

# Ultra-Low Power Arm® ARM926EJ-S™ Processor-Based MPU, 600 MHz, Camera, LCD, 2D Graphics, Dual 10/100 Ethernet, CAN, USB, QSPI, FLEXCOMs, AES, SHA

## SAM9X60 Data Sheet

[www.microchip.com](http://www.microchip.com)  
Product Page Links

## Introduction

The SAM9X60 is a high-performance, ultra-low power ARM926EJ-S CPU-based embedded microprocessor (MPU) running up to 600 MHz, with support for multiple memories such as SDRAM, LP-SDRAM, LPDDR, DDR2, and QSPI and e.MMC Flash. The device integrates powerful peripherals for connectivity and user interface applications, and offers security functions (tamper detection, secure boot program, secure key storage, etc.), TRNG, as well as high-performance crypto accelerators for AES and SHA.

## Reference Document

The SAM9X60 device conforms functionally to this data sheet, except for the anomalies described in the following document.

Type	Title	Literature No.	Available
Errata	SAM9X60 Device Silicon Errata and Data Sheet Clarifications	DS80000846	<a href="http://www.microchip.com">www.microchip.com</a>

# Overview

## 1. Features

- CPU running up to 600 MHz
  - ARM926EJ-S Arm Thumb® processor
  - 32-Kbyte data cache, 32-Kbyte instruction cache, Memory Management Unit (MMU)
- Memories
  - One 160-Kbyte internal ROM
    - 64-Kbyte internal ROM embedding a secure bootloader program supporting boot on NAND Flash, SD Card, SPI or QSPI Flash. Bootloader features selectable by OTP bits
    - 96-Kbyte ROM for NAND Flash BCH ECC table
  - One 64-Kbyte internal SRAM (SRAM0), single-cycle access at system speed
  - High-bandwidth Multi-port DDR2/LPDDR Controller
  - 32/16-bit External Bus Interface (EBI) supporting 8/4-bank DDR2/LPDDR, 4/2-bank SDR/LPSDR, static memories, with scrambling
  - NAND Flash Controller, with up to 24-bit Programmable Multi-bit Error Correcting Code
  - One 11-Kbyte OTP memory for secure key storage with emulation mode (OTP bits are emulated by a 4-Kbyte SRAM (SRAM1))
- System Running up to 200 MHz
  - Power-on reset cells, Reset Controller, Shutdown Controller, Periodic Interval Timer, Watchdog Timer running on internal slow RC oscillator (32 kHz typical) and Real Time Clock running on slow crystal oscillator (32.768 kHz)
  - Two internal trimmed RC oscillators with typical values: 32 kHz (slow) and 12 MHz (fast)
  - Two crystal oscillators: 32.768 kHz (slow) and 12 to 48 MHz (fast)
  - One PLL for the system and one PLL optimized for USB high-speed operation (480 MHz)
  - One dual-port 16-channel DMA Controller
  - Advanced Interrupt Controller and Debug Unit
  - JTAG port with disable bit in OTP memory
  - Two programmable clock output signals
- Low-Power Modes
  - Backup mode with RTC, eight 32-bit general purpose backup registers, and Shutdown Controller to control the external power supply
  - Clock Generator and Power Management Controller
  - Software-programmable ultra-low power modes: Very Slow Clock operating mode (ULP0), and No-Clock operating Mode (ULP1) with fast wake-up capabilities
  - Software programmable power optimization capabilities
- Peripherals
  - LCD Controller with overlay, alpha-blending, rotation, scaling and color conversion. Up to 1024 x 768 resolution
  - 2D Graphics Controller supporting fill BLT, copy BLT, transparent BLT, blend/alpha BLT, ROP4 BLT (Raster Operations) and command ring buffer

- ITU-R BT. 601/656, up to 12-bit Image Sensor Interface
- One USB Device High Speed, three USB Host High Speed with dedicated On-Chip Transceivers
- Two 10/100 Mbps Ethernet Mac Controller
- Two 4-bit Secure Digital MultiMedia Card Controller
- Two CAN Controllers
- One Quad I/O SPI Controller
- Two three-channel 32-bit Timers/Counters
- One high resolution (64-bit) Periodic Interval Timer
- One Synchronous Serial Controller
- One Inter-IC Sound Multi-Channel Controller with TDM support
- One Audio Class D Controller with single-ended or bridge-tied load connection to power stage
- One four-channel 16-bit PWM Controller
- Thirteen FLEXCOMs (USART, SPI and TWI)
- One 12-channel 12-bit Analog-to-Digital Converter with 4/5 wires resistive touchscreen support
- Hardware Cryptography
  - SHA (SHA1, SHA224, SHA256, SHA384, SHA512) and HMAC: compliant with FIPS PUB 180-2
  - AES: 256-, 192-, 128-bit key algorithms, compliant with FIPS PUB 197
  - TDES: two-key or three-key algorithms, compliant with FIPS PUB 46-3
  - True Random Number Generator, compliant with NIST Special Publication 800-22 Test Suite and FIPS PUBs 140-2 and 140-3
- I/O Ports
  - Four 32-bit Parallel Input/Output Controllers
  - Up to 112 programmable I/O lines multiplexed with up to three peripheral I/Os
  - Input change interrupt capability on each I/O line, optional Schmitt Trigger input
  - Individually programmable open-drain, pull-up and pull-down resistor, synchronous output
  - General-purpose analog and digital inputs tolerant to positive and negative current injection
- Qualification
  - AEC-Q100 Grade 2  $[-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$ ] ambient temperature). Applies to -V/DWBVAO devices only.
- Design for low ElectroMagnetic Interference (EMI)
  - Slewrate-controlled I/Os
  - DDR/SDR Phy with impedance-calibrated drivers
  - Spread spectrum PLLs
  - Careful BGA power/ground ball assignment to provide optimum decoupling capacitors placement
- Operating Conditions
  - Ambient temperature range ( $T_A$ ):  $-40^{\circ}\text{C}$  to  $+105^{\circ}\text{C}$
  - Junction temperature range ( $T_J$ ):  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Packages

- 11x11 mm<sup>2</sup>, 0.65 mm pitch, 228-ball TFBGA optimized for standard class PCB layout (down to four layers)
- 9x9 mm<sup>2</sup>, 0.5-mm pitch, 256-ball BGA for space-constrained applications

## 2. Ordering Information

Ordering Code <sup>(1)(2)</sup>	Tier	Package	Ambient Operating Temperature Range
SAM9X60(T)-V/DWB(-SLx)	Extended Industrial	TFBGA228	-40°C to +105°C
SAM9X60(T)-V/DWB(-SLx)VAO	Automotive		
SAM9X60(T)-V/6GW(-SLx)	Extended Industrial	TFBGA256	

### Notes:

1. For details on ordering codes, refer to the section [Product Identification System](#).
2. For SL1, SL2 and SL3 device availability, contact a Microchip Sales representative.

### 3. Product Identification System

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

Architecture:	SAM9	= ARM926EJ-S Arm Thumb microprocessor
Series:	X60	= General purpose microprocessor
Carrier Type:	Blank	= Standard packaging (tray)
	T	= Tape and reel
Temperature Range:	V	= -40°C to +105°C (Extended Industrial temperature)
Package:	DWB	= TFBGA228
	6GW	= TFBGA256
Software License Level:	Blank	= Standard
	SL1	= Level 1
	SL2	= Level 2
	SL3	= Level 3
Pattern:	Blank	= Standard device
	VAO	= Automotive flow/material without PPAP. Available upon request.
	Vxx	= Automotive flow/material with associated PPAP. Available upon request.

Example:

- SAM9X60T-V/DWB-SL3VAO = ARM926EJ-S Arm Thumb microprocessor for Automotive applications, Tape and reel, Extended Industrial temperature, 228-ball TFBGA package, software license level 3, automotive flow/material without PPAP

**Note:** The Tape and Reel identifier and the Software License Level identifier only appear in the catalog part number description. These identifiers are used for ordering purposes and are not printed on the device package. Check with your Microchip Sales Office for package availability.

## 4. Marking

Top marking follows the scheme below:

with possible values:

Line	Description	Values
1	Company logo	Microchip logo
2	Company name	Microchip
3	Device name	SAM9X60
4	Temperature code/Packaging code, JEDEC symbol	V / DWB  V / 6GW 
5	Not used	-
6	Lot traceability, ARM logo	YYWWNNN ARM

