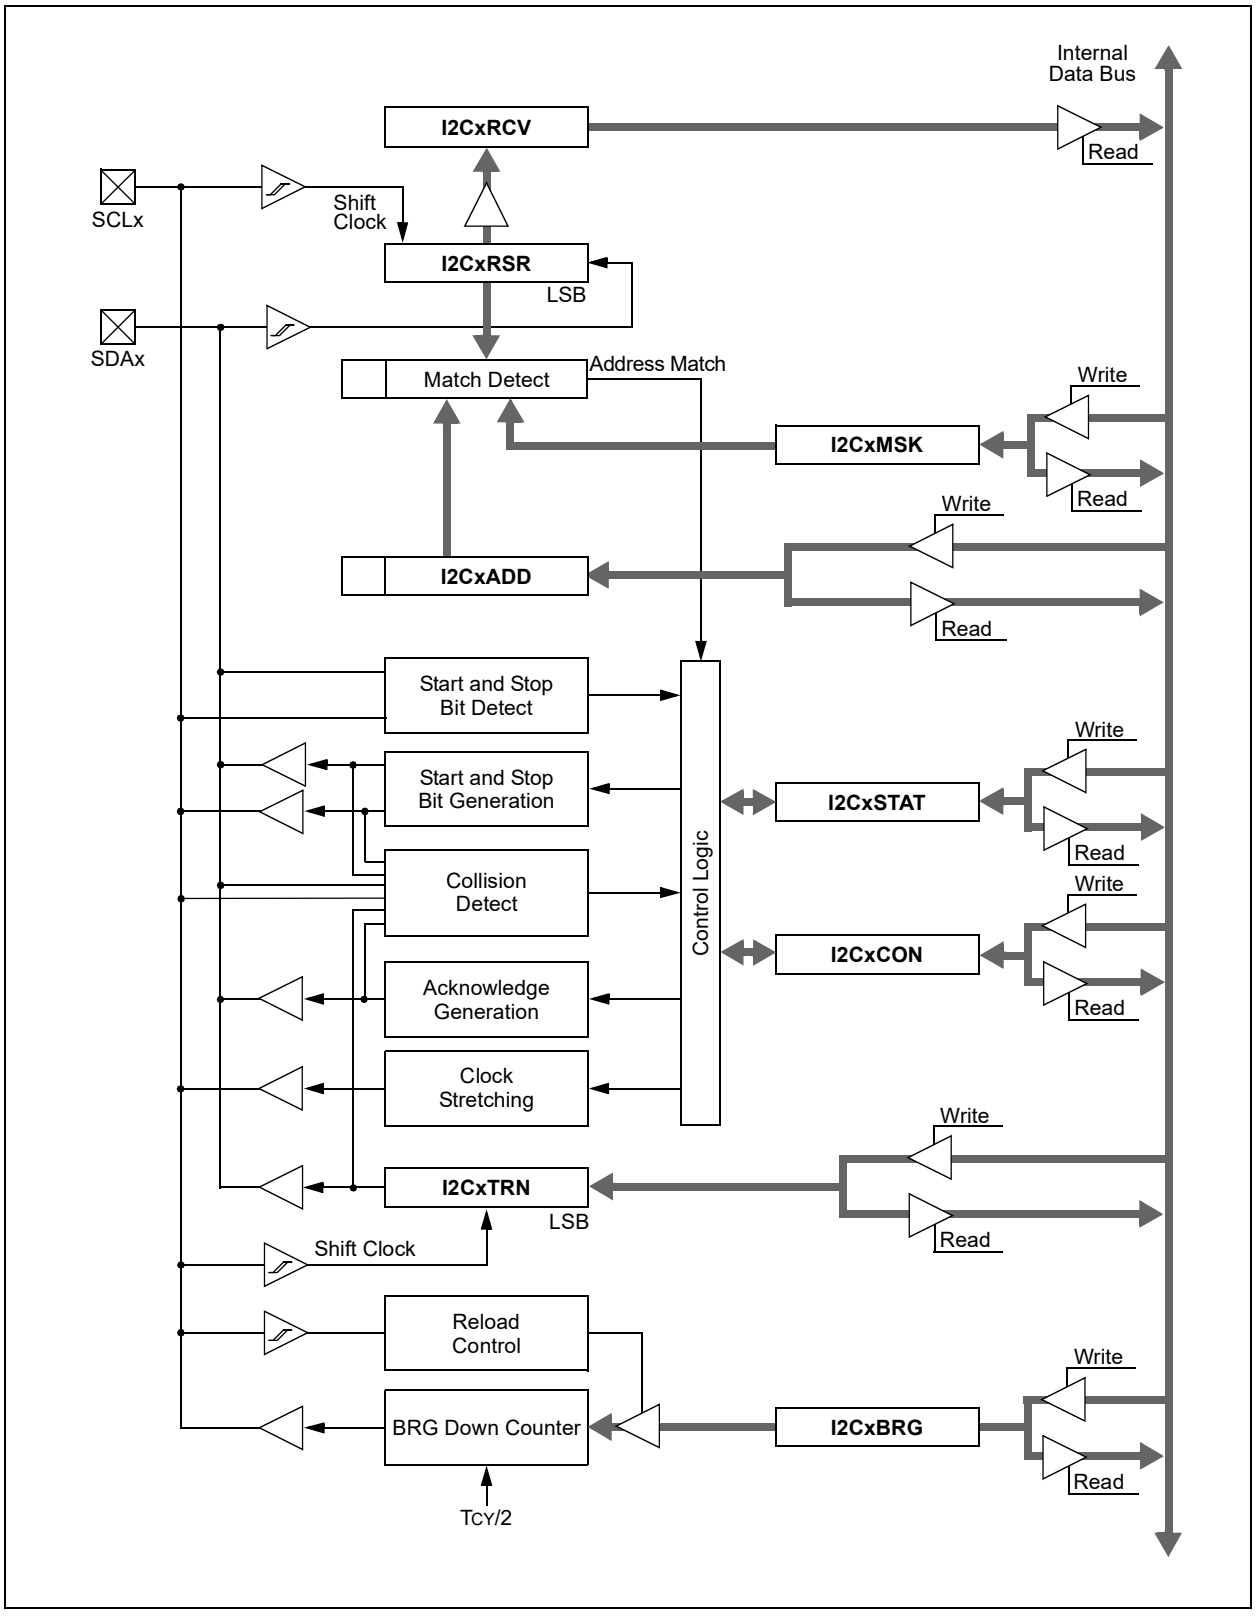
A block diagram of the module is shown in Figure 18-1.

18.1 Communicating as a Master in a Single Master Environment

The details of sending a message in Master mode depends on the communications protocol for the device being communicated with. Typically, the sequence of events is as follows:

1. Assert a Start condition on SDAx and SCLx.
2. Send the I^2C device address byte to the slave with a write indication.
3. Wait for and verify an Acknowledge from the slave.
4. Send the first data byte (sometimes known as the command) to the slave.
5. Wait for and verify an Acknowledge from the slave.
6. Send the serial memory address low byte to the slave.
7. Repeat Steps 4 and 5 until all data bytes are sent.
8. Assert a Repeated Start condition on SDAx and SCLx.
9. Send the device address byte to the slave with a read indication.
10. Wait for and verify an Acknowledge from the slave.
11. Enable master reception to receive serial memory data.
12. Generate an ACK or NACK condition at the end of a received byte of data.
13. Generate a Stop condition on SDAx and SCLx.

FIGURE 18-1: I2Cx BLOCK DIAGRAM



18.2 Setting Baud Rate When Operating as a Bus Master

To compute the Baud Rate Generator reload value, use Equation 18-1.

EQUATION 18-1: COMPUTING BAUD RATE RELOAD VALUE(1,2)

$$F_{SCL} = \frac{F_{CY}}{2 \cdot (BRG + 2)}$$

or

$$BRG = \left(\frac{F_{CY}}{2 \cdot F_{SCL}}\right) - 2$$

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

2: These clock rate values are for guidance only. The actual clock rate can be affected by various system-level parameters. The actual clock rate should be measured in its intended application.

18.3 Slave Address Masking

The I2CxMSK register (Register 18-4) designates address bit positions as "don't care" for both 7-Bit and 10-Bit Addressing modes. Setting a particular bit location (= 1) in the I2CxMSK register causes the slave module to respond, whether the corresponding address bit value is a '0' or a '1'. For example, when I2CxMSK is set to '0010000000', the slave module will detect both addresses, '0000000000' and '0010000000'.

To enable address masking, the Intelligent Peripheral Management Interface (IPMI) must be disabled by clearing the STRICT bit (I2CxCONH[11]).

Note: As a result of changes in the I^2C protocol, the addresses in Table 18-2 are reserved and will not be Acknowledged in Slave mode. This includes any address mask settings that include any of these addresses.

TABLE 18-1: I2Cx CLOCK RATES(1,2)

Required System FSCL	FCY	I2CxBRG Value		Actual FSCL
		(Decimal)	(Hexadecimal)	
100 kHz	16 MHz	157	9D	100 kHz
100 kHz	8 MHz	78	4E	100 kHz
100 kHz	4 MHz	39	27	99 kHz
400 kHz	16 MHz	37	25	404 kHz
400 kHz	8 MHz	18	12	404 kHz
400 kHz	4 MHz	9	9	385 kHz
400 kHz	2 MHz	4	4	385 kHz
1 MHz	16 MHz	13	D	1.026 MHz
1 MHz	8 MHz	6	6	1.026 MHz
1 MHz	4 MHz	3	3	0.909 MHz

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

2: These clock rate values are for guidance only. The actual clock rate can be affected by various system-level parameters. The actual clock rate should be measured in its intended application.

TABLE 18-2: I2Cx RESERVED ADDRESSES(1)

Slave Address	R/$\overline{W}$ Bit	Description
0000 000	0	General Call Address(2)
0000 000	1	Start Byte
0000 001	x	CBus Address
0000 01x	x	Reserved
0000 1xx	x	HS Mode Master Code
1111 0xx	x	10-Bit Slave Upper Byte(3)
1111 1xx	x	Reserved

Note 1: The address bits listed here will never cause an address match independent of address mask settings.

2: This address will be Acknowledged only if GCEN = 1.

3: A match on this address can only occur on the upper byte in 10-Bit Addressing mode.

REGISTER 18-1: I2CxCONL: I2Cx CONTROL REGISTER LOW

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **I2CEN:** I2Cx Enable bit (writable from SW only)
1 = Enables the I2Cx module and configures the SDAx and SCLx pins as serial port pins
0 = Disables the I2Cx module; all I^2C pins are controlled by port functions

bit 14 **Unimplemented:** Read as '0'

bit 13 **I2CSIDL:** I2Cx Stop in Idle Mode bit
1 = Discontinues module operation when device enters Idle mode
0 = Continues module operation in Idle mode

bit 12 **SCKREL:** SCLx Release Control bit (I^2C Slave mode only)(1)
Module resets and (I2CEN = 0) sets SCKREL = 1.
If STREN = 0:(2)
1 = Releases clock
0 = Forces clock low (clock stretch)
If STREN = 1:
1 = Releases clock
0 = Holds clock low (clock stretch); user may program this bit to '0'; clock stretch at next SCLx low

bit 11 **STRICT:** I2Cx Strict Reserved Address Rule Enable bit
1 = Strict reserved addressing is enforced; for reserved addresses, refer to Table 18-2.
(In Slave Mode) – The device doesn't respond to reserved address space and addresses falling in that category are NACKed.
(In Master Mode) – The device is allowed to generate addresses with reserved address space.
0 = Reserved addressing would be Acknowledged.
(In Slave Mode) – The device will respond to an address falling in the reserved address space. When there is a match with any of the reserved addresses, the device will generate an ACK.
(In Master Mode) – Reserved.

bit 10 **A10M:** 10-Bit Slave Address Flag bit
1 = I2CxADD is a 10-bit slave address
0 = I2CADD is a 7-bit slave address

bit 9 **DISSLW:** Slew Rate Control Disable bit
1 = Slew rate control is disabled for Standard Speed mode (100 kHz, also disabled for 1 MHz mode)
0 = Slew rate control is enabled for High-Speed mode (400 kHz)

bit 8 **SMEN:** SMBus Input Levels Enable bit
1 = Enables input logic so thresholds are compliant with the SMBus specification
0 = Disables SMBus-specific inputs

Note 1: Automatically cleared to '0' at the beginning of slave transmission; automatically cleared to '0' at the end of slave reception.
2: Automatically cleared to '0' at the beginning of slave transmission.

REGISTER 18-1: I2CxCONL: I2Cx CONTROL REGISTER LOW (CONTINUED)

bit 7 **GCEN:** General Call Enable bit (I^2C Slave mode only)
1 = Enables interrupt when a general call address is received in I2CxRSR; module is enabled for reception
0 = General call address is disabled.

bit 6 **STREN:** SCLx Clock Stretch Enable bit
In I^2C Slave mode only; used in conjunction with the SCKREL bit.
1 = Enables clock stretching
0 = Disables clock stretching

bit 5 **ACKDT:** Acknowledge Data bit
In I^2C Master mode during Master Receive mode. The value that will be transmitted when the user initiates an Acknowledge sequence at the end of a receive.
In I^2C Slave mode when AHEN = 1 or DHEN = 1. The value that the slave will transmit when it initiates an Acknowledge sequence at the end of an address or data reception.
1 = NACK is sent
0 = ACK is sent

bit 4 **ACKEN:** Acknowledge Sequence Enable bit
In I^2C Master mode only; applicable during Master Receive mode.
1 = Initiates Acknowledge sequence on SDAx and SCLx pins, and transmits ACKDT data bit
0 = Acknowledge sequence is Idle

bit 3 **RCEN:** Receive Enable bit (I^2C Master mode only)
1 = Enables Receive mode for I^2C; automatically cleared by hardware at end of 8-bit receive data byte
0 = Receive sequence is not in progress

bit 2 **PEN:** Stop Condition Enable bit (I^2C Master mode only)
1 = Initiates Stop condition on SDAx and SCLx pins
0 = Stop condition is Idle

bit 1 **RSEN:** Restart Condition Enable bit (I^2C Master mode only)
1 = Initiates Restart condition on SDAx and SCLx pins
0 = Restart condition is Idle

bit 0 **SEN:** Start Condition Enable bit (I^2C Master mode only)
1 = Initiates Start condition on SDAx and SCLx pins
0 = Start condition is Idle

Note 1: Automatically cleared to '0' at the beginning of slave transmission; automatically cleared to '0' at the end of slave reception.

2: Automatically cleared to '0' at the beginning of slave transmission.

0 = I2CxRCV is only updated when I2COV is clear

bit 3 **SDAHT:** SDAx Hold Time Selection bit
1 = Minimum of 300 ns hold time on SDAx after the falling edge of SCLx
0 = Minimum of 100 ns hold time on SDAx after the falling edge of SCLx

bit 2 **SBCDE:** Slave Mode Bus Collision Detect Enable bit (I^2C Slave mode only)
If, on the rising edge of SCLx, SDAx is sampled low when the module is outputting a high state, the BCL bit is set and the bus goes Idle. This detection mode is only valid during data and ACK transmit sequences.
1 = Enables slave bus collision interrupts
0 = Slave bus collision interrupts are disabled

bit 1 **AHEN:** Address Hold Enable bit (I^2C Slave mode only)
1 = Following the 8th falling edge of SCLx for a matching received address byte; SCKREL bit (I2CxCONH[12]) will be cleared and the SCLx will be held low
0 = Address holding is disabled

bit 0 **DHEN:** Data Hold Enable bit (I^2C Slave mode only)
1 = Following the 8th falling edge of SCLx for a received data byte; slave hardware clears the SCKREL bit (I2CxCONH[12]) and SCLx is held low
0 = Data holding is disabled

bit 15 **ACKSTAT:** Acknowledge Status bit (updated in all Master and Slave modes)
1 = Acknowledge was not received from slave
0 = Acknowledge was received from slave

bit 14 **TRSTAT:** Transmit Status bit (when operating as I^2C master; applicable to master transmit operation)
1 = Master transmit is in progress (8 bits + ACK)
0 = Master transmit is not in progress

bit 13 **ACKTIM:** Acknowledge Time Status bit (valid in I^2C Slave mode only)
1 = Indicates I^2C bus is in an Acknowledge sequence, set on 8th falling edge of SCLx clock
0 = Not an Acknowledge sequence, cleared on 9th rising edge of SCLx clock

bit 12-11 **Unimplemented:** Read as '0'

bit 10 **BCL:** Bus Collision Detect bit (Master/Slave mode; cleared when I^2C module is disabled, I2CEN = 0)
1 = A bus collision has been detected during a master or slave transmit operation
0 = No bus collision has been detected

bit 9 **GCSTAT:** General Call Status bit (cleared after Stop detection)
1 = General call address was received
0 = General call address was not received

bit 8 **ADD10:** 10-Bit Address Status bit (cleared after Stop detection)
1 = 10-bit address was matched
0 = 10-bit address was not matched

bit 7 **IWCOL:** I2Cx Write Collision Detect bit
1 = An attempt to write to the I2CxTRN register failed because the I^2C module is busy; must be cleared in software
0 = No collision

bit 6 **I2COV:** I2Cx Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register is still holding the previous byte; I2COV is a "don't care" in Transmit mode, must be cleared in software
0 = No overflow

bit 5 **D/$\overline{A}$:** Data/$\overline{\text{Address}}$ bit (when operating as I^2C slave)
1 = Indicates that the last byte received was data
0 = Indicates that the last byte received or transmitted was an address

bit 4 **P:** I2Cx Stop bit
Updated when Start, Reset or Stop is detected; cleared when the I^2C module is disabled, I2CEN = 0.
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last

REGISTER 18-3: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

bit 3 **S:** I2Cx Start bit
Updated when Start, Reset or Stop is detected; cleared when the I^2C module is disabled, I2CEN = 0.

19.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Universal Asynchronous Receiver Transmitter (UART)"** (www.microchip.com/DS70000582). The information in this data sheet supersedes the information in the FRM.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the PIC24F device family. The UART is a full-duplex, asynchronous system that can communicate with peripheral devices, such as personal computers, LIN/J2602, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins. The UART module includes IrDA® encoder/decoder unit.

The PIC24FJ256GA412/GB412 family devices are equipped with six UART modules, referred to as UART1 through UART6.

The primary features of the UARTx modules are:

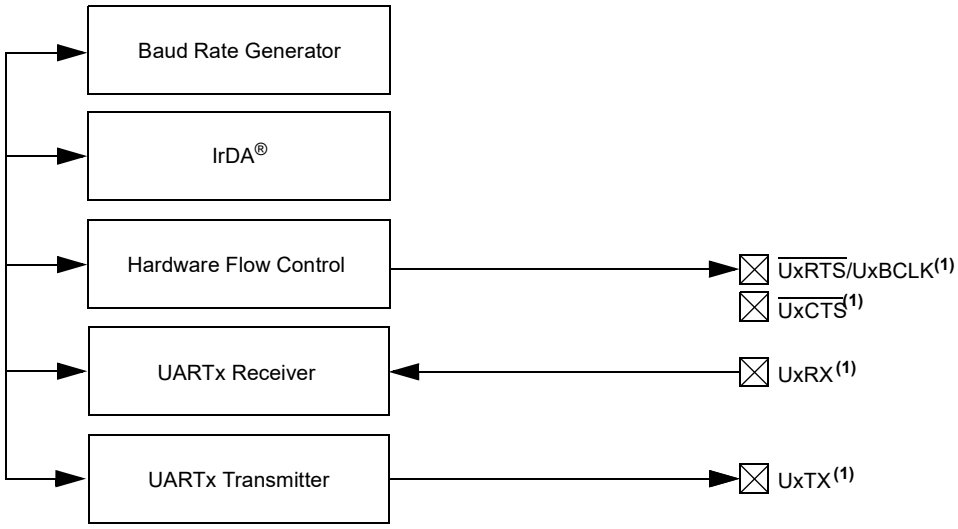
- Full-Duplex, 8 or 9-Bit Data Transmission through the UxTX and UxRX Pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or Two Stop bits
- Hardware Flow Control Option with the $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Pins
- Fully Integrated Baud Rate Generator with 16-Bit Prescaler
- Baud Rates Range from up to 2.5 Mbps and Down to 38 Hz at 40 MIPS in 16x Mode
- Baud Rates Range from up to 10 Mbps and Down to 152 Hz at 40 MIPS in 4x Mode
- 4-Deep, First-In-First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-Bit Mode with Address Detect (9^{th} bit = 1)
- Separate Transmit and Receive Interrupts
- Loopback Mode for Diagnostic Support
- Polarity Control for Transmit and Receive Lines
- Support for Sync and Break Characters
- Supports Automatic Baud Rate Detection
- IrDA® Encoder and Decoder Logic
- Includes DMA Support
- 16x Baud Clock Output for IrDA Support

A simplified block diagram of the UARTx module is shown in Figure 19-1. The UARTx module consists of these key important hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

Note: Throughout this section, references to register and bit names that may be associated with a specific UART module are referred to generically by the use of 'x' in place of the specific module number. Thus, "UxSTAL" might refer to the Status Low register for either UART1, UART2, UART3 or UART4.

FIGURE 19-1: UARTx SIMPLIFIED BLOCK DIAGRAM



Note 1: For UARTs that use Peripheral Pin Select (PPS), their inputs and outputs must all be assigned to available RPn/RPIn pins before use. See **Section 11.5 "Peripheral Pin Select (PPS)"** for more information.

19.1 UARTx Baud Rate Generator (BRG)

The UARTx module includes a dedicated, 16-bit Baud Rate Generator. The UxBRG register controls the period of a free-running, 16-bit timer. Equation 19-1 shows the formula for computation of the baud rate when BRGH = 0.

EQUATION 19-1: UARTx BAUD RATE WITH BRGH = 0(1,2)

$$\text{Baud Rate} = \frac{FCY}{16 \bullet (UxBRG + 1)}$$

$$UxBRG = \frac{FCY}{16 \bullet \text{Baud Rate}} - 1$$

Note 1: FCY denotes the instruction cycle clock frequency (FOSC/2).

2: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

Example 19-1 shows the calculation of the baud rate error for the following conditions:

- FCY = 4 MHz
- Desired Baud Rate = 9600

The maximum baud rate (BRGH = 0) possible is FCY/16 (for UxBRG = 0) and the minimum baud rate possible is FCY/(16 * 65536).

Equation 19-2 shows the formula for computation of the baud rate when BRGH = 1.

EQUATION 19-2: UARTx BAUD RATE WITH BRGH = 1(1,2)

$$\text{Baud Rate} = \frac{FCY}{4 \bullet (UxBRG + 1)}$$

$$UxBRG = \frac{FCY}{4 \bullet \text{Baud Rate}} - 1$$

Note 1: FCY denotes the instruction cycle clock frequency.

2: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

The maximum baud rate (BRGH = 1) possible is FCY/4 (for UxBRG = 0) and the minimum baud rate possible is FCY/(4 * 65536).

Writing a new value to the UxBRG register causes the BRG timer to be reset (cleared). This ensures the BRG does not wait for a timer overflow before generating the new baud rate.

EXAMPLE 19-1: BAUD RATE ERROR CALCULATION (BRGH = 0)(1)

Desired Baud Rate = FCY/(16 (UxBRG + 1))

Solving for UxBRG Value:

UxBRG = ((FCY/Desired Baud Rate)/16) – 1
UxBRG = ((4000000/9600)/16) – 1
UxBRG = 25

Calculated Baud Rate = 4000000/(16 (25 + 1))
= 9615

Error = (Calculated Baud Rate – Desired Baud Rate) / Desired Baud Rate
= (9615 – 9600)/9600
= 0.16%

Note 1: Based on FCY = FOSC/2; Doze mode and PLL are disabled.

19.2 Transmitting in 8-Bit Data Mode

1. Set up the UARTx:
   a) Write appropriate values for data, parity and Stop bits.
   b) Write appropriate baud rate value to the UxBRG register.
   c) Set up transmit and receive interrupt enable and priority bits.
2. Enable the UARTx.
3. Set the UTXEN bit (causes a transmit interrupt, two cycles after being set).
4. Write a data byte to the lower byte of the UxTXREG word. The value will be immediately transferred to the Transmit Shift Register (TSR) and the serial bit stream will start shifting out with the next rising edge of the baud clock.
5. Alternatively, the data byte may be transferred while UTXEN = 0 and then the user may set UTXEN. This will cause the serial bit stream to begin immediately because the baud clock will start from a cleared state.
6. A transmit interrupt will be generated as per interrupt control bits, UTXISEL[1:0].

19.3 Transmitting in 9-Bit Data Mode

1. Set up the UARTx (as described in **Section 19.2 "Transmitting in 8-Bit Data Mode"**).
2. Enable the UARTx.
3. Set the UTXEN bit (causes a transmit interrupt).
4. Write UxTXREG as a 16-bit value only.
5. A word write to UxTXREG triggers the transfer of the 9-bit data to the TSR. The serial bit stream will start shifting out with the first rising edge of the baud clock.
6. A transmit interrupt will be generated as per the setting of control bits, UTXISELx.

19.4 Break and Sync Transmit Sequence

The following sequence will send a message frame header, made up of a Break, followed by an auto-baud Sync byte.

1. Configure the UARTx for the desired mode.
2. Set UTXEN and UTXBRK to set up the Break character.
3. Load the UxTXREG with a dummy character to initiate transmission (value is ignored).
4. Write 55h to UxTXREG; this loads the Sync character into the transmit FIFO.
5. After the Break has been sent, the UTXBRK bit is reset by hardware. The Sync character now transmits.

19.5 Receiving in 8-Bit or 9-Bit Data Mode

1. Set up the UARTx (as described in **Section 19.2 "Transmitting in 8-Bit Data Mode"**).
2. Enable the UARTx.
3. Set the URXEN bit (UxSTAL[12]).
4. A receive interrupt will be generated when one or more data characters have been received as per interrupt control bits, URXISEL[1:0].
5. Read the OERR bit to determine if an overrun error has occurred. The OERR bit must be reset in software.
6. Read UxRXREG.

The act of reading the UxRXREG character will move the next character to the top of the receive FIFO, including a new set of PERR and FERR values.

19.6 Operation of $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ Control Pins

UARTx Clear-to-Send ($\overline{\text{UxCTS}}$) and Request-to-Send ($\overline{\text{UxRTS}}$) are the two hardware controlled pins that are associated with the UARTx modules. These two pins allow the UARTx to operate in Simplex and Flow Control mode. They are implemented to control the transmission and reception between the Data Terminal Equipment (DTE). The UEN[1:0] bits in the UxMODE register configure these pins.

19.7 Infrared Support

The UARTx module provides two types of infrared UART support: one is the IrDA clock output to support an external IrDA encoder and decoder device (legacy module support), and the other is the full implementation of the IrDA encoder and decoder. Note that because the IrDA modes require a 16x baud clock, they will only work when the BRGH bit (UxMODE[3]) is '0'.

19.7.1 IrDA CLOCK OUTPUT FOR EXTERNAL IrDA SUPPORT

To support external IrDA encoder and decoder devices, the UxBCLK pin (same as the $\overline{\text{UxRTS}}$ pin) can be configured to generate the 16x baud clock. With UEN[1:0] = 11, the UxBCLK pin will output the 16x baud clock if the UARTx module is enabled. It can be used to support the IrDA codec chip.

19.7.2 BUILT-IN IrDA ENCODER AND DECODER

The UARTx has full implementation of the IrDA encoder and decoder as part of the UARTx module. The built-in IrDA encoder and decoder functionality is enabled using the IREN bit (UxMODE[12]). When enabled (IREN = 1), the receive pin (UxRX) acts as the input from the infrared receiver. The transmit pin (UxTX) acts as the output to the infrared transmitter.

20.0 UNIVERSAL SERIAL BUS WITH ON-THE-GO SUPPORT (USB OTG)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"USB On-The-Go (OTG)"** (www.microchip.com/DS39721). The information in this data sheet supersedes the information in the FRM.

PIC24FJ256GB412 family devices contain a full-speed and low-speed compatible, On-The-Go (OTG) USB Serial Interface Engine (SIE). The OTG capability allows the device to act as either a USB peripheral device or as a USB embedded host with limited host capabilities. The OTG capability allows the device to dynamically switch from device to host operation using OTG's Host Negotiation Protocol (HNP).

For more details on OTG operation, refer to the *"On-The-Go Supplement"* to the *"USB 2.0 Specification"*, published by the USB-IF. For more details on USB operation, refer to the *"Universal Serial Bus Specification"*, v2.0.

Note: USB functionality is not available on PIC24FJ256GA412 family devices.

The USB OTG module offers these features:

- USB Functionality in Device and Host Modes, and OTG Capabilities for Application-Controlled Mode Switching
- Software-Selectable Module Speeds of Full Speed (12 Mbps) or Low Speed (1.5 Mbps, available in Host mode only)
- Support for All Four USB Transfer Types: Control, Interrupt, Bulk and Isochronous
- 16 Bidirectional Endpoints for a Total of 32 Unique Endpoints
- DMA Interface for Data RAM Access
- Queues up to Sixteen Unique Endpoint Transfers without Servicing
- Integrated, On-Chip USB Transceiver with Support for Off-Chip Transceivers via a Digital Interface
- Integrated VBUS Generation with On-Chip Comparators and Boost Generation, and Support of External VBUS Comparators and Regulators through a Digital Interface
- Configurations for On-chip Bus Pull-up and Pull-Down Resistors

A simplified block diagram of the USB OTG module is shown in Figure 20-1.

The USB OTG module can function as a USB peripheral device or as a USB host, and may dynamically switch between Device and Host modes under software control. In either mode, the same data paths and Buffer Descriptors (BDs) are used for the transmission and reception of data.

In discussing USB operation, this section will use a controller-centric nomenclature for describing the direction of the data transfer between the microcontroller and the USB. RX (Receive) will be used to describe transfers that move data from the USB to the microcontroller and TX (Transmit) will be used to describe transfers that move data from the microcontroller to the USB. Table 20-1 shows the relationship between data direction in this nomenclature and the USB tokens exchanged.

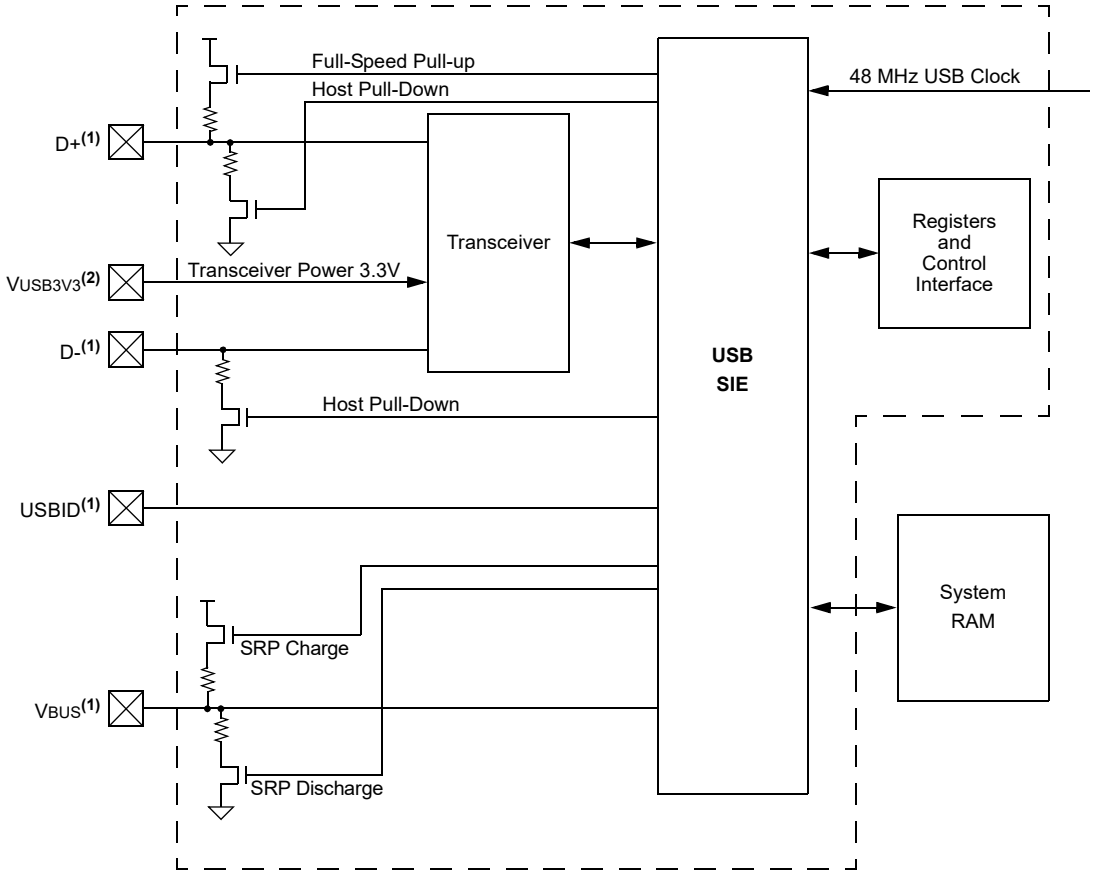
TABLE 20-1: CONTROLLER-CENTRIC DATA DIRECTION FOR USB HOST OR TARGET

USB Mode	Direction	
	RX	TX
Device	OUT or SETUP	IN
Host	IN	OUT or SETUP

This chapter presents the most basic operations needed to implement USB OTG functionality in an application. A complete and detailed discussion of the USB protocol and its OTG supplement are beyond the scope of this data sheet. It is assumed that the user already has a basic understanding of USB architecture and the latest version of the protocol.

Not all steps for proper USB operation (such as device enumeration) are presented here. It is recommended that application developers use an appropriate device driver to implement all of the necessary features. Microchip provides a number of application-specific resources, such as USB firmware and driver support. Refer to www.microchip.com/usb for the latest firmware and driver support.

FIGURE 20-1: USB OTG MODULE BLOCK DIAGRAM



Note 1: Pins are multiplexed with digital I/O and other device features.

2: Connecting V_{BUS3V3} to V_{DD} is highly recommended, as floating this input can cause increased I_{PD} currents. The pin should be tied to V_{DD} when the USB functions are not used.

20.1 Hardware Configuration

20.1.1 DEVICE MODE

20.1.1.1 D+ Pull-up Resistor

PIC24FJ256GA412/GB412 family devices have a built-in 1.5 kΩ resistor on the D+ line that is available when the microcontroller is operating in Device mode. This is used to signal an external host that the device is operating in Full-Speed Device mode. It is engaged by setting the USBEN bit (U1CON[0]) and powering up the USB module (USBPWR = 1). If the OTGEN bit (U1OTGCON[2]) is set, then the D+ pull-up is enabled through the DPPULUP bit (U1OTGCON[7]).

20.1.1.2 The VBUS Pin

In order to meet the USB 2.0 specification requirement, relating to the back drive voltage on the D+/D- pins, the USB module incorporates VBUS-level sensing comparators. When the comparators detect the VBUS level below the VA_SESS_VLD level, the hardware will automatically disable the D+ pull-up resistor described in **Section 20.1.1.1 "D+ Pull-up Resistor"**. This allows the device to automatically meet the back drive requirement for D+ and D-, even if the application firmware does not explicitly monitor the VBUS level. Therefore, the VBUS microcontroller pin should not be left floating in USB Device mode application designs, and should normally be connected to the VBUS pin on the USB connector/cable (either directly or through a small resistance ≤ 100 ohms).

20.1.1.3 Power Modes

Many USB applications will likely have several different sets of power requirements and configuration. The most common power modes encountered are:

- Bus Power Only mode
- Self-Power Only mode
- Dual Power with Self-Power Dominance mode

Bus Power Only mode (Figure 20-2) is effectively the simplest method. All power for the application is drawn from the USB.