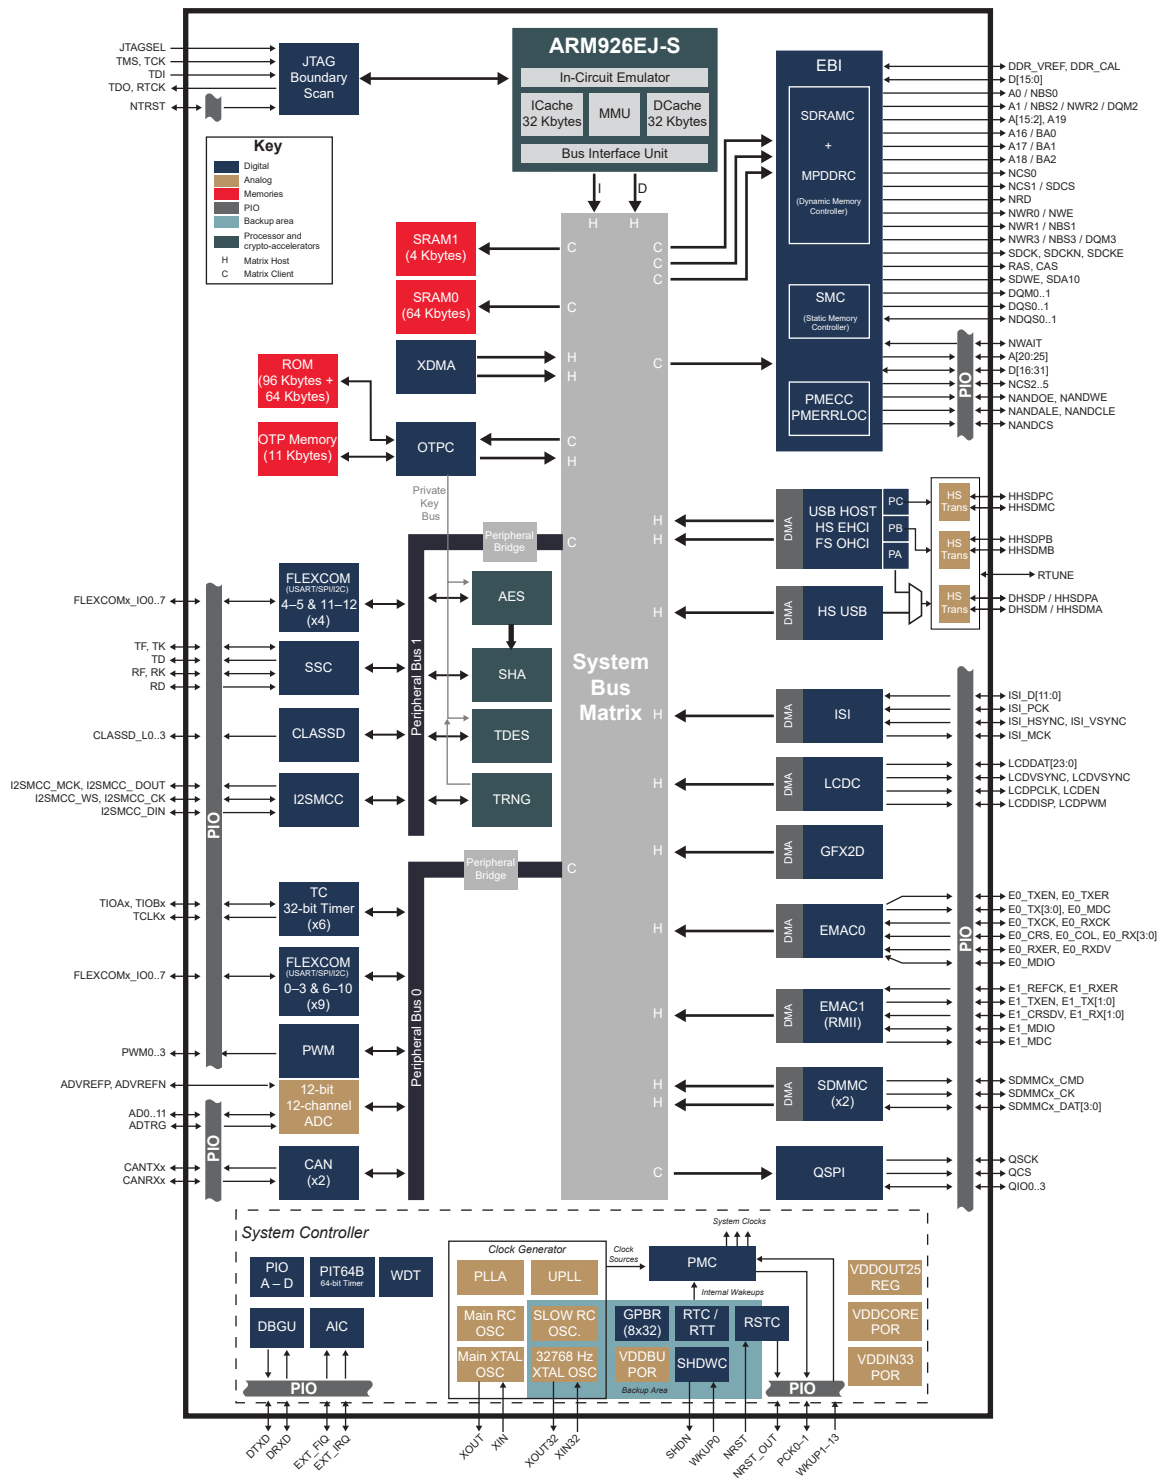

## 5. Configuration Summary

**Table 5.1.** Configuration Summary

Feature	SAM9X60
Package	11 x 11 mm <sup>2</sup> , 0.65-mm pitch, 228-ball BGA
	9x9 mm <sup>2</sup> , 0.5-mm pitch, 256-ball BGA
Core	Arm926EJ-S @ 600 MHz
SRAM0 + SRAM1	64 Kbytes + 4 Kbytes
L1 Cache (I + D)	32 Kbytes + 32 Kbytes
SDRAM Support	(LPDDR / SDR) 16/32-bit, (LPDDR / DDR2) 16-bit
External Bus I/F	Parallel bus, NAND Flash
Camera I/F (ISI)	1x 12-bit
EMAC 10/100	1x MII / RMII + 1x RMII
USB	3x HS transceivers 2x host + 1x (host or device)
CAN	2x
LCD / GFX2D	24-bit RGB Up to 1024 x 768 @ 60 fps
SDIO / SD Card / e.MMC	2x (4-bit / up to 52 MHz)
ADC	1x 12-bit ADC
Serial I/F	13x FLEXCOMs
DDR QSPI	1x
Audio Peripherals SSC / I2S / CLASSD	1 / 1 / 1
Security	TDES / AES / SHA + Secure bootloader

CLASSD_L1	Class D Controller Left Output 1	Output	–	–
CLASSD_L2	Class D Controller Left Output 2	Output	–	–
CLASSD_L3	Class D Controller Left Output 3	Output	–	–
<b>Quad I/O SPI - QSPI</b>				
QSCK	Quad IO SPI Serial Clock	Output	–	–
QCS	Quad IO SPI Chip Select	Output	–	–
QIO[3:0]	Quad IO SPI I/O 0 to 3	I/O	–	–
<b>Inter IC Sound Multi Channel Controller - I2SMCC</b>				
I2SMCC_MCK	Main System Bus Clock	Output	–	–
I2SMCC_CK	Serial Clock	I/O	–	–
I2SMCC_WS	I2S Word Select	I/O	–	–
I2SMCC_DIN	Serial Data Input	Input	–	–
I2SMCC_DOUT	Serial Data Output	Output	–	–

## 8. Package and Pinout

### 8.1. Packages

The SAM9X60 device is available in the following packages.

**Table 8.1.** SAM9X60 Packages

Package Name	Pin Count	Ball Pitch	Package Size
TFBGA228	228	0.65 mm	11 x 11 x 1.2 mm
TFBGA256	256	0.5 mm	9 x 9 x 1.2 mm

For further details, refer to [Mechanical Characteristics](#).

## 8.2. Pinout

### 8.2.1. BGA228 Pinout

Figure 8.1. SAM9X60 BGA228 Pinout

### 8.2.2. BGA256 Pinout

### Figure 8.2. SAM9X60 BGA256 Pinout

### 8.2.3. Pin Description

The device features several PIO controllers that multiplex the I/O lines of the peripheral set. The following [Pin Description](#) table defines how the I/O lines are multiplexed on the different PIO controllers. The "Reset State" column shows whether the PIO line resets in I/O mode or in Peripheral mode. If I/O is shown, the PIO line resets with the characteristics (input, output, pull-up or pull-down) indicated in this same column, so that the device is configured in a known state as soon as the reset is released. As a result, PIO\_CFGR.FUNC resets to '0'. If a signal name is shown in the "Reset State" column, the PIO line is assigned to this function and PIO\_CFGR.FUNC is not set to '0'. That is the case for pins controlling memories, in particular address lines, which require the pin to be driven as soon as the reset is released.

1. When using an I/O line with the Analog-to-Digital Converter (ADC), the PIO line configuration (pull-up, pull-down) programmed before assigning this line to the ADC peripheral is not modified by this peripheral.
2. Refer to the [Electrical Characteristics](#) section for further details.
3. I/Os for each peripheral are grouped into I/O sets, listed in the column "I/O Set". For all peripherals, use I/Os that belong to the same I/O set. Timings can be unpredictable when I/Os from different I/O sets are mixed.
4. Signal = 'PIO' if GPIO; Dir = Direction; PU = Pull-up; PD = Pull-down; HiZ = High impedance; ST = Schmitt Trigger

## 9. Microchip Recommended Power Management Solutions

MCP16502 and MCP16501 are multi-channel Power Management Integrated Circuits (PMICs) recommended for the SAM9X60.

### 9.1. MCP16502 PMIC

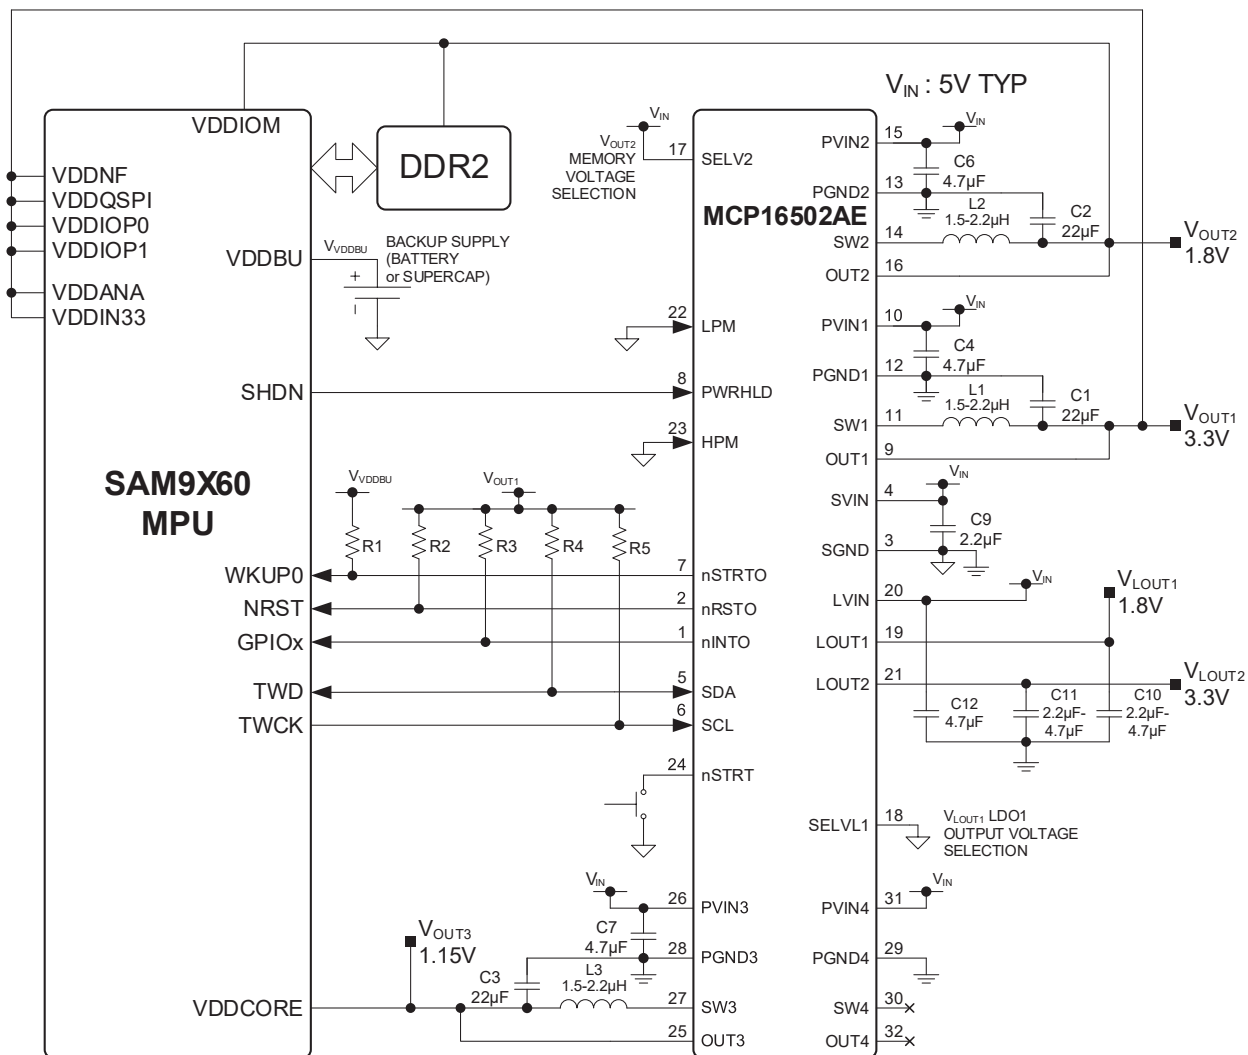

MCP16502 features four 1A DC-DC buck regulators and two 0.3A auxiliary LDO regulators, and provides a comprehensive interface to the MPU, which includes an interrupt flag and a 1-MHz I<sup>2</sup>C interface.