To meet the inrush current requirements of the *"USB 2.0 OTG Specification"*, the total effective capacitance, appearing across VBUS and ground, must be no more than 10 µF.

In the USB Suspend mode, devices must consume no more than 2.5 mA from the 5V VBUS line of the USB cable. During the USB Suspend mode, the D+ or D- pull-up resistor must remain active, which will consume some of the allowed suspend current.

In Self-Power Only mode (Figure 20-3), the USB application provides its own power, with very little power being pulled from the USB. Note that an attach indication is added to indicate when the USB has been connected and the host is actively powering VBUS.

To meet compliance specifications, the USB module (and the D+ or D- pull-up resistor) should not be enabled until the host actively drives VBUS high. One of the 5.5V tolerant I/O pins may be used for this purpose.

The application should never source any current onto the 5V VBUS pin of the USB cable when the USB module is operated in USB Device mode.

The Dual Power with Self-Power Dominance mode (Figure 20-4) allows the application to use internal power primarily, but switch to power from the USB when no internal power is available. Dual power devices must also meet all of the special requirements for inrush current and Suspend mode current previously described, and must not enable the USB module until VBUS is driven high.

FIGURE 20-2: BUS POWER ONLY INTERFACE EXAMPLE

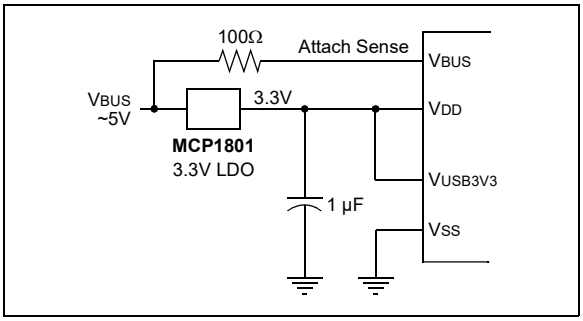


FIGURE 20-3: SELF-POWER ONLY

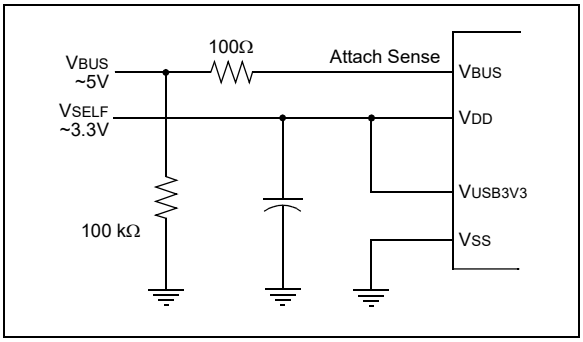

FIGURE 20-4: DUAL POWER EXAMPLE

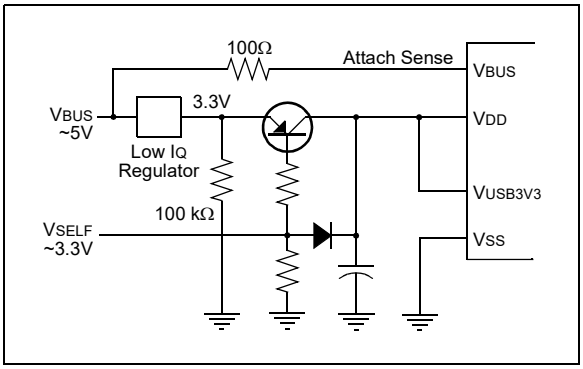

20.1.2 HOST AND OTG MODES

20.1.2.1 D+ and D- Pull-Down Resistors

PIC24FJ256GA412/GB412 family devices have a built-in 15 kΩ pull-down resistor on the D+ and D- lines. These are used in tandem to signal to the bus that the microcontroller is operating in Host mode. They are engaged by setting the HOSTEN bit (U1CON[3]). If the OTGEN bit (U1OTGCON[2]) is set, then these pull-downs are enabled by setting the DPPULDWN and DMPULDWN bits (U1OTGCON[5:4]).

20.1.2.2 Power Configurations

In Host mode, as well as Host mode in On-The-Go operation, the *"USB 2.0 OTG Specification"* requires that the host application should supply power on VBUS. Since the microcontroller is running below VBUS, and is not able to source sufficient current, a separate power supply must be provided.

When the application is always operating in Host mode, a simple circuit can be used to supply VBUS and regulate current on the bus (Figure 20-5). For OTG operation, it is necessary to be able to turn VBUS on or off as needed, as the microcontroller switches between Device and Host modes. A typical example using an external charge pump is shown in Figure 20-6.

FIGURE 20-5: HOST INTERFACE EXAMPLE

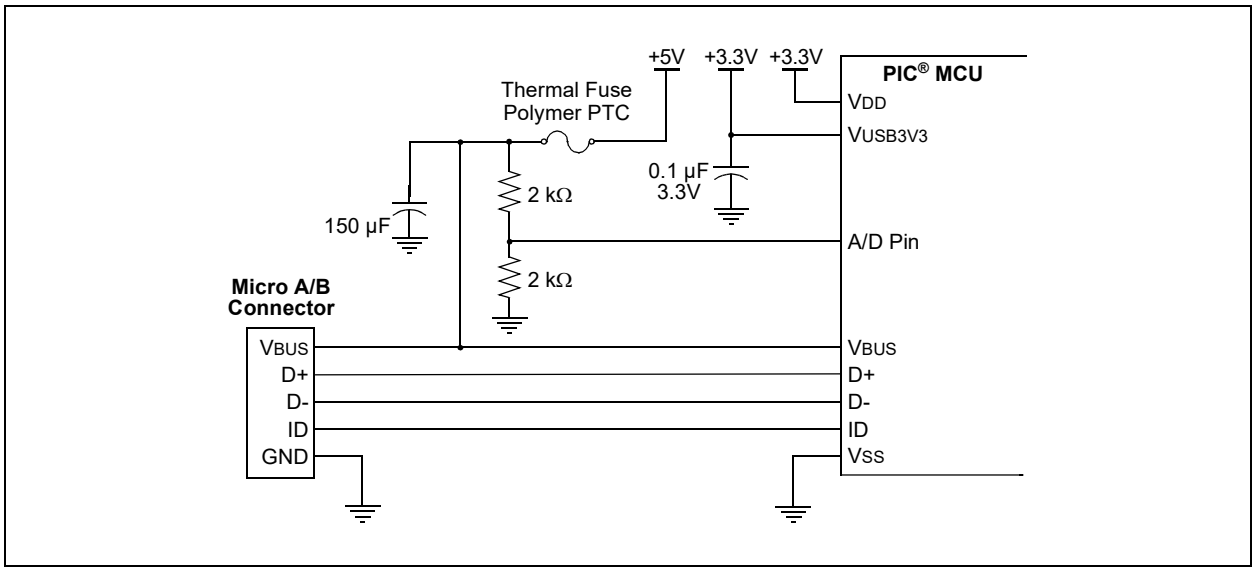

FIGURE 20-6: OTG INTERFACE EXAMPLE

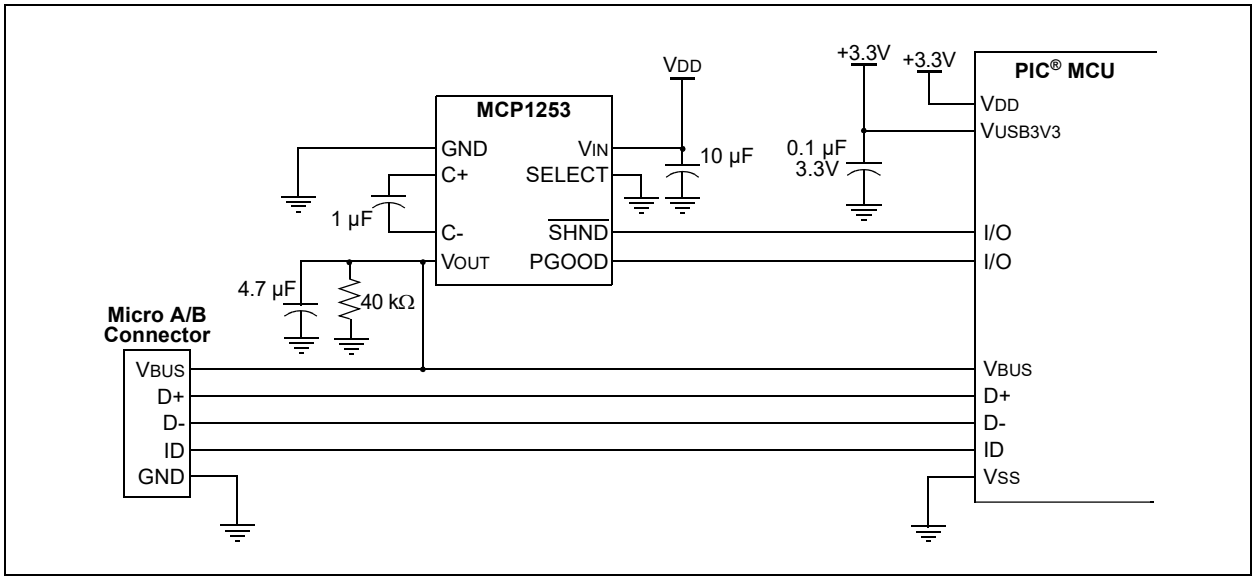


20.1.3 CALCULATING TRANSCEIVER POWER REQUIREMENTS

The USB transceiver consumes a variable amount of current depending on the characteristic impedance of the USB cable, the length of the cable, the V_{USB3V3} supply voltage and the actual data patterns moving across the USB cable. Longer cables have larger capacitances and consume more total energy when switching output states. The total transceiver current consumption will be application-specific.

Equation 20-1 can help estimate how much current actually may be required in full-speed applications. Refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"USB On-The-Go (OTG)"** (www.microchip.com/DS39721) for a complete discussion on transceiver power consumption.

EQUATION 20-1: ESTIMATING USB TRANSCEIVER CURRENT CONSUMPTION

$$I_{XCVR} = \frac{40\ mA \bullet V_{USB3V3} \bullet P_{ZERO} \bullet P_{IN} \bullet L_{CABLE}}{3.3V \bullet 5m} + I_{PULLUP}$$

Legend: V_{USB3V3} – Voltage applied to the V_{USB3V3} pin in volts (3.0V to 3.6V).

P_{ZERO} – Percentage (in decimal) of the IN traffic bits sent by the PIC® microcontroller that are a value of '0'.

P_{IN} – Percentage (in decimal) of total bus bandwidth that is used for IN traffic.

L_{CABLE} – Length (in meters) of the USB cable. The *"USB 2.0 OTG Specification"* requires that full-speed applications use cables no longer than 5m.

I_{PULLUP} – Current which the nominal, 1.5 kΩ pull-up resistor (when enabled) must supply to the USB cable.

20.2 USB Buffer Descriptors and the BDT

Endpoint buffer control is handled through a structure called the Buffer Descriptor Table (BDT). This provides a flexible method for users to construct and control endpoint buffers of various lengths and configurations.

The BDT can be located in any available 512-byte, aligned block of data RAM. The BDT Pointer (U1BDTP1) contains the upper address byte of the BDT and sets the location of the BDT in RAM. The user must set this pointer to indicate the table's location.

The BDT is composed of Buffer Descriptors (BDs) which are used to define and control the actual buffers in the USB RAM space. Each BD consists of two 16-bit, "soft" (non-fixed address) registers, BDnSTAT and BDnADR, where n represents one of the 64 possible BDs (range of 0 to 63). BDnSTAT is the status register for BDn, while BDnADR specifies the starting address for the buffer associated with BDn.

Note:	Since BDnADR is a 16-bit register, only the first 64 Kbytes of RAM can be accessed by the USB module.

Depending on the endpoint buffering configuration used, there are up to 64 sets of Buffer Descriptors, for a total of 256 bytes. At a minimum, the BDT must be at least 8 bytes long. This is because the *"USB 2.0 OTG Specification"* mandates that every device must have Endpoint 0 with both input and output for initial setup.

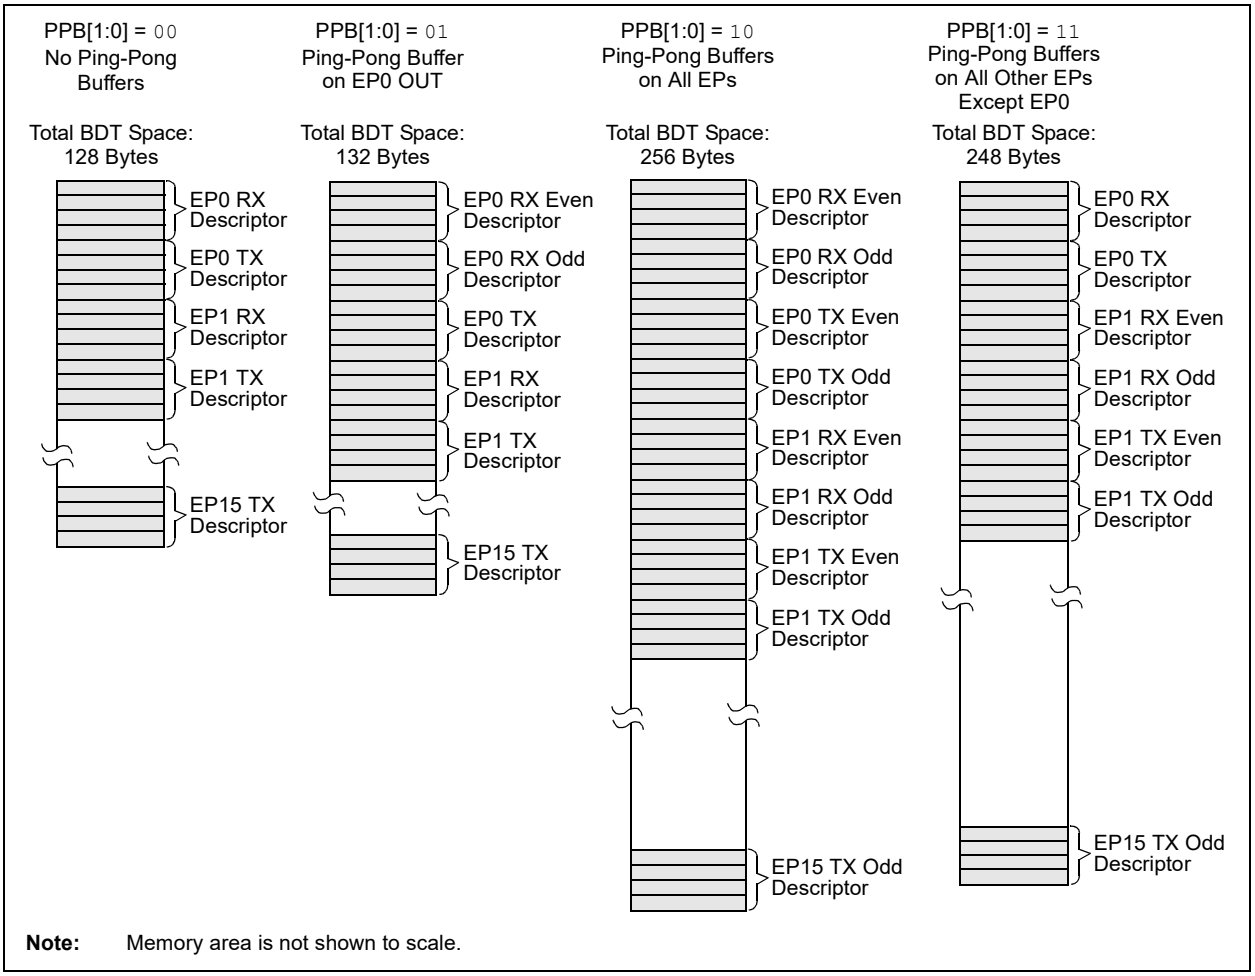
Endpoint mapping in the BDT is dependent on three variables:

- Endpoint number (0 to 15)
- Endpoint direction (RX or TX)
- Ping-pong settings (U1CNFG1[1:0])

Figure 20-7 illustrates how these variables are used to map endpoints in the BDT.

In Host mode, only Endpoint 0 Buffer Descriptors are used. All transfers utilize the Endpoint 0 Buffer Descriptor and Endpoint Control register (U1EP0). For received packets, the attached device's source endpoint is indicated by the value of ENDPT[3:0] in the USB status register (U1STAT[7:4]). For transmitted packets, the attached device's destination endpoint is indicated by the value written to the USB Token register (U1TOK).

FIGURE 20-7: BDT MAPPING FOR ENDPOINT BUFFERING MODES



Note: Memory area is not shown to scale.

BDs have a fixed relationship to a particular endpoint, depending on the buffering configuration. Table 20-2 provides the mapping of BDs to endpoints. This relationship also means that gaps may occur in the BDT if endpoints are not enabled contiguously. This, theoretically, means that the BDs for disabled endpoints could be used as buffer space. In practice, users should avoid using such spaces in the BDT unless a method of validating BD addresses is implemented.

20.2.1 BUFFER OWNERSHIP

Because the buffers and their BDs are shared between the CPU and the USB module, a simple semaphore mechanism is used to distinguish which is allowed to update the BD and associated buffers in memory. This is done by using the UOWN bit as a semaphore to distinguish which is allowed to update the BD and associated buffers in memory. UOWN is the only bit that is shared between the two configurations of BDnSTAT.

When UOWN is clear, the BD entry is “owned” by the microcontroller core. When the UOWN bit is set, the BD entry and the buffer memory are “owned” by the USB peripheral. The core should not modify the BD or its corresponding data buffer during this time. Note that the microcontroller core can still read BDnSTAT while the SIE owns the buffer and vice versa.

The Buffer Descriptors have a different meaning based on the source of the register update. Register 20-1 and Register 20-2 show the differences in BDnSTAT depending on its current “ownership”.

When UOWN is set, the user can no longer depend on the values that were written to the BDs. From this point, the USB module updates the BDs as necessary, overwriting the original BD values. The BDnSTAT register is updated by the SIE with the token PID and the transfer count is updated.

20.2.2 DMA INTERFACE

The USB OTG module uses a dedicated DMA to access both the BDT and the endpoint data buffers. Since part of the address space of the DMA is dedicated to the Buffer Descriptors, a portion of the memory connected to the DMA must comprise a contiguous address space, properly mapped for the access by the module.

TABLE 20-2: ASSIGNMENT OF BUFFER DESCRIPTORS FOR THE DIFFERENT BUFFERING MODES

Endpoint	BDs Assigned to Endpoint							
	Mode 0 (No Ping-Pong)		Mode 1 (Ping-Pong on EP0 OUT)		Mode 2 (Ping-Pong on All EPs)		Mode 3 (Ping-Pong on All Other EPs, Except EP0)

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **UOWN:** USB Own bit

1 = The USB module owns the BD and its corresponding buffer; the CPU must not modify the BD or the buffer

bit 14 **DTS:** Data Toggle Packet bit

1 = Data 1 packet
0 = Data 0 packet

bit 13-10 **PID[3:0]:** Packet Identifier bits (written by the USB module)

In Device Mode:
Represents the PID of the received token during the last transfer.

In Host Mode:
Represents the last returned PID or the transfer status indicator.

bit 9-0 **BC[9:0]:** Byte Count bits

This represents the number of bytes to be transmitted or the maximum number of bytes to be received during a transfer. Upon completion, the byte count is updated by the USB module with the actual number of bytes transmitted or received.

REGISTER 20-2: BDnSTAT: BUFFER DESCRIPTOR n STATUS REGISTER PROTOTYPE, CPU MODE (BD0STAT THROUGH BD63STAT)

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **UOWN:** USB Own bit
- 0 = The microcontroller core owns the BD and its corresponding buffer; the USB module ignores all other fields in the BD

bit 14 **DTS:** Data Toggle Packet bit(1)
- 1 = Data 1 packet
- 0 = Data 0 packet

bit 13-12 **Reserved:** Maintain as '0'

bit 11 **DTSEN:** Data Toggle Synchronization Enable bit
- 1 = Data toggle synchronization is enabled; data packets with incorrect Sync value will be ignored
- 0 = No data toggle synchronization is performed

bit 10 **BSTALL:** Buffer STALL Enable bit
- 1 = Buffer STALL is enabled; Stall handshake issued if a token is received that would use the BD in the given location (UOWN bit remains set, BD value is unchanged); corresponding EPSTALL bit will get set on any STALL handshake
- 0 = Buffer STALL is disabled

bit 9-0 **BC[9:0]:** Byte Count bits

This represents the number of bytes to be transmitted or the maximum number of bytes to be received during a transfer. Upon completion, the byte count is updated by the USB module with the actual number of bytes transmitted or received.

Note 1: This bit is ignored unless DTSEN = 1.

20.3 USB Interrupts

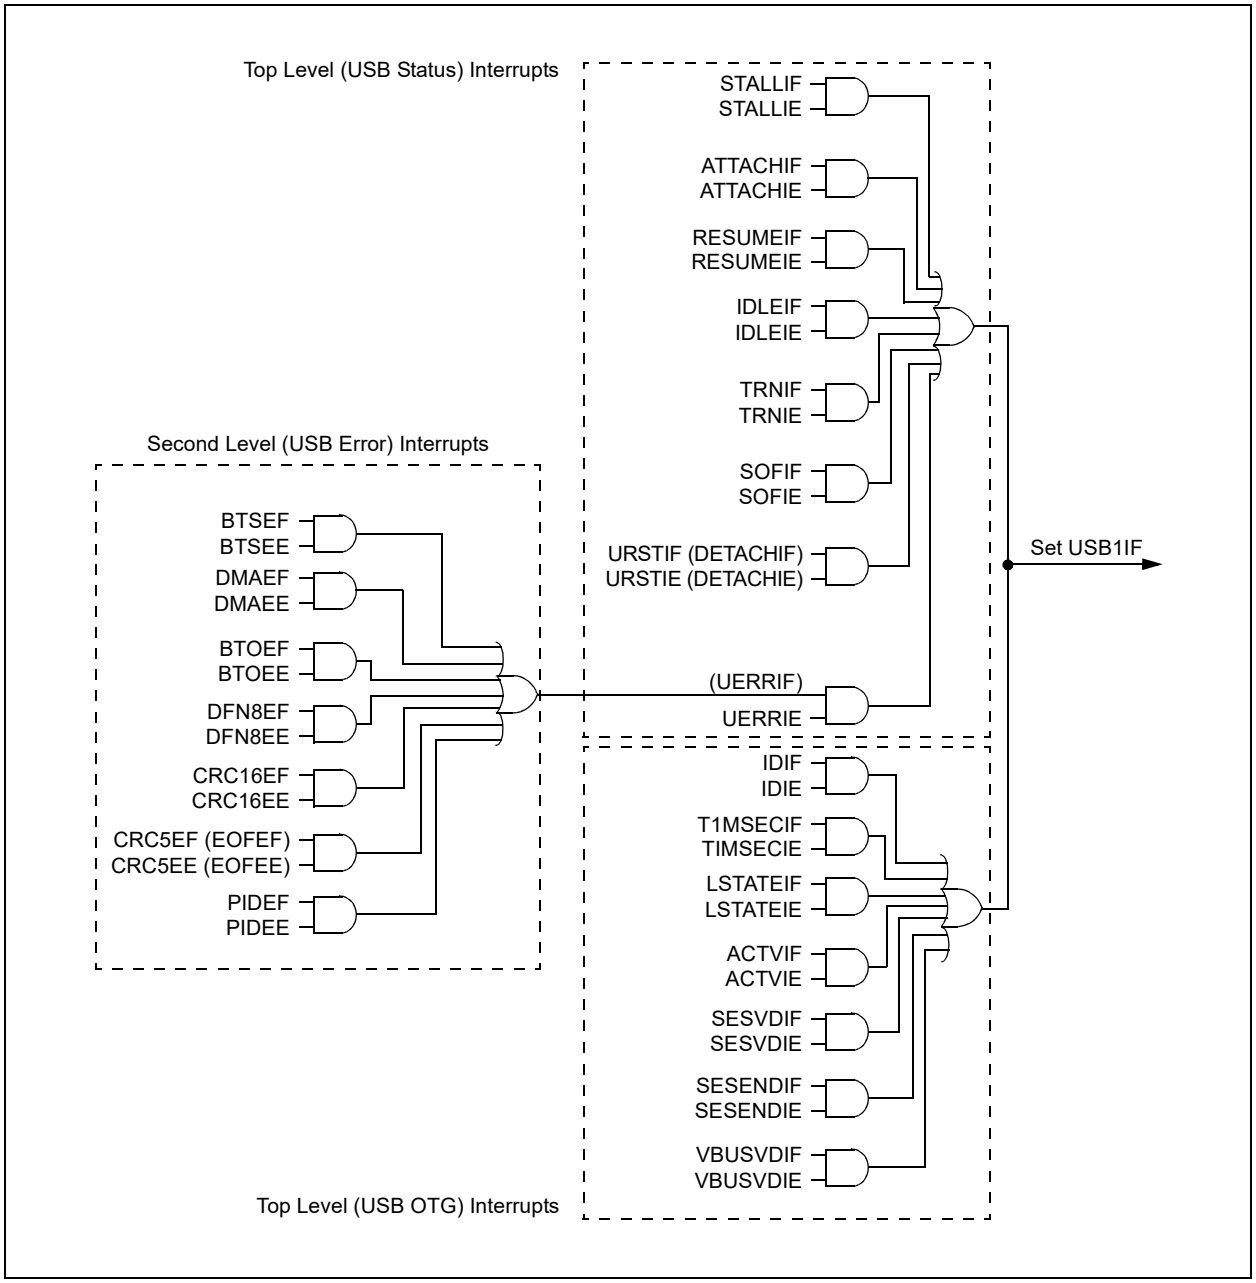
The USB OTG module has many conditions that can be configured to cause an interrupt. All interrupt sources use the same interrupt vector.

Figure 20-8 shows the interrupt logic for the USB module. There are two layers of interrupt registers in the USB module. The top level consists of overall USB status interrupts; these are enabled and flagged in the U1IE and U1IR registers, respectively. The second level consists of USB error conditions, which are enabled and flagged in the U1EIR and U1EIE registers.

An interrupt condition in any of these triggers a USB Error Interrupt Flag (UERRIF) in the top level. Unlike the device-level interrupt flags in the IFSx registers, USB interrupt flags in the U1IR registers can only be cleared by writing a '1' to the bit position.

Interrupts may be used to trap routine events in a USB transaction. Figure 20-9 provides some common events within a USB frame and their corresponding interrupts.

FIGURE 20-8: USB OTG INTERRUPT FUNNEL

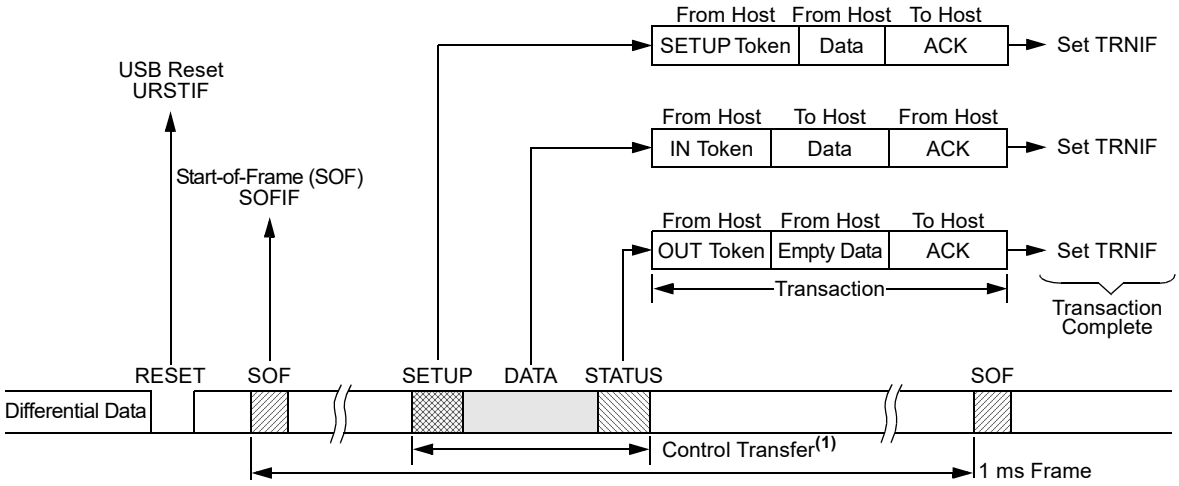


20.3.1 CLEARING USB OTG INTERRUPTS

Unlike device-level interrupts, the USB OTG interrupt status flags are not freely writable in software. All USB OTG flag bits are implemented as hardware settable only bits. Additionally, these bits can only be cleared in software by writing a '1' to their locations (i.e., performing a MOV type instruction). Writing a '0' to a flag bit (i.e., a BCLR instruction) has no effect.

Note: Throughout this data sheet, a bit that can only be cleared by writing a '1' to its location is referred to as "Write 1 to Clear". In register descriptions, this function is indicated by the descriptor, "K".

FIGURE 20-9: EXAMPLE OF A USB TRANSACTION AND INTERRUPT EVENTS



Note 1: The control transfer shown here is only an example showing events that can occur for every transaction. Typical control transfers will spread across multiple frames.

20.4 Device Mode Operation

The following section describes how to perform a common Device mode task. In Device mode, USB transfers are performed at the transfer level. The USB module automatically performs the status phase of the transfer.

20.4.1 ENABLING DEVICE MODE

1. Reset the Ping-Pong Buffer Pointers by setting, then clearing, the Ping-Pong Buffer Reset bit, PPBRST (U1CON[1]).
2. Disable all interrupts (U1IE and U1EIE = 00h).
3. Clear any existing interrupt flags by writing FFh to U1IR and U1EIR.
4. Verify that VBUS is present (non-OTG devices only).
5. Enable the USB module by setting the USBEN bit (U1CON[0]).
6. Set the OTGEN bit (U1OTGCON[2]) to enable OTG operation.
7. Enable the endpoint zero buffer to receive the first setup packet by setting the EPRXEN and EPHSHK bits for Endpoint 0 (U1EP0[3,0] = 1).
8. Power up the USB module by setting the USBPWR bit (U1PWRC[0]).
9. Enable the D+ pull-up resistor to signal an attach by setting the DPPULUP bit (U1OTGCON[7]).

20.4.2 RECEIVING AN IN TOKEN IN DEVICE MODE

1. Attach to a USB host and enumerate as described in Chapter 9 of the *"USB 2.0 Specification"*.
2. Create a data buffer and populate it with the data to send to the host.
3. In the appropriate (even or odd) TX BD for the desired endpoint:
   a) Set up the status register (BDnSTAT) with the correct data toggle (DATA0/1) value and the byte count of the data buffer.
   b) Set up the address register (BDnADR) with the starting address of the data buffer.
   c) Set the UOWN bit of the status register to '1'.
4. When the USB module receives an IN token, it automatically transmits the data in the buffer. Upon completion, the module updates the status register (BDnSTAT) and sets the Token Complete Interrupt Flag, TRNIF (U1IR[3]).

20.4.3 RECEIVING AN OUT TOKEN IN DEVICE MODE

1. Attach to a USB host and enumerate as described in Chapter 9 of the *"USB 2.0 Specification"*.
2. Create a data buffer with the amount of data you are expecting from the host.
3. In the appropriate (even or odd) TX BD for the desired endpoint:
   a) Set up the status register (BDnSTAT) with the correct data toggle (DATA0/1) value and the byte count of the data buffer.
   b) Set up the address register (BDnADR) with the starting address of the data buffer.
   c) Set the UOWN bit of the status register to '1'.
4. When the USB module receives an OUT token, it automatically receives the data sent by the host to the buffer. Upon completion, the module updates the status register (BDnSTAT) and sets the Token Complete Interrupt Flag, TRNIF (U1IR[3]).

20.5 Host Mode Operation

The following sections describe how to perform common Host mode tasks. In Host mode, USB transfers are invoked explicitly by the host software. The host software is responsible for the Acknowledge portion of the transfer. Also, all transfers are performed using the USB Endpoint 0 Control register (U1EP0) and Buffer Descriptors.

20.5.1 ENABLE HOST MODE AND DISCOVER A CONNECTED DEVICE

1. Enable Host mode by setting the HOSTEN bit (U1CON[3]). This causes the Host mode control bits in other USB OTG registers to become available.
2. Enable the D+ and D- pull-down resistors by setting the DPPULDWN and DMPULDWN bits (U1OTGCON[5:4]). Disable the D+ and D- pull-up resistors by clearing the DPPULUP and DMPULUP bits (U1OTGCON[7:6]).
3. At this point, SOF generation begins with the SOF counter loaded with 12,000. Eliminate noise on the USB by clearing the SOFEN bit (U1CON[0]) to disable Start-of-Frame (SOF) packet generation.
4. Enable the device attached interrupt by setting the ATTACHIE bit (U1IE[6]).
5. Wait for the device attached interrupt (U1IR[6] = 1). This is signaled by the USB device changing the state of D+ or D- from '0' to '1' (SE0 to J-state). After it occurs, wait 100 ms for the device power to stabilize.
6. Check the state of the JSTATE and SE0 bits in U1CON. If the JSTATE bit (U1CON[7]) is '0', the connecting device is low speed. If the connecting device is low speed, set the LSPDEN and LSPD bits (U1ADDR[7] and U1EP0[7]) to enable low-speed operation.
7. Reset the USB device by setting the USBRST bit (U1CON[4]) for at least 50 ms, sending Reset signaling on the bus. After 50 ms, terminate the Reset by clearing USBRST.
8. In order to keep the connected device from going into suspend, enable the SOF packet generation by setting the SOFEN bit.
9. Wait 10 ms for the device to recover from Reset.
10. Perform enumeration as described by Chapter 9 of the *"USB 2.0 Specification"*.

20.5.2 COMPLETE A CONTROL TRANSACTION TO A CONNECTED DEVICE

1. Follow the procedure described in **Section 20.5.1 "Enable Host Mode and Discover a Connected Device"** to discover a device.
2. Set up the Endpoint Control register for bidirectional control transfers by writing 0Dh to U1EP0 (this sets the EPCONDIS, EPTXEN and EPHSHK bits).
3. Place a copy of the device framework setup command in a memory buffer. See Chapter 9 of the *"USB 2.0 Specification"* for information on the device framework command set.
4. Initialize the Buffer Descriptor (BD) for the current (even or odd) TX EP0 to transfer the eight bytes of command data for a device framework command (i.e., `GET DEVICE DESCRIPTOR`):
   a) Set the BD Data Buffer Address (BD0ADR) to the starting address of the 8-byte memory buffer containing the command.
   b) Write 8008h to BD0STAT (this sets the UOWN bit and sets a byte count of 8).
5. Set the USB device address of the target device in the address register (U1ADDR[6:0]). After a USB bus Reset, the device USB address will be zero. After enumeration, it will be set to another value between 1 and 127.
6. Write D0h to U1TOK; this is a SETUP token to Endpoint 0, the target device's default control pipe. This initiates a SETUP token on the bus, followed by a data packet. The device handshake is returned in the PID field of BD0STAT after the packets are complete. When the USB module updates BD0STAT, a Token Complete Interrupt Flag is asserted (the TRNIF flag is set). This completes the setup phase of the setup transaction, as referenced in Chapter 9 of the *"USB 2.0 Specification"*.
7. To initiate the data phase of the setup transaction (i.e., get the data for the `GET DEVICE DESCRIPTOR` command), set up a buffer in memory to store the received data.
8. Initialize the current (even or odd) RX or TX (RX for IN, TX for OUT) EP0 BD to transfer the data.
   a) Write C040h to BD0STAT. This sets the UOWN, configures Data Toggle (DTS) to DATA1 and sets the byte count to the length of the data buffer (64 or 40h in this case).
   b) Set BD0ADR to the starting address of the data buffer.
9. Write the Token register with the appropriate IN or OUT token to Endpoint 0, the target device's default control pipe (e.g., write 90h to U1TOK for an IN token for a `GET DEVICE DESCRIPTOR` command). This initiates an IN token on the bus, followed by a data packet from the device to the host. When the data packet completes, the BD0STAT is written and a Token Complete Interrupt Flag is asserted (the TRNIF flag is set). For control transfers with a single packet data phase, this completes the data phase of the setup transaction, as referenced in Chapter 9 of the *"USB 2.0 Specification"*. If more data need to be transferred, return to Step 8.
10. To initiate the status phase of the setup transaction, set up a buffer in memory to receive or send the zero length status phase data packet.
11. Initialize the current (even or odd) TX EP0 BD to transfer the status data:
    a) Set the BDT buffer address field to the start address of the data buffer.
    b) Write 8000h to BD0STAT (set UOWN bit, configure DTS to DATA0 and set byte count to 0).
12. Write the Token register with the appropriate IN or OUT token to Endpoint 0, the target device's default control pipe (e.g., write 01h to U1TOK for an OUT token for a `GET DEVICE DESCRIPTOR` command). This initiates an OUT token on the bus, followed by a zero length data packet from the host to the device. When the data packet completes, the BD is updated with the handshake from the device and a Token Complete Interrupt Flag is asserted (the TRNIF flag is set). This completes the status phase of the setup transaction, as described in Chapter 9 of the *"USB 2.0 Specification"*.