The PMIC-processor interface is optimized so that it remains leakage-free in Backup mode. The following figure gives an application schematic example of a SAM9X60 with DDR2-SDRAM system, powered by MCP16502**AE**. This variant is specifically tailored for SAM9X60 systems with CPU frequency up to 600 MHz. The 3.3V, 1.8V and 1.15V supply rails are fed from DC-DC converters for maximum efficiency. The fourth DC-DC converter (Buck4) of MCP16502**AE** is left OFF by default during start-up and its components may be removed, if not needed for other purposes.

The two LDO regulator outputs LOUT1 and LOUT2 are auxiliary power rails available for the application. LOUT1 output is ON by default at power-up and its default voltage is set to 1.8V, 2.5V or 3.3V depending on the SELV1 pin connection. Buck4 and LOUT2, OFF by default at power-up, can be started by software through the I<sup>2</sup>C control bus to the necessary voltage.

For further details, refer to the MCP16502 documentation on [www.microchip.com](http://www.microchip.com).

Figure 9.1. MCP16502 Simplified Application Block Diagram

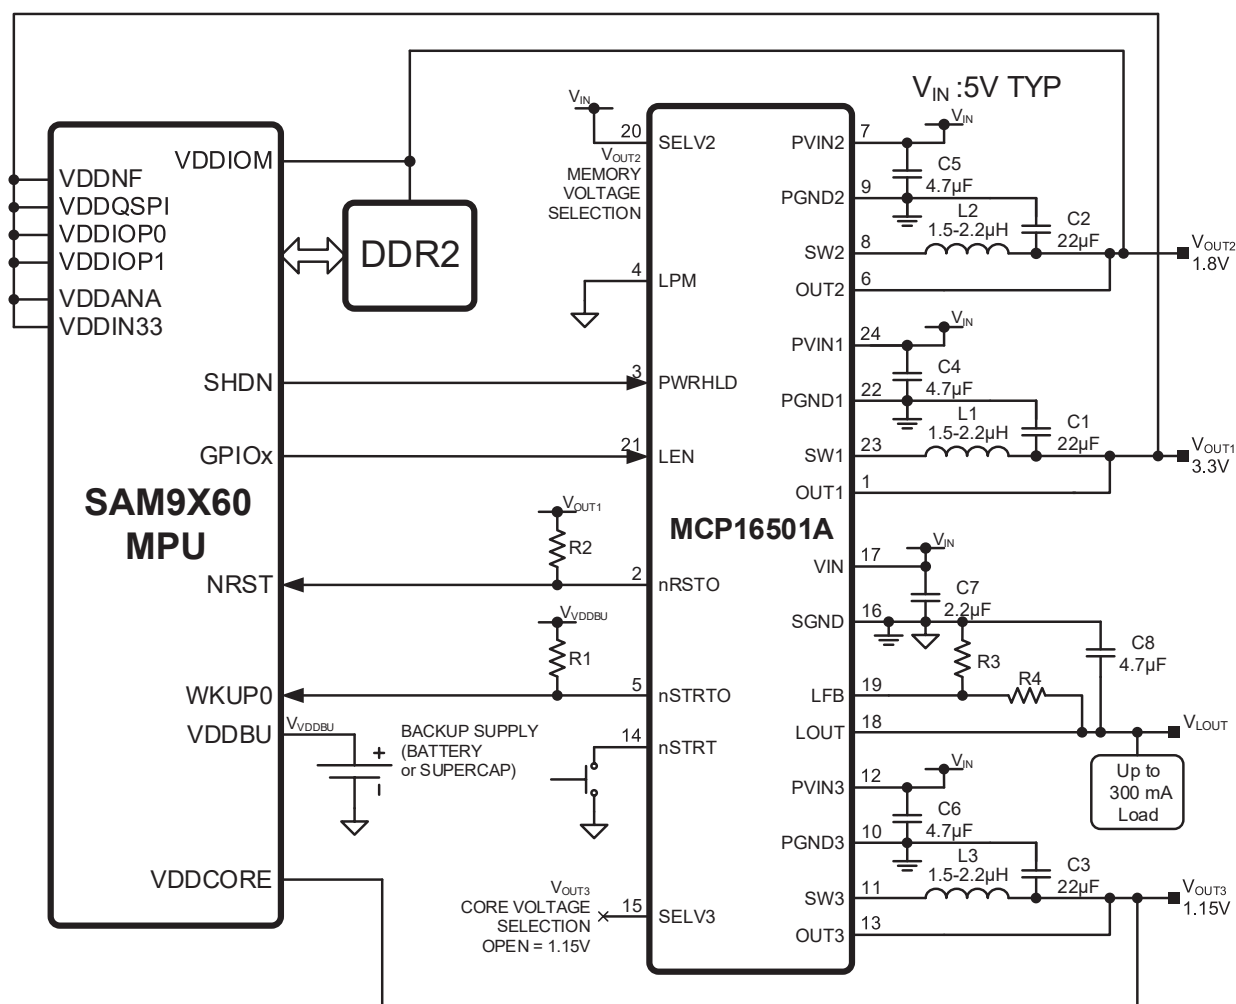

## 9.2. MCP16501 PMIC

MCP16501 is a 4-channel PMIC designed for PCB area constrained applications. In a 4x4mm QFN24 package, it features three 1A DC-DC buck regulators and one 0.3A auxiliary LDO regulator, and provides a simple, leakage-free interface with SAM9X60.

The following figure gives an application schematic example of SAM9X60 with DDR2-SDRAM system, powered by MCP16501A. This variant is specifically tailored for SAM9X60 systems with CPU frequency up to 600 MHz. The 3.3V, 1.8V and 1.15V supply rails are fed from DC-DC converters for maximum efficiency. The LDO regulator output LOUT is controlled with the LEN input and its output voltage is set with the resistive divider R3/R4.

For further details, refer to the MCP16501 documentation on [www.microchip.com](http://www.microchip.com).

**Figure 9.2.** MCP16501 Simplified Application Block Diagram

## 10. Safety and Security Features

### 10.1. Design for Safety and IEC60730 Class B Certification

#### 10.1.1. Background Information

The IEC 60730 standard encompasses all aspects of appliance design. Annex H of the standard covers the aspects most relevant to microcontrollers. It details the tests and diagnostics which are intended to ensure safe operation of embedded control hardware and software. IEC 60730 defines three classifications for electronic control functions:

- Class A - Control functions which are not intended to be relied upon for safety of the equipment
- Class B - Control functions intended to prevent unsafe operation of the controlled equipment
- Class C - Control functions intended to prevent special hazards such as explosions

Specific design techniques have been used in the SAM9X60 to ease compliance with the IEC 60730 Class B Certification and to resolve general-purpose safety concerns. This allows reduced software development and code size as well as savings on external hardware circuitry, since built-in self-tests are already embedded in the MPU. [Table 10.1](#) gives the list of peripherals which incorporate these techniques, and details whether these features are applicable for the IEC 60730 Class B Certification or for general-purpose safety considerations.

### 10.2. Design for Security

The SAM9X60 embeds peripherals with security features to prevent counterfeiting, to secure external communication, and to authenticate the system.

[Table 10.2](#) provides the list of peripherals and an overview of their security function. For more information, see the sections on each peripheral.

### 10.3. Safety and IEC 60730 Features

**Table 10.1.** Safety and IEC 60730 Features

Peripheral	Component	Fault/Error/Feature	Requirements for Class B IEC 60730 <sup>(1)</sup>	General Safety
PMC	Clock	MCK frequency monitor - MCK out-of-range operation	-	X
		32.768 kHz crystal oscillator frequency monitor - Abnormal frequency deviation	X	X
		Main crystal oscillator failure detector - Crystal failure detection	X	X
System Controller	All	Safety critical peripherals and/or counters are fed by the always-on slow RC oscillator - WDT, RSTC, startup counters, timeout counters, etc.	-	X
PIOC	I/O lines	Digital I/O - Plausibility check	X	-
ADCC		Analog I/O and ADC converter - Plausibility check	X	-
NAND Flash Controller ECC	Memory	Non-volatile memory - Multiple error detection (2 to 24)	-	X

.....continued

Peripheral	Component	Fault/Error/Feature	Requirements for Class B IEC 60730 <sup>(1)</sup>	General Safety
WDT, RSTC	Watchdog	Watchdog is driven by an internal always on clock - Program counter stuck at faults	X	X
		Watchdog configuration can be locked until the next reset - Errant writes (programming errors, errors introduced by system or hardware failures)	-	X
		Watchdog overflow generates a system reset	X	X
ARM926EJ-S MMU	Memory Management Unit	ARM926EJ-S Memory Management Unit	-	X
MATRIX, AIC, RTC, RTT, RSTC, SHDWC, SDRAM, PMC, PIOC, MPDDRC, SMC, CLASSD, SSC, FLEXCOM, QSPI, TC, I2SMCC, ADC	Peripherals	Configuration, Interrupt Enable/Disable, Control registers can be independently write-protected - Errant writes (programming errors, errors introduced by system or hardware failures)	-	X
AES, TDES, SHA, PIT64B, TC, SDRAMC, MPDDRC	Peripherals	Embedded integrity checker with reports in status registers	-	X

**Note:**

1. Class B IEC 60730 Requirements. Annex H - Table H.1 (H.11.12.7 in Edition 3).

## 10.4. Security Features

**Table 10.2.** Security Features

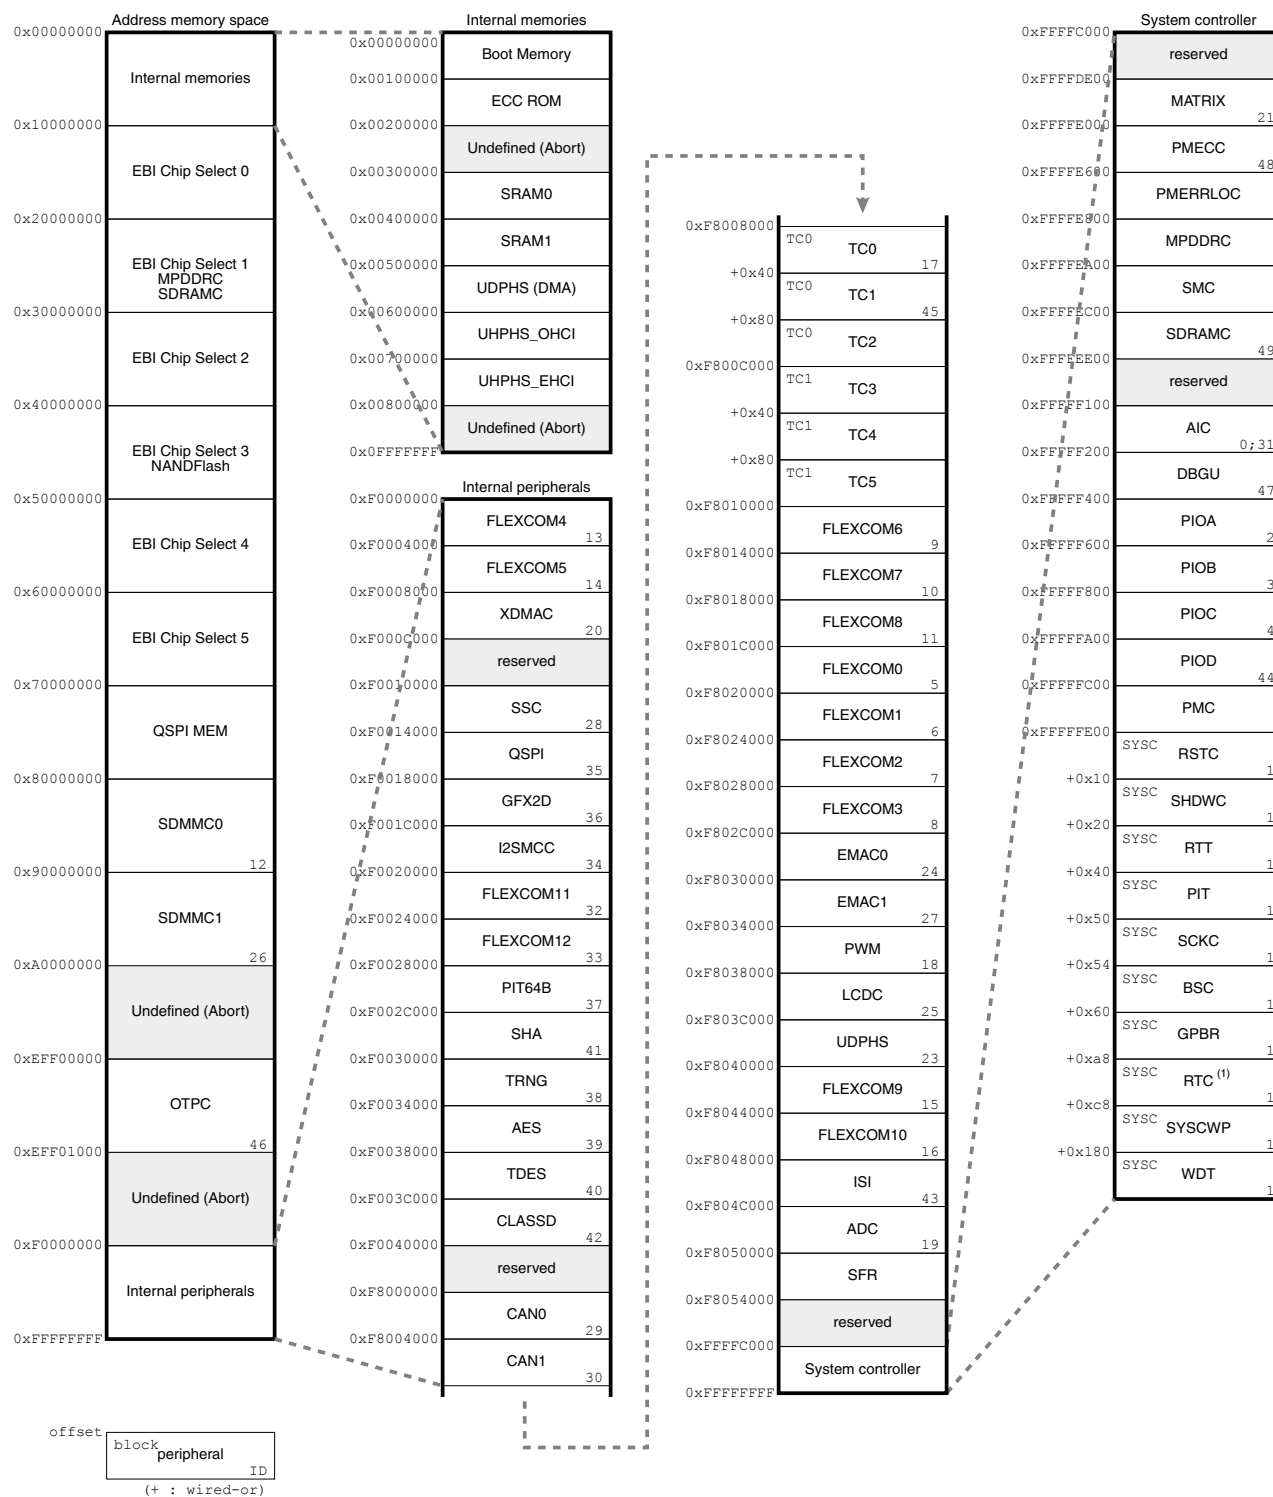

Peripheral	Function	Description	Comments
ARM926EJ-S MMU	Memory Management Unit	Memory Management Unit	-
PIO	I/O Control/ Peripheral Access	When a peripheral is not selected (PIO-controlled), I/O lines have no access to the peripheral.	-
AES	Cryptography Standards	Hardware-accelerated AES up to 256 bits	FIPS-compliant
SHA		SHA up to 512 and HMAC-SHA	
TDES		Hardware-accelerated Triple DES	
TRNG		True Random Number Generator	
AES, TDES	Cryptography Tamper	Immediate clear of keys in case of external tamper event detection (if enabled)	
AES, TDES, SHA	Cryptography Integrity Checks	AES/TDES/SHA embed integrity checks on configuration registers and algorithm circuitries and a specific flag in status register. If this specific flag is set, an integrity error has been detected. This can occur only on abnormal operating conditions (electromagnetic attacks, VDD glitches, etc.)	-

.....continued

Peripheral	Function	Description	Comments
OTPC, AES, TDES, TRNG	Cryptography Private Key Bus	Capability to transfer a key to AES/TDES in a totally invisible manner from software	–
Secure Boot	Secure Boot	Code encrypted/decrypted, Trusted Code Authentication	Hardware SHA (HMAC) + Software RSA or AES Hardware (CMAC)
Memories	Scrambling	On-the-fly scrambling/ unscrambling for memories	All external memories such as QSPI, DDR, and all memories on SMC
RTC	IO Tamper Pin	Eight tamper detection pins	VDDCORE WKUP1 to WKUP8 pins can be selected as a source of tamper, performing an immediate clear of AES/TDES keys (if enabled), immediate clear of scrambling keys in SDR/DDR/ QSPI/SMC, and immediate clear of General Purposes Backup Registers (if enabled)
	Timestamping	Timestamping of tamper events	All events are logged in the RTC. Timestamping gives the source of the reset/erase memory/interruption
	Configuration	Protection against bad configuration (invalid entry for date and time are impossible)	–
	Glitch Robustness	Glitch on 32 KHz does not corrupt the downstream counters	Glitch on 32 KHz can only create a phase shift of the downstream counters
	Integrity Check	If RTC Status flag TDERR is set, counters integrity have been corrupted	–
Secure OTP	JTAG Access Control	Disable JTAG access by OTP bit	–
PIT64B, TC	Integrity Checks	PIT64B/TC embed integrity checks on configuration registers and algorithm circuitries and a specific flag in status register. If this specific flag is set, an integrity error has been detected. This can occur only on abnormal operating conditions (electromagnetic attacks, VDD glitches, etc.)	–
GPBR	Access Protection	GPBR can be write-protected and/or read-protected	–
	Tamper	GPBR can be immediately cleared on tamper detection (if enabled)	–

## 11. Memory Mapping

Figure 11.1. Memory Mapping

<sup>(1)</sup> Refer to the table System Controller Peripheral Mapping in section [System Controller Write Protection \(SYSCWP\)](#) for RTC detailed mapping.

## 12. Peripheral Identifiers

Table 12.1. Peripheral Identifiers

Instance ID	Instance Name	Internal Interrupt	External Interrupt	Wired-OR	PMC Clock Control	Main System Bus Clock	Generic Clock	f <sub>GCLK</sub> (Max)	PLLACLK	UPLLCLK	Instance Description

## CPU and Interconnect

### 13. ARM926EJ-S Processor

The ARM926EJ-S processor is a member of the ARM9™ family of general-purpose microprocessors. The ARM926EJ-S implements ARM architecture version 5TEJ and is targeted at multi-tasking applications where full memory management, high performance, low die size and low power are important features.

The ARM926EJ-S processor supports the 32-bit ARM and 16-bit THUMB instruction sets, enabling the user to trade off between high performance and high code density. It also supports the 8-bit Java instruction set and includes features for efficient execution of Java bytecode, providing a Java performance similar to JITs (Just-In-Time compilers), for the next generation of Java-powered wireless and embedded devices. It includes an enhanced multiplier design for improved DSP performance.