Note:	Only one control transaction can be performed per frame.

20.5.3 SEND A FULL-SPEED BULK DATA TRANSFER TO A TARGET DEVICE

1. Follow the procedure described in **Section 20.5.1 "Enable Host Mode and Discover a Connected Device"** and **Section 20.5.2 "Complete a Control Transaction to a Connected Device"** to discover and configure a device.
2. To enable transmit and receive transfers with handshaking enabled, write 1Dh to U1EP0. If the target device is a low-speed device, also set the LSPD (U1EP0[7]) bit. If you want the hardware to automatically retry indefinitely if the target device asserts a NAK on the transfer, clear the Retry Disable bit, RETRYDIS (U1EP0[6]).
3. Set up the BD for the current (even or odd) TX EP0 to transfer up to 64 bytes.
4. Set the USB device address of the target device in the address register (U1ADDR[6:0]).
5. Write an OUT token to the desired endpoint to U1TOK. This triggers the module's transmit state machines to begin transmitting the token and the data.
6. Wait for the Token Complete Interrupt Flag, TRNIF. This indicates that the BD has been released back to the microprocessor and the transfer has completed. If the Retry Disable bit (RETRYDIS) is set, the handshake (ACK, NAK, STALL or ERROR (0Fh)) is returned in the BD PID field. If a STALL interrupt occurs, the pending packet must be dequeued and the error condition in the target device cleared. If a detach interrupt occurs (SE0 for more than 2.5 µs), then the target has detached (U1IR[0] is set).
7. Once the Token Complete Interrupt Flag occurs (TRNIF is set), the BD can be examined and the next data packet queued by returning to Step 2.

Note:	USB speed, transceiver and pull-ups should only be configured during the module setup phase. It is not recommended to change these settings while the module is enabled.

20.6 OTG Operation

20.6.1 SESSION REQUEST PROTOCOL (SRP)

An OTG A-device may decide to power down the VBUS supply when it is not using the USB link through the Session Request Protocol (SRP). Software may do this by configuring a GPIO pin to disable an external power transistor, or voltage regulator enable signal, which controls the VBUS supply. When the VBUS supply is powered down, the A-device is said to have ended a USB session.

An OTG A-device or embedded host may repower the VBUS supply at any time (initiate a new session). An OTG B-device may also request that the OTG A-device repower the VBUS supply (initiate a new session). This is accomplished via Session Request Protocol (SRP).

Prior to requesting a new session, the B-device must first check that the previous session has definitely ended. To do this, the B-device must check for two conditions:

1. VBUS supply is below the session valid voltage.
2. Both D+ and D- have been low for at least 2 ms.

The B-device will be notified of Condition 1 by the SESENDIF (U1OTGIR[2]) interrupt. Software will have to manually check for Condition 2.

Note:	When the A-device powers down the VBUS supply, the B-device must disconnect its pull-up resistor from power. If the device is self-powered, it can do this by clearing DPPULUP (U1OTGCON[7]) and DMPULUP (U1OTGCON[6]).

The B-device may aid in achieving Condition 1 by discharging the VBUS supply through a resistor. Software may do this by setting VBUSDIS (U1OTGCON[0]).

After these initial conditions are met, the B-device may begin requesting the new session. The B-device begins by pulsing the D+ data line. Software should do this by setting DPPULUP (U1OTGCON[7]). The data line should be held high for 5 to 10 ms.

The B-device then proceeds by pulsing the VBUS supply. Software should do this by setting PUVBUS (U1CNFG2[4]). When an A-device detects SRP signaling (either via the ATTACHIF (U1IR[6]) interrupt or via the SESVDIF (U1OTGIR[3]) interrupt), the A-device must restore the VBUS supply by properly configuring the general purpose I/O port pin controlling the external power source.

The B-device should not monitor the state of the VBUS supply while performing VBUS supply pulsing. When the B-device does detect that the VBUS supply has been restored (via the SESVDIF (U1OTGIR[3]) interrupt), the B-device must reconnect to the USB link by pulling up D+ or D- (via the DPPULUP or DMPULUP bit).

The A-device must complete the SRP by driving USB Reset signaling.

20.6.2 HOST NEGOTIATION PROTOCOL (HNP)

In USB OTG applications, a Dual Role Device (DRD) is a device that is capable of being either a host or a peripheral. Any OTG DRD must support Host Negotiation Protocol (HNP).

HNP allows an OTG B-device to temporarily become the USB host. The A-device must first enable the B-device to follow HNP. Refer to the *"On-The-Go Supplement"* to the *"USB 2.0 Specification"* for more information regarding HNP. HNP may only be initiated at full speed.

After being enabled for HNP by the A-device, the B-device requests being the host any time that the USB link is in suspend state, by simply indicating a disconnect. This can be done in software by clearing DPPULUP and DMPULUP. When the A-device detects the disconnect condition (via the URSTIF (U1IR[0]) interrupt), the A-device may allow the B-device to take over as host. The A-device does this by signaling connect as a full-speed function. Software may accomplish this by setting DPPULUP.

If the A-device responds instead with resume signaling, the A-device remains as host. When the B-device detects the connect condition, via ATTACHIF (U1IR[6]), the B-device becomes host. The B-device drives Reset signaling prior to using the bus.

When the B-device has finished in its role as host, it stops all bus activity and turns on its D+ pull-up resistor by setting DPPULUP. When the A-device detects a suspend condition (Idle for 3 ms), the A-device turns off its D+ pull-up. The A-device may also power down the VBUS supply to end the session. When the A-device detects the connect condition (via ATTACHIF), the A-device resumes host operation and drives Reset signaling.

20.7 USB OTG Module Registers

There are a total of 37 memory-mapped registers associated with the USB OTG module. They can be divided into four general categories:

- USB OTG Module Control (12)
- USB Interrupt (7)
- USB Endpoint Management (16)
- USB VBUS Power Control (2)

This total does not include the (up to) 128 BD registers in the BDT. Their prototypes, described in Register 20-1 and Register 20-2, are shown separately in **Section 20.2 "USB Buffer Descriptors and the BDT"**.

All USB OTG registers are implemented in the Least Significant Byte (LSB) of the register. Bits in the upper byte are unimplemented and have no function. Note that some registers are instantiated only in Host mode, while other registers have different bit instantiations and functions in Device and Host modes.

The registers described in the following sections are those that have bits with specific control and configuration features. The following registers are used for data or address values only:

- U1BDTP1: Specifies the 256-word page in data RAM used for the BDT; 8-bit value with bit 0 fixed as '0' for boundary alignment.
- U1FRML and U1FRMH: Contain the 11-bit byte counter for the current data frame.

20.7.1 USB OTG MODULE CONTROL REGISTERS

REGISTER 20-3: U1OTGSTAT: USB OTG STATUS REGISTER (HOST MODE ONLY)

0 = Retry NAK transactions are enabled; retry is done in hardware

bit 5 **Unimplemented:** Read as '0'

bit 4 **EPCONDIS:** Bidirectional Endpoint Control bit
If EPTXEN and EPRXEN = 1:
1 = Disables Endpoint n from control transfers; only TX and RX transfers are allowed
0 = Enables Endpoint n for control (SETUP) transfers; TX and RX transfers are also allowed
For All Other Combinations of EPTXEN and EPRXEN:
This bit is ignored.

bit 3 **EPRXEN:** Endpoint Receive Enable bit
1 = Endpoint n receive is enabled
0 = Endpoint n receive is disabled

bit 2 **EPTXEN:** Endpoint Transmit Enable bit
1 = Endpoint n transmit is enabled
0 = Endpoint n transmit is disabled

bit 1 **EPSTALL:** Endpoint STALL Status bit
1 = Endpoint n was stalled
0 = Endpoint n was not stalled

bit 0 **EPHSHK:** Endpoint Handshake Enable bit
1 = Endpoint handshake is enabled
0 = Endpoint handshake is disabled (typically used for isochronous endpoints)

Note 1: These bits are available only for U1EP0 and only in Host mode. For all other U1EPn registers, these bits are always unimplemented and read as '0'.

NOTES:

21.0 ENHANCED PARALLEL MASTER PORT (EPMP)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Enhanced Parallel Master Port (EPMP)"** (www.microchip.com/DS39730). The information in this data sheet supersedes the information in the FRM.

The Enhanced Parallel Master Port (EPMP) module provides a parallel, 4-bit (Master mode only), 8-bit (Master and Slave modes) or 16-bit (Master mode only) data bus interface to communicate with off-chip modules, such as memories, FIFOs, LCD controllers and other microcontrollers. This module can serve as either the master or the slave on the communication bus.

For EPMP Master modes, all external addresses are mapped into the internal Extended Data Space (EDS). This is done by allocating a region of the EDS for each Chip Select (CS), and then assigning each Chip Select to a particular external resource, such as a memory or external controller. This region should not be assigned to another device resource, such as RAM or SFRs. To perform a write or read on an external resource, the CPU simply performs a write or read within the address range assigned for the EPMP.

Key features of the EPMP module are:

- Extended Data Space (EDS) Interface allows Direct Access from the CPU
- Up to 23 Programmable Address Lines
- Up to Two Chip Select Lines
- Up to Two Acknowledgment Lines (one per Chip Select)
- 4-Bit, 8-Bit or 16-Bit Wide Data Bus
- Programmable Strobe Options (per Chip Select):
  - Individual Read and Write Strobes or;
  - Read/$\overline{\text{Write}}$ Strobe with Enable Strobe
- Programmable Address/Data Multiplexing
- Programmable Address Wait States
- Programmable Data Wait States (per Chip Select)
- Programmable Polarity on Control Signals (per Chip Select)
- Legacy Parallel Slave Port Support
- Enhanced Parallel Slave Support:
  - Address Support
  - 4-Byte Deep Auto-Incrementing Buffer

21.1 Specific Package Variations

While all PIC24FJ256GA412/GB412 family devices implement the EPMP, I/O pin constraints place some limits on 16-Bit Master mode operations in some package types. This is reflected in the number of dedicated Chip Select pins implemented and the number of dedicated address lines that are available. The differences are summarized in Table 21-1. All available EPMP pin functions are summarized in Table 21-2.

For 64-pin devices, the dedicated Chip Select pins (PMCS1 and PMS2) are not implemented. In addition, only 16 address lines (PMA[15:0]) are available. If required, PMA14 and PMA15 can be remapped to function as APMCS1 and APMCS2 (Alternate Chip Select 1/2), respectively.

The memory space addressable by the device depends on the number of address lines available, as well as the number of Chip Select signals required for the application. Devices with lower pin counts are more affected by Chip Select requirements, as these take away address lines. Table 21-1 shows the maximum addressable range for each pin count.

TABLE 21-1: EPMP FEATURE DIFFERENCES BY DEVICE PIN COUNT

Device	Dedicated Chip Select		Address Lines	Address Range (bytes)		
	CS1	CS2		No CS	1 CS	2 CS
PIC24FJXXXGX406 (64-pin)(1)	—	—	16	64K	32K	16K
PIC24FJXXXGX410 (100-pin)	X	X	23	16M		
PIC24FJXXXGX412 (121/124-pin)	X	X	23	16M		

Note 1: The 64-pin devices can use the Alternate Chip Select pins, APMCS1 and APMCS2.

TABLE 21-2: ENHANCED PARALLEL MASTER PORT PIN DESCRIPTIONS

Pin Name (Alternate Function)	Type	Description
PMA[22:16]	O	Address Bus bits[22:16]
PMA15	O	Address Bus bit 15
	I/O	Data Bus bit 15 (16-bit port with Multiplexed Addressing)

NOTES:

22.0 LIQUID CRYSTAL DISPLAY (LCD) CONTROLLER

Note: This data sheet summarizes the features of the PIC24FJ256GA412/GB412 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Liquid Crystal Display (LCD)"** (www.microchip.com/DS30009740) which is available from the Microchip website (www.microchip.com).

The Liquid Crystal Display (LCD) Controller generates the data and timing control required to directly drive a static or multiplexed LCD panel. The module can drive up to 8 Commons signals on all devices, and from 34 to 64 Segments, depending on the specific device.

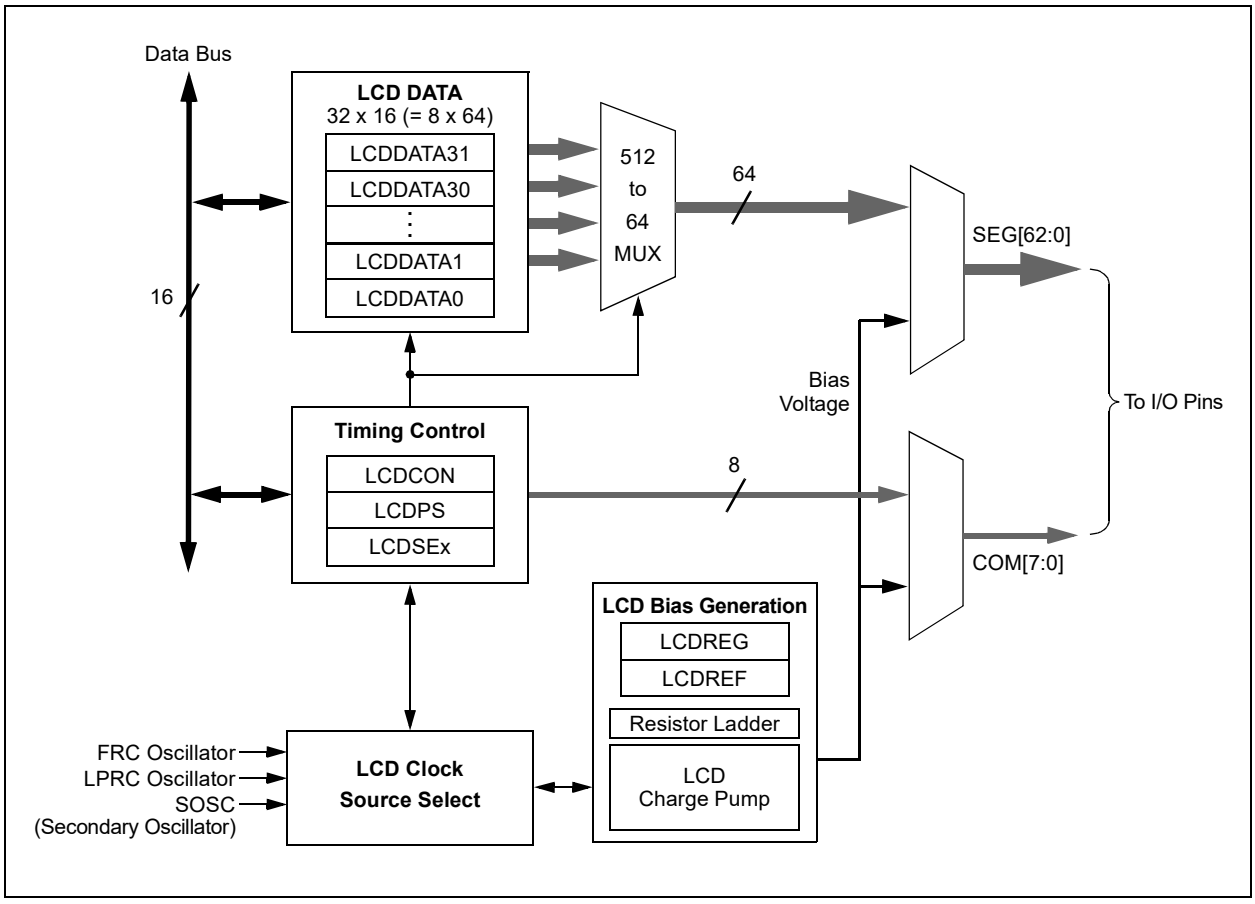
Note: To be driven by the LCD controller, pins must be set as analog inputs. For the port corresponding to the desired Common or Segment pin, set TRISx = 1 and ANSx = 1.

The LCD Controller has these features:

- Direct Driving of LCD Panel
- Three LCD Clock Sources with Selectable Prescaler
- Up to Eight Commons:
  - Static (one Common)
  - 1/2 multiplex (two Commons)
  - 1/3 multiplex (three Commons)
  - 1/8 multiplex (eight Commons)
- Ability to Drive up to 34 (in 64-pin USB devices), 35 (64-pin non-USB devices) or up to 64 (all other devices) Segments, depending on the Multiplexing Mode Selected
- Static, 1/2 or 1/3 LCD Bias
- On-Chip Bias Generator with Dedicated Charge Pump to Support a Range of Fixed and Variable Bias Options
- Internal Resistors for Bias Voltage Generation
- Software Contrast Control for LCD using Internal Biasing

A simplified block diagram of the module is shown in Figure 22-1.

FIGURE 22-1: LCD CONTROLLER MODULE BLOCK DIAGRAM



22.1 Registers

The LCD Controller has up to 40 registers:

- LCD Control Register (LCDCON)
- LCD Charge Pump Control Register (LCDREG)
- LCD Phase Register (LCDPS)
- LCD Voltage Ladder Control Register (LCDREF)
- Four LCD Segment Enable Registers (LCDSE3:LCDSE0)
- Up to 32 LCD Data Registers (LCDDATA31:LCDDATA0)

001 = Internal LCD reference ladder is in A Power mode for 1 clock and B Power mode for 31 clocks
000 = Internal LCD reference ladder is always in B Power mode

23.0 CONFIGURABLE LOGIC CELL (CLC)

Note: This data sheet summarizes the features of the PIC24FJ256GA412/GB412 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Configurable Logic Cell (CLC)"** (www.microchip.com/DS33949), which is available from the Microchip website (www.microchip.com).

The Configurable Logic Cell (CLC) module allows the user to specify combinations of signals as inputs to a logic function and to use the logic output to control other peripherals or I/O pins. This provides greater flexibility and potential in embedded designs since the CLC module can operate outside the limitations of software execution and supports a vast amount of output designs.

There are four input gates to the selected logic function. These four input gates select from a pool of up to 32 signals that are selected using four data source selection multiplexers. Figure 23-1 shows an overview of the module. Figure 23-3 shows the details of the data source multiplexers and logic input gate connections.

23.1 Control Registers

The CLCx module is controlled by the following registers:

- CLCxCONL
- CLCxCONH
- CLCxSEL
- CLCxGLSL
- CLCxGLSH

The CLCx Control registers (CLCxCONL and CLCxCONH) are used to enable the module and interrupts, control the output enable bit, select output polarity and select the logic function. The CLCx Control registers also allow the user to control the logic polarity of not only the cell output, but also some intermediate variables.

The CLCx Input MUX Select register (CLCxSEL) allows the user to select up to four data input sources using the four data input selection multiplexers. Each multiplexer has a list of eight data sources available.

The CLCx Gate Logic Input Select registers (CLCxGLSL and CLCxGLSH) allow the user to select which outputs from each of the selection MUXes are used as inputs to the input gates of the logic cell. Each data source MUX outputs both a true and a negated version of its output. All of these 8 signals are enabled, ORed together by the logic cell input gates.

24.0 REAL-TIME CLOCK AND CALENDAR (RTCC) WITH TIMESTAMP

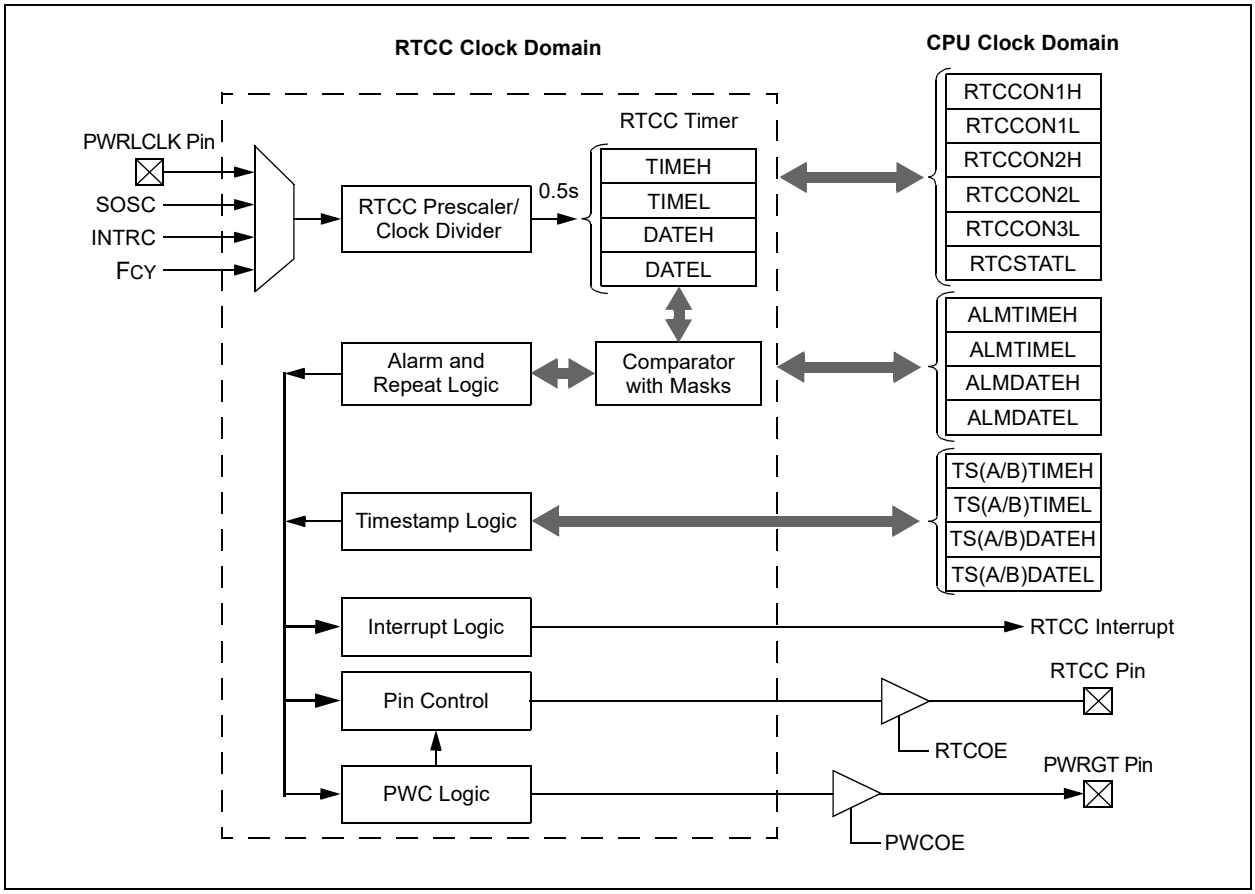
Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Real-Time Clock and Calendar, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"RTCC with Timestamp"** (www.microchip.com/DS70005193). The information in this data sheet supersedes the information in the FRM.

The RTCC provides the user with a Real-Time Clock and Calendar (RTCC) function that can be calibrated.

Key features of the RTCC module are:

- Time (Hours, Minutes and Seconds) in 24-Hour (Military Time) Format
- Calendar (Weekday, Date, Month and Year)
  - Year range from 2000 to 2099 with automatic Leap Year correction
- Alarm with Configurable Mask and Repeat Options
- BCD Format for Compact Firmware
- Optimized for Low-Power Operation
- Multiple Clock Input Options, Including:
  - 32.768 kHz crystal
  - External Real-Time Clock (RTC)
  - 50/60 Hz power line clock
  - 31.25 kHz LPRC clock
  - System clock, up to 32 MHz
- User Calibration with a Range of 2 ppm when using 32 kHz Source
- Interrupt on Alarm and Timestamp Events
- Optional Timestamp Capture for Tamper Pin or Other Events
- User-Configurable Power Control with Dedicated Output Pin to Periodically Wake External Devices

FIGURE 24-1: RTCC HIGH-LEVEL BLOCK DIAGRAM



24.1 RTCC Source Clock

The RTCC clock divider block converts the incoming oscillator source into an accurate 1/2 second clock for the RTCC timer. The clock divider is optimized to work with four different oscillator sources:

- System clock, up to 32 MHz
- 32.768 kHz crystal oscillator
- 31 kHz Low-Power RC Oscillator (LPRC)
- External 50 Hz or 60 Hz power line frequency

An asynchronous prescaler, PS[1:0] (RTCCON2L[5:4]), is provided that allows the RTCC to work with higher speed clock sources, such as the system clock. Divide ratios of 1:16, 1:64 or 1:256 may be selected, allowing sources up to 32 MHz to clock the RTCC.

24.1.1 SELECTING RTCC CLOCK SOURCE

The clock source for the RTCC module can be selected using the CLKSEL[1:0] bits in the RTCCON2L register. When the bits are set to '00', the Secondary Oscillator (SOSC) is used as the reference clock and when the bits are '01', LPRC is used as the reference clock. When CLKSEL[1:0] = 10, the external power line (50 Hz and 60 Hz) is used as the clock source. When CLKSEL[1:0] = 11, the system clock is used as the clock source.

24.1.2 COARSE FREQUENCY DIVISION

The clock divider block has a 16-bit counter used to divide the input clock frequency. The divide ratio is set by the DIV[15:0] register bits (RTCCON2H[15:0]). The DIV[15:0] bits should be programmed with a value to produce a nominal 1/2 second clock divider count period.

24.1.3 FINE FREQUENCY DIVISION

The fine frequency division is set using the FDIV[4:0] (RTCCON2L[15:11]) bits. Increasing the FDIVx value will lengthen the overall clock divider period.

If FDIV[4:0] = 00000, the fine frequency division circuit is effectively disabled. Otherwise, it will optionally remove a clock pulse from the input of the clock divider every 1/2 second. This functionality will allow the user to remove up to 31 pulses over a fixed period of 16 seconds, depending on the value of FDIVx.

The value for DIV[15:0] is calculated as shown in Equation 24-1. The fractional remainder of the DIV[15:0] calculation result can be used to calculate the value for FDIV[4:0].

EQUATION 24-1: RTCC CLOCK DIVIDER OUTPUT FREQUENCY

$$FOUT = \frac{FIN}{2 \bullet (PS[1:0]\ Prescaler) \bullet (DIV[15:0] + 1) + \left(\frac{FDIV[4:0]}{32}\right)}$$

The DIV[15:0] value is the integer part of this calculation:

$$DIV[15:0] = \left(\frac{FIN}{2 \bullet (PS[1:0]\ Prescaler)}\right) - 1$$

The FDIV[4:0] value is the fractional part of the DIV[15:0] calculation, multiplied by 32.

24.1.4 CLOCK SOURCE CALIBRATION

A crystal oscillator that is connected to the RTCC may be calibrated to provide an accurate 1-second clock in two ways. First, coarse frequency adjustment is performed by adjusting the value written to the DIV[15:0] bits. Secondly, a 5-bit value can be written to the FDIV[4:0] control bits to perform a fine clock division.

The DIVx and FDIVx values can be concatenated and considered as a 21-bit prescaler value. If the oscillator source is slightly faster than ideal, the FDIV[4:0] value can be increased to make a small decrease in the RTC frequency. The value of DIV[15:0] should be increased to make larger decreases in the RTC frequency. If the oscillator source is slower than ideal, FDIV[4:0] may be decreased for small calibration changes and DIV[15:0] may need to be decreased to make larger calibration changes.

Before calibration, the user must determine the error of the crystal. This should be done using another timer resource on the device or an external timing reference. It is up to the user to include in the error value the initial error of the crystal, drift due to temperature and drift due to crystal aging.

24.2 Alarm

The RTCC alarm includes these features:

- Configurable from half second to one year
- One-time alarm and repeat alarm options available

24.2.1 CONFIGURING THE ALARM

The alarm feature is enabled using the ALRMEN bit. This bit is cleared when an alarm is issued. Writes to ALRMVAL should only take place when ALRMEN = 0.

As shown in Figure 24-2, the interval selection of the alarm is configured through the AMASK[3:0] bits (RTCCON1H[11:8]). These bits determine which, and how many, digits of the alarm must match the clock value for the alarm to occur.

The alarm can also be configured to repeat based on a preconfigured interval. The amount of times this occurs, once the alarm is enabled, is stored in the ALMRPT[7:0] bits (RTCCON1H[7:0]). When the value of the ALMRPTx bits equals 00h and the CHIME bit (RTCCON1H[14]) is cleared, the repeat function is disabled and only a single alarm will occur. The alarm can be repeated, up to 255 times, by loading ALMRPT[7:0] with FFh.

After each alarm is issued, the value of the ALMRPTx bits is decremented by one. Once the value has reached 00h, the alarm will be issued one last time, after which, the ALRMEN bit will be cleared automatically and the alarm will turn off.

Indefinite repetition of the alarm can occur if the CHIME bit = 1. Instead of the alarm being disabled when the value of the ALMRPTx bits reaches 00h, it rolls over to FFh and continues counting indefinitely while CHIME is set.

24.2.2 ALARM INTERRUPT

At every alarm event, an interrupt is generated. This output is completely synchronous to the RTCC clock and can be used as a trigger clock to other peripherals.

Note:	Changing any of the register bits, other than the RTCOE bit, the ALMRPT[7:0] bits and the CHIME bit, while the alarm is enabled (ALRMEN = 1), can result in a false alarm event leading to a false alarm interrupt. To avoid a false alarm event, the timer and alarm values should only be changed while the alarm is disabled (ALRMEN = 0).

FIGURE 24-2: ALARM MASK SETTINGS

Alarm Mask Setting (AMASK[3:0])	Day of the Week	Month	Day	Hours	Minutes	Seconds
0000 - Every half second 0001 - Every second						
0010 - Every 10 seconds						s
0011 - Every minute						s s
0100 - Every 10 minutes					m	s s
0101 - Every hour					m m	s s
0110 - Every day				h h	m m	s s
0111 - Every week	d			h h	m m	s s
1000 - Every month			d d	h h	m m	s s
1001 - Every year(1)		m m	d d	h h	m m	s s

Note 1: Annually, except when configured for February 29.

24.3 Power Control

The RTCC includes a power control feature that allows the device to periodically wake-up an external device, wait for the device to be stable before sampling wake-up events from that device and then shut down the external device. This can be done completely autonomously by the RTCC, without the need to wake from the current lower power mode.

To use this feature:

1. Enable the RTCC (RTCEN = 1).
2. Set the PWCEN bit (RTCCON1L[10]).
3. Configure the RTCC pin to drive the PWC control signal (RTCOE = 1 and OUTSEL[2:0] = 011).

The polarity of the PWC control signal is selected by the PWCPOL bit (RTCCON1L[9]). An active-low or active-high signal may be used with the appropriate external switch to turn on or off the power to one or more external devices. The active-low setting may also be used in conjunction with an open-drain setting on the RTCC pin, in order to drive the ground pin(s) of the external device directly (with the appropriate external VDD pull-up device), without the need for external switches. Finally, the CHIME bit should be set to enable the PWC periodicity.

Once the RTCC and PWC are enabled and running, the PWC logic will generate a control output and a sample gate output. The control output is driven out on the RTCC pin (when RTCOE = 1 and OUTSEL[2:0] = 011) and is used to power-up or power-down the device, as described above.

Once the control output is asserted, the Stability Window begins, in which the external device is given enough time to power-up and provide a stable output.

Once the output is stable, the RTCC provides a sample gate during the Sample Window. The use of this sample gate depends on the external device being used, but typically, it is used to mask out one or more wake-up signals from the external device.

Finally, both the Stability and the Sample Windows close after the expiration of the Sample Window, and the external device is powered down.

24.3.1 POWER CONTROL CLOCK SOURCE

The Stability and Sample Windows are controlled by the PWCSAMP[7:0] and PWCSTAB[7:0] bits field in the RTCCON3L register (RTCCON3L[15:8] and [7:0], respectively). As both the Stability and Sample Windows are defined in terms of the RTCC clock, their absolute values vary by the value of the PWC clock base period. The 8-bit magnitude of PWCSTABx and PWCSAMPx allows for a window size of 0 to 255 clock periods.

The period of the PWC clock can also be adjusted with a 1:1, 1:16, 1:64 or 1:256 prescaler, determined by the PWCPS[1:0] bits (RTCCON2L[7:6]).

In addition, certain values for the PWCSTABx and PWCSAMPx fields have specific control meanings in determining power control operations. If either bit field is 00h, the corresponding window is inactive. In addition, if the PWCSTABx field is FFh, the Stability Window remains active continuously, even if power control is disabled.

24.4 Event Timestamping

The RTCC includes two sets of Timestamp registers that may be used for the capture of Time and Date register values when an external input signal is received. The RTCC triggers the timestamps for two events:

- For Timestamp A, a falling edge on the $\overline{\text{TMPR}}$ pin
- For Timestamp B, when the devices transition from VDD to VBAT power

A Timestamp A event can be triggered while running the device in VBAT mode if the $\overline{\text{TMPR}}$ pin is pulled up to VBAT.

24.4.1 TIMESTAMP OPERATION

The event input is enabled for timestamping using the TSAEN bit (RTCCON1L[0]). When the timestamp event occurs, the present time and date values are stored in the TSATIMEL/H and TSADATEL/H registers, the TSAEVT status bit (RTCSTATL[3]) becomes set and an RTCC interrupt occurs. A new timestamp capture event cannot occur until the user clears the TSAEVT status bit.

Note 1: The TSATIMEL/H and TSADATEL/H register pairs can be used for data storage when TSAEN = 0. The values of TSATIMEL/H and TSADATEL/H will be maintained throughout all types of non-power Resets ($\overline{\text{MCLR}}$, WDT, etc).

24.4.2 MANUAL TIMESTAMP

The current time and date may be captured in the TSATIMEL/H and TSADATEL/H registers by writing a '1' to the TSAEVT bit location while the timestamp functionality is enabled (TSAEN = 1). This write will not set the TSAEVT bit, but it will initiate a timestamp capture. The TSAEVT bit will be set when the capture operation is complete. The user must poll the TSAEVT bit to determine when the capture operation is complete.

After the Timestamp registers have been read, the TSAEVT bit should be cleared to allow further hardware or software timestamp capture events.

24.5 RTCC Module Registers

The RTCC module registers are organized into three categories:

- RTCC Control and Status registers
- Time/Alarm/Timestamp Value registers
- Date/Alarm/Timestamp registers

All Date and Time registers are directly mapped to memory and are individually addressable. In addition, the Date and Time registers for the RTCC timer, the alarm and the timestamps are identical in format.

24.5.1 WRITE LOCK

To perform a write to certain RTCC Timer registers, the WRLOCK bit in the RTCCON1L register must be cleared. The WRLOCK bit affects only those registers associated with accurate timekeeping:

- RTCCON1L
- RTCCON2L
- RTCCON2H
- TIMEL
- TIMEH
- DATEL
- DATEH

Other register functions associated with alarm control, power control and timestamping are not affected by the WRLOCK bit. To avoid accidental writes to the timer, it is recommended that the WRLOCK bit be set after initializing the RTCC. WRLOCK may be set at any time without executing an unlock sequence.

Once the WRLOCK bit has been set by the user, it can only be cleared once an unlocking sequence has been executed. The unlocking sequence consists of writing 0x55, immediately followed by 0xAA, to the NVMKEY register.

The WRLOCK bit must be cleared on the very next instruction cycle after the unlock sequence. Due to the critical timing of the unlock sequence that is required to clear the WRLOCK bit, a built-in function has been provided in the MPLAB® XC16 compiler to perform the unlock sequence and clear the WRLOCK bit, as shown in Example 24-1.

EXAMPLE 24-1: SETTING THE WRLOCK BIT

```
// Initialize the RTCC as needed
------------------------------------------------

// Lock the RTCC registers
RTCCON1Lbits.WRLOCK = 1;

------------------------------------------------

// Clear WRLOCK to modify RTCC as needed
__builtin_write_RTCC_WRLOCK();
```

0 = First half of 1-second period

Note 1: User software may write a '1' to this location to initiate a Timestamp A event; timestamp capture is not valid until TSAEVT reads as '1'.

2: This bit is read-only; it is cleared to '0' on a write to the SECONE[3:0] bits in Register 24-7.

24.5.3 TIME/ALARM/TIMESTAMP VALUE REGISTERS

25.0 CRYPTOGRAPHIC ENGINE

Note: This data sheet summarizes the features of the PIC24FJ256GA412/GB412 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Cryptographic Engine"** (www.microchip.com/DS70005133) which is available from the Microchip website (www.microchip.com).

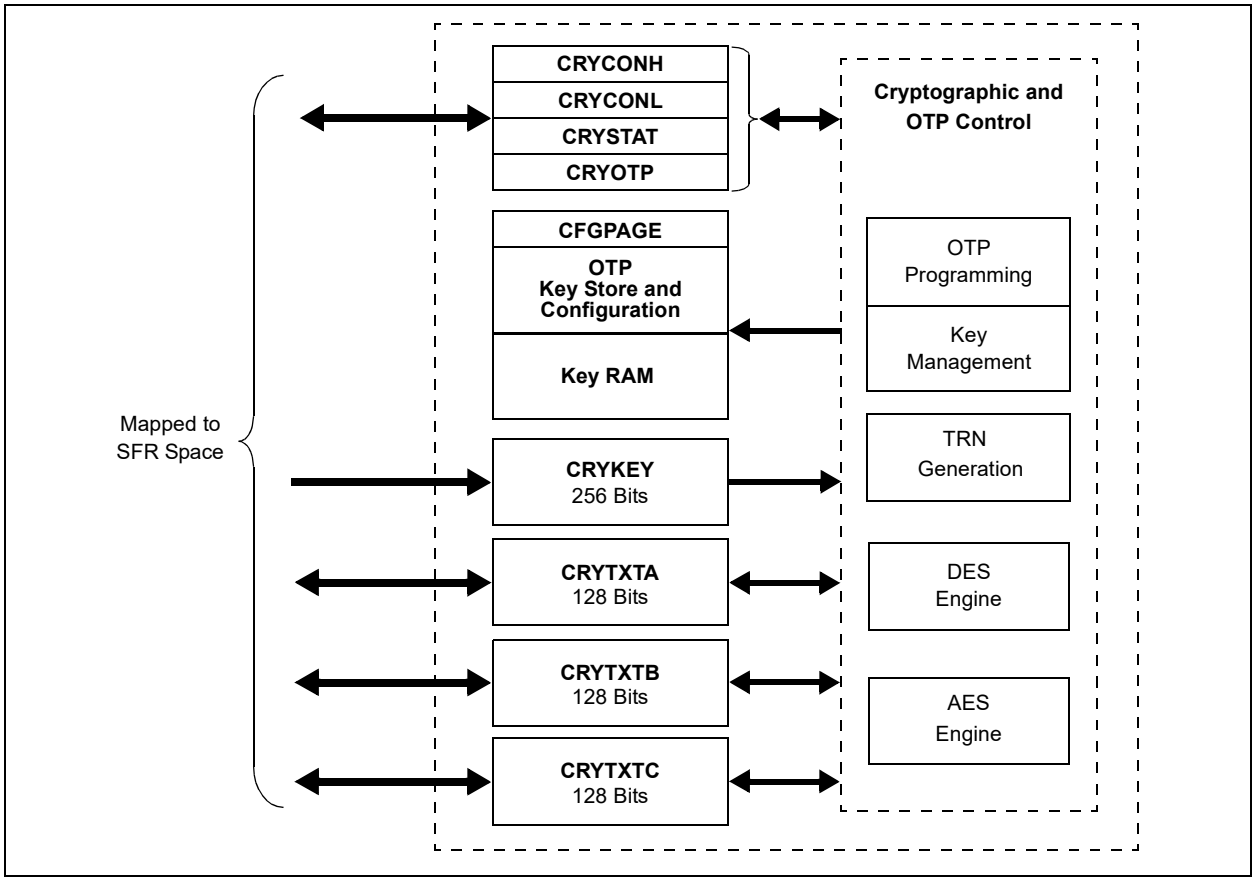
The Cryptographic Engine provides a new set of data security options. Using its own free-standing state machines, the engine can independently perform NIS standard encryption and decryption of data independently of the CPU. This eliminates the concerns of excessive CPU or program memory overhead that encryption and decryption would otherwise require, while enhancing the application's security.

The primary features of the Cryptographic Engine are:

- Memory-Mapped, 128-Bit and 256-Bit Memory Spaces for Encryption/Decryption Data
- Multiple Options for Key Storage, Selection and Management
- Support for Internal Context Saving
- Session Key Encryption and Loading
- Half-Duplex Operation
- DES and Triple DES (3DES) Encryption and Decryption (64-bit block size):
  - Supports 64-bit keys and 2-key or 3-key Triple DES
- AES Encryption and Decryption (128-bit block size):
  - Supports key sizes of 128, 192 or 256 bits
- Supports ECB, CBC, CFB, OFB and CTR Modes for Both DES and AES Standards
- Programmatically Secure Key Storage:
  - 512-byte OTP array for key storage, not readable from other memory spaces
  - 32-bit Configuration Page
  - Independent, 512-byte Key RAM for volatile key storage
  - Simple in-module programming interface
  - Supports Key Encryption Key (KEK)
- Support for True Random Number Generation (TRNG) and Pseudorandom Number Generation (PRNG), NIST SP800-90 Compliant
- Hardware Anti-Tamper Feature for Additional Data Security

A simplified block diagram of the Cryptographic Engine is shown in Figure 25-1.

FIGURE 25-1: CRYPTOGRAPHIC ENGINE BLOCK DIAGRAM



25.1 Data Register Spaces

There are four register spaces used for cryptographic data and key storage:

- CRYTXTA
- CRYTXTB
- CRYTXTC
- CRYKEY

Although mapped into the SFR space, all of these Data Spaces are actually implemented as 128-bit or 256-bit wide arrays, rather than groups of 16-bit wide Data registers. Reads and writes to and from these arrays are automatically handled as if they were any other register in the SFR space.

CRYTXTA through CRYTXTC are 128-bit wide spaces; they are used for writing data to, and reading from, the Cryptographic Engine. Additionally, they are also used for storing intermediate results of the encryption/decryption operation. None of these registers may be written to when the module is performing an operation (CRYGO = 1).

CRYTXTA and CRYTXTB normally serve as inputs to the encryption/decryption process.

CRYTXTA usually contains the initial plaintext or ciphertext to be encrypted or decrypted. Depending on the mode of operation, CRYTXTB may contain the ciphertext output or intermediate cipher data. It may also function as a programmable length counter in certain operations.

CRYTXTC is primarily used to store the final output of an encryption/decryption operation. It is also used as the input register for data to be programmed to the Secure OTP Array.

CRYKEY is a 256-bit wide space, used to store cryptographic keys for the selected operation; it is writable from both the SFR space and the Secure OTP Array. Although mapped into the SFR space, it is a write-only memory area; any data placed here, regardless of their source, cannot be read back by any run-time operations. This feature helps to ensure the security of any key data.

25.2 Modes of Operation

The Cryptographic Engine supports the following modes of operation, determined by the OPMOD[3:0] (CRYCONL[7:4]) bits:

- Block Encryption
- Block Decryption
- AES Decryption Key Expansion
- Random Number Generation
- Session Key Generation
- Session Key Encryption
- Session Key Loading

The OPMOD[3:0] bits may be changed while CRYON is set. They should only be changed when a cryptographic operation is not being done (CRYGO = 0).

Once the encryption operation, and the appropriate and valid key configuration is selected, the operation is performed by setting the CRYGO bit. This bit is automatically cleared by hardware when the operation is complete. The CRYGO bit can also be manually cleared by software; this causes any operation in progress to terminate immediately. Clearing this bit in software also sets the CRYABRT bit (CRYSTAT[5]).

For most operations, CRYGO can only be set when an OTP operation is not being performed and there are no other error conditions. CRYREAD, CRYWR, CRYABRT, ROLLOVR, MODFAIL and KEYFAIL must all be '0'.

Setting CRYWR and CRYGO simultaneously will not initiate an OTP programming operation or any other operation. Setting CRYGO when the module is disabled (CRYON = 0) also has no effect.

25.3 Enabling the Engine

The Cryptographic Engine is enabled by setting the CRYON bit. Clearing this bit disables both the DES and AES engines, as well as causing the following register bits to be held in Reset:

- CRYGO (CRYCONL[8])
- TXTABSY (CRYSTAT[6])
- CRYWR (CRYOTP[0])

All other register bits and registers may be read and written while CRYON = 0.

25.4 Encrypting Data

1. If not already set, set the CRYON bit.
2. Configure the CPHRSEL, CPHRMODx, KEYMODx and KEYSRCx bits as desired to select the proper mode and key length.
3. Set OPMOD[3:0] to '0000'.
4. If a software key is being used, write it to the CRYKEY register. It is only necessary to write the lowest *n* bits of CRYKEY for a key length of *n*, as all unused CRYKEY bits are ignored.
5. Read the KEYFAIL bit. If this bit is '1', an illegal configuration has been selected and the encrypt operation will NOT be performed.
6. Write the data to be encrypted to the appropriate CRYTXT register. For a single DES encrypt operation, it is only necessary to write the lowest 64 bits. However, for data less than the block size (64 bits for DES, 128 bits for AES), it is the responsibility of the software to properly pad the upper bits within the block.
7. Set the CRYGO bit.
8. In ECB and CBC modes, set the FREEIE bit (CRYCONL[10]) to enable the optional CRYTXTA interrupt to indicate when the next plaintext block can be loaded.
9. Poll the CRYGO bit until it is cleared or wait for the CRYDNIF module interrupt (DONEIE must be set). If other Cryptographic Engine interrupts are enabled, it will be necessary to poll the CRYGO bit to verify the interrupt source.
10. Read the encrypted block from the appropriate CRYTXT register.
11. Repeat Steps 5 through 8 to encrypt further blocks in the message with the same key.

25.5 Decrypting Data

1. If not already set, set the CRYON bit.
2. Configure the CPHRSEL, CPHRMODx, KEYMODx and KEYSRCx bits as desired to select the proper mode and key length.
3. Set OPMOD[3:0] to '0001'.
4. If a software key is being used, write the CRYKEY register. It is only necessary to write the lowest *n* bits of CRYKEY for a key length of *n*, as all unused CRYKEY bits are ignored.
5. If an AES-ECB or AES-CBC mode decryption is being performed, you must first perform an AES decryption key expansion operation.
6. Read the KEYFAIL status bit. If this bit is '1', an illegal configuration has been selected and the encrypt operation will not be performed.
7. Write the data to be decrypted into the appropriate Text/Data register. For a DES decrypt operation, it is only necessary to write the lowest 64 bits of CRYTXTB.
8. Set the CRYGO bit.
9. If this is the first decrypt operation after a Reset, or if a key storage program operation was performed after the last decrypt operation, or if the KEYMODx or KEYSRCx fields are changed, the engine will perform a new key expansion operation. This will result in extra clock cycles for the decrypt operation, but will otherwise be transparent to the application (i.e., the CRYGO bit will be cleared only after the key expansion and the decrypt operation have completed).
10. In ECB and CBC modes, set the FREEIE bit (CRYCONL[10]) to enable the optional CRYTXTA interrupt to indicate when the next plaintext block can be loaded.
11. Poll the CRYGO bit until it is cleared or wait for the CRYDNIF module interrupt (DONEIE must be set). If other Cryptographic Engine interrupts are enabled, it will be necessary to poll the CRYGO bit to verify the interrupt source.
12. Read the decrypted block out of the appropriate Text/Data register.
13. Repeat Steps 6 through 10 to encrypt further blocks in the message with the same key.

25.6 Encrypting a Session Key

Note: ECB and CBC modes are restricted to 128-bit session keys only.

1. If not already set, set the CRYON bit.
2. If not already programmed, program the SKEYEN bit to '1'.

Note: Setting SKEYEN permanently makes Key #1 available as a Key Encryption Key only. It cannot be used for other encryption or decryption operations after that.

3. Set OPMOD[3:0] to '1110'.
4. Configure the CPHRSEL, CPHRMOD[2:0] and KEYMOD[1:0] register bit fields as desired, set SKEYSEL to '0'.
5. Read the KEYFAIL status bit. If this bit is '1', an illegal configuration has been selected and the encrypt operation will not be performed.
6. Write the software generated session key into the CRYKEY register or generate a random key into the CRYKEY register. It is only necessary to write the lowest *n* bits of CRYKEY for a key length of *n*, as all unused key bits are ignored.
7. Set the CRYGO bit. Poll the bit until it is cleared by hardware; alternatively, set the DONEIE bit (CRYCONL[11]) to generate an interrupt when the encryption is done.
8. Read the encrypted session key out of the appropriate CRYTXT register.
9. For total key lengths of more than 128 bits, set SKEYSEL to '1' and repeat Steps 6 and 7.
10. Set KEYSRC[3:0] to '0000' to use the session key to encrypt data.

25.7 Receiving a Session Key

Note: ECB and CBC modes are restricted to 128-bit session keys only.

1. If not already set, set the CRYON bit.
2. If not already programmed, program the SKEYEN bit to '1'.

Note: Setting SKEYEN permanently makes Key #1 available as a Key Encryption Key only. It cannot be used for other encryption or decryption operations after that. It also permanently disables the ability of software to decrypt the session key into the CRYTXTA register, thereby breaking programmatic security (i.e., software can read the unencrypted key).

3. Set OPMOD[3:0] to '1111'.
4. Configure the CPHRSEL, CPHRMOD[2:0] and KEYMOD[1:0] register bit fields as desired; set SKEYSEL to '0'.
5. Read the KEYFAIL status bit. If this bit is '1', an illegal configuration has been selected and the encrypt operation will NOT be performed.
6. Write the encrypted session key received into the appropriate CRYTXT register.
7. Set the CRYGO bit. Poll the bit until it is cleared by hardware; alternatively, set the DONEIE bit (CRYCONL[11]) to generate an interrupt when the process is done.
8. For total key lengths of more than 128 bits, set SKEYSEL to '1' and repeat Steps 6 and 7.
9. Set KEYSRC[3:0] to '0000' to use the newly generated session key to encrypt and decrypt data.

25.8 Generating a Pseudorandom Number (PRN)

For operations that require a Pseudorandom Number (PRN), the method outlined in NIST SP800-90 can be adapted for efficient use with the Cryptographic Engine. This method uses the AES algorithm in CTR mode to create PRNs with minimal CPU overhead. PRNs generated in this manner can be used for cryptographic purposes or any other purpose that the host application may require.

The random numbers used as initial seeds can be taken from any source convenient to the user's application. If possible, a non-deterministic random number source should be used.

Note:	PRN generation is not available when software keys are disabled (SWKYDIS = 1).

To perform the initial reseeding operation, and subsequent reseedings after the reseeding interval has expired:

1. Store a random number (128 bits) in CRYTXTA.
2. For the initial generation ONLY, use a key value of 0h (128 bits) and a counter value of 0h.
3. Configure the engine for AES encryption, CTR mode (OPMOD[3:0] = 0000, CPHRSEL = 1, CPHRMOD[2:0] = 100).
4. Perform an encrypt operation by setting CRYGO.
5. Move the results in CRYTXTC to RAM. This is the New Key Value (NEW_KEY).
6. Store another random number (128 bits) in CRYTXTA.
7. Configure the module for encryption as in Step 3.
8. Perform an encrypt operation by setting CRYGO.
9. Store this value in RAM. This is the New Counter Value (NEW_CTR).
10. For subsequent reseeding operations, use NEW_KEY and NEW_CTR for the starting key and counter values.

To generate the Pseudorandom Number:

1. Load NEW_KEY value from RAM into CRYKEY.
2. Load NEW_CTR value from RAM into CRYTXTB.
3. Load CRYTXTA with 0h (128 bits).
4. Configure the engine for AES encryption, CTR mode (OPMOD[3:0] = 0000, CPHRSEL = 1, CPHRMOD[2:0] = 100).
5. Perform an encrypt operation by setting CRYGO.
6. Copy the generated PRN in CRYTXTC (PRNG_VALUE) to RAM.
7. Repeat the encrypt operation.
8. Store the value of CRYTXTC from this round as the new value of NEW_KEY.
9. Repeat the encrypt operation.
10. Store the value of CRYTXTC from this round as the new value of NEW_CTR.

Subsequent PRNs can be generated by repeating this procedure until the reseeding interval has expired. At that point, the reseeding operation is performed using the stored values of NEW_KEY and NEW_CTR.

25.9 Generating a True Random Number

1. Enable the Cryptographic mode (CRYON (CRYCONL[15]) = 1).
2. Set the OPMOD[3:0] bits to '1010'.
3. Start the request by setting the CRYGO bit (CRYCONL[8]) to '1'.
4. Wait for the CRYGO bit to be cleared to '0' by the hardware.
5. Read the random number from the CRYTXTA register.

25.10 Testing the Key Source Configuration

The validity of the key source configuration can always be tested by writing the appropriate register bits and then reading the KEYFAIL register bit. No operation needs to be started to perform this check; the module does not even need to be enabled.

25.11 Programming CFGPAGE (Page 0) Configuration Bits

1. If not already set, set the CRYON bit. Set KEYPG[3:0] to '0000'.
2. Read the PGMFAIL status bit. If this bit is '1', an illegal configuration has been selected and the programming operation will not be performed.
3. Write the data to be programmed into the Configuration Page into CRYTXTC[31:0]. Any bits that are set ('1') will be permanently programmed, while any bits that are cleared ('0') will not be programmed and may be programmed at a later time.
4. Set the CRYWR bit. Poll the bit until it is cleared; alternatively, set the OTPIE bit (CRYOTP[6]) to enable the optional OTP done interrupt.
5. Once all programming has completed, set the CRYREAD bit to reload the values from the on-chip storage. A read operation must be performed to complete programming.

Note:	Do not clear the CRYON bit while the CRYREAD bit is set; this will result in an incomplete read operation and unavailable key data. To recover, set CRYON and CRYREAD, and allow the read operation to fully complete.

6. Poll the CRYREAD bit until it is cleared; alternatively, set the OTPIE bit (CRYOTP[6]) to enable the optional OTP done interrupt.
7. For production programming, the TSTPGM bit can be set to indicate a successful programming operation. When TSTPGM is set, the PGMTST bit (CRYOTP[7]) will also be set, allowing users to see the OTP array status by performing a read operation on the array.

Note:	If the device enters Sleep mode during OTP programming, the contents of the OTP array may become corrupted. This is not a recoverable error. Users must ensure that entry into power-saving modes is disabled before OTP programming is performed.

25.12 Programming Keys

1. If not already set, set the CRYON bit.
2. Configure KEYPG[3:0] to the page you want to program.
3. Select the key storage destination using the KEYPSEL bit (CRYOTP[8]).
4. Read the PGMFAIL status bit. If this bit is '1', an illegal configuration has been selected and the programming operation will not be performed.
5. Write the data to be programmed into the Configuration Page into CRYTXTC[63:0]. Any bits that are set ('1') will be permanently programmed, while any bits that are cleared ('0') will not be programmed and may be programmed at a later time.
6. Set the CRYWR bit. Poll the bit until it is cleared; alternatively, set the OTPIE bit (CRYOTP[6]) to enable the optional OTP done interrupt.
7. Repeat Steps 2 through 5 for each OTP array page to be programmed.
8. Once all programming has completed, set the CRYREAD bit to reload the values from the on-chip storage. A read operation must be performed to complete programming.

Note:	Do not clear the CRYON bit while the CRYREAD bit is set; this will result in an incomplete read operation and unavailable key data. To recover, set CRYON and CRYREAD, and allow the read operation to fully complete.

9. Poll the CRYREAD bit until it is cleared; alternatively, set the OTPIE bit (CRYOTP[6]) to enable the optional OTP done interrupt.
10. For production programming, the TSTPGM bit can be set to indicate a successful programming operation. When TSTPGM is set, the PGMTST bit (CRYOTP[7]) will also be set, allowing users to see the OTP array status by performing a read operation on the array.

Note:	If the device enters Sleep mode during OTP programming, the contents of the OTP array may become corrupted. This is not a recoverable error. Users must ensure that entry into power-saving modes is disabled before OTP programming is performed.

25.12.1 KEY RAM WRITE PROTECTION

To prevent accidental overwriting of Key RAM data, each 64-bit block of Key RAM has an internal write lock bit that is not accessible from software. When a block is programmed, its write lock is set; this prevents further writes to the block. All write locks are cleared when the Key RAM is erased (resulting from either a tamper event or a software-initiated wipe) or on a device POR.

25.13 Verifying Programmed Keys

To maintain key security, the Secure OTP Array has no provision to read back its data to any user-accessible memory space in any operating mode. Therefore, there is no way to directly verify programmed data. The only method for verifying that they have been programmed correctly is to perform an encryption operation with a known plaintext/ciphertext pair for each programmed key.

25.14 Key Erasure

Cryptographic keys written to the Secure OTP Array are considered to be programmatically secure. As they cannot be read by any program operation in any operating mode, no provision is made for their erasure.

To prevent an unauthorized third party from obtaining data in Key RAM, two methods are provided to erase key data in the event of application tampering: hardware anti-tampering and software-based erasure.

Hardware anti-tampering monitors the $\overline{\text{TMPR}}$ pin. If a low pulse or sustained low-voltage level is detected, the Key RAM will be automatically erased. Anti-tampering is enabled as a device configuration option by programming (= 0) the TMPRWIPE Configuration bit (FDEVOPT[3]).

Software-based erasure uses software monitoring in the application to detect an interruption of normal execution. Should this happen, the application can set the KEYWIPE bit (CRYCONH[4]) to immediately erase the Key RAM.

25.15 Operation During Sleep and Idle Modes

25.15.1 OPERATION DURING SLEEP MODES

Whenever the device enters any Sleep or Deep Sleep mode, all operation engine state machines are reset. This feature helps to preserve the integrity, or any data being encrypted or decrypted, by discarding any intermediate text that might be used to break the key.

Any OTP programming operations under way when a Sleep mode is entered are also halted. Depending on what is being programmed, this may result in permanent loss of a memory location or potentially the use of the entire Secure OTP Array. Users are advised to perform OTP programming only when entry into power-saving modes is disabled.

Note:	OTP programming errors, regardless of the source, are not recoverable errors. Users should ensure that all foreseeable interruptions to the programming operation, including device interrupts and entry into power-saving modes, are disabled.

25.15.2 KEY STORAGE IN DEEP SLEEP AND VBAT MODES

Under normal circumstances, power is removed from the Key RAM along with the Cryptographic Engine during Deep Sleep and VBAT modes. This results in the loss of any key data that may be stored there. To maintain the Key RAM in these modes, set the KEYRAMEN bit (DSCON[11]). This will result in a fractional increase of current consumption.

25.15.3 OPERATION DURING IDLE MODE

When the CRYSIDL bit (CRYCONL[13]) is '0', the engine will continue any ongoing operations without interruption when the device enters Idle mode.

When CRYSIDL is '1', the module behaves as in Sleep modes.

REGISTER 25-1: CRYCONH: CRYPTOGRAPHIC CONTROL HIGH REGISTER

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **Unimplemented:** Read as '0'

bit 14-8 **CTRSIZE[6:0]:** Counter Size Select bits(1,2,3)

Counter is defined as CRYTXTB[n:0], where n = CTRSIZEx. The counter increments after each operation and generates a rollover event when the counter rolls over from (2^{n-1} – 1) to 0.

1111111 = 128 bits (CRYTXTB[127:0])
1111110 = 127 bits (CRYTXTB[126:0])
•
•
•
0000010 = 3 bits (CRYTXTB[2:0])
0000001 = 2 bits (CRYTXTB[1:0])
0000000 = 1 bit (CRYTXTB[0]); rollover event occurs when CRYTXTB[0] toggles from '1' to '0'

bit 7 **SKEYSEL:** Session Key Select bit(1)

1 = Key generation/encryption/loading performed with CRYKEY[255:128]
0 = Key generation/encryption/loading performed with CRYKEY[127:0]

bit 6-5 **KEYMOD[1:0]:** AES/DES Encrypt/Decrypt Key Mode/Key Length Select bits(1,2)

For DES Encrypt/Decrypt Operations (CPHRSEL = 0):
11 = 64-bit, 3-key 3DES
10 = Reserved
01 = 64-bit, standard 2-key 3DES
00 = 64-bit DES

For AES Encrypt/Decrypt Operations (CPHRSEL = 1):
11 = Reserved
10 = 256-bit AES
01 = 192-bit AES
00 = 128-bit AES

bit 4 **KEYWIPE:** Key RAM Erase Enable bit(1)

1 = Erases Key RAM (set only by software, cleared only by hardware on the next clock cycle)
0 = Key RAM erase has not been requested or has completed

bit 3-0 **KEYSRC[3:0]:** Cipher Key Source bits(1,2)

Refer to Table 25-1 and Table 25-2 for KEYSRC[3:0] values.

Note 1: These bits are reset on system Resets or whenever the CRYMD bit (PMD8[0]) is set.
2: Writes to these bit fields are locked out whenever an operation is in progress (CRYGO bit is set).
3: Used only in CTR operations when CRYTXTB is being used as a counter; otherwise, these bits have no effect.

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **CRYON:** Cryptographic Enable bit
1 = Module is enabled
0 = Module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **CRYSIDL:** Cryptographic Stop in Idle Control bit(3)
1 = Stops module operation in Idle mode
0 = Continues module operation in Idle mode

bit 12 **ROLLIE:** CRYTXTB Rollover Interrupt Enable bit(1)
1 = Generates an interrupt event when the counter portion of CRYTXTB rolls over to '0'
0 = Does not generate an interrupt event when the counter portion of CRYTXTB rolls over to '0'

bit 11 **DONEIE:** Operation Done Interrupt Enable bit(1)
1 = Generates an interrupt event when the current cryptographic operation completes
0 = Does not generate an interrupt event when the current cryptographic operation completes; software must poll the CRYGO or CRYBSY bit to determine when the current cryptographic operation is complete

bit 10 **FREEIE:** Input Text Interrupt Enable bit(1)
1 = Generates an interrupt event when the input text (plaintext or ciphertext) is consumed during the current cryptographic operation
0 = Does not generate an interrupt event when the input text is consumed

bit 9 **Unimplemented:** Read as '0'

bit 8 **CRYGO:** Cryptographic Engine Start bit(1)
1 = Starts the operation specified by OPMOD[3:0] (cleared automatically when operation is done)
0 = Stops the current operation (when cleared by software); also indicates the current operation has completed (when cleared by hardware)

Note 1: These bits are reset on system Resets or whenever the CRYMD bit (PMD8[0]) is set.
2: Writes to these bit fields are locked out whenever an operation is in progress (CRYGO bit is set).
3: If the device enters Idle mode when CRYSIDL = 1, the module will stop its current operation. Entering into Idle mode while an OTP write operation is in process can result in irreversible corruption of the OTP.

REGISTER 25-2: CRYCONL: CRYPTOGRAPHIC CONTROL LOW REGISTER (CONTINUED)

bit 7-4 **OPMOD[3:0]:** Operating Mode Selection bits(1,2)

1111 = Loads session key (decrypts session key in CRYTXTA/CRYTXTB using the Key Encryption Key and writes to CRYKEY)
1110 = Encrypts session key (encrypts session key in CRYKEY using the Key Encryption Key and writes to CRYTXTA/CRYTXTB)
1011 = Generates a session key (generates a True Random Number with the TRNG) and loads it into CRYKEY
1010 = Generates a True Random Number (using the TRNG) and loads it into CRYTXTA
1001

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **CRYBSY:** Cryptographic Engine Busy Status bit(1,4)
1 = A cryptographic operation is in progress
0 = No cryptographic operation is in progress

bit 6 **TXTABSY:** CRYTXTA Busy Status bit(1)
1 = The CRYTXTA register is busy and may not be written to
0 = The CRYTXTA is free and may be written to

bit 5 **CRYABRT:** Cryptographic Operation Aborted Status bit(2,5)
1 = Last operation was aborted by clearing the CRYGO bit in software
0 = Last operation completed normally (CRYGO cleared in hardware)

bit 4 **ROLLOVR:** Counter Rollover Status bit(2)
1 = The CRYTXTB counter rolled over on the last CTR mode operation; once set, this bit must be cleared by software before the CRYGO bit can be set again
0 = No rollover event has occurred

bit 3 **Unimplemented:** Read as '0'

bit 2 **MODFAIL:** Mode Configuration Fail Flag bit(1,3)
1 = Currently selected operating and Cipher mode configuration is invalid; the CRYWR bit cannot be set until a valid mode is selected (automatically cleared by hardware with any valid configuration)
0 = Currently selected operating and Cipher mode configurations are valid

bit 1 **KEYFAIL:** Key Configuration Fail Status bit(1,3,4)
See Table 25-1 and Table 25-2 for invalid key configurations.
1 = Currently selected key and mode configurations are invalid; the CRYWR bit cannot be set until a valid mode is selected (automatically cleared by hardware with any valid configuration)
0 = Currently selected configurations are valid

bit 0 **PGMFAIL:** Key Storage/Configuration Program Fail Flag bit(1,3,4)
1 = The page indicated by KEYPG[3:0] is reserved or locked; the CRYWR bit cannot be set and no programming operation can be started
0 = The page indicated by KEYPG[3:0] is available for programming

Note 1: These bits are reset on system Resets or whenever the CRYMD bit (PMD8[0]) is set.
2: These bits are reset on system Resets when the CRYMD bit is set or when CRYGO is cleared.
3: These bits are functional even when the module is disabled (CRYON = 0); this allows mode configurations to be validated for compatibility before enabling the module.
4: These bits are automatically set during all OTP read operations, including the initial read at POR. Once the read is completed, the bit assumes the proper state that reflects the current configuration.
5: If this bit is set, a cryptographic operation cannot be performed.

NOTES:

26.0 32-BIT PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"32-Bit Programmable Cyclic Redundancy Check (CRC)"** (www.microchip.com/DS30009729). The information in this data sheet supersedes the information in the FRM.

The 32-bit programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-Programmable CRC Polynomial Equation, up to 32 bits
- Programmable Shift Direction (little or big-endian)
- Independent Data and Polynomial Lengths
- Configurable Interrupt Output
- Data FIFO

Figure 26-1 displays a simplified block diagram of the CRC generator. A simple version of the CRC shift engine is displayed in Figure 26-2.

FIGURE 26-1: CRC MODULE BLOCK DIAGRAM

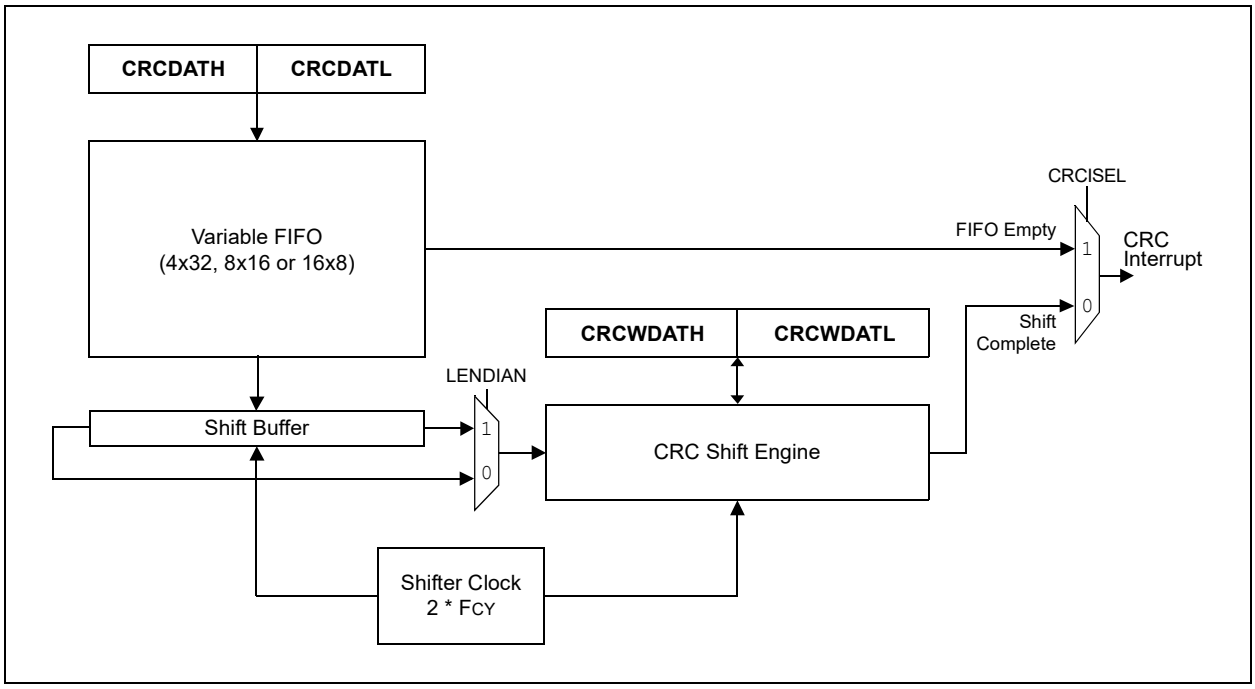

FIGURE 26-2: CRC SHIFT ENGINE DETAIL

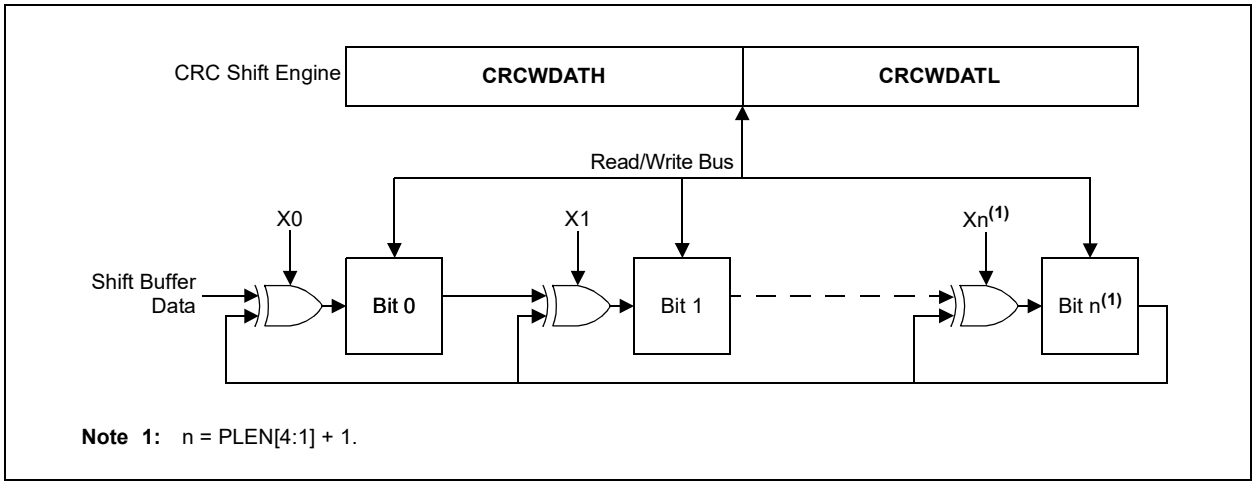

Note 1: n = PLEN[4:1] + 1.