The ARM926EJ-S processor supports the ARM debug architecture and includes logic to assist in both hardware and software debug.

The ARM926EJ-S provides a complete high performance processor subsystem, including:

- an ARM9EJ-S™ integer core,
- a Memory Management Unit (MMU),
- separate instruction and data AMBA AHB bus interfaces,
- a 32-Kbyte L1 instruction cache and a 32-Kbyte data cache.

For information on the ARM926EJ-S processor, refer to *ARM926EJ-S™ Technical Reference Manual* on [www.arm.com](http://www.arm.com).

## 14. Debug and Test

### 14.1. Description

The product features a number of complementary debug and test capabilities. A common JTAG/ICE (In-Circuit Emulator) port is used for standard debugging functions, such as downloading code and single-stepping through programs. The Debug Unit provides a two-pin UART that can be used to upload an application into internal SRAM. It manages the interrupt handling of the internal COMMTX and COMMRX signals that trace the activity of the Debug Communication Channel.

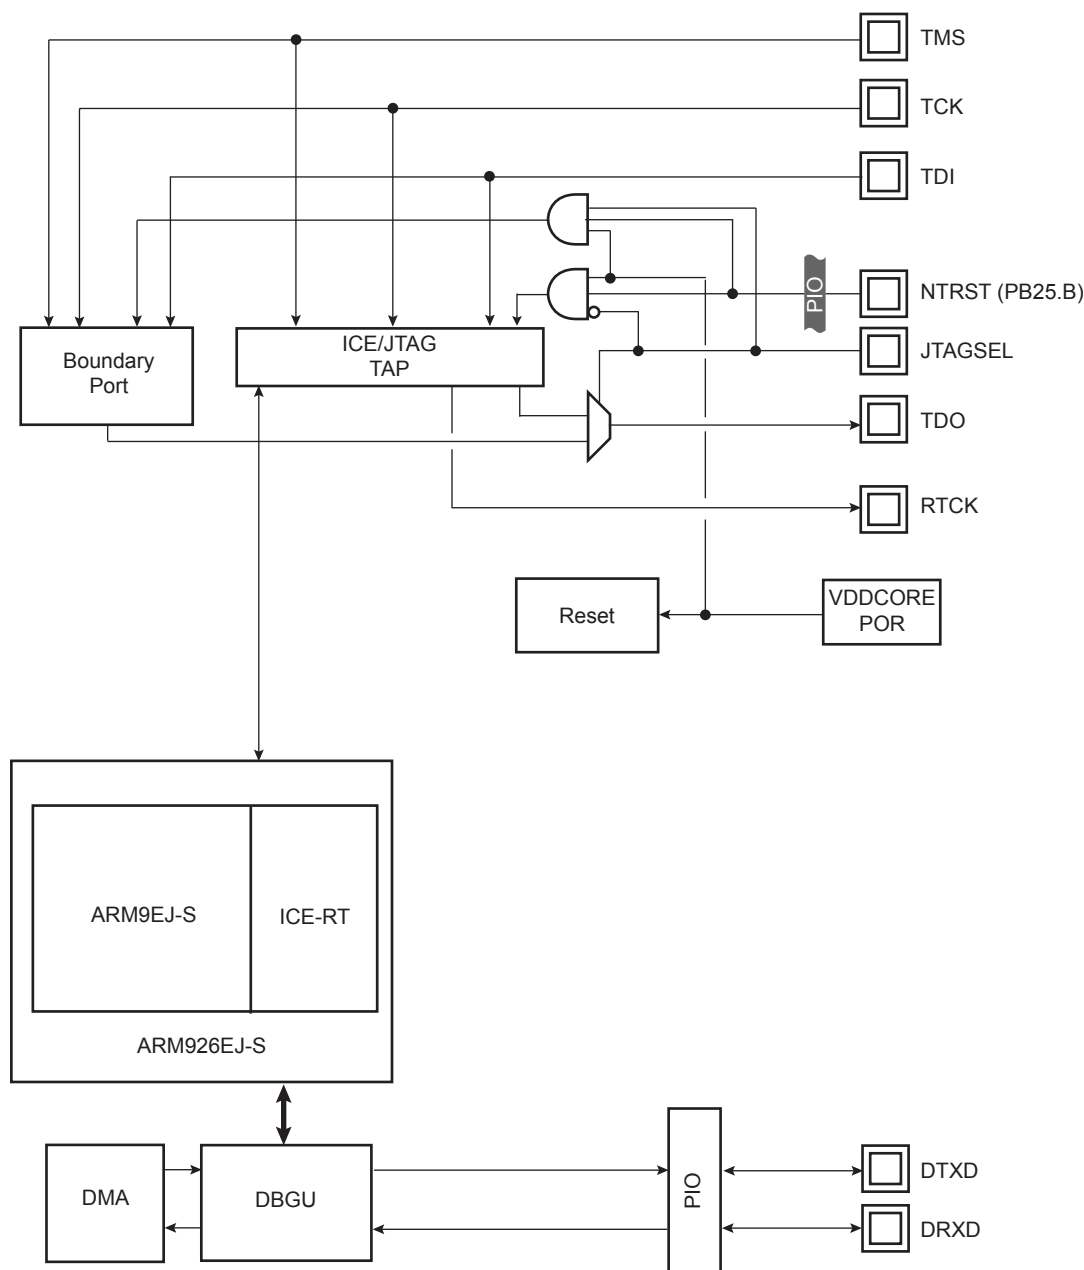

A set of dedicated debug and test input/output pins gives direct access to these capabilities from a PC-based test environment.

### 14.2. Embedded Characteristics

- ARM926 Real-time In-circuit Emulator
  - Two real-time watchpoint units
  - Two independent registers: Debug Control register and Debug Status register
  - Test access port accessible through JTAG protocol
  - Debug communications channel
- Debug Unit
  - Two-pin UART
  - Debug communication channel interrupt handling
  - Chip ID register
- IEEE® 1149.1 JTAG Boundary-scan on All Digital Pins

## 14.3. Block Diagram

Figure 14.1. Debug and Test Block Diagram

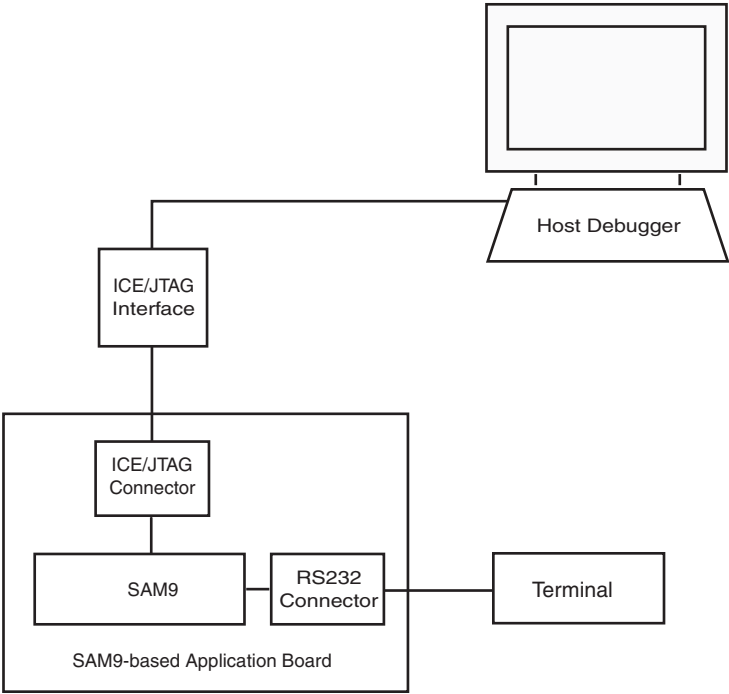

TAP: Test Access Port

## 14.4. Application Examples

### 14.4.1. Debug Environment

The following figure shows a complete debug environment example. The ICE/JTAG interface is used for standard debugging functions, such as downloading code and single-stepping through the program. A software debugger running on a personal computer provides the user interface for configuring a Trace Port interface utilizing the ICE/JTAG interface.

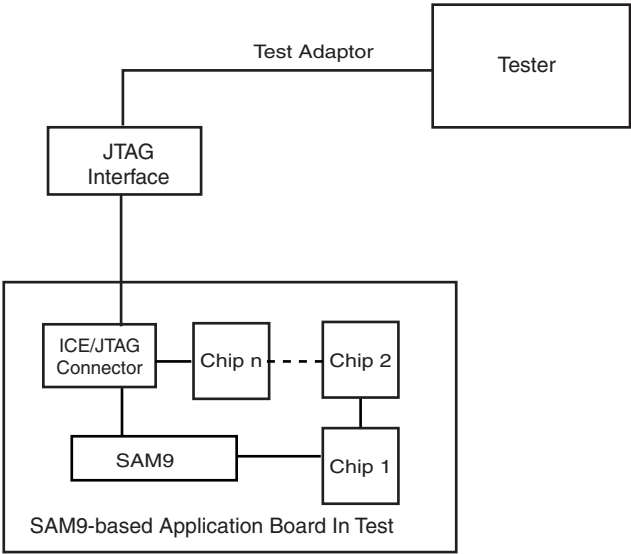

Figure 14.2. Application Debug and Trace Environment Example

14.4.2. Test Environment

The following figure shows a test environment example. Test vectors are sent and interpreted by the tester. In this example, the “board in test” is designed using a number of JTAG-compliant devices. These devices can be connected to form a single scan chain.

Figure 14.3. Application Test Environment Example

## 14.6. Functional Description

### 14.6.1. EmbeddedICE™

The Arm 9EJ-S EmbeddedICE-RT™ is supported via the ICE/JTAG port. It is connected to a host computer via an ICE interface. Debug support is implemented using an ARM9EJ-S core embedded within the ARM926EJ-S. The internal state of the ARM926EJ-S is examined through an ICE/JTAG port which allows instructions to be serially inserted into the pipeline of the core without using the external data bus. Therefore, when in debug state, a store-multiple (STM) can be inserted into the instruction pipeline. This exports the contents of the ARM9EJ-S registers. This data can be serially shifted out without affecting the rest of the system.

There are two scan chains inside the ARM9EJ-S processor which support testing, debugging, and programming of the EmbeddedICE-RT. The scan chains are controlled by the ICE/JTAG port.

EmbeddedICE mode is selected when JTAGSEL is low. It is not possible to switch directly between ICE and JTAG operations. A chip reset must be performed after JTAGSEL is changed.

For further details on the EmbeddedICE-RT, refer to the Arm document ARM9EJ-S Technical Reference Manual (DDI 0222A).