26.1 User Interface

26.1.1 POLYNOMIAL INTERFACE

The CRC module can be programmed for CRC polynomials of up to the 32nd order, using up to 32 bits.

Polynomial length, which reflects the highest exponent in the equation, is selected by the PLEN[4:0] bits (CRCCON2[4:0]).

The CRCXORL and CRCXORH registers control which exponent terms are included in the equation. Setting a particular bit includes that exponent term in the equation. Functionally, this includes an XOR operation on the corresponding bit in the CRC engine. Clearing the bit disables the XOR.

For example, consider two CRC polynomials, one is a 16-bit and the other is a 32-bit equation.

EQUATION 26-1: 16-BIT, 32-BIT CRC POLYNOMIALS

$$X16 + X12 + X5 + 1$$

and

$$X32+X26 + X23 + X22 + X16 + X12 + X11 + X10 + X8 + X7 + X5 + X4 + X2 + X + 1$$

To program these polynomials into the CRC generator, set the register bits, as shown in Table 26-1.

Note that the appropriate positions are set to '1' to indicate that they are used in the equation (for example, X26 and X23). The '0' bit required by the equation is always XORed; thus, X0 is a don't care. For a polynomial of length 32, it is assumed that the 32nd bit will be used. Therefore, the X[31:1] bits do not have the 32nd bit.

26.1.2 DATA INTERFACE

The module incorporates a FIFO that works with a variable data width. Input data width can be configured to any value, between 1 and 32 bits, using the DWIDTH[4:0] bits (CRCCON2[12:8]). When the data width is greater than 15, the FIFO is 4 words deep. When the DWIDTHx bits are between 15 and 8, the FIFO is 8 words deep. When the DWIDTHx bits are less than 8, the FIFO is 16 words deep.

The data for which the CRC is to be calculated must first be written into the FIFO. Even if the data width is less than 8, the smallest data element that can be written into the FIFO is 1 byte. For example, if the DWIDTHx bits are 5, then the size of the data is DWIDTH[4:0] + 1 or 6. The data are written as a whole byte; the two unused upper bits are ignored by the module.

Once data are written into the MSb of the CRCDAT registers (that is, the MSb as defined by the data width), the value of the VWORD[4:0] bits (CRCCON1[12:8]) increments by one. For example, if the DWIDTHx bits are 24, the VWORDx bits will increment when bit 7 of CRCDATH is written. Therefore, CRCDATL must always be written to before CRCDATH.

The CRC engine starts shifting data when the CRCGO bit is set and the value of the VWORDx bits is greater than zero.

Each word is copied out of the FIFO into a buffer register, which decrements the VWORDx bits. The data are then shifted out of the buffer. The CRC engine continues shifting at a rate of two bits per instruction cycle, until the VWORDx bits reach zero. This means that for a given data width, it takes half that number of instructions for each word to complete the calculation. For example, it takes 16 cycles to calculate the CRC for a single word of 32-bit data.

When the VWORDx bits reach the maximum value for the configured value of the DWIDTHx bits (4, 8 or 16), the CRCFUL bit becomes set. When the VWORDx bits reach zero, the CRCMPT bit becomes set. The FIFO is emptied and the VWORD[4:0] bits are set to '00000' whenever CRCEN is '0'.

At least one instruction cycle must pass after a write to CRCWDAT before a read of the VWORDx bits is done.

TABLE 26-1: CRC SETUP EXAMPLES FOR 16 AND 32-BIT POLYNOMIALS

CRC Control Bits	Bit Values	
	16-Bit Polynomial	32-Bit Polynomial
PLEN[4:0]	01111	11111
X[31:16]	0000 0000 0000 0001	0000 0100 1100 0001
X[15:0]	0001 0000 0010 000x	0001 1101 1011 011x

26.1.3 DATA SHIFT DIRECTION

The LENDIAN bit (CRCCON1[3]) is used to control the shift direction. By default, the CRC will shift data through the engine, MSb first. Setting LENDIAN (= 1) causes the CRC to shift data, LSb first. This setting allows better integration with various communication schemes and removes the overhead of reversing the bit order in software. Note that this only changes the direction the data are shifted into the engine. The result of the CRC calculation will still be a normal CRC result, not a reverse CRC result.

26.1.4 INTERRUPT OPERATION

The module generates an interrupt that is configurable by the user for either of two conditions.

If CRCISEL is '0', an interrupt is generated when the VWORD[4:0] bits make a transition from a value of '1' to '0'. If CRCISEL is '1', an interrupt will be generated after the CRC operation finishes and the module sets the CRCGO bit to '0'. Manually setting CRCGO to '0' will not generate an interrupt. Note that when an interrupt occurs, the CRC calculation would not yet be complete. The module will still need (PLEN + 1)/2 clock cycles, after the interrupt is generated, until the CRC calculation is finished.

26.1.5 TYPICAL OPERATION

To use the module for a typical CRC calculation:

1. Set the CRCEN bit to enable the module.
2. Configure the module for desired operation:
   a) Program the desired polynomial using the CRCXORL and CRCXORH registers, and the PLEN[4:0] bits.
   b) Configure the data width and shift direction using the DWIDTH[4:0] and LENDIAN bits.
   c) Select the desired Interrupt mode using the CRCISEL bit.
3. Preload the FIFO by writing to the CRCDATL and CRCDATH registers until the CRCFUL bit is set or no data are left.
4. Clear old results by writing 00h to CRCWDATL and CRCWDATH. The CRCWDAT registers can also be left unchanged to resume a previously halted calculation.
5. Set the CRCGO bit to start calculation.
6. Write the remaining data into the FIFO as space becomes available.
7. When the calculation completes, CRCGO is automatically cleared. An interrupt will be generated if CRCISEL = 1.
8. Read CRCWDATL and CRCWDATH for the result of the calculation.

There are eight registers used to control programmable CRC operation:

- CRCCON1
- CRCCON2
- CRCXORL
- CRCXORH
- CRCDATL
- CRCDATH
- CRCWDATL
- CRCWDATH

The CRCCON1 and CRCCON2 registers (Register 26-1 and Register 26-2) control the operation of the module and configure the various settings.

The CRCXOR registers (Register 26-3 and Register 26-4) select the polynomial terms to be used in the CRC equation. The CRCDAT and CRCWDAT registers are each register pairs that serve as buffers for the double-word input data, and CRC processed output, respectively.

27.0 12-BIT A/D CONVERTER WITH THRESHOLD DETECT

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the 12-Bit A/D Converter, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"12-Bit A/D Converter with Threshold Detect"** (www.microchip.com/DS39739). The information in this data sheet supersedes the information in the FRM.

The 12-bit A/D Converter has the following key features:

- Successive Approximation Register (SAR) Conversion
- Conversion Speeds of up to 200 ksps
- Up to 20 Analog Input Channels (internal and external)
- Selectable 10-Bit or 12-Bit (default) Conversion Resolution
- Multiple Internal Reference Input Channels
- External Voltage Reference Input Pins
- Unipolar Differential Sample-and-Hold (S/H) Amplifier
- Automated Threshold Scan and Compare Operation to Pre-Evaluate Conversion Results
- Selectable Conversion Trigger Source
- Fixed Length (one word per channel), Configurable Conversion Result Buffer
- Four Options for Results Alignment
- Configurable Interrupt Generation
- Enhanced DMA Operations with Indirect Address Generation
- Operation During CPU Sleep and Idle modes

The 12-bit A/D Converter module is an enhanced version of the 10-bit module offered in earlier PIC24 devices. It is a Successive Approximation Register (SAR) Converter, enhanced with 12-bit resolution, a wide range of automatic sampling options, tighter integration with other analog modules and a configurable results buffer.

It also includes a unique Threshold Detect feature that allows the module itself to make simple decisions based on the conversion results, and enhanced operation with the DMA Controller through Peripheral Indirect Addressing (PIA).

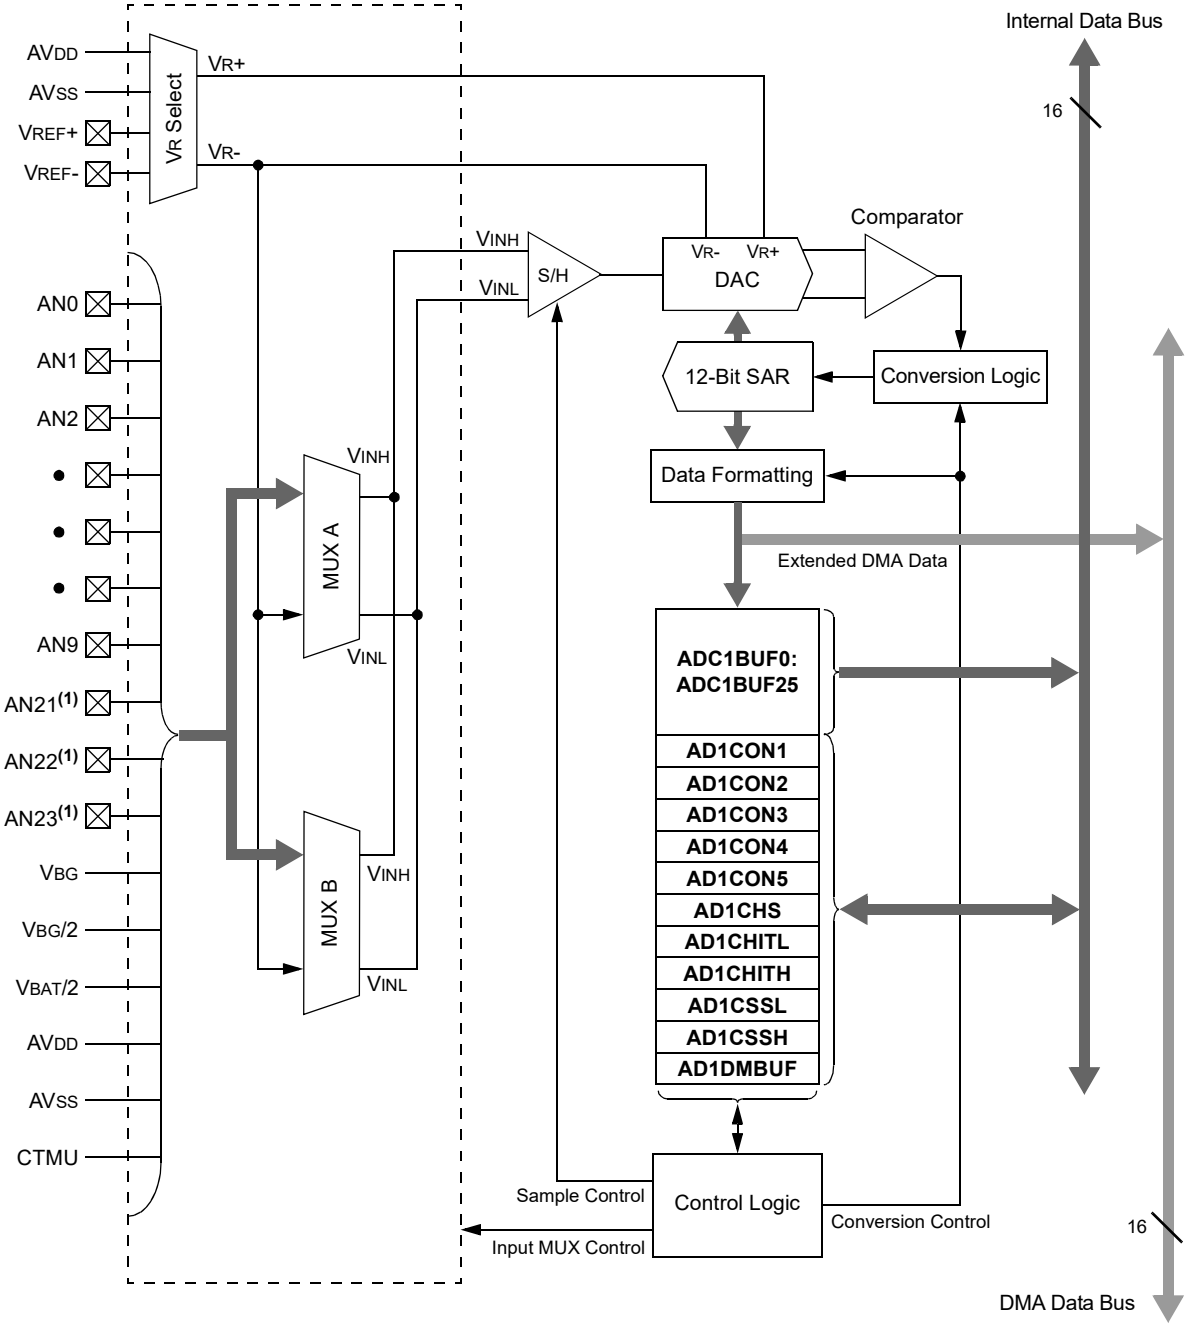
A simplified block diagram for the module is shown in Figure 27-1.

27.1 Basic Operation

To perform a standard A/D conversion:

1. Configure the module:
   a) Configure port pins as analog inputs by setting the appropriate bits in the ANSx registers (see **Section 11.2 "Configuring Analog Port Pins (ANSx)"** for more information).
   b) Select the voltage reference source to match the expected range on analog inputs (AD1CON2[15:13]).
   c) Select the positive and negative multiplexer inputs for each channel (AD1CHS[15:0]).
   d) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3[7:0]).
   e) Select the appropriate sample/conversion sequence (AD1CON1[7:4] and AD1CON3[12:8]).
   f) For Channel A scanning operations, select the positive channels to be included (AD1CSSH and AD1CSSL registers).
   g) Select how conversion results are presented in the buffer (AD1CON1[9:8] and AD1CON5 register).
   h) Select the interrupt rate (AD1CON2[6:2]).
   i) Turn on A/D module (AD1CON1[15]).
2. Configure the A/D interrupt (if required):
   a) Clear the AD1IF bit (IFS0[13]).
   b) Enable the AD1IE interrupt (IEC0[13]).
   c) Select the A/D interrupt priority (IPC3[6:4]).
3. If the module is configured for manual sampling, set the SAMP bit (AD1CON1[1]) to begin sampling.

FIGURE 27-1: 12-BIT A/D CONVERTER BLOCK DIAGRAM (PIC24FJ256GA412/GB412 FAMILY)



Note 1: AN16 through AN23 are not implemented on 64-pin devices.

27.2 Extended DMA Operations

In addition to the standard features available on all 12-bit A/D Converters, PIC24FJ256GA412/GB412 family devices implement a limited extension of DMA functionality. This extension adds features that work with the device's DMA Controller to expand the A/D module's data storage abilities beyond the module's built-in buffer.

The Extended DMA functionality is controlled by the DMAEN bit (AD1CON1[11]); setting this bit enables the functionality. The DMABM bit (AD1CON1[12]) configures how the DMA feature operates.

27.2.1 EXTENDED BUFFER MODE

Extended Buffer mode (DMABM = 1) is useful for storing the results of channels. It can also be used to store the conversion results on any A/D channel in any implemented address in data RAM.

In Extended Buffer mode, all data from the A/D Buffer register, and channels above 26, are mapped into data RAM. Conversion data are written to a destination specified by the DMA Controller, specifically by the DMADSTn register. This allows users to read the conversion results of channels above 26, which do not have their own memory-mapped A/D buffer locations, from data memory.

When using Extended Buffer mode, always set the BUFREGEN bit to disable FIFO operation. In addition, disable the Split Buffer mode by clearing the BUFM bit.

27.2.2 PIA MODE

When DMABM = 0, the A/D module is configured to function with the DMA Controller for Peripheral Indirect Addressing (PIA) mode operations. In this mode, the A/D module generates an 11-bit Indirect Address (IA). This is ORed with the destination address in the DMA Controller to define where the A/D conversion data will be stored.

In PIA mode, the buffer space is created as a series of contiguous smaller buffers, one per analog channel. The size of the channel buffer determines how many analog channels can be accommodated. The size of the buffer is selected by the DMABL[2:0] bits (AD1CON4[2:0]). The size options range from a single word per buffer to 128 words. Each channel is allocated a buffer of this size, regardless of whether or not the channel will actually have conversion data.

The IA is created by combining the base address within a channel buffer with three to five bits (depending on the buffer size) to identify the channel. The base address ranges from zero to seven bits wide, depending on the buffer size. The address is right-padded with a '0' in order to maintain address alignment in the Data Space. The concatenated channel and base address bits are then left-padded with zeros, as necessary, to complete the 11-bit IA.

The IA is configured to auto-increment during write operations by using the SMPIx bits (AD1CON2[6:2]).

As with PIA operations for any DMA-enabled module, the base destination address in the DMADSTn register must be masked properly to accommodate the IA. Table 27-1 shows how complete addresses are formed. Note that the address masking varies for each buffer size option. Because of masking requirements, some address ranges may not be available for certain buffer sizes. Users should verify that the DMA base address is compatible with the buffer size selected.

Figure 27-2 shows how the parts of the address define the buffer locations in data memory. In this case, the module "allocates" 256 bytes of data RAM (1000h to 1100h) for 32 buffers of four words each. However, this is not a hard allocation and nothing prevents these locations from being used for other purposes. For example, in the current case, if Analog Channels 1, 3 and 8 are being sampled and converted, conversion data will only be written to the channel buffers, starting at 1008h, 1018h and 1040h. The holes in the PIA buffer space can be used for any other purpose. It is the user's responsibility to keep track of buffer locations and prevent data overwrites.

27.3 A/D Operation with VBAT

One of the A/D channels is connected to the VBAT pin to monitor the VBAT voltage. This allows monitoring the VBAT pin voltage (battery voltage) with no external connection. The voltage measured, using the A/D VBAT monitor, is VBAT/2. The voltage can be calculated by reading A/D = ((VBAT/2)/VDD) * 1024 for 10-bit A/D and ((VBAT/2)/VDD) * 4096 for 12 bit A/D.

When using the VBAT A/D monitor:

- Connect the A/D channel to ground to discharge the sample capacitor.
- Because of the high-impedance of VBAT, select higher sampling time to get an accurate reading.

Since the VBAT pin is connected to the A/D during sampling, to prolong the VBAT battery life, the recommendation is to only select the VBAT channel when needed.

FIGURE 27-2: EXAMPLE OF BUFFER ADDRESS GENERATION IN PIA MODE (4-WORD BUFFERS PER CHANNEL)

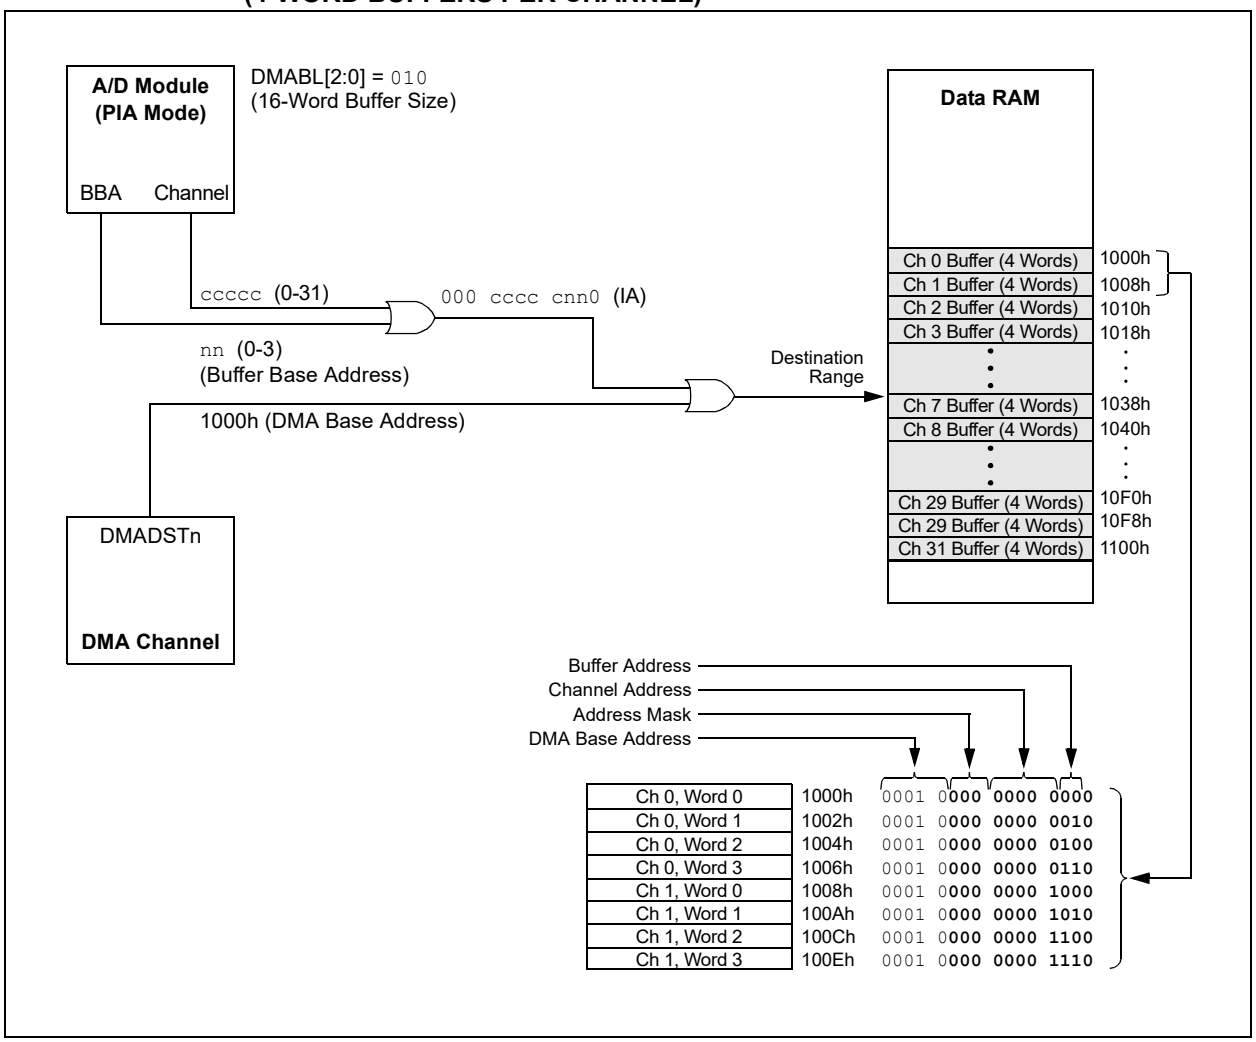


TABLE 27-1: INDIRECT ADDRESS GENERATION IN PIA MODE

DMABL[2:0]	Buffer Size per Channel (words)	Generated Offset Address (lower 11 bits)	Available Input Channels	Allowable DMADSTn Addresses
000	1	000 00cc ccc0	32	xxxx xxxx xx00 0000
001	2	000 0ccc ccn0	32	xxxx xxxx x000 0000

Legend: ccc = Channel number (three to five bits), n = Base buffer address (zero to seven bits), x = User-definable range of DMADSTn for base address, 0 = Masked bits of DMADSTn for IA.

27.4 Registers

The 12-bit A/D Converter is controlled through a total of 13 registers:

- AD1CON1 through AD1CON5 (Register 27-1 through Register 27-5)
- AD1CHS (Register 27-6)
- AD1CHITH and AD1CHITL (Register 27-8 and Register 27-9)
- AD1CSSH and AD1CSSL (Register 27-10 and Register 27-11)
- AD1CTMENH and AD1CTMENL (Register 27-12 and Register 27-13)
- AD1DMBUF (not shown) – The 16-bit conversion buffer for Extended Buffer mode

In addition, the ANCFG register (Register 27-7) controls the band gap voltage resources for the A/D Converter, as well as other modules.

FIGURE 27-4: 12-BIT A/D TRANSFER FUNCTION

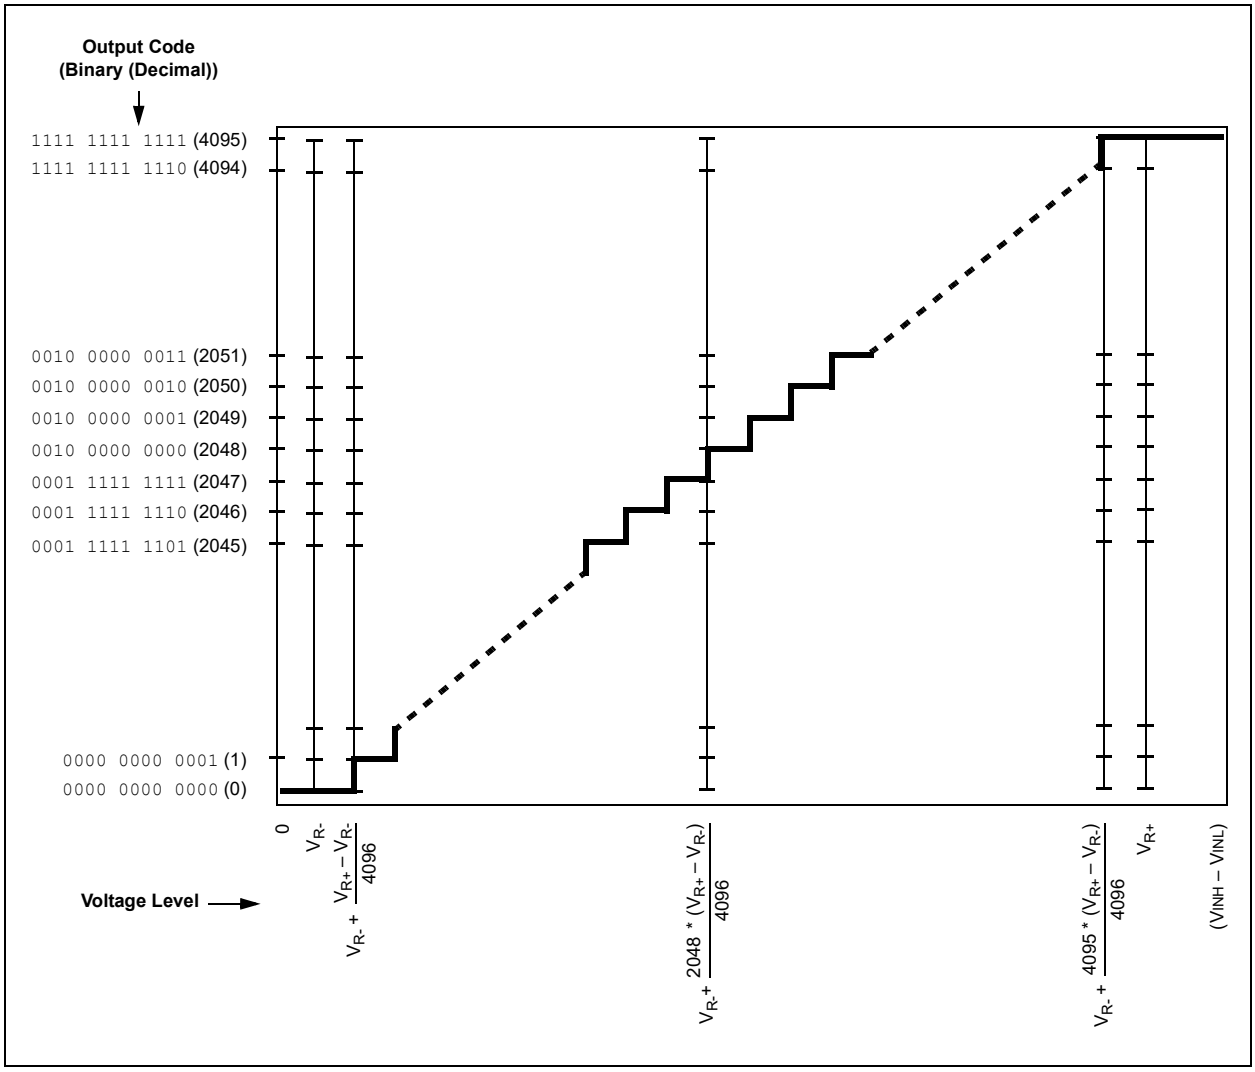

FIGURE 27-5: 10-BIT A/D TRANSFER FUNCTION

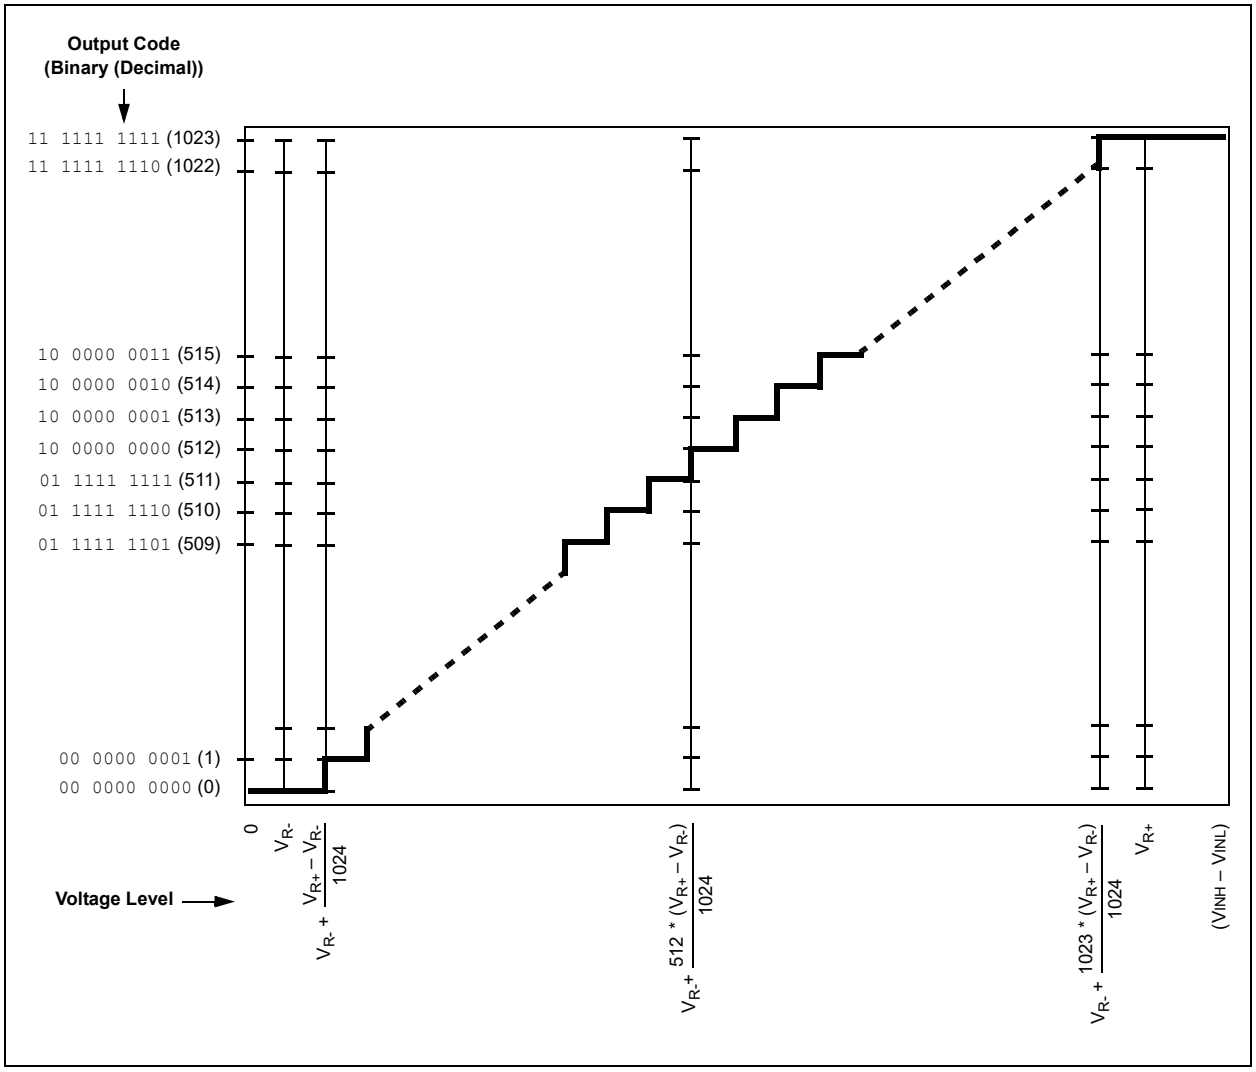

28.0 10-BIT DIGITAL-TO-ANALOG CONVERTER (DAC)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"10-Bit Digital-to-Analog Converter (DAC)"** (www.microchip.comDS39615). The information in this data sheet supersedes the information in the FRM.

PIC24FJ256GA412/GB412 family devices include 10-bit Digital-to-Analog Converters (DACs) for generating analog outputs from digital data. A simplified block diagram for a the DAC is shown in Figure 28-1.

The DAC generates an analog output voltage based on the digital input code, according to the formula:

$$V_{DAC} = \frac{V_{DACREF} \times DACxDAT}{1024}$$

where V_{DAC} is the analog output voltage and V_{DACREF} is the reference voltage selected by DACREF[1:0].

The DAC includes these features:

- Precision 10-Bit Resistor Ladder for High Accuracy
- Fast Settling Time, Supporting 1 Msps Effective Sampling Rates
- Buffered Output Voltage
- Three User-Selectable Voltage Reference Options
- Multiple Conversion Trigger Options, Plus a Manual Convert-on-Write Option
- Left and Right Justified Input Data Options
- User-Selectable Sleep and Idle mode Operation

When using the DAC, it is required to set the ANSx and TRISx bits for the DACx output pin to configure it as an analog output. See **Section 11.2 "Configuring Analog Port Pins (ANSx)"** for more information.

NOTES:

29.0 TRIPLE COMPARATOR MODULE

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Scalable Comparator Module"** (www.microchip.com/DS39734). The information in this data sheet supersedes the information in the FRM.

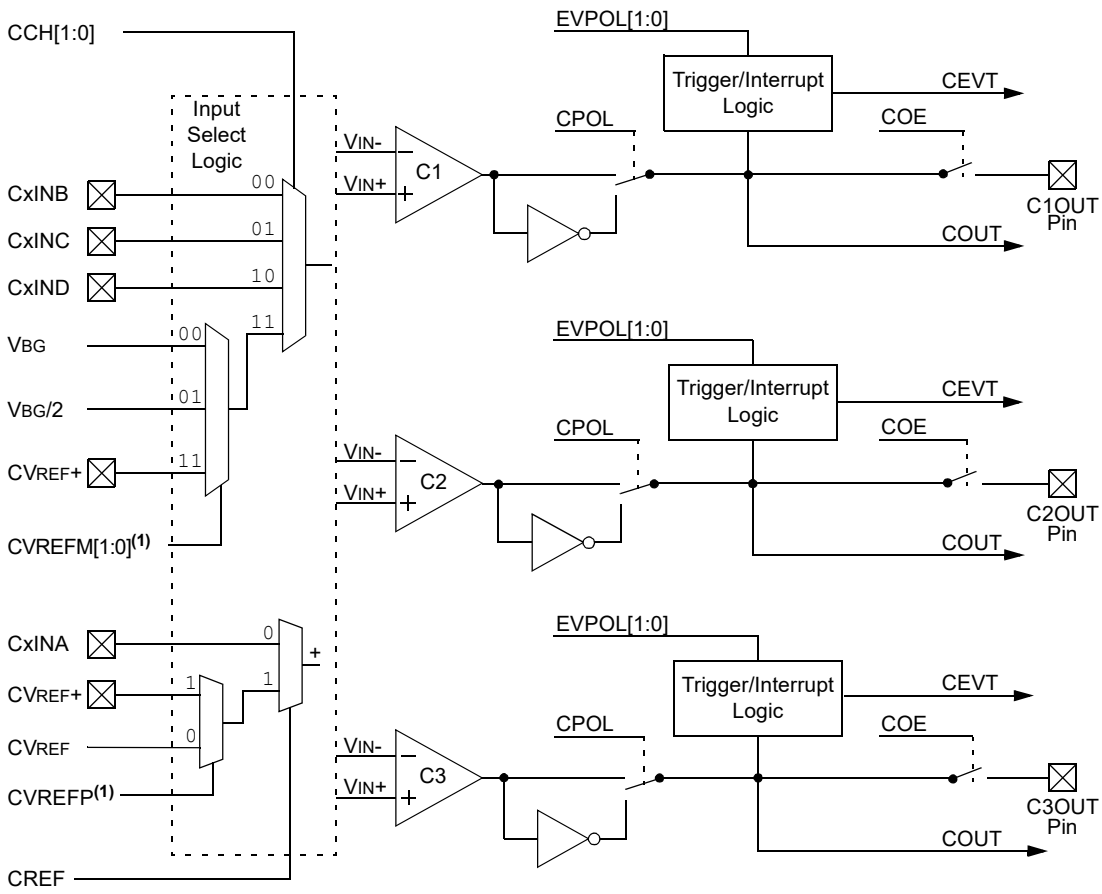
The triple comparator module provides three dual input comparators. The inputs to the comparator can be configured to use any one of five external analog inputs (CxINA, CxINB, CxINC, CxIND and VREF+) and a voltage reference input from one of the internal band gap references or the comparator voltage reference generator (VBG, VBG/2 and CVREF).

The comparator outputs may be directly connected to the CxOUT pins. When the respective COE bit equals '1', the I/O pad logic makes the unsynchronized output of the comparator available on the pin.

A simplified block diagram of the module in shown in Figure 29-1. Diagrams of the possible individual comparator configurations are shown in Figure 29-2.

Each comparator has its own control register, CMxCON (Register 29-1), for enabling and configuring its operation. The output and event status of all three comparators is provided in the CMSTAT register (Register 29-2).

FIGURE 29-1: TRIPLE COMPARATOR MODULE BLOCK DIAGRAM



Note 1: Refer to the CVRCON register (Register 30-1) for bit details.

NOTES:

30.0 COMPARATOR VOLTAGE REFERENCE

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Dual Comparator Module"** (www.microchip.com/DS39710). The information in this data sheet supersedes the information in the FRM.

30.1 Configuring the Comparator Voltage Reference

The comparator voltage reference module is controlled through the CVRCON register (Register 30-1). The comparator voltage reference provides a range of output voltages with 32 distinct levels. The comparator reference supply voltage can come from either VDD and VSS or the external CVREF+ and CVREF- pins. The voltage source is selected by the CVRSS bit (CVRCON[5]).

The settling time of the comparator voltage reference must be considered when changing the CVREF output.

31.0 CHARGE TIME MEASUREMENT UNIT (CTMU)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Charge Time Measurement Unit, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"Charge Time Measurement Unit (CTMU) and CTMU Operation with Threshold Detect"** (www.microchip.com/DS30009743). The information in this data sheet supersedes the information in the FRM.

The Charge Time Measurement Unit (CTMU) is a flexible analog module that provides charge measurement, accurate differential time measurement between pulse sources and asynchronous pulse generation. Its key features include:

- Thirteen External Edge Input Trigger Sources
- Polarity Control for Each Edge Source
- Control of Edge Sequence
- Control of Response to Edge Levels or Edge Transitions
- Time Measurement Resolution of One Nanosecond
- Accurate Current Source Suitable for Capacitive Measurement

Together with other on-chip analog modules, the CTMU can be used to precisely measure time, measure capacitance, measure relative changes in capacitance or generate output pulses that are independent of the system clock. The CTMU module is ideal for interfacing with capacitive-based touch sensors.

The CTMU is controlled through three registers: CTMUCON1L, CTMUCON1H and CTMUCON2L. CTMUCON1L enables the module and controls the mode of operation of the CTMU, edge sequencing and current source control. CTMUCON1H controls edge source selection and edge source polarity selection. The CTMUCON2L register controls the reset and discharge of the current source.

31.1 Measuring Capacitance

The CTMU module measures capacitance by generating an output pulse, with a width equal to the time between edge events, on two separate input channels. The pulse edge events to both input channels can be selected from four sources: two internal peripheral modules (OC1 and Timer1) and up to 13 external pins (CTED1 through CTED13). This pulse is used with the module's precision current source to calculate capacitance according to the relationship:

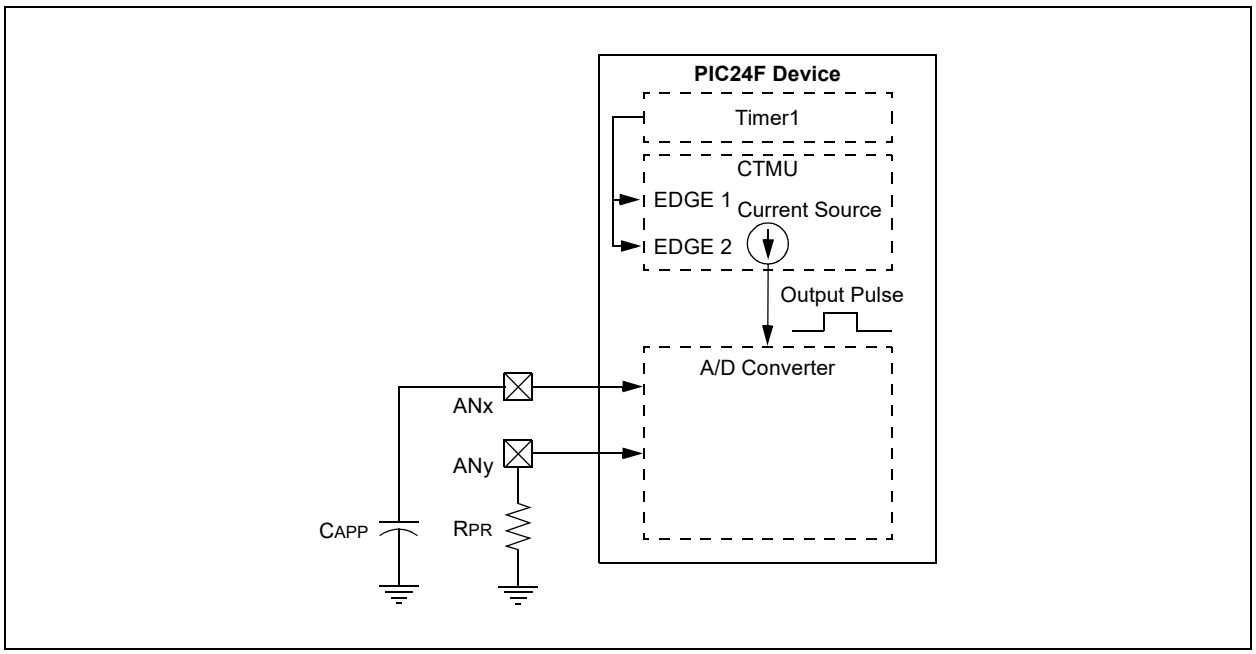
EQUATION 31-1:

$$I = C \bullet \frac{dV}{dT}$$

For capacitance measurements, the A/D Converter samples an External Capacitor (C_{APP}) on one of its input channels after the CTMU output's pulse. A Precision Resistor (R_{PR}) provides current source calibration on a second A/D channel. After the pulse ends, the converter determines the voltage on the capacitor. The actual calculation of capacitance is performed in software by the application.

Figure 31-1 illustrates the external connections used for capacitance measurements and how the CTMU and A/D modules are related in this application. This example also shows the edge events coming from Timer1, but other configurations using external edge sources are possible. A detailed discussion on measuring capacitance and time with the CTMU module is provided in the *"dsPIC33/PIC24 Family Reference Manual"*, **"Charge Time Measurement Unit (CTMU) and CTMU Operation with Threshold Detect"** (www.microchip.com/DS30009743).

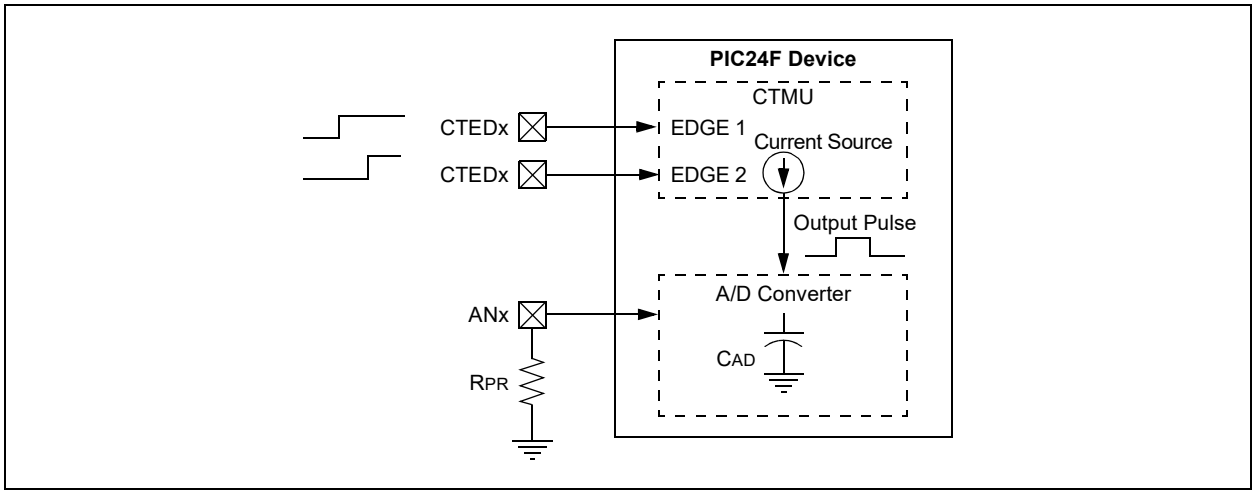
FIGURE 31-1: TYPICAL CONNECTIONS AND INTERNAL CONFIGURATION FOR CAPACITANCE MEASUREMENT



31.2 Measuring Time

Time measurements on the pulse width can be similarly performed using the A/D module's Internal Capacitor (C_{AD}) and a precision resistor for current calibration. Figure 31-2 displays the external connections used for time measurements, and how the CTMU and A/D modules are related in this application. This example also shows both edge events coming from the external CTEDx pins, but other configurations using internal edge sources are possible.

FIGURE 31-2: TYPICAL CONNECTIONS AND INTERNAL CONFIGURATION FOR TIME MEASUREMENT



31.3 Pulse Generation and Delay

The CTMU module can also generate an output pulse with edges that are not synchronous with the device's system clock. More specifically, it can generate a pulse with a programmable delay from an edge event input to the module.

When the module is configured for pulse generation delay by setting the TGEN bit (CTMUCON1L[12]), the internal current source is connected to the B input of Comparator 2. A Capacitor (CDELAY) is connected to the Comparator 2 pin, C2INB, and the Comparator Voltage Reference, CVREF, is connected to C2INA. CVREF is then configured for a specific trip point. The module begins to charge CDELAY when an edge event is detected. When CDELAY charges above the CVREF trip point, a pulse is output on CTPLS. The length of the pulse delay is determined by the value of CDELAY and the CVREF trip point.

Figure 31-3 illustrates the external connections for pulse generation, as well as the relationship of the different analog modules required. While CTED1 is shown as the input pulse source, other options are available. A detailed discussion on pulse generation with the CTMU module is provided in the *"dsPIC33/PIC24 Family Reference Manual"*.

NOTES:

32.0 HIGH/LOW-VOLTAGE DETECT (HLVD)

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the High/Low-Voltage Detect, refer to the *"dsPIC33/PIC24 Family Reference Manual"*, **"High-Level Integration with Programmable High/Low-Voltage Detect (HLVD)"** (www.microchip.com/DS39725). The information in this data sheet supersedes the information in the FRM.

The High/Low-Voltage Detect (HLVD) module is a programmable circuit that allows the user to specify both the device voltage trip point and the direction of change.

An interrupt flag is set if the device experiences an excursion past the trip point in the direction of change. If the interrupt is enabled, the program execution will branch to the interrupt vector address and the software can then respond to the interrupt.

The HLVD Control register (see Register 32-1) completely controls the operation of the HLVD module. This allows the circuitry to be "turned off" by the user under software control, which minimizes the current consumption for the device.

33.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information, refer to the following sections in the *"dsPIC33/PIC24 Reference Manual"*. The information in this data sheet supersedes the information in the FRMs.

- **"Watchdog Timer (WDT)"** (www.microchip.com/DS39697)
- **"High-Level Device Integration"** (www.microchip.com/DS39719)
- **"Programming and Diagnostics"** (www.microchip.com/DS39716)
- **"CodeGuard™ Intermediate Security"** (www.microchip.com/DS70005182)

PIC24FJ256GA412/GB412 family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™
- In-Circuit Emulation

33.1 Configuration Bits

The Flash Configuration Words are stored in the last page location of implemented program memory. Their bits can be programmed (read as '0'), or left unprogrammed (read as '1'), to select various device configurations. There are two types of Configuration bits: system operation bits and code-protect bits. The system operation bits determine the power-on settings for system-level components, such as the oscillator and the Watchdog Timer. The code-protect bits prevent program memory from being read and written.

Table 33-1 lists the Configuration register address ranges for each device in Single and Dual Partition Flash modes. A detailed explanation of the various bit functions is provided in Register 33-1 through Register 33-12.

33.1.1 CONSIDERATIONS FOR CONFIGURING PIC24FJ256GA412/GB412 FAMILY DEVICES

In PIC24FJ256GA412/GB412 family devices, most of the Configuration Words are implemented as volatile memory. This means that configuration data must be programmed each time the device is powered up. The configuration data are automatically loaded from the Flash Configuration Words to the proper Configuration registers during device Resets.

Note: Configuration data are reloaded on all types of device Resets.

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration Word for configuration data. This is to make certain that program code is not stored in this address when the code is compiled.

The upper byte of all Configuration Words in program memory should always be '0000 0000'. This makes them appear to be NOP instructions in the remote event that their locations are ever executed by accident. Since Configuration bits are not implemented in the corresponding locations, writing '0's to these locations has no effect on device operation.

Note: Performing a page erase operation on the last page of program memory clears the Flash Configuration Words, enabling code protection as a result. Therefore, users should avoid performing page erase operations on the last page of program memory.

33.1.2 FBOOT

Unlike the Configuration Words, the FBOOT register is not implemented as volatile Flash memory. It is located away from the other Flash Configuration Words, at a constant address for all devices outside of the program memory space. Device Resets do not affect its contents.

Note that the address for FBOOT, 801800h, belongs to the configuration memory space (800000h-FFFFFFh), which can only be accessed using Table Reads and Table Writes.

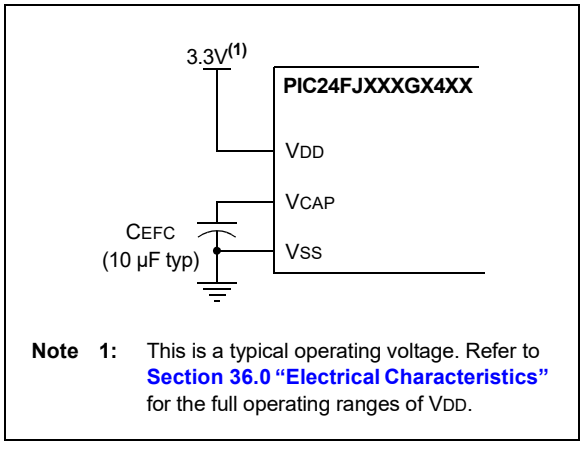
33.2 On-Chip Voltage Regulator

All PIC24FJ256GA412/GB412 family devices power their core digital logic at a nominal 1.8V. This may create an issue for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the PIC24FJ256GA412/GB412 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

This regulator is always enabled. It provides a constant voltage (1.8V nominal) to the digital core logic, from a VDD of 2.0V all the way up to the device's VDDMAX. It does not have the capability to boost VDD levels. In order to prevent "brown-out" conditions when the voltage drops too low for the regulator, the Brown-out Reset occurs. Then, the regulator output follows VDD with a typical voltage drop of 300 mV.

A low-ESR capacitor (such as ceramic) must be connected to the VCAP pin (Figure 33-1). This helps to maintain the stability of the regulator. The recommended value for the Filter Capacitor (CEFC) is provided in **Section 36.1 "DC Characteristics"**.

FIGURE 33-1: CONNECTIONS FOR THE ON-CHIP REGULATOR



Note 1: This is a typical operating voltage. Refer to **Section 36.0 "Electrical Characteristics"** for the full operating ranges of VDD.

33.2.1 ON-CHIP REGULATOR AND POR

The voltage regulator requires a small amount of time to transition from a disabled or standby state into normal operating mode. During this time, designated as TVREG, code execution is disabled. TVREG is applied every time the device resumes operation after any power-down, including Sleep mode. TVREG is determined by the status of the PMSLP bit (RCON[8]). Refer to **Section 36.0 "Electrical Characteristics"** for more information on TVREG.

Note: For more information, see **Section 36.0 "Electrical Characteristics"**. The information in this data sheet supersedes the information in the *"dsPIC33/PIC24 Family Reference Manual"*.

33.2.2 VOLTAGE REGULATOR STANDBY MODE

The on-chip regulator always consumes a small incremental amount of current over IDD/IPD, including when the device is in Sleep mode, even though the core digital logic does not require power. To provide additional savings in applications where power resources are critical, the regulator can be made to enter Standby mode on its own whenever the device goes into Sleep mode. This feature is controlled by the PMSLP bit (RCON[8]). Clearing the PMSLP bit enables the Standby mode. When waking up from Standby mode, the regulator needs to wait for TVREG to expire before wake-up.

33.2.3 LOW-VOLTAGE/RETENTION REGULATOR

When power-saving modes, such as Sleep is used, PIC24FJ256GA412/GB412 family devices may use a separate low-power, low-voltage/retention regulator to power critical circuits. This regulator, which operates at 1.2V nominal, maintains power to data RAM and the RTCC while all other core digital logic is powered down. It operates only in Sleep and VBAT modes.

The low-voltage/retention regulator is described in more detail in **Section 10.1.3 "Low-Voltage/Retention Regulator"**.

33.3 Watchdog Timer (WDT)

For PIC24FJ256GA412/GB412 family devices, the WDT is driven by the LPRC Oscillator. When the WDT is enabled, the clock source is also enabled.

The nominal WDT clock source from LPRC is 31 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the FWPSA Configuration bit. With a 31 kHz input, the prescaler yields a nominal WDT Time-out period (TWDT) of 1 ms in 5-bit mode or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPS[3:0] Configuration bits (FWDT[3:0]), which allows the selection of a total of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler time-out periods, ranges from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSCx bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

If the WDT is enabled, it will continue to run during Sleep or Idle modes. When the WDT time-out occurs, the device will wake the device and code execution will continue from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE (RCON[3:2]) bit will need to be cleared in software after the device wakes up.

The WDT Flag bit, WDTO (RCON[4]), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

33.3.1 WINDOWED OPERATION

The Watchdog Timer has an optional Fixed Window mode of operation. In this Windowed mode, CLRWDT instructions can only reset the WDT during the last 1/4 of the programmed WDT period. A CLRWDT instruction executed before that window causes a WDT Reset, similar to a WDT time-out.

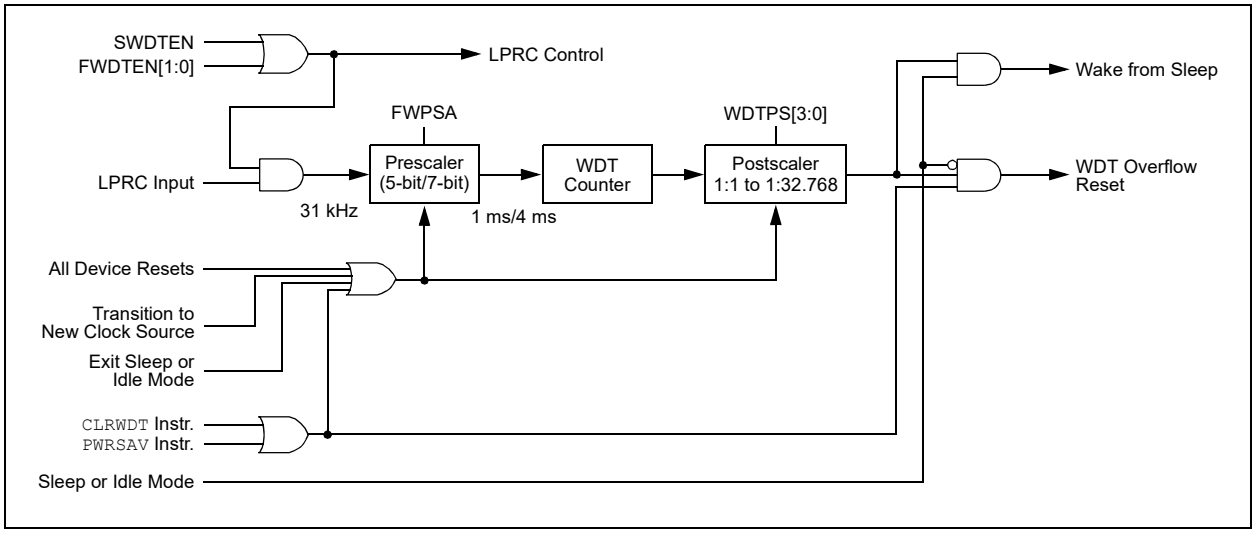
Windowed WDT mode is enabled by programming the WINDIS Configuration bit (FWDT[7]) to '0'.

33.3.2 CONTROL REGISTER

The WDT is enabled or disabled by the FWDTEN[1:0] Configuration bits. When the Configuration bits, FWDTEN[1:0] = 11, the WDT is always enabled.

The WDT can be optionally controlled in software when the Configuration bits, FWDTEN[1:0] = 10. When FWDTEN[1:0] = 00, the Watchdog Timer is always disabled. The WDT is enabled in software by setting the SWDTEN control bit (RCON[5]). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

FIGURE 33-2: WDT BLOCK DIAGRAM



33.4 Code Protection and CodeGuard™ Security

To help protect individual intellectual property in software applications, PIC24FJ256GA412/GB412 family devices offer an intermediate implementation of CodeGuard Security. This version implements the following features:

- General Segment (GS) security
- Boot Segment (BS) security, including boot block resizing protection
- Configuration Segment (CS) security
- Separately configurable write protection for all segments
- Enhanced features for Dual Partition applications

Security features are controlled by the FSEC and FBSLIM registers. The Boot Segment (BS) is the higher privileged segment and the General Segment (GS) is the lower privileged segment. The total user code memory can be split into BS or GS. The size of the segments is determined by BSLIM[12:0]. The relative location of the segments within user space does not change, such that BS (if present) occupies the memory area just after the Interrupt Vector Table (IVT), and the GS occupies the space just after the BS (or if the Alternate IVT is enabled, just after it).

The Configuration Segment (or CS) is a small segment (less than a page, typically just one row) within user Flash address space. It contains all user configuration data that are loaded by the NVM Controller during the Reset sequence.

Refer to **"CodeGuard™ Intermediate Security"** (www.microchip.com/DS70005182) in the "*dsPIC33/PIC24 Family Reference Manual*" for further information on usage, configuration and operation of CodeGuard Security.

33.4.1 CONFIGURATION REGISTER PROTECTION

The Configuration registers are protected against inadvertent or unwanted changes, or reads in two ways. The primary protection method is the same as that of the RP registers – shadow registers contain a complimentary value which is constantly compared with the actual value.

To safeguard against unpredictable events, Configuration bit changes resulting from individual cell-level disruptions (such as ESD events) will cause a parity error and trigger a device Reset.

The data for the Configuration registers are derived from the Flash Configuration Words in program memory. When the configuration security is enabled, the source data for device configuration are protected.

33.5 JTAG Interface

PIC24FJ256GA412/GB412 family devices implement a JTAG interface, which supports boundary scan device testing.

33.6 In-Circuit Serial Programming

PIC24FJ256GA412/GB412 family microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock (PGECx) and data (PGEDx), and three other lines for power (V_{DD}), ground (V_{SS}) and $\overline{MCLR}$. This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

33.7 In-Circuit Debugger

When MPLAB® ICD 3 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pins.

To use the in-circuit debugger function of the device, the design must implement ICSP™ connections to $\overline{MCLR}$, V_{DD}, V_{SS} and the PGECx/PGEDx pin pair, designated by the ICSx Configuration bits. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

NOTES:

34.0 DEVELOPMENT SUPPORT

Move a design from concept to production in record time with Microchip's award-winning development tools. Microchip tools work together to provide state of the art debugging for any project with easy-to-use Graphical User Interfaces (GUIs) in our free MPLAB® X and Atmel Studio Integrated Development Environments (IDEs), and our code generation tools. Providing the ultimate ease-of-use experience, Microchip's line of programmers, debuggers and emulators work seamlessly with our software tools. Microchip development boards help evaluate the best silicon device for an application, while our line of third party tools round out our comprehensive development tool solutions.

Microchip's MPLAB X and Atmel Studio ecosystems provide a variety of embedded design tools to consider, which support multiple devices, such as PIC® MCUs, AVR® MCUs, SAM MCUs and dsPIC® DSCs. MPLAB X tools are compatible with Windows®, Linux® and Mac® operating systems while Atmel Studio tools are compatible with Windows.

Go to the following website for more information and details:

https://www.microchip.com/development-tools/

NOTES:

35.0 INSTRUCTION SET SUMMARY

Note: This chapter is a brief summary of the PIC24F Instruction Set Architecture (ISA) and is not intended to be a comprehensive reference source.

The PIC24F instruction set adds many enhancements to the previous PIC® MCU instruction sets, while maintaining an easy migration from previous PIC MCU instruction sets. Most instructions are a single program memory word. Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction. The instruction set is highly orthogonal and is grouped into four basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- Control operations

Table 35-1 shows the general symbols used in describing the instructions. The PIC24F instruction set summary in Table 35-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register, ‘Wb’, without any address modifier
- The second source operand, which is typically a register, ‘Ws’, with or without an address modifier
- The destination of the result, which is typically a register, ‘Wd’, with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value, ‘f’
- The destination, which could either be the file register, ‘f’, or the W0 register, which is denoted as ‘WREG’

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of ‘Ws’ or ‘f’)
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register, ‘Wb’)

The literal instructions that involve data movement may use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by the value of ‘k’)
- The W register or file register where the literal value is to be loaded (specified by ‘Wb’ or ‘f’)

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register, ‘Wb’, without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register, ‘Wd’, with or without an address modifier

The control instructions may use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

All instructions are a single word, except for certain double-word instructions, which were made double-word instructions so that all the required information is available in these 48 bits. In the second word, the 8 MSbs are ‘0’s. If this second word is executed as an instruction (by itself), it will execute as a NOP.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true or the Program Counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles, with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO, all Table Reads and Writes, and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles.

Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles. The double-word instructions execute in two instruction cycles.

TABLE 35-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

Field	Description
#text	Means literal defined by "text"
(text)	Means "content of text"
[text]	Means "the location addressed by text"
{ }	Optional field or operation
[n:m]	Register bit field
.b	Byte mode selection
.d	Double-Word mode selection
.S	Shadow register select
.w	Word mode selection (default)
bit4	4-bit Bit Selection field (used in word addressed instructions) ∈ {0...15}
C, DC, N, OV, Z	MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address ∈ {0000h...1FFFh}
lit1	1-bit unsigned literal ∈ {0,1}
lit4	4-bit unsigned literal ∈ {0...15}
lit5	5-bit unsigned literal ∈ {0...31}
lit8	8-bit unsigned literal ∈ {0...255}
lit10	10-bit unsigned literal ∈ {0...255} for Byte mode, {0:1023} for Word mode
lit14	14-bit unsigned literal ∈ {0...16383}
lit16	16-bit unsigned literal ∈ {0...65535}
lit23	23-bit unsigned literal ∈ {0...8388607}; LSB must be '0'
None	Field does not require an entry, may be blank
PC	Program Counter
Slit10	10-bit signed literal ∈ {-512...511}
Slit16	16-bit signed literal ∈ {-32768...32767}
Slit6	6-bit signed literal ∈ {-16...16}
Wb	Base W register ∈ {W0..W15}
Wd	Destination W register ∈ { Wd, [Wd], [Wd++], [Wd--], [++Wd], [--Wd] }
Wdo	Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb] }
Wm,Wn	Dividend, Divisor Working register pair (direct addressing)
Wn	One of 16 Working registers ∈ {W0..W15}
Wnd	One of 16 Destination Working registers ∈ {W0..W15}
Wns	One of 16 Source Working registers ∈ {W0..W15}
WREG	W0 (Working register used in file register instructions)
Ws	Source W register ∈ { Ws, [Ws], [Ws++], [Ws--], [++Ws], [--Ws] }
Wso	Source W register ∈ { Wns, [Wns], [Wns++], [Wns--], [++Wns], [--Wns], [Wns+Wb] }

NOTES:

36.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC24FJ256GA412/GB412 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC24FJ256GA412/GB412 family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Absolute Maximum Ratings(†)

Ambient temperature under bias ..... -40°C to +100°C
Storage temperature ..... -65°C to +150°C
Voltage on V_{DD} with respect to V_{SS} ..... -0.3V to +4.0V
Voltage on any general purpose digital or analog pin (not 5.5V tolerant) with respect to V_{SS} ..... -0.3V to (V_{DD} + 0.3V)
Voltage on any general purpose digital or analog pin (5.5V tolerant, including $\overline{MCLR}$) with respect to V_{SS}:
- When V_{DD} = 0V: ..... -0.3V to + 4.0V
- When $V_{DD} \geq$ 2.0V: ..... -0.3V to +6.0V

Voltage on AV_{DD} with respect to V_{SS} ..... (V_{DD} – 0.3V) to (lesser of: 4.0V or (V_{DD} + 0.3V))
Voltage on AV_{SS} with respect to V_{SS} ..... -0.3V to +0.3V
Voltage on V_{BAT} with respect to V_{SS} ..... -0.3V to +4.0V
Voltage on V_{USB3V3} with respect to V_{SS} ..... (V_{CAP} – 0.3V) to +4.0V
Voltage on V_{BUS} with respect to V_{SS} ..... -0.3V to +6.0V
Voltage on D+ or D- with respect to V_{SS}:
- (0Ω source impedance) **(Note 1)** ..... -0.5V to (V_{USB3V3} + 0.5V)
- (Source Impedance ≥ 28Ω, $V_{USB3V3} \geq$ 3.0V) ..... -1.0V to +4.6V

Maximum current out of V_{SS} pin ..... 300 mA
Maximum current into V_{DD} pin **(Note 2)** ..... 250 mA
Maximum output current sunk by any I/O pin ..... 25 mA
Maximum output current sourced by any I/O pin ..... 25 mA
Maximum current sunk by all ports ..... 200 mA
Maximum current sourced by all ports **(Note 2)** ..... 200 mA

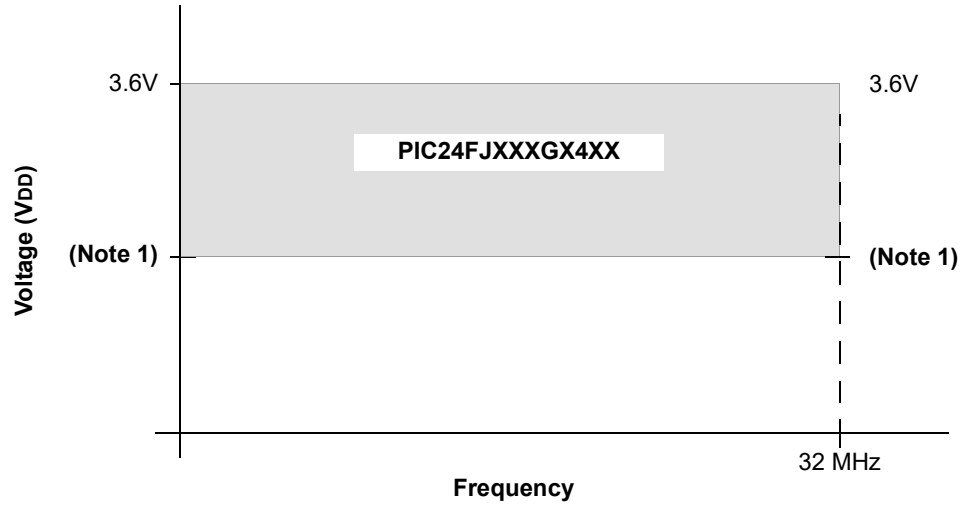
Note 1: The original *"USB 2.0 Specification"* indicated that USB devices should withstand 24-hour short circuits of D+ or D- to V_{BUS} voltages. This requirement was later removed in an Engineering Change Notice (ECN) supplement to the USB specifications, which supersedes the original specifications. PIC24FJ256GA412/GB412 family devices will typically be able to survive this short-circuit test, but it is recommended to adhere to the absolute maximum specified here to avoid damaging the device.

2: Maximum allowable current is a function of device maximum power dissipation (see Table 36-1).

† **NOTICE:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

36.1 DC Characteristics

FIGURE 36-1: PIC24FJ256GA412/GB412 FAMILY VOLTAGE-FREQUENCY GRAPH (INDUSTRIAL)



Note 1: Lower recommended operating boundary is 2.0V or VBOR (when BOR is enabled). For best analog performance, operation above 2.2V is suggested, but not required.

TABLE 36-1: THERMAL OPERATING CONDITIONS

Rating	Symbol	Min	Typ	Max	Unit
PIC24FJ256GA412/GB412 Family:					
Operating Junction Temperature Range	TJ	-40	—	+100	°C
Operating Ambient Temperature Range	TA	-40	—	+85	°C
Power Dissipation: Internal Chip Power Dissipation: PINT = VDD x (IDD – Σ IOH) I/O Pin Power Dissipation: PI/O = Σ ({VDD – VOH} x IOH) + Σ (VOL x IOL)	PD	PINT + PI/O			W
Maximum Allowed Power Dissipation	PDMAX	(TJMAX – TA)/θJA			W

TABLE 36-2: THERMAL PACKAGING CHARACTERISTICS

Characteristic	Symbol	Typ	Max	Unit	Note
Package Thermal Resistance, 12x12x1 mm 100-pin TQFP	θJA	45.0	—	°C/W	**(Note 1)**
Package Thermal Resistance, 10x10x1 mm 64-pin TQFP	θJA	48.3	—	°C/W	**(Note 1)**
Package Thermal Resistance, 9x9x0.9 mm 64-pin QFN	θJA	28.0	—	°C/W	**(Note 1)**
Package Thermal Resistance, 10x10x1.1 mm 121-pin TFBGA	θJA	40.2	—	°C/W	**(Note 1)**

Note 1: Junction to ambient thermal resistance, Theta-JA (θJA) numbers are achieved by package simulations.