### 14.6.2. JTAG Signal Description

TMS is the Test Mode Select input which controls the transitions of the test interface state machine.

TDI is the Test Data Input line which supplies the data to the JTAG registers (Boundary Scan Register, Instruction Register, or other data registers).

TDO is the Test Data Output line which is used to serially output the data from the JTAG registers to the equipment controlling the test. It carries the sampled values from the boundary scan chain (or other JTAG registers) and propagates them to the next chip in the serial test circuit.

NTRST (optional in IEEE Standard 1149.1) is a Test-ReSeT input which is mandatory in Arm cores and used to reset the debug logic. On Microchip ARM926EJ-S-based cores, NTRST is a Power On Reset output. It is asserted on power on. If necessary, the user can also reset the debug logic with the NTRST pin assertion during 2.5 MCK periods.

TCK is the Test Clock input which enables the test interface. TCK is pulsed by the equipment controlling the test and not by the tested device. It can be pulsed at any frequency. Note the maximum JTAG clock rate on ARM926EJ-S cores is 1/6th the clock of the CPU. This gives 5.45 kHz maximum initial JTAG clock rate for an ARM9E running from the 32.768 kHz slow clock.

RTCK is the Return Test Clock. Not an IEEE Standard 1149.1 signal added for a better clock handling by emulators. From some ICE Interface probes, this return signal can be used to synchronize the TCK clock and take not care about the given ratio between the ICE Interface clock and system clock equal to 1/6th. This signal is only available in JTAG ICE Mode and not in boundary scan mode.

### 14.6.3. Debug Unit

The Debug Unit manages the interrupt handling of the COMMTX and COMMRX signals that come from the ICE and that trace the activity of the Debug Communication Channel. The Debug Unit allows blockage of access to the system through the ICE interface.

For further details on the Debug Unit, refer to [Debug Unit \(DBGU\)](#).

### 14.6.4. IEEE 1149.1 JTAG Boundary Scan

IEEE 1149.1 JTAG Boundary Scan allows pin-level access independent of the device packaging technology.

IEEE 1149.1 JTAG Boundary Scan is enabled when JTAGSEL and NTRST (PB25) are high<sup>(1)</sup>. The SAMPLE, EXTEST and BYPASS functions are implemented. In ICE debug mode, the Arm processor responds with a non-JTAG chip ID that identifies the processor to the ICE system. This is not IEEE 1149.1 JTAG-compliant.

It is not possible to switch directly between JTAG and ICE operations. A chip reset must be performed after JTAGSEL is changed.

A Boundary-scan Descriptor Language (BSDL) file is provided to set up test.

**Note:**

1. With JTAGSEL high, PB25 is configured as an input line with a pull-down resistor. Therefore, it is recommended to use a 10k Ohms (max) resistor to force the high level on PB25. Refer to  $R_{PULL}$  and  $V_{IH}$  characteristics in the section "Electrical Characteristics".

### 14.6.5. JTAG ID Code Register

**Name:** JTAG ID Code Register

**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	VERSION[3:0]				PART NUMBER[15:12]			
Access	R	R	R	R	R	R	R	R
Reset								
Bit	23	22	21	20	19	18	17	16
	PART NUMBER[11:4]							
Access	R	R	R	R	R	R	R	R
Reset								
Bit	15	14	13	12	11	10	9	8
	PART NUMBER[3:0]				MANUFACTURER IDENTITY[10:7]			
Access	R	R	R	R	R	R	R	R
Reset								
Bit	7	6	5	4	3	2	1	0
	MANUFACTURER IDENTITY[6:0]							
Access	R	R	R	R	R	R	R	
Reset								

**Bits 31:28 – VERSION[3:0]** Product Version Number  
Set to 0x0.

**Bits 27:12 – PART NUMBER[15:0]** Product Part Number  
Product part number is 0x5B2F.

**Bits 11:1 – MANUFACTURER IDENTITY[10:0]**  
Set to 0x01F.  
Bit[0] required by IEEE Std. 1149.1.  
Set to 0x1.  
JTAG ID Code value is 0x05B4\_403F.

## 15. Bus Matrix (MATRIX)

### 15.1. Description

The Bus Matrix (MATRIX) implements a multi-layer AHB, based on the AHB-Lite protocol, that enables parallel access paths between multiple hosts and clients in a system, thus increasing the overall bandwidth.

The MATRIX interconnects 15 hosts to 13 clients. The normal latency to connect a host to a client is one cycle, except for the default host of the accessed client which is connected directly (zero cycle latency).

The MATRIX user interface is compliant with the Arm Advanced Peripheral Bus.

#### 15.1.1. MATRIX Hosts

The MATRIX manages 15 hosts listed in the table below. Each host can perform an access, concurrently with others, to an available client. The MATRIX operates at the main system bus clock (MCK) frequency. Each host has its own decoder, which is defined specifically for each host. In order to simplify the addressing, all the hosts have the same decodings.

**Table 15.1.** List of MATRIX Hosts

Host No.	Description
0	ARM926 instruction
1	ARM926 data
2, 3	XDMA controller with QoS support
4	SDMMC0 DMA
5	SDMMC1 DMA
6	USB high-speed device port (UDPHS) DMA
7	USB high-speed host port (UHPHS) EHCI DMA
8	USB high-speed host port (UHPHS) OHCI DMA
9	ISI DMA
10	EMAC0 DMA
11	EMAC1 DMA
12	OTP controller host interface
13	GFX2D DMA
14	LCDC DMA with QoS support

#### 15.1.2. MATRIX Clients

The MATRIX manages the 13 clients listed in the table below. Each client has its own arbiter providing a dedicated arbitration per client.

**Table 15.2.** List of MATRIX Clients

Client No.	Description
0	SRAM0
1	OTPC client interface (ROM and OTP memory)
2	UDPHS dual port RAM
	UHPHS OHCI configuration registers
	UHPHS EHCI configuration registers
3	External Bus Interface / MPDDRC / SDRAMC port 0 with QoS support
4	MPDDRC / SDRAMC port 1 <sup>(1)</sup> with QoS support
5	MPDDRC / SDRAMC port 2 <sup>(1)</sup> with QoS support

.....continued

Client No.	Description
6	MPDDRC / SDRAMC port 3 <sup>(1)</sup> with QoS support
7	Peripheral bridge 0
8	Peripheral bridge 1
9	QSPI
10	SDMMC0 configuration registers
11	SDMMC1 configuration registers
12	SRAM1

**Note:**

1. The multiport is available for the SDRAMC when the Multiplexed Address/Data Lines or the Address/Data/Command Lines mode is used. In standard SDRAM Connection mode, only port 0 is used. Refer to “Interface with Multiplexed Data/Address Lines and Data/Address/Command Lines”, in section SDRAM Controller (SDRAMC).

**15.1.3. Host to Client Access**

The table below describes how hosts and clients can be interconnected. Writing in a register or field not dedicated to a host or a client has no effect.

**Table 15.3.** Host to Client Access

Hosts		0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Clients		ARM926 Instr.	ARM926 Data	XDMAC0	XDMAC1	SDMMC0 DMA	SDMMC1 DMA	UDPHS DMA	UHPHS EHCI	UHPHS OHCI	ISI DMA	EMAC0 DMA	EMAC1 DMA	OTPC Host I/F	GFX2D	LCDC DMA
0	SRAM0	X	X	X	X	X	X	X	X	X	X	X	X	-	X	X

2	UDPHS DPRAM UHPHS EHCI config. reg. UHPHS OHCI config. reg.	X	X	-	-	-	-	-	-	-	-	-	-	-	-	-
3	EBI / MPDDRC / SDRAMC port 0	X	X	X	X	X	X	X	X	X	X	X	X	-	X	X
4	MPDDRC / SDRAMC port 1	X	-	X	-	X	-	X	-	-	-	X	-	-	-	-
5	MPDDRC / SDRAMC port 2	-	X	-	X	-	X	-	X	X	-	-	X	-	X	-
6	MPDDRC / SDRAMC port 3	-	-	-	-	-	-	-	-	-	X	-	-	-	-	X
7	Peripheral Bridge 0	-	X	X	X	-	-	-	-	-	-	-	-	-	-	-
8	Peripheral Bridge 1	-	X	X	X	-	-	-	-	-	-	-	-	-	-	-
9	QSPI	X	X	X	X	-	-	-	-	-	-	-	-	-	-	X
10	SDMMC0 config. reg.	-	X	-	-	-	-	-	-	-	-	-	-	-	-	-
11	SDMMC1 config. reg.	-	X	-	-	-	-	-	-	-	-	-	-	-	-	-
12	SRAM1	X	X	-	-	-	-	-	-	-	-	-	-	X	-	-

**15.2. Embedded Characteristics**

- 15 Configurable Host Ports
- 13 Configurable Client Ports
- One Decoder for Each Host
- One Remap Function for Each Host

- Support for Long Bursts of Length 32, 64, 128 and Up to the Limit of 256-bit Burst Beats of Words
- Enhanced Programmable Mixed Arbitration for Each Client
  - Round-robin
  - Fixed priority
  - Latency Quality of Service
- Programmable Default Host for Each Client
  - No default host
  - Last accessed default host
  - Fixed default host
- Deterministic Maximum Access Latency for Hosts
- Zero or One Cycle Arbitration Latency for the First Access of a Burst
- Bus Lock Forwarding to Clients
- Host Number Forwarding to Clients
- Register Write Protection of User Interface Registers

### 15.3. Memory Mapping

The MATRIX provides one decoder for every host interface. The decoder offers each host several memory mappings. Each memory area can be assigned to several clients. Booting at the same address while using different clients (i.e., external RAM, internal ROM or internal Flash, etc.) becomes possible.

### 15.4. Special Bus Granting Techniques

The MATRIX provides some speculative bus granting techniques in order to anticipate access requests from hosts. Hence, latency is reduced at first access of a burst or, for a single transfer, as long as the client is free from any other host access. It does not provide any benefit if the client is continuously accessed by more than one host, since arbitration is pipelined and has no negative effect on the client bandwidth or access latency.

This bus granting technique sets a different default host for every client.

At the end of the current access, if no other request is pending, the client remains connected to its associated default host. A client can be associated with three kinds of default hosts:

- no default host
- last access host
- fixed default host

To change from one type of default host to another, the user interface provides Client Configuration registers (MATRIX\_SCFGx), one for every client, which set a default host for each client. MATRIX\_SCFGx contain two fields to manage host selection: DEFMSTR\_TYPE and FIXED\_DEFMSTR. The 2-bit DEFMSTR\_TYPE field selects the default host type (no default, last access host, fixed default host), whereas the 4-bit FIXED\_DEFMSTR field selects a fixed default host provided that DEFMSTR\_TYPE is set to fixed default host. See [MATRIX\\_SCFGx](#).

### 15.5. No Default Host

After the end of the current access, if no other request is pending, the client is disconnected from all hosts. This saves power by preventing useless bus activity, in particular when the bus target clock is disabled by software.

This configuration incurs one latency clock cycle for the first access of a burst after bus Idle. Arbitration without default host may be used for hosts that perform significant bursts or several transfers with no Idle cycle in-between, or if the client bus bandwidth is widely used by one or more hosts.

This configuration provides no benefit on access latency or bandwidth when reaching maximum client bus throughput whatever the number of requesting hosts.

## 15.6. Last Access Host

After the end of the current access, if no other request is pending, the client remains connected to the last host that performed an access request.

This enables the MATRIX to remove the one latency cycle for the last host that accessed the client. Other non-privileged hosts still get one latency clock cycle if they need to access the same client. This technique is useful for hosts that mainly perform single accesses or short bursts with some idle cycles in-between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum client bus throughput whatever is the number of requesting hosts.

## 15.7. Fixed Default Host

After the end of the current access, if no other request is pending, the client connects to its fixed default host. Unlike the last access host, the fixed default host does not change unless the user modifies it by software (FIXED\_DEFMSTR field of the related MATRIX\_SCFG).

This allows the MATRIX arbiters to remove the one latency clock cycle for the fixed default host of the client. All requests attempted by the fixed default host do not cause any arbitration latency, whereas other non-privileged hosts get one latency cycle. This technique is useful for a host that mainly performs single accesses or short bursts with idle cycles in-between.

This configuration provides no benefit on access latency or bandwidth when reaching maximum client bus throughput, regardless of the number of requesting hosts.

## 15.8. Arbitration

The MATRIX provides an arbitration technique that reduces latency when conflicts occur, i.e., when two or more hosts try to access the same client at the same time. One arbiter per client is provided, thus arbitrating each client specifically.

The user can either choose one of the following arbitration types, or mix them for each client:

1. Round-robin Arbitration (default)
2. Fixed Priority Arbitration

The resulting algorithm may be complemented by selecting a default host configuration for each client.

When re-arbitration must be done, specific conditions apply. See [Arbitration Scheduling](#).

### 15.8.1. Arbitration Scheduling

Each arbiter has the ability to arbitrate between two or more different host requests. In order to avoid burst breaking as well as to provide the maximum throughput for client interfaces, arbitration may only take place during the following cycles:

- Idle Cycles: When a client is not connected to any host or is connected to a host which is not currently accessing it.
- Single Cycles: When a client is currently doing a single access.
- End of Burst Cycles: When the current cycle is the last cycle of a burst transfer. For defined length burst, predicted end of burst matches the size of the transfer but is managed differently for undefined length burst. See [Undefined Length Burst Arbitration](#).
- Slot Cycle Limit: When the slot cycle counter has reached the limit value indicating that the current host access is too long and must be broken. See [Slot Cycle Limit Arbitration](#).

### 15.8.1.1. Undefined Length Burst Arbitration

In order to prevent long burst lengths that can lock the access to the client for an excessive period of time, the user can trigger the re-arbitration before the end of the incremental bursts. The re-arbitration period can be selected from the following Undefined Length Burst Type (ULBT) possibilities:

- Unlimited: no predetermined end of burst is generated. This value enables 1 Kbyte burst lengths.
- 1-beat bursts: predetermined end of burst is generated at each single transfer during the INCR transfer.
- 4-beat bursts: predetermined end of burst is generated at the end of each 4-beat boundary during INCR transfer.
- 8-beat bursts: predetermined end of burst is generated at the end of each 8-beat boundary during INCR transfer.
- 16-beat bursts: predetermined end of burst is generated at the end of each 16-beat boundary during INCR transfer.
- 32-beat bursts: predetermined end of burst is generated at the end of each 32-beat boundary during INCR transfer.
- 64-beat bursts: predetermined end of burst is generated at the end of each 64-beat boundary during INCR transfer.
- 128-beat bursts: predetermined end of burst is generated at the end of each 128-beat boundary during INCR transfer.

Undefined-length bursts lower than 8 beats should not be used since this may decrease the overall bus bandwidth due to arbitration and client latencies at each first access of a burst.

However, if the length of undefined-length bursts is known for a host, it is recommended to configure `MATRIX_MCFG.ULBT` accordingly.

### 15.8.1.2. Slot Cycle Limit Arbitration

The MATRIX contains specific logic to break long accesses, such as very long bursts on a very slow client (e.g., an external low speed memory). At each arbitration time, a counter is loaded with the value previously written in `MATRIX_SCFGx.SLOT_CYCLE` and decreased at each clock cycle. When the counter elapses, the arbiter has the ability to re-arbitrate at the end of the current system bus access cycle.

The default reset value of `MATRIX_SCFGx.SLOT_CYCLE` does not need to be changed.

**WARNING** This feature cannot prevent any client from locking its access indefinitely.

## 15.8.2. Arbitration Priority Scheme

The MATRIX arbitration scheme is organized in priority pools, each corresponding to an access criticality class as shown in the “Latency Quality of Service” column in the table below. When the Latency Quality of Service is enabled for a host-client pair through the MATRIX, the priority pool number to use for arbitration at the client port is determined from the host. When the Latency Quality of Service is disabled, it is determined through the MATRIX user interface. See [MATRIX\\_PRASx](#).

After reset, the Latency Quality of Service is enabled by default on all of the host ports that are connected to a host driving the Latency Quality of Service signals, as shown in the bit `LQOSEN` of [MATRIX\\_PRASx](#) and [MATRIX\\_PRBSx](#).

**Table 15.4.** Arbitration Priority Pools

Priority Pool	Latency Quality of Service
3	Latency Critical
2	Latency Sensitive
1	Bandwidth Sensitive
0	Background Transfers

Round-robin priority is used in the highest and lowest priority pools 3 and 0, whereas fixed level priority is used between priority pools and in the intermediate priority pools 2 and 1.

For each client, each host is assigned to one of the client priority pools based on the Latency Quality of Service inputs or to the priority registers for clients (MxPR fields of MATRIX\_PRAS and MATRIX\_PRBS). When evaluating host requests, this priority pool level always takes precedence.

After reset, most of the hosts belong to the lowest priority pool (MxPR = 0, Background Transfer) and are therefore granted bus access in a true round-robin order.

The highest priority pool must be specifically reserved for hosts requiring very low access latency. If more than one host belongs to this pool, those hosts are granted bus access in a biased round-robin manner which enables tight and deterministic maximum access latency from system bus requests. In the worst case, any currently occurring high-priority host request is granted after the current bus host access has ended and any other high priority pool host requests have been granted once each.

The lowest priority pool shares the remaining bus bandwidth between hosts.

Intermediate priority pools enable fine priority tuning. Typically, a latency-sensitive host or a bandwidth-sensitive host use such a priority level. The higher the priority level (MxPR value), the higher the host priority.

For good CPU performance, it is recommended to let the CPU priority configured with the default reset value 2 (Latency Sensitive).

All combinations of MxPR values are allowed for all hosts and clients. For example, some hosts might be assigned the highest priority pool (round-robin), and remaining hosts the lowest priority pool (round-robin), with no host for intermediate fixed priority levels.

#### 15.8.2.1. Fixed Priority Arbitration

The fixed priority arbitration algorithm is the first and only arbitration algorithm applied between hosts from distinct priority pools. It is also used in priority pools other than the highest and lowest priority pools (intermediate priority pools).

Fixed priority arbitration enables the MATRIX arbiters to dispatch the requests from different hosts to the same client by using the fixed priority defined by the user in the MxPR field for each host in the registers, MATRIX\_PRAS and MATRIX\_PRBS. If two or more host requests are active at the same time, the host with the highest priority MxPR number is serviced first.

In intermediate priority pools, if two or more host requests with the same priority are active at the same time, the host with the highest number is serviced first.

#### 15.8.2.2. Round-Robin Arbitration

This algorithm is only used in the highest and lowest priority pools. It allows the MATRIX arbiters to properly dispatch requests from different hosts to the same client. If two or more host requests are active at the same time in the priority pool, they are serviced in a round-robin increasing host number order.

### 15.9. Register Write Protection

To prevent any single software error from corrupting MATRIX behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the Write Protection Mode register (MATRIX\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the Write Protection Status register (MATRIX\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is reset by writing the MATRIX\_WPMR with the appropriate access key WPKEY.

The registers listed below can be write-protected.

### 15.10.1. MATRIX Host Configuration Register x

**Name:** MATRIX\_MCFGx  
**Offset:** 0x00 + x\*0x04 [x=0..14]  
**Reset:** 0x00000004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						ULBT[2:0]		
Access						R/W	R/W	R/W
Reset						1	0	0

#### Bits 2:0 – ULBT[2:0] Undefined Length Burst Type

Value	Name	Description
0	UNLIMITED	Unlimited Length Burst—No predicted end of burst is generated, therefore INCR bursts coming from this host can only be broken if the Client Slot Cycle Limit is reached. If the Slot Cycle Limit is not reached, the burst is normally completed by the host, at the latest, on the next system bus 1 Kbyte address boundary, allowing up to 256-beat word bursts or 128-beat double-word bursts.  This value should not be used in the very particular case of a host capable of performing back-to-back undefined length bursts on a single client, since this could indefinitely freeze the client arbitration and thus prevent another host from accessing this client.
1	SINGLE	Single Access—The undefined length burst is treated as a succession of single accesses, allowing re-arbitration at each beat of the INCR burst or bursts sequence.
2	4_BEAT	4-beat Burst—The undefined length burst or bursts sequence is split into 4-beat bursts or less, allowing re-arbitration every 4 beats.
3	8_BEAT	8-beat Burst—The undefined length burst or bursts sequence is split into 8-beat bursts or less, allowing re-arbitration every 8 beats.
4	16_BEAT	16-beat Burst—The undefined length burst or bursts sequence is split into 16-beat bursts or less, allowing re-arbitration every 16 beats.
5	32_BEAT	32-beat Burst—The undefined length burst or bursts sequence is split into 32-beat bursts or less, allowing re-arbitration every 32 beats.
6	64_BEAT	64-beat Burst—The undefined length burst or bursts sequence is split into 64-beat bursts or less, allowing re-arbitration every 64 beats.
7	128_BEAT	128-beat Burst—The undefined length burst or bursts sequence is split into 128-beat bursts or less, allowing re-arbitration every 128 beats.  Unless duly needed, the ULBT should be left at its default 0 value for power saving.