TABLE 36-3: DC CHARACTERISTICS: TEMPERATURE AND VOLTAGE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
Operating Voltage							
DC10	VDD	**Supply Voltage**	2.0	—	3.6	V	BOR disabled
			VBOR	—	3.6	V	BOR enabled
DC12	VDR	**RAM Data Retention Voltage**(1)	Greater of: VPORREL or VBOR	—	—	V	VBOR used only if BOR is enabled (BOREN = 1)
DC16	VPOR	**VDD Start Voltage** to Ensure Internal Power-on Reset Signal	VSS	—	—	V	**(Note 2)**
DC16A	VPORREL	**VDD Power-on Reset Release Voltage**	—	1.95	—	V	**(Note 3)**
DC17A	SRVDD	**Recommended VDD Rise Skew Rate** to Ensure Internal Power-on Reset Signal	0.05	—	—	V/ms	0-3.3V in 66 ms, 0-2.5V in 50 ms **(Note 2)**
DC17B	VBOR	**Brown-out Reset Voltage** on VDD Transition, High-to-Low	—	2.2	—	V	**(Note 3)**

Note 1: This is the limit to which VDD may be lowered and the RAM contents will always be retained.

2: If the VPOR or SRVDD parameters are not met, or the application experiences slow power-down VDD ramp rates, it is recommended to enable and use the BOR.

3: On a rising VDD power-up sequence, application firmware execution begins at the higher of the VPORREL or VBOR level (when BOREN = 1).

TABLE 36-4: DC CHARACTERISTICS: OPERATING CURRENT (IDD)(3)

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Operating Temperature**	**VDD**	**Conditions**
Operating Current (IDD)(2)						
DC19	0.17	0.4	mA	-40°C to +85°C	2.0V	0.5 MIPS, FOSC = 1 MHz
	0.19	0.4	mA	-40°C to +85°C	3.3V	
DC20	0.28	0.7	mA	-40°C to +85°C	2.0V	1 MIPS, FOSC = 2 MHz
	0.31	0.7	mA	-40°C to +85°C	3.3V	
DC23	0.90	2.5	mA	-40°C to +85°C	2.0V	4 MIPS, FOSC = 8 MHz
	1.00	2.5	mA	-40°C to +85°C	3.3V	
DC24	5.13	9	mA	-40°C to +85°C	2.0V	16 MIPS, FOSC = 32 MHz
	5.28	9	mA	-40°C to +85°C	3.3V	
DC31	24.4	100	µA	-40°C to +85°C	2.0V	LPRC (15.5 KIPS), FOSC = 31 kHz
	24.5	110	µA	-40°C to +85°C	3.3V	

Note 1: Data in the "Typical" column are at 3.3V, +25°C unless otherwise stated. Typical parameters are for design guidance only and are not tested.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. No peripheral modules are operating and all of the Peripheral Module Disable x (PMDx) bits are set.

3: Due to the double-word instruction fetch process, the lowest IDD current is achieved when the BRA/GOTO instruction is aligned on an even address pair; for example, 0x00, 0x04, 0x08 and so on. The CPU should be executing:

```
while(1)
{
Nop();
// Nop(); /* add or remove second Nop(); to shift BRA/GOTO instruction alignment */
```

TABLE 36-5: DC CHARACTERISTICS: IDLE CURRENT (IIDLE)

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Operating Temperature**	**VDD**	**Conditions**
Idle Current (IIDLE)						
DC40	130	180	µA	-40°C to +85°C	2.0V	1 MIPS, FOSC = 2 MHz
	180	200	µA	-40°C to +85°C	3.3V	
DC43	0.33	0.7	mA	-40°C to +85°C	2.0V	4 MIPS, FOSC = 8 MHz
	0.44	0.8	mA	-40°C to +85°C	3.3V	
DC47	1.54	2.2	mA	-40°C to +85°C	2.0V	16 MIPS, FOSC = 32 MHz
	1.67	2.3	mA	-40°C to +85°C	3.3V	
DC50	0.56	0.8	mA	-40°C to +85°C	2.0V	4 MIPS (FRC), FOSC = 8 MHz
	0.56	0.9	mA	-40°C to +85°C	3.3V	
DC51	18.76	90	µA	-40°C to +85°C	2.0V	LPRC (15.5 KIPS), FOSC = 31 kHz
	19.30	100	µA	-40°C to +85°C	3.3V	

Note 1: Data in the "Typical" column are at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 36-6: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Operating Temperature**	**VDD**	**Conditions**
Power-Down Current (IPD)						
DC60	3.24	—	µA	-40°C	2.0V	Sleep(2)
	4.08	22	µA	+25°C		
	7.81	—	µA	+60°C		
	23.25	40	µA	+85°C		
	3.20	—	µA	-40°C	3.3V	
	4.07	25	µA	+25°C		
	7.94	—	µA	+60°C		
	19.85	42	µA	+85°C		
DC61	0.07	—	µA	-40°C	2.0V	Low-Voltage Sleep(3)
	0.63	—	µA	+25°C		
	3.54	—	µA	+60°C		
	15.30	—	µA	+85°C		
	0.10	—	µA	-40°C	3.3V	
	0.63	—	µA	+25°C		
	3.68	—	µA	+60°C		
	15.65	—	µA	+85°C		
DC70	120	—	nA	-40°C	2.0V	Deep Sleep, capacitor on VCAP is fully discharged
	80	800	nA	+25°C		
	620	—	nA	+60°C		
	1.13	5	µA	+85°C		
	110	—	nA	-40°C	3.3V	
	110	1500	nA	+25°C		
	830	—	nA	+60°C		
	3.67	10	µA	+85°C		
DC74	0.6	3	µA	-40°C to +85°C	0V	RTCC with VBAT mode (LPRC/SOSC)(4)

Note 1: Data in the “Typical” column are at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The low-voltage/retention regulator is disabled; RETEN (RCON[12]) = 0, $\overline{\text{LPCFG}}$ (FPOR[2]) = 1.

3: The low-voltage/retention regulator is enabled; RETEN (RCON[12]) = 1, $\overline{\text{LPCFG}}$ (FPOR[2]) = 0.

4: The VBAT pin is connected to the battery and RTCC is running with VDD = 0.

TABLE 36-7: DC CHARACTERISTICS: Δ CURRENT (BOR, WDT, HLVD, RTCC, DSBOR, DSWDT, LCD)

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Operating Temperature**	**VDD**	**Conditions**
Incremental Current Brown-out Reset (ΔBOR)(2)						
DC25	4	8	µA	-40°C to +85°C	VBOR	ΔBOR(2)
	4	8	µA	-40°C to +85°C	3.3V	
Incremental Current Watchdog Timer (ΔWDT)(2)						
DC71	0.15	2	µA	-40°C to +85°C	2.0V	ΔWDT (with LPRC selected)(2)
	0.24	2	µA	-40°C to +85°C	3.3V	
Incremental Current HLVD (ΔHLVD)(2)						
DC75	3.8	25	µA	-40°C to +85°C	2.0V	ΔHLVD(2)
	3.8	25	µA	-40°C to +85°C	3.3V	
Incremental Current Real-Time Clock and Calendar (ΔRTCC)(2)						
DC77	0.17	2.5	µA	-40°C to +85°C	2.0V	ΔRTCC (with SOSC)(2)
	0.17	2.5	µA	-40°C to +85°C	3.3V	
DC77A	0.55	2.5	µA	-40°C to +85°C	2.0V	ΔRTCC (with LPRC)(2)
	0.55	2.5	µA	-40°C to +85°C	3.3V	
Incremental Current Deep Sleep BOR (ΔDSBOR)(2)						
DC81	0.1	0.9	µA	-40°C to +85°C	2.0V	ΔDeep Sleep BOR(2)
	0.1	0.9	µA	-40°C to +85°C	3.3V	
Incremental Current Deep Sleep Watchdog Timer (ΔDSWDT)(2)						
DC80	0.1	0.9	µA	-40°C to +85°C	2.0V	ΔDeep Sleep WDT(2)
	0.1	0.9	µA	-40°C to +85°C	3.3V	
VBAT A/D Monitor(5)						
DC91	2	—	µA	-40°C to +85°C	3.3V	VBAT = 2V
	5	—	µA	-40°C to +85°C	3.3V	VBAT = 3.3V
Incremental Current LCD (ΔLCD)						
DC82	5	—	µA	+25°C	2.0V	(ΔLCD)/LCD internal, 1/8 MUX, 1/3 bias(2,4)
	5	—	µA	+25°C	3.3V	
DC90	100	—	µA	+25°C	2.0V	(ΔLCD)/LCD charge pump, 1/8 MUX, 1/3 bias(2,3)
	6	—	µA	+25°C	3.3V	

Note 1: Data in the "Typical" column are at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: Incremental current while the module is enabled and running.

3: LCD is enabled and running, no glass is connected; the resistor ladder current is not included.

4: LCD is enabled and running, no glass is connected; the low-power resistor ladder current is included.

5: The A/D channel is connected to the VBAT pin internally; this is the current during A/D VBAT operation.

TABLE 36-8: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Sym**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
	VIL	**Input Low Voltage(3)**					
DI10		I/O Pins with ST Buffer	VSS	—	0.2 VDD	V	
DI11		I/O Pins with TTL Buffer	VSS	—	0.15 VDD	V	
DI15		$\overline{MCLR}$	VSS	—	0.2 VDD	V	
DI16		OSCI (XT mode)	VSS	—	0.2 VDD	V	
DI17		OSCI (HS mode)	VSS	—	0.2 VDD	V	
DI18		I/O Pins with I2C Buffer	VSS	—	0.3 VDD	V	
DI19		I/O Pins with SMBus Buffer	VSS	—	0.8	V	SMBus enabled
	VIH	**Input High Voltage(3)**					
DI20		I/O Pins with ST Buffer:					
		without 5V Tolerance	0.65 VDD	—	VDD	V	
		with 5V Tolerance	0.65 VDD	—	5.5	V	
DI21		I/O Pins with TTL Buffer:					
		without 5V Tolerance	0.25 VDD + 0.8	—	VDD	V	
		with 5V Tolerance	0.25 VDD + 0.8	—	5.5	V	
DI25		$\overline{MCLR}$	0.8 VDD	—	VDD	V	
DI26		OSCI (XT mode)	0.7 VDD	—	VDD	V	
DI27		OSCI (HS mode)	0.7 VDD	—	VDD	V	
DI28		I/O Pins with I2C Buffer	0.7 VDD	—	5.5	V

DI30	ICNPU	**CNx Pull-up Current**	150	550	550	µA	VDD = 3.3V, VPIN = VSS
DI30A	ICNPD	**CNx Pull-Down Current**	15	150	150	µA	VDD = 3.3V, VPIN = VDD
	IIL	**Input Leakage Current(2)**					
DI50		I/O Ports	—	—	±1	µA	VSS ≤ VPIN ≤ VDD, pin at high-impedance
DI51		Analog Input Pins	—	—	±1	µA	VSS ≤ VPIN ≤ VDD, pin at high-impedance
DI55		$\overline{MCLR}$	—	—	±1	µA	VSS ≤ VPIN ≤ VDD
DI56		OSCI/CLKI	—	—	±1	µA	VSS ≤ VPIN ≤ VDD, EC, XT and HS modes

Note 1: Data in the "Typ" column are at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: Negative current is defined as current sourced by the pin.

3: Refer to Table 1-4 or Table 1-5 for I/O pin buffer types.

TABLE 36-9: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	Symbol	Characteristic	Min	Typ(1)	Max	Units	Conditions
	VOL	**Output Low Voltage**					
DO10		I/O Ports	—	—	0.4	V	IOL = 6.6 mA, VDD = 3.6V
			—	—	0.4	V	IOL = 5.0 mA, VDD = 2V
DO16		OSCO/CLKO	—	—	0.4	V	IOL = 6.6 mA, VDD = 3.6V
			—	—	0.4	V	IOL = 5.0 mA, VDD = 2V
	VOH	**Output High Voltage**					
DO20		I/O Ports	3.0	—	—	V	IOH = -3.0 mA, VDD = 3.6V
			2.4	—	—	V	IOH = -6.0 mA, VDD = 3.6V
			1.65	—	—	V	IOH = -1.0 mA, VDD = 2V
			1.4	—	—	V	IOH = -3.0 mA, VDD = 2V
DO26		OSCO/CLKO	2.4	—	—	V	IOH = -6.0 mA, VDD = 3.6V
			1.4	—	—	V	IOH = -1.0 mA, VDD = 2V

Note 1: Data in the "Typ" column are at 3.3V, +25°C unless otherwise stated.

TABLE 36-10: DC CHARACTERISTICS: PROGRAM MEMORY

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	Symbol	Characteristic	Min	Typ(1)	Max	Units	Conditions
		Program Flash Memory					
D130	EP	Cell Endurance	20000	—	—	E/W	-40°C to +85°C
D131	VPR	VDD for Read	VMIN	—	3.6	V	VMIN = Minimum operating voltage
D132B		VDD for Self-Timed Write	VMIN	—	3.6	V	VMIN = Minimum operating voltage
D133A	TIW	Self-Timed Word Write Cycle Time	—	20	—	µs	
		Self-Timed Row Write Cycle Time	—	1.5	—	ms	
D133B	TIE	Self-Timed Page Erase Time	20	—	40	ms	
D134	TRETD	Characteristic Retention	20	—	—	Year	If no other specifications are violated
D135	IDDP	Supply Current During Programming	—	5	—	mA	

Note 1: Data in the "Typ" column are at 3.3V, +25°C unless otherwise stated.

TABLE 36-11: INTERNAL VOLTAGE REGULATOR SPECIFICATIONS

Operating Conditions: -40°C < TA < +85°C (unless otherwise stated)							
Param No.	**Symbol**	**Characteristics**	**Min**	**Typ**	**Max**	**Units**	**Comments**
DVR10	VBG	Internal Band Gap Reference	—	1.2	—	V	
DVR11	TBG	Band Gap Reference Start-up Time	—	1	—	ms	
DVR20	VRGOUT	Regulator Output Voltage	—	1.8	—	V	VDD > 2.0V
DVR21	CEFC	External Filter Capacitor Value	4.7	10	—	µF	Series Resistance < 3Ω recommended; < 5Ω required.
DVR	TVREG	Start-up Time	—	10	—	µs	PMSLP = 1 with any POR or BOR
DVR30	VLVR	Low-Voltage Regulator Output Voltage	—	1.2	—	V	RETEN = 1, $\overline{\text{LPCFG}}$ = 0

TABLE 36-12: VBAT OPERATING VOLTAGE SPECIFICATIONS

Param No.	**Symbol**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Comments**
DVB01	VBT	Operating Voltage	1.6	—	3.6	V	Battery connected to the VBAT pin, VBTBOR = 0
DVB02			VBATBOR	—	3.6	V	Battery connected to the VBAT pin, VBTBOR = 1
DVB10	VBTADC	VBAT A/D Monitoring Voltage Specification(1)	1.6	—	3.6	V	A/D is monitoring the VBAT pin using the internal A/D channel

Note 1: Measuring the A/D value using the A/D is represented by the equation: Measured Voltage = ((VBAT/2)/VDD) * 4096) for 12-bit A/D.

TABLE 36-13: CTMU CURRENT SOURCE SPECIFICATIONS

DC CHARACTERISTICS			**Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated)** Operating temperature -40°C ≤ TA ≤ +85°C for Industrial					
Param No.	**Sym**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Comments**	**Conditions**
DCT10	IOUT1	CTMU Current Source, Base Range	—	550	—	nA	CTMUCON1L[1:0] = 00	2.5V < VDD < VDDMAX
DCT11	IOUT2	CTMU Current Source, 10x Range	—	5.5	—	µA	CTMUCON1L[1:0] = 01	
DCT12	IOUT3	CTMU Current Source, 100x Range	—	55	—	µA	CTMUCON1L[1:0] = 10	
DCT13	IOUT4	CTMU Current Source, 1000x Range	—	550	—	µA	CTMUCON1L[1:0] = 11(2)	
DCT21	VΔ	Temperature Diode Voltage Change per Degree Celsius	—	-3	—	mV/°C		

Note 1: Nominal value at center point of current trim range (CTMUCON1L[7:2] = 000000).

2: Do not use this current range with temperature sensing diode.

TABLE 36-14: USB ON-THE-GO MODULE SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
Operating Voltage							
DUS01	VUSB3V3	USB Supply Voltage	Greater of: 3.0 or (VDD – 0.3V)	3.3	3.6	V	USB module enabled
			(VDD – 0.3V)(1)	—	3.6	V	USB disabled, RG2/RG3 are unused and externally pulled low or left in a high-impedance state
			(VDD – 0.3V)	VDD	3.6	V	USB disabled, RG2/RG3 are used as general purpose I/Os

Note 1: The VUSB3V3 pin may also be left in a high-impedance state under these conditions. However, if the voltage floats below (VDD – 0.3V), this may result in higher IPD currents than specified. The preferred method is to tie the VUSB pin to VDD, even if the USB module is not used.

TABLE 36-15: HIGH/LOW-VOLTAGE DETECT CHARACTERISTICS

Operating Conditions: -40°C < TA < +85°C (unless otherwise stated)								
Param No.	**Symbol**	**Characteristic**		**Min**	**Typ**	**Max**	**Units**	**Conditions**
DC18	VHLVD	HLVD Voltage on VDD Transition	HLVDL[3:0] = 0100(1)	3.45	—	3.73	V	
			HLVDL[3:0] = 0101	3.30	—	3.57	V	
			HLVDL[3:0] = 0110	3.00	—	3.25	V	
			HLVDL[3:0] = 0111	2.80	—	3.03	V	
			HLVDL[3:0] = 1000	2.67	—	2.92	V	
			HLVDL[3:0] = 1001	2.45	—	2.70	V	
			HLVDL[3:0] = 1010	2.33	—	2.60	V	
			HLVDL[3:0] = 1011	2.21	—	2.49	V	
			HLVDL[3:0] = 1100	2.11	—	2.38	V	
			HLVDL[3:0] = 1101	2.10	—	2.25	V	
			HLVDL[3:0] = 1110	2.00	—	2.15	V	
DC101	VTHL	HLVD Voltage on LVDIN Pin Transition	HLVDL[3:0] = 1111	—	1.20	—	V	

Note 1: Trip points for values of HLVD[3:0], from '0000' to '0011', are not implemented.

TABLE 36-16: COMPARATOR DC SPECIFICATIONS

Operating Conditions: 2.0V < VDD < 3.6V, -40°C < TA < +85°C (unless otherwise stated)							
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Comments**
D300	VIOFF	Input Offset Voltage	—	12	±30	mV	
D301	VICM	Input Common-Mode Voltage	0	—	VDD	V	
D302	CMRR	Common-Mode Rejection Ratio	55	—	—	dB	
D306	IQCMP	AVDD Quiescent Current per Comparator	—	27	—	µA	Comparator enabled
D307	TRESP	Response Time	—	300	—	ns	**(Note 1)**
D308	TMC2OV	Comparator Mode Change to Valid Output	—	10	—	µs	

Note 1: Measured with one input at VDD/2 and the other transitioning from VSS to VDD, 40 mV step, 15 mV overdrive.

TABLE 36-17: COMPARATOR VOLTAGE REFERENCE DC SPECIFICATIONS

Operating Conditions: 2.0V < VDD < 3.6V, -40°C < TA < +85°C (unless otherwise stated)							
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Comments**
VR310	TSET	Settling Time	—	—	10	µs	**(Note 1)**
VRD311	CVRAA	Absolute Accuracy	-100	—	100	mV	
VRD312	CVRUR	Unit Resistor Value (R)	—	4.5	—	kΩ	

Note 1: Measures the interval while CVR[4:0] transitions from '11111' to '00000'.

36.2 AC Characteristics and Timing Parameters

The information contained in this section defines the PIC24FJ256GA412/GB412 family AC characteristics and timing parameters.

TABLE 36-18: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

AC CHARACTERISTICS	**Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated)** Operating temperature -40°C ≤ TA ≤ +85°C for Industrial Operating voltage VDD range as described in **Section 36.1 "DC Characteristics"**.

FIGURE 36-2: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

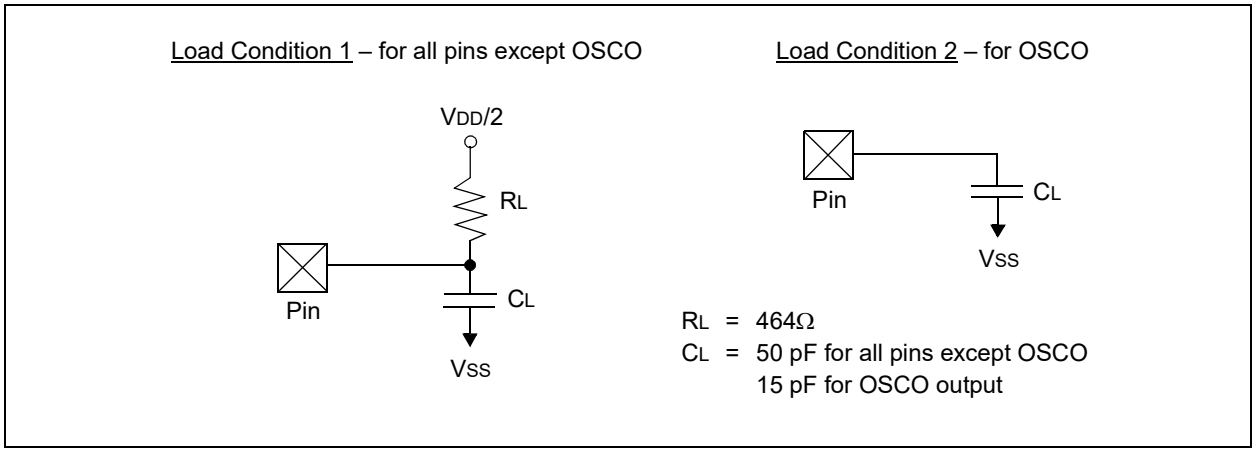

TABLE 36-19: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

Param No.	Symbol	Characteristic	Min	Typ(1)	Max	Units	Conditions
DO50	COSCO	OSCO/CLKO Pin	—	—	15	pF	In XT and HS modes when external clock is used to drive OSCI
DO56	CIO	All I/O Pins and OSCO	—	—	50	pF	EC mode
DO58	CB	SCLx, SDAx	—	—	400	pF	In I^2C mode

Note 1: Data in the "Typ" column are at 3.3V, +25°C unless otherwise stated.

FIGURE 36-3: EXTERNAL CLOCK TIMING

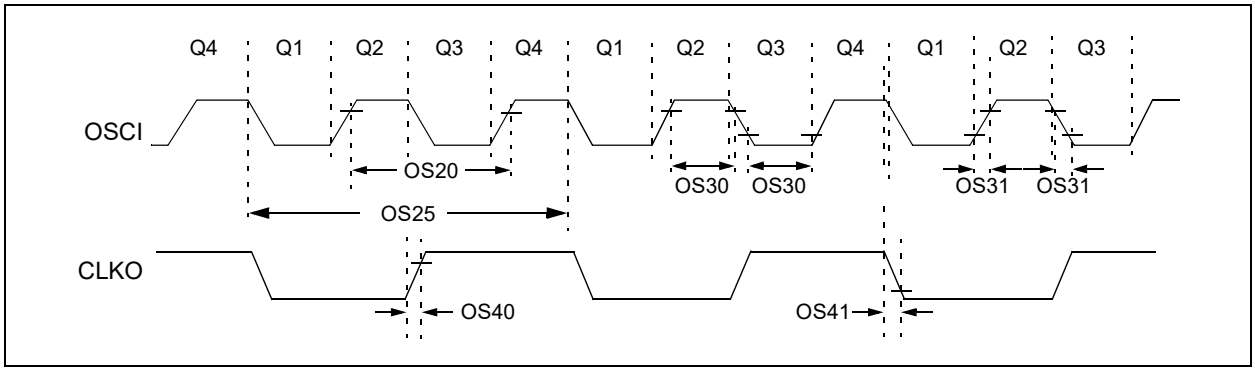

TABLE 36-20: EXTERNAL CLOCK TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
OS10	FOSC	External CLKI Frequency (External clocks allowed only in EC mode)	DC 1.97	— —	32 48	MHz MHz	EC ECPLL (**Note 2**)
		Oscillator Frequency	3.5 4 10 12 31	— — — — —	10 8 32 32 33	MHz MHz MHz MHz kHz	XT XTPLL HS HSPLL SOSC
OS20	TOSC	TOSC = 1/FOSC	—	—	—	—	See Parameter OS10 for FOSC value
OS25	TCY	Instruction Cycle Time(3)	62.5	—	DC	ns	
OS30	TosL, TosH	External Clock in (OSCI) High or Low Time	0.45 x TOSC	—	—	ns	EC
OS31	TosR, TosF	External Clock in (OSCI) Rise or Fall Time	—	—	20	ns	EC
OS40	TckR	CLKO Rise Time(4)	—	6	10	ns	
OS41	TckF	CLKO Fall Time(4)	—	6	10	ns	

Note 1: Data in the "Typ" column are at 3.3V, +25°C unless otherwise stated.

2: Represents input to the system clock prescaler. PLL dividers and postscalers must still be configured so that the system clock frequency does not exceed the maximum frequency shown in Figure 36-1.

3: Instruction cycle period (TCY) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "Min." values with an external clock applied to the OSCI/CLKI pin. When an external clock input is used, the "Max." cycle time limit is "DC" (no clock) for all devices.

4: Measurements are taken in EC mode. The CLKO signal is measured on the OSCO pin. CLKO is low for the Q1-Q2 period (1/2 TCY) and high for the Q3-Q4 period (1/2 TCY).

TABLE 36-21: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	Symbol	Characteristic	Min	Typ	Max	Units	Conditions
OS50	FPLLI	PLL Input Frequency Range(1)	1.97	4	4.04	MHz	ECPLL, XTPLL, HSPLL or FRCPLL modes
OS52	TLOCK	PLL Start-up Time (Lock Time)	—	—	128	µs	
OS53	DCLK	CLKO Stability (Jitter)	-0.25	—	0.25	%	

Note 1: The PLL accepts a 1.97 MHz to 4.04 MHz input frequency. Higher input frequencies, up to 48 MHz, may be supplied to the PLL if they are prescaled down by the PLLMODE[3:0] Configuration bits into the 1.97 MHz to 4.04 MHz range.

TABLE 36-22: INTERNAL RC ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	Characteristic	Min	Typ	Max	Units	Conditions
F20	FRC Accuracy @ 8 MHz(4)	-1	±0.15	1	%	2.0V ≤ VDD ≤ 3.6V, 0°C ≤ TA ≤ +85°C **(Note 1)**
		-1.5	—	1.5	%	2.0V ≤ VDD ≤ 3.6V, -40°C ≤ TA < 0°C
		-0.20	±0.05	0.20	%	2.0V ≤ VDD ≤ 3.6V, -40°C ≤ TA ≤ +85°C, self-tune is enabled and locked **(Note 2)**
F21	LPRC @ 31 kHz	-20	—	20	%	
F22	OSCTUN Step-Size	—	0.05	—	%/bit	
F23	FRC Self-Tune Lock Time	—	<5	8	ms	**(Note 3)**

Note 1: To achieve this accuracy, physical stress applied to the microcontroller package (ex., by flexing the PCB) must be kept to a minimum.

2: Accuracy measured with respect to reference source accuracy.

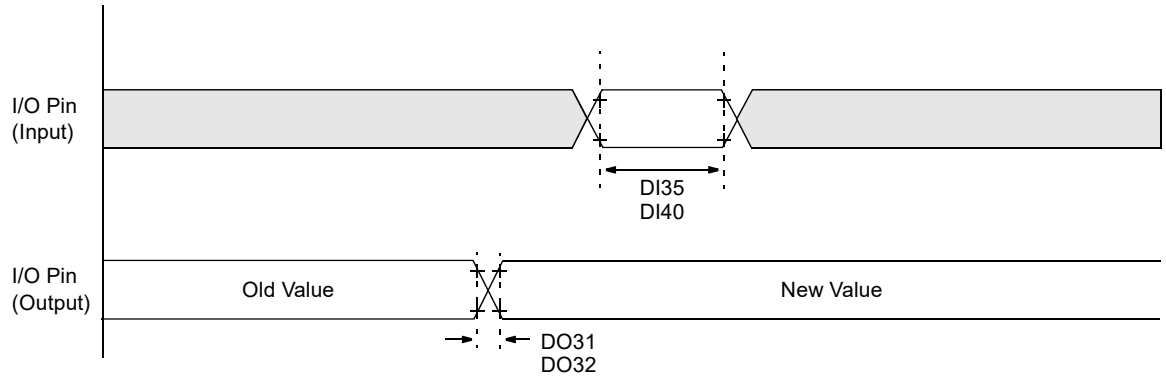
3: Time from when the reference clock is stable and in range until the FRC is tuned within the range specified by F20 (with self-tune).

4: Other frequencies that are derived from the FRC (either through digital division by prescalers or multiplication through a PLL) will also have the same accuracy tolerance specifications as provided here.

TABLE 36-23: RC OSCILLATOR START-UP TIME

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	Symbol	Characteristic	Min	Typ	Max	Units	Conditions
FR0	TFRC	FRC Oscillator Start-up Time	—	15	—	µs	
FR1	TLPRC	Low-Power RC Oscillator Start-up Time	—	50	—	µs	

FIGURE 36-4: CLKO AND I/O TIMING CHARACTERISTICS



Note: Refer to Figure 36-2 for load conditions.

TABLE 36-24: CLKO AND I/O TIMING REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
DO31	TIOR	Port Output Rise Time	—	5	25	ns	
DO32	TIOF	Port Output Fall Time	—	5	25	ns	
DI35	TINP	INTx Pin High or Low Time (input)	20	—	—	ns	
DI40	TRBP	CNx High or Low Time (input)	2	—	—	TCY	

Note 1: Data in the "Typ" column are at 3.3V, +25°C unless otherwise stated.

TABLE 36-25: RESET AND BROWN-OUT RESET REQUIREMENTS

AC CHARACTERISTICS			Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
SY10	TMCL	$\overline{\text{MCLR}}$ Pulse Width (Low)	2	—	—	µs	
SY12	TPOR	Power-on Reset Delay	—	2	—	µs	
SY13	TIOZ	I/O High-Impedance from $\overline{\text{MCLR}}$ Low or Watchdog Timer Reset	Lesser of: (3 TCY + 2) or 700	—	(3 TCY + 2)	µs	
SY25	TBOR	Brown-out Reset Pulse Width	1	—	—	µs	VDD ≤ VBOR
SY45	TRST	Internal State Reset Time	—	50	—	µs	
SY70	TDSWU	Deep Sleep Wake-up Time	—	200	—	µs	VCAP fully discharged before wake-up
SY71	TPM	Program Memory Wake-up Time	—	20	—	µs	Sleep wake-up with PMSLP = 0
			—	1	—	µs	Sleep wake-up with PMSLP = 1
SY72	TLVR	Low-Voltage Regulator Wake-up Time	—	90	—	µs	Sleep wake-up with PMSLP = 0
			—	70	—	µs	Sleep wake-up with PMSLP = 1

FIGURE 36-5: TIMER1/2/3/4/5 EXTERNAL CLOCK INPUT TIMING

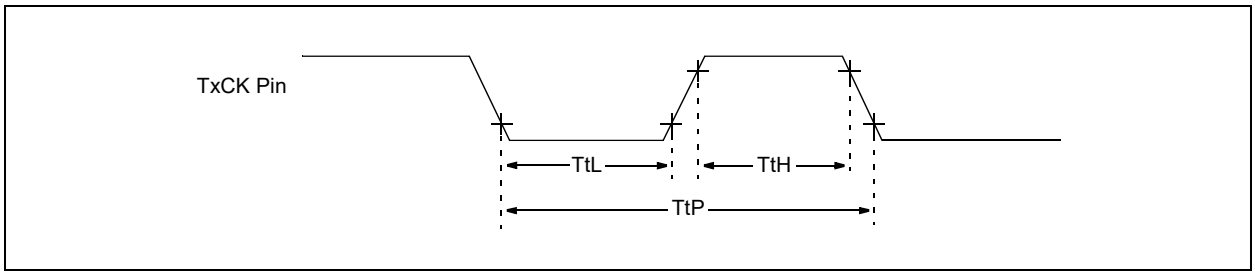


TABLE 36-26: TIMER1/2/3/4/5 EXTERNAL CLOCK INPUT REQUIREMENTS(1)

Param. No.	Symbol	Characteristic		Min	Max	Units	Conditions
	TtH	TxCK High Pulse Time	Synchronous w/Prescaler	TCY + 20	—	ns	Must also meet Parameter TtP
			Asynchronous w/Prescaler	10	—	ns	
			Asynchronous Counter	20	—	ns	
	TtL	TxCK Low Pulse Time	Synchronous w/Prescaler	TCY + 20	—	ns	Must also meet Parameter TtP
			Asynchronous w/Prescaler	10	—	ns	
			Asynchronous Counter	20	—	ns	
	TtP	TxCK External Input Period	Synchronous w/Prescaler	2 * TCY + 40	—	ns	N = Prescale Value (1, 4, 8, 16)
			Asynchronous w/Prescaler	Greater of: 20 or $\frac{2 * T_{CY} + 40}{N}$	—	ns	
			Asynchronous Counter	40	—	ns	
		Delay for Input Edge to Timer Increment	Synchronous	1	2	TCY	
			Asynchronous	—	20	ns	

Note 1: Asynchronous mode is available only on Timer1.

FIGURE 36-6: INPUT CAPTURE x TIMINGS

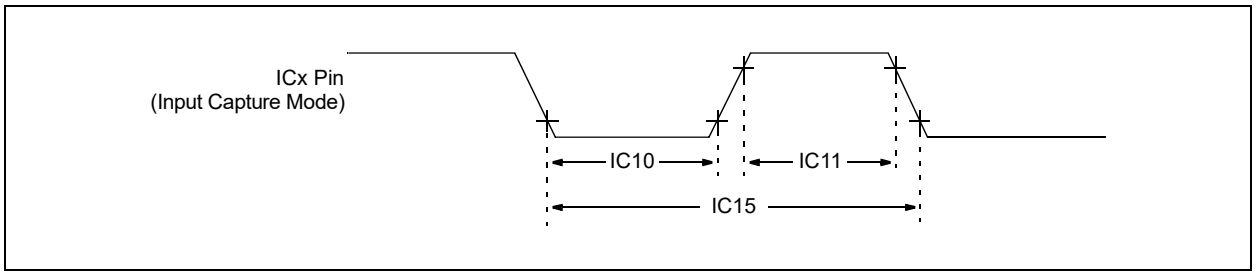

TABLE 36-27: INPUT CAPTURE x TIMINGS REQUIREMENTS

Param. No.	Symbol	Characteristic		Min	Max	Units	Conditions
IC10	TccL	ICx Input Low Time – Synchronous Timer	No Prescaler	TCY + 20	—	ns	Must also meet Parameter IC15
			With Prescaler	20	—	ns	
IC11	TccH	ICx Input Low Time – Synchronous Timer	No Prescaler	TCY + 20	—	ns	Must also meet Parameter IC15
			With Prescaler	20	—	ns	
IC15	TccP	ICx Input Period – Synchronous Timer		$\frac{2 * T_{CY} + 40}{N}$	—	ns	N = Prescale Value (1, 4, 16)

FIGURE 36-7: OUTPUT COMPARE x TIMINGS

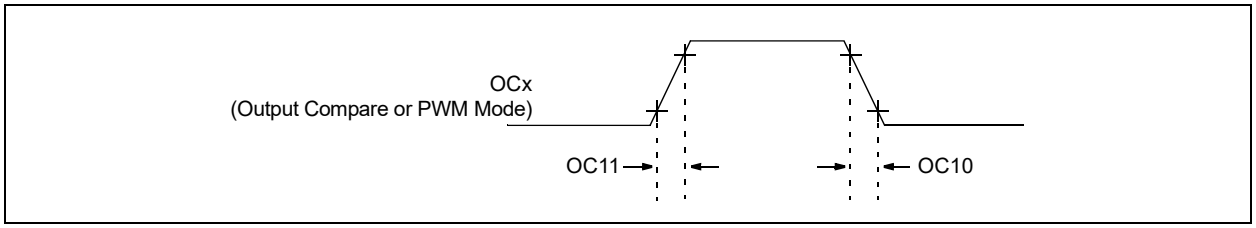

TABLE 36-28: OUTPUT COMPARE 1 TIMINGS

Param. No.	Symbol	Characteristic	Min	Max	Unit	Condition
OC11	TccR	OC1 Output Rise Time	—	10	ns	
			—	—	ns	
OC10	TccF	OC1 Output Fall Time	—	10	ns	
			—	—	ns	

FIGURE 36-8: PWMx MODULE TIMING REQUIREMENTS

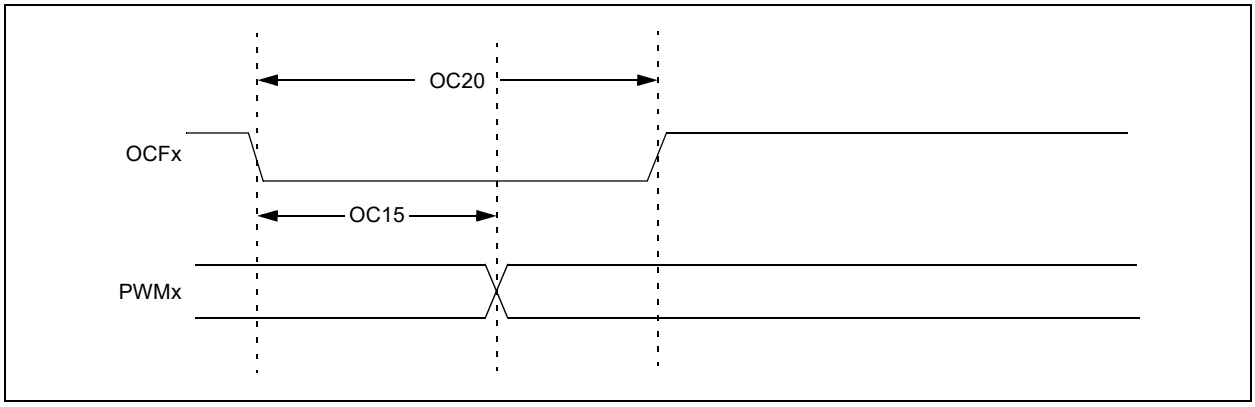

TABLE 36-29: PWMx TIMING REQUIREMENTS

Param. No.	Symbol	Characteristic	Min	Typ(1)	Max	Unit	Condition
OC15	TFD	Fault Input to PWM I/O Change	—	—	25	ns	VDD = 3.0V, -40°C to +85°C
OC20	TFH	Fault Input Pulse Width	50	—	—	ns	VDD = 3.0V, -40°C to +85°C

Note 1: Data in "Typ" column are at 3.3V, +25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

FIGURE 36-9: I2Cx BUS START/STOP BITS TIMING CHARACTERISTICS (MASTER MODE)

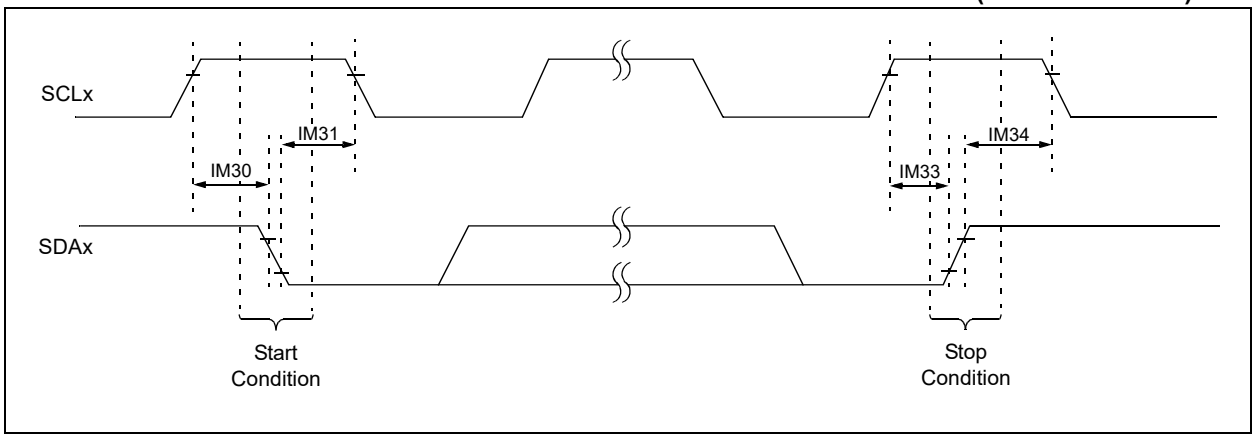

TABLE 36-30: I2Cx BUS START/STOP BITS TIMING REQUIREMENTS (MASTER MODE)

AC CHARACTERISTICS				Standard Operating Conditions: 2.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial			
Param No.	**Symbol**	**Characteristic**		**Min(1)**	**Max**	**Units**	**Conditions**
IM30	TSU:STA	Start Condition Setup Time	100 kHz mode	TCY/2 (BRG + 1)	—	µs	Only relevant for Repeated Start condition
			400 kHz mode	TCY/2 (BRG + 1)	—	µs	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	µs	
IM31	THD:STA	Start Condition Hold Time	100 kHz mode	TCY/2 (BRG + 1)	—	µs	After this period, the first clock pulse is generated
			400 kHz mode	TCY/2 (BRG + 1)	—	µs	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	µs	
IM33	TSU:STO	Stop Condition Setup Time	100 kHz mode	TCY/2 (BRG + 1)	—	µs	
			400 kHz mode	TCY/2 (BRG + 1)	—	µs	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	µs	
IM34	THD:STO	Stop Condition Hold Time	100 kHz mode	TCY/2 (BRG + 1)	—	ns	
			400 kHz mode	TCY/2 (BRG + 1)	—	ns	
			1 MHz mode(2)	TCY/2 (BRG + 1)	—	ns	

Note 1: BRG is the value of the I^2C Baud Rate Generator. Refer to **Section 18.2 "Setting Baud Rate When Operating as a Bus Master"** for details.

2: Maximum Pin Capacitance = 10 pF for all I^2C pins (for 1 MHz mode only).

FIGURE 36-10: I2Cx BUS DATA TIMING CHARACTERISTICS (MASTER MODE)

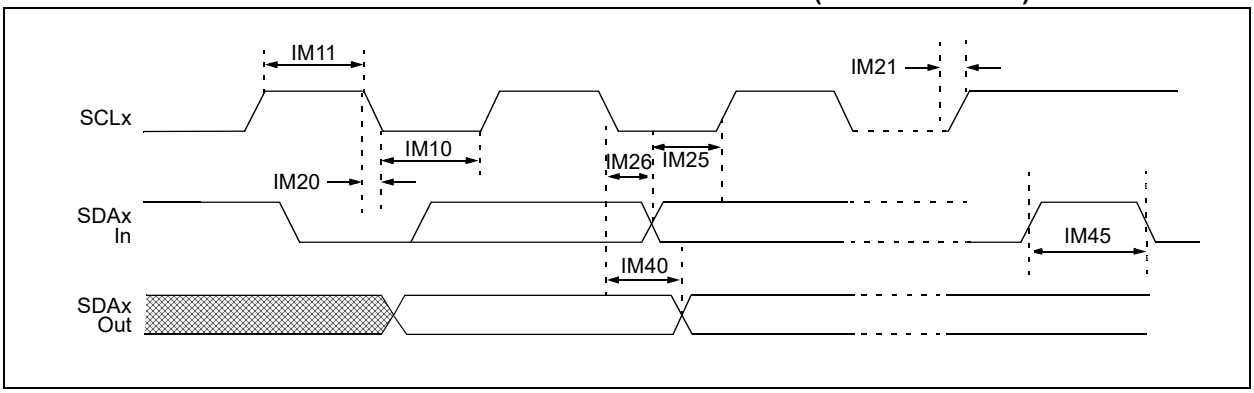

TABLE 36-31: I2Cx BUS DATA TIMING REQUIREMENTS (MASTER MODE)

TSETUP	Start bit Falling Edge to System Clock Rising Edge Setup Time	3	—	—	ns
TSTDELAY	Maximum Delay in the Detection of the Start bit Falling Edge	—	—	TCY + TSETUP	ns

TABLE 36-39: A/D MODULE SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 2V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	**Symbol**	**Characteristic**	**Min.**	**Typ**	**Max.**	**Units**	**Conditions**
Device Supply							
AD01	AVDD	Module VDD Supply	Greater of: VDD – 0.3 or 2.2	—	Lesser of: VDD + 0.3 or 3.6	V	
AD02	AVSS	Module VSS Supply	VSS – 0.3	—	VSS + 0.3	V	
Reference Inputs							
AD05	VREFH	Reference Voltage High	AVSS + 1.7	—	AVDD	V	
AD06	VREFL	Reference Voltage Low	AVSS	—	AVDD – 1.7	V	
AD07	VREF	Absolute Reference Voltage	AVSS – 0.3	—	AVDD + 0.3	V	
Analog Input							
AD10	VINH-VINL	Full-Scale Input Span	VREFL	—	VREFH	V	**(Note 2)**
AD11	VIN	Absolute Input Voltage	AVSS – 0.3	—	AVDD + 0.3	V	
AD12	VINL	Absolute VINL Input Voltage	AVSS – 0.3	—	AVDD/3	V	
AD13		Leakage Current	—	±1.0	±610	nA	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3V, Source Impedance = 2.5 kΩ
AD17	RIN	Recommended Impedance of Analog Voltage Source	—	—	2.5K	Ω	10-bit
Accuracy							
AD20B	Nr	Resolution	—	12	—	bits	
AD21B	INL	Integral Nonlinearity	—	±1	<±2	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3V
AD22B	DNL	Differential Nonlinearity	—	—	<±1	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3V
AD23B	GERR	Gain Error	—	±1	±3	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3V
AD24B	EOFF	Offset Error	—	±1	±2	LSb	VINL = AVSS = VREFL = 0V, AVDD = VREFH = 3V
AD25B		Monotonicity(1)	—	—	—	—	Guaranteed

Note 1: The conversion result never decreases with an increase in the input voltage and has no missing codes.

2: Measurements are taken with the external VREF+ and VREF- used as the voltage reference.

TABLE 36-40: A/D CONVERSION TIMING REQUIREMENTS(1)

AC CHARACTERISTICS			Standard Operating Conditions: 2V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial				
Param No.	Symbol	Characteristic	Min.	Typ	Max.	Units	Conditions
Clock Parameters							
AD50	TAD	A/D Clock Period	278	—	—	ns	
AD51	tRC	A/D Internal RC Oscillator Period	—	250	—	ns	
Conversion Rate							
AD55	tCONV	Conversion Time	—	14	—	TAD	
AD56	FCNV	Throughput Rate	—	—	200	ksps	AVDD > 2.7V
AD57	tSAMP	Sample Time	—	1	—	TAD	
Clock Parameters							
AD61	tPSS	Sample Start Delay from Setting Sample bit (SAMP)	2	—	3	TAD	

Note 1: Because the sample caps will eventually lose charge, clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures.

TABLE 36-41: 10-BIT DAC SPECIFICATIONS

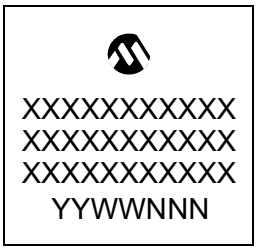
AC CHARACTERISTICS			Operating Conditions: -40°C < TA < +85°C, 2.0V < (A)VDD < 3.6V(1)				
Param No.	Sym	Characteristic	Min	Typ	Max	Units	Conditions
DAC01		Resolution	10	—	—	bits	
DAC02		DVREF+ Input Voltage Range	—	—	AVDD	V	
DAC03	DNL	Differential Linearity Error	-1	—	+1	LSb	
DAC04	INL	Integral Linearity Error	-3.0	—	+3.0	LSb	
DAC05		Offset Error	-20	—	+20	mV	Code 000h
DAC06		Gain Error	-3.0	—	+3.0	LSb	Code 3FFh, not including offset error

Note 1: Unless otherwise stated, test conditions are with VDD = AVDD = DVREF+ = 3.3V, 3 kΩ load to VSS.

37.0 PACKAGING INFORMATION

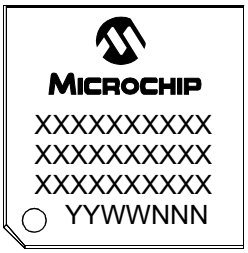
37.1 Package Marking Information

64-Lead QFN (9x9x0.9 mm)

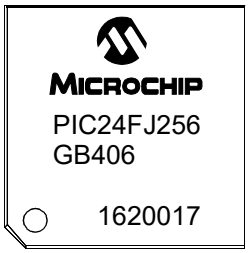


Example

64-Lead TQFP (10x10x1 mm)



Example

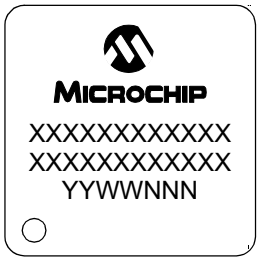


Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

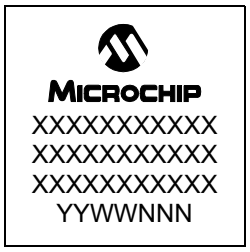
37.2 Package Marking Information (Continued)

100-Lead TQFP (12x12x1 mm)



Example

121-TFBGA (10x10x1.1 mm)



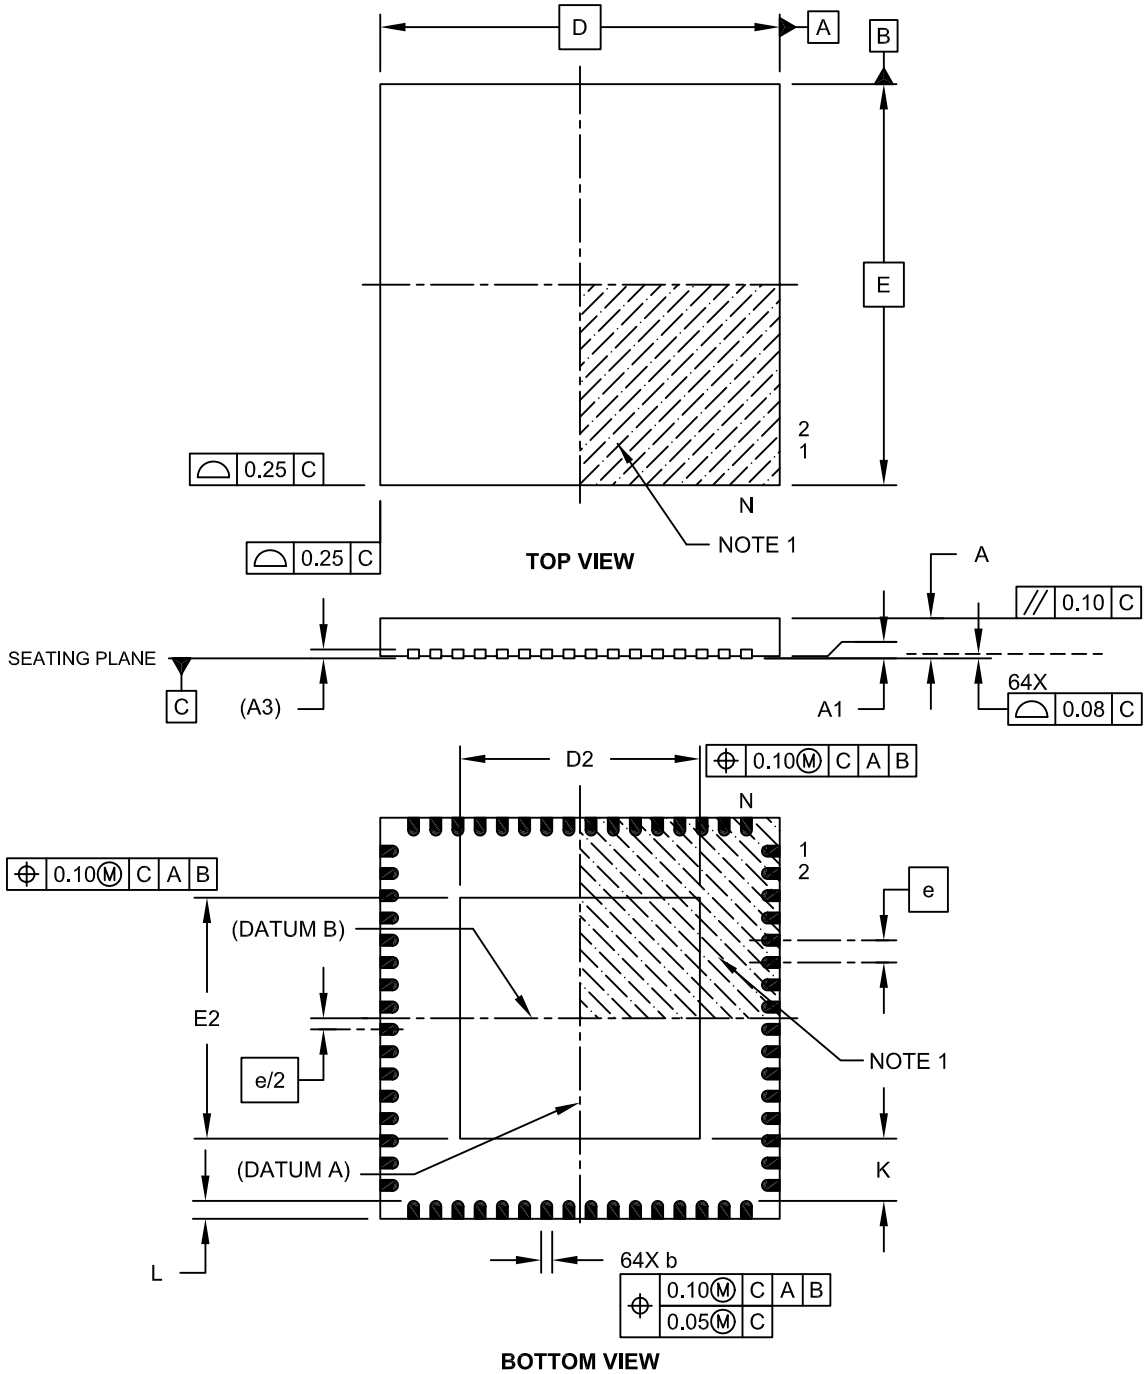
Example

37.3 Package Details

The following sections give the technical details of the packages.

64-Lead Plastic Quad Flat, No Lead Package (MR) – 9x9x0.9 mm Body with 5.40 x 5.40 Exposed Pad [QFN]

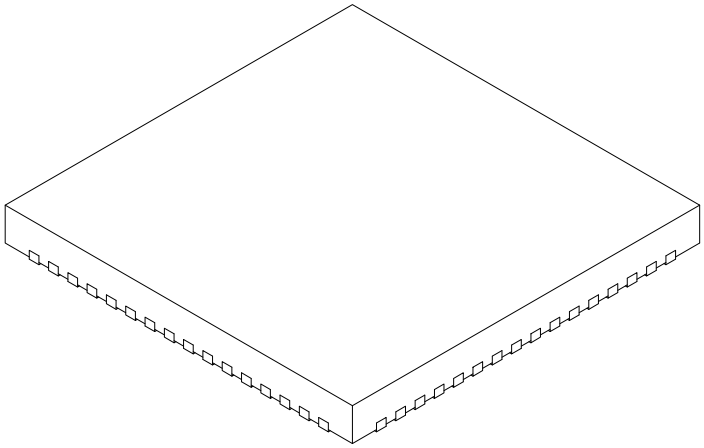
Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Microchip Technology Drawing C04-154A Sheet 1 of 2

64-Lead Plastic Quad Flat, No Lead Package (MR) – 9x9x0.9 mm Body with 5.40 x 5.40 Exposed Pad [QFN]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Pins	N		64	
Pitch	e		0.50 BSC	
Overall Height	A	0.80	0.90	1.00
Standoff	A1	0.00	0.02	0.05
Contact Thickness	A3		0.20 REF	
Overall Width	E		9.00 BSC	
Exposed Pad Width	E2	5.30	5.40	5.50
Overall Length	D		9.00 BSC	
Exposed Pad Length	D2	5.30	5.40	5.50
Contact Width	b	0.20	0.25	0.30
Contact Length	L	0.30	0.40	0.50
Contact-to-Exposed Pad	K	0.20	-	-

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw singulated.
3. Dimensioning and tolerancing per ASME Y14.5M.
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
   REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-154A Sheet 2 of 2

64-Lead Plastic Quad Flat, No Lead Package (MR) – 9x9x0.9 mm Body [QFN]
With 0.40 mm Contact Length and 5.40x5.40mm Exposed Pad

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

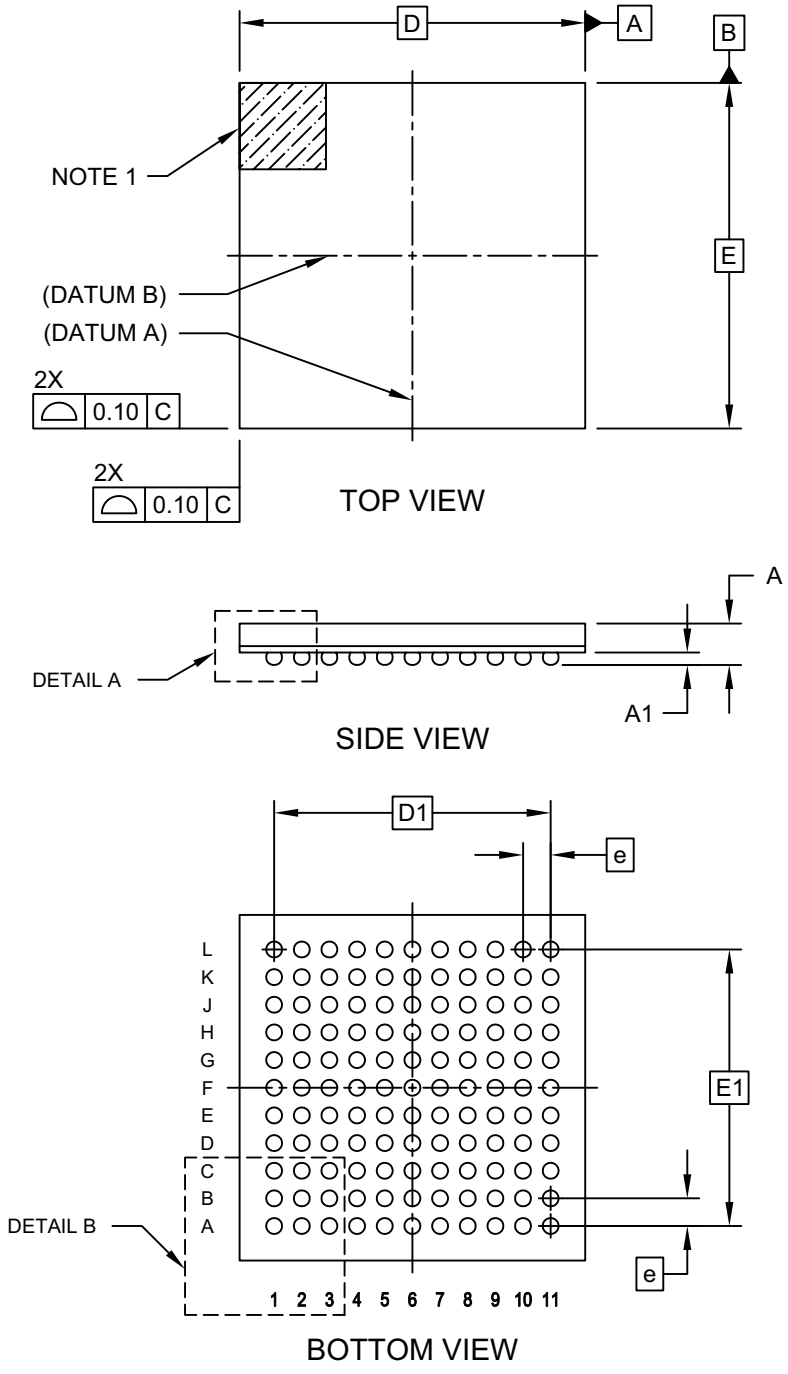
Microchip Technology Drawing No. C04-2100B

121-Ball Plastic Thin Profile Fine Pitch Ball Grid Array (BG) - 10x10x1.10 mm Body [TFBGA]

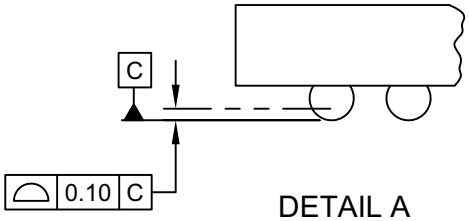
Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



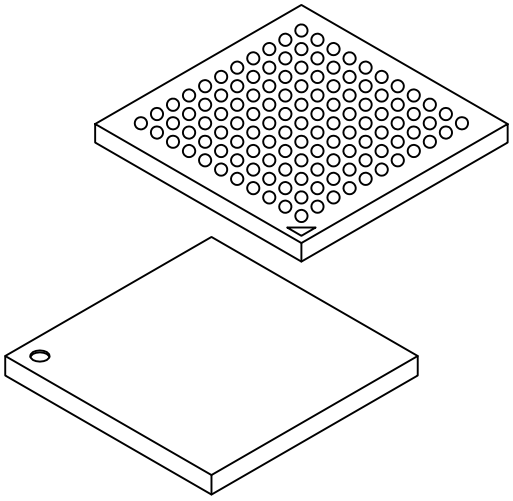
Microchip Technology Drawing C04-148 Rev F Sheet 1 of 2

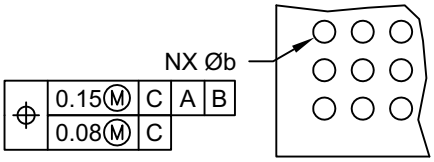
121-Ball Plastic Thin Profile Fine Pitch Ball Grid Array (BG) - 10x10x1.10 mm Body [TFBGA]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



DETAIL A





DETAIL B

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Contacts	N		121	
Contact Pitch	e		0.80 BSC	
Overall Height	A	1.00	1.10	1.20
Ball Height	A1	0.25	0.30	0.35
Overall Width	E		10.00 BSC	
Array Width	E1		8.00 BSC	
Overall Length	D		10.00 BSC	
Array Length	D1		8.00 BSC	
Contact Diameter	b	0.35	0.40	0.45

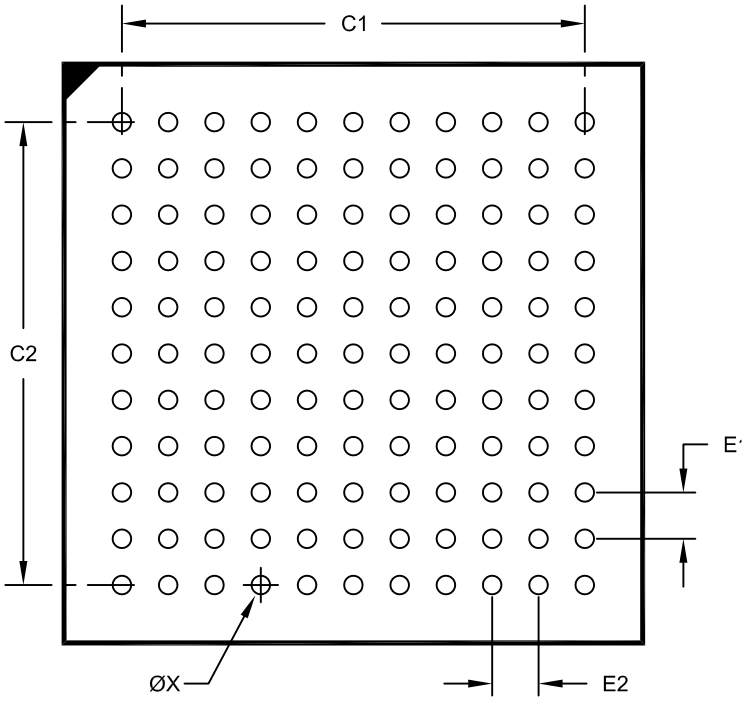
Notes:

1. Ball A1 visual index feature may vary, but must be located within the hatched area.
2. Dimensioning and tolerancing per ASME Y14.5M.
   BSC: Basic Dimension. Theoretically exact value shown without tolerances.
   REF: Reference Dimension, usually without tolerance, for information purposes only.
3. The outer rows and colums of balls are located with respect to datums A and B.
4. Ball interface to package body: 0.37mm nominal diameter.

Microchip Technology Drawing C04-148 Rev F Sheet 2 of 2

121-Lead Plastic Thin Profile Ball Grid Array (BG) - 10x10x1.10 mm Body [TFBGA--Formerly XBGA]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E1		0.80 BSC	
Contact Pitch	E2		0.80 BSC	
Contact Pad Spacing	C1		8.00	
Contact Pad Spacing	C2		8.00	
Contact Pad Diameter (X121)	X			0.32

Notes:

1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Microchip Technology Drawing No. C04-2148 Rev D

NOTES:

APPENDIX A: REVISION HISTORY

Revision A (February 2015)

Original data sheet for the PIC24FJ256GA412/GB412 family of devices.

Revision B (July 2015)

This revision incorporates the following updates:

- Sections:
  - Updates the Special Microcontroller Features and Peripheral Features sections at the beginning of the data sheet (Page 1 and Page 2).
  - Adds **Section 4.2 "Unique Device Identifier (UDID)"** and **Section 4.2 "Unique Device Identifier (UDID)"**.
  - Updates **Section 22.0 "Liquid Crystal Display (LCD) Controller"**.
- Registers:
  - Updates Register 33-1 and Register 33-10.
- Tables:
  - Updates the 16/32-Bit Timers column in the Device Features table on Page 2.
  - Updates Table 1-5, Table 4-5, Table 4-6, Table 4-7, Table 4-8, Table 4-9, Table 4-10, Table 4-11, Table 4-12, Table 23-1, Table 36-4, Table 36-5 and Table 36-5.
  - Adds Table 36-41.
- Removes all references to ISO 7816 Support and Deep Sleep mode.
- Changes to text and formatting were incorporated throughout the document.

Revision C (September 2015)

This revision incorporates the following updates:

- Sections:
  - Updates **Section 2.6 "External Oscillator Pins"**.
  - Removes **Section 4.2 "Unique Device Identifier (UDID)"** and updates what was Section 4.3 and is now **Section 4.2 "Unique Device Identifier (UDID)"**.
- Tables:
  - Removes Table 4-3 and updates what was Table 4-4 and is now Table 4-3.
  - Replaces all Reset values in Table 4-5 through Table 4-12.
  - Registers:
  - Updates Register 24-3, Register 24-7, Register 24-8, Register 24-9 and Register 24-10.

Index and Table of Contents were updated accordingly.

Revision D (December 2016)

This revision incorporates the following updates:

- Sections:
  - Updates **Section 10.5 "VBAT Mode"** and **Section 24.5.1 "Write Lock"**.
- Figures:
  - Updates Figure 17-1 and Figure 17-2.
- Registers:
  - Updates Register 14-6, Register 14-6, Register 15-2, Register 16-2, Register 17-1, Register 23-3, Register 24-3, Register 28-1, Register 31-3, Register 33-6 and Register 33-9.
- Tables:
  - Updates all pin diagrams and Table 1 through Table 6.
  - Updates Table 1-1, Table 1-2, Table 1-3, Table 1-4, Table 1-5, Table 4-2, Table 4-11, Table 14-6, Table 14-7, Table 33-1, Table 36-7 and Table 36-41.
- Examples:
  - Updates Example 11-4 and Example 24-1.

Revision E (November 2019)

This revision incorporates the following updates:

- Sections:
  - Updates **Section 4.2 "Unique Device Identifier (UDID)"**, **Section 5.1.5 "Addressing Modes"**, **Section 5.2 "Typical Setup"**, **Section 10.4.1 "Entering Deep Sleep Mode"** and **Section 17.0 "Serial Peripheral Interface (SPI)"**.
- Registers:
  - Updates Register 5-2, Register 6-1 and Register 14-1.
  - Adds Register 14-8.
- Tables:
  - Updates Table 1 through Table 6, Table 1-4, Table 4-3, Table 4-6, Table 4-7, Table 4-8, Table 4-12, Table 5-1, Table 8-1, Table 8-2, Table 11-2, Table 11-7, Table 14-2, Table 14-6 and Table 36-5.
- Examples:
  - Updates Example 10-1 and Example 10-2

NOTES:

THE MICROCHIP WEBSITE

Microchip provides online support via our WWW site at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

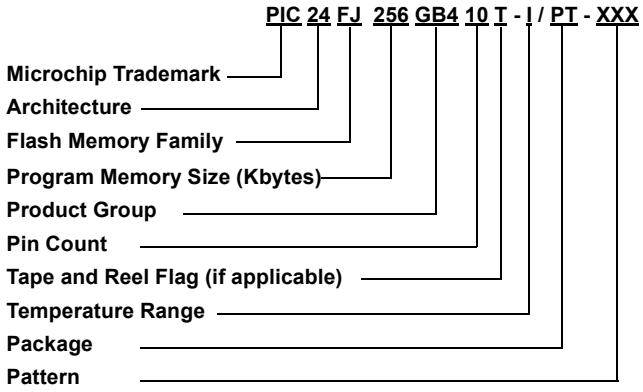
Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the website at: http://microchip.com/support

NOTES:

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.



Architecture	24	= 16-Bit Modified Harvard without DSP
Flash Memory Family	FJ	= Flash Program Memory
Product Group	GA4	= General Purpose Microcontrollers with Dual Partition Flash Program Memory and XLP Technology
	GB4	= USB OTG Microcontrollers with Dual Partition Flash Program Memory and XLP Technology
Pin Count	06	= 64-pin (TQFP, QFN)
	10	= 100-pin (TQFP)
	12	= 121-pin (TFBGA)
Temperature Range	I	= -40°C to +85°C (Industrial)
Package	BG	= 121-ball (10x10x1.1 mm) TFBGA (Ball Grid Array)
	PT	= 100-lead (12x12x1 mm) TQFP (Thin Quad Flatpack)
	PT	= 64-lead (10x10x1 mm) TQFP (Thin Quad Flatpack)
	MR	= 64-lead (9x9x0.9 mm) QFN (Quad Flatpack, No Lead)
Pattern		Three-digit QTP, SQTP, Code or Special Requirements (blank otherwise)
	ES	= Engineering Sample

Examples:

a) PIC24FJ64GA406-I/MR:
PIC24F General Purpose Device with Dual Partition Flash Program Memory and XLP Technology, 64-Kbyte Program Memory, 64-Pin, Industrial Temp., QFN Package.

b) PIC24FJ128GB410-I/PT:
PIC24F USB OTG Device with Dual Partition Flash Program Memory and XLP Technology, 128-Kbyte Program Memory, 100-Pin, Industrial Temp., TQFP Package.

c) PIC24FJ256GB412-I/BG:
PIC24F USB OTG Device with Dual Partition Flash Program Memory and XLP Technology, 256-Kbyte Program Memory, 121-Pin, Industrial Temp., TFBGA Package.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

For information regarding Microchip's Quality Management Systems, please visit www.microchip.com/quality.