**15.10.2. MATRIX Client Configuration Register x**

**Name:** MATRIX\_SCFGx  
**Offset:** 0x40 + x\*0x04 [x=0..12]  
**Reset:** 0x000001FF  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

	1	1	1	1	1	1	1	1

**Bits 21:18 – FIXED\_DEFMSTR[3:0] Fixed Default Host**

This is the number of the Default Host for this client. Only used if DEFMSTR\_TYPE is 2. Specifying the number of a host which is not connected to the selected client is equivalent to setting DEFMSTR\_TYPE to 0.

**Bits 17:16 – DEFMSTR\_TYPE[1:0] Default Host Type**

Value	Name	Description
0	NONE	No Default Host—At the end of the current client access, if no other host request is pending, the client is disconnected from all hosts.  This results in a one clock cycle latency for the first access of a burst transfer or for a single access.
1	LAST	Last Default Host—At the end of the current client access, if no other host request is pending, the client stays connected to the last host having accessed it.  This results in not having one clock cycle latency when the last host tries to access the client again.
2	FIXED	Fixed Default Host—At the end of the current client access, if no other host request is pending, the client connects to the fixed host the number that has been written in the FIXED_DEFMSTR field.  This results in not having one clock cycle latency when the fixed host tries to access the client again.

**Bits 8:0 – SLOT\_CYCLE[8:0] Maximum Bus Grant Duration for Hosts**

When SLOT\_CYCLE system bus clock cycles have elapsed since the last arbitration, a new arbitration takes place to let another host access this client. If another host is requesting the client bus, then the current host burst is broken.

If SLOT\_CYCLE = 0, the Slot Cycle Limit feature is disabled and bursts always complete unless broken according to the ULBT.

This limit has been placed in order to enforce arbitration so as to meet potential latency constraints of hosts waiting for client access.

This limit must not be too small. Unreasonably small values break every burst and the MATRIX arbitrates without performing any data transfer. The default maximum value is usually an optimal conservative choice.

In most cases, this feature is not needed and should be disabled for power saving.

See [Slot Cycle Limit Arbitration](#) for details.

**15.10.3. MATRIX Priority Register A For Clients x**

**Name:** MATRIX\_PRASx  
**Offset:** 0x80 + x\*0x08 [x=0..12]  
**Reset:** –  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Bits 2, 6, 10, 14, 18, 22, 26, 30 – LQOSENx** Latency Quality of Service Enable for Host x

Value	Description
0	Disables propagation of Latency Quality of Service from the Host x to the Client and apply MxPR priority for all access from Host x to the Client.
1	Enables the propagation of Latency Quality of Service from the Host x to the Client if supported by the Host x.

**Bits 0:1, 4:5, 8:9, 12:13, 16:17, 20:21, 24:25, 28:29 – MxPR** Host x Priority

Fixed priority of Host x for accessing the selected client. The higher the number, the higher the priority.

All the hosts programmed with the same MxPR value for the client make up a priority pool.

Round-robin arbitration is used in the lowest (MxPR = 0) and highest (MxPR = 3) priority pools.

Fixed priority is used in intermediate priority pools (MxPR = 1) and (MxPR = 2).

See [Arbitration Priority Scheme](#) for details.

If LQOSENx bit is cleared, then this priority value is used as it for arbitration and downward propagation to the client. If LQOSENx bit is set, then this priority acts as the upper limit for the Latency Quality of Service from Host x.

For hosts other than the CPU, the usual value of this field should be 0x0 if LQOSENx bit is cleared, and 0x1 if LQOSENx bit is set. For the CPU host, the usual value of this field should be 0x2.

**15.10.4. MATRIX Priority Register B For Clients x**

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 – MERRx** Host x Access Error

Value	Description
0	No effect.
1	Enables Host x Access Error interrupt source.

### 15.10.7. MATRIX Host Error Interrupt Disable Register

**Name:** MATRIX\_MEIDR  
**Offset:** 0x0154  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
	CFGFRZ							WPEN
Access	R/W							R/W
Reset	0							0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x4D4154	PASSWD	Writing any other value in this field aborts the write operation of the WPEN and CFGFRZ bits. Always reads as 0.

#### Bit 7 – CFGFRZ Configuration Freeze

Value	Description
0	The MATRIX configuration is not frozen.
1	Freezes the MATRIX configuration until hardware reset. The registers that can be protected by the WPEN bit and the Write Protection Mode Register are no longer modifiable.

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x4D4154 ("MAT" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x4D4154 ("MAT" in ASCII).

## 15.10.12.MATRIX Write Protection Status Register

**Name:** MATRIX\_WPSR  
**Offset:** 0x01E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last write of the MATRIX_WPMR.
1	A write protection violation has occurred since the last write of the MATRIX_WPMR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 16. DMA Controller (XDMAC)

### 16.1. Description

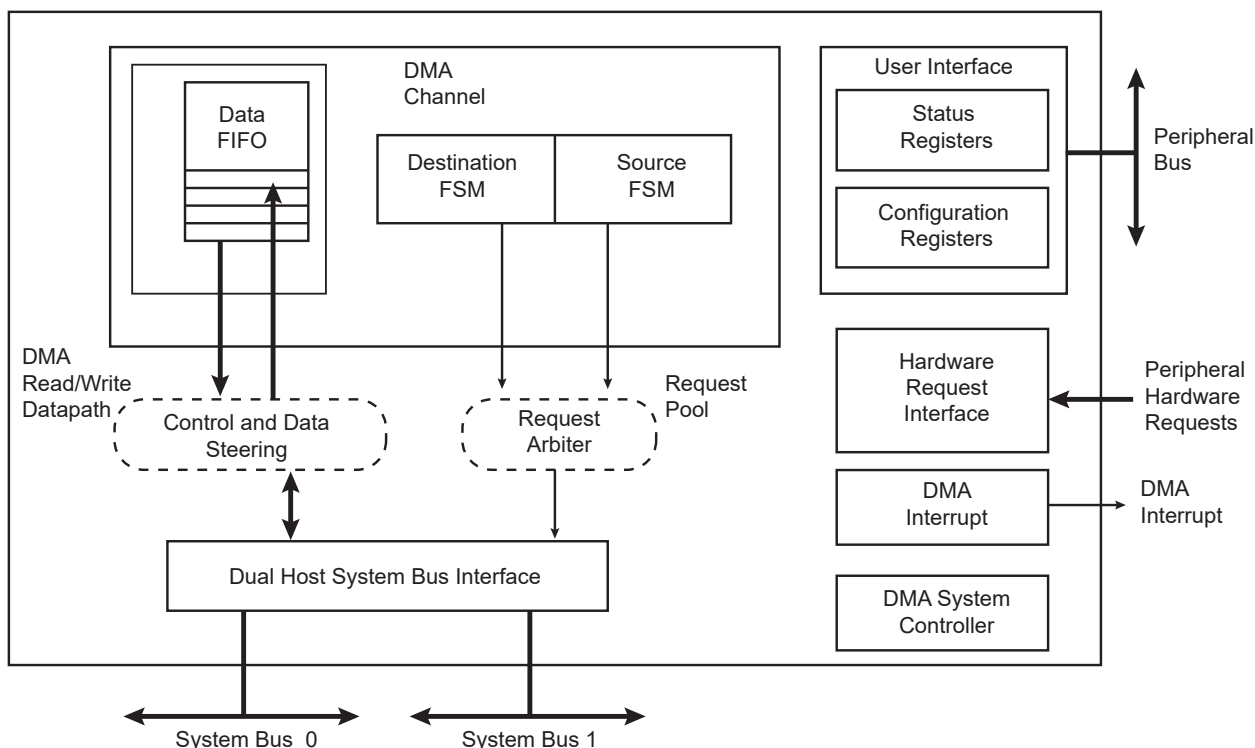

The DMA Controller (XDMAC) is a central direct memory access controller. It performs peripheral data transfer and memory move operations over one or two bus ports through the unidirectional communication channel. Each channel is fully programmable and provides both peripheral or memory-to-memory transfers.

### 16.2. Embedded Characteristics

- 2 System Bus Host Interfaces
- 16 DMA Channels
- 51 Hardware Requests
- 4 Kbytes Embedded FIFO
- Supports Peripheral-to-Memory, Memory-to-Peripheral, or Memory-to-Memory Transfer Operations
- Peripheral DMA Operation Runs on Bytes (8-bit), Half-Word (16-bit) and Word (32-bit)
- Memory DMA Operation Runs on Bytes (8 bit), Half-Word (16-bit) and Word (32 -bit)
- Supports Hardware and Software Initiated Transfers
- Supports Linked List Operations
- Supports Incrementing or Fixed Addressing Mode
- Supports Programmable Independent Data Striding for Source and Destination
- Supports Programmable Independent Microblock Striding for Source and Destination
- Configurable Priority Group and Arbitration Policy
- Programmable AHB Burst Length
- Configuration Interface on Peripheral Bus
- XDMAC Architecture Includes Multiport FIFO
- Supports Multiple View Channel Descriptor
- Automatic Flush of Channel Trailing Bytes
- Automatic Coarse-Grain and Fine-Grain Clock Gating
- Hardware Acceleration of Memset Pattern
- Supports Configurable Quality of Service per Channel

## 16.3. Block Diagram

Figure 16.1. XDMAC Block Diagram

## 16.4. DMA Controller Peripheral Connections

DMA Controller 0 manages transfers between peripherals and memory, and receives the triggers from the peripherals listed in the following table.

Table 16.1. DMA Channels Definitions (XDMAC0)

Instance Name	Channel T/R	Interface Number

TC4_ETRG	External Event trigger, timer channel 1 for TC4_ETRG	50

## 16.5. Functional Description

### 16.5.1. Basic Definitions

**Source Peripheral:** Client device, memory mapped on the interconnection network, from where the XDMAC reads data. The source peripheral teams up with a destination peripheral to form a channel. A data read operation is scheduled when the peripheral transfer request is asserted.

**Destination Peripheral:** Client device, memory mapped on the interconnection network, to which the XDMAC writes. A write data operation is scheduled when the peripheral transfer request is asserted.

**Channel:** The data movement between source and destination creates a logical channel.

**Stride:** Number of address locations between successive elements/data measured in bytes.

**Transfer Type:** The transfer is hardware-synchronized when it is paced by the peripheral hardware request, otherwise the transfer is self-triggered (memory to memory transfer).

**XDMAC Host Transfer:** The host transfer is composed of a linked list of blocks. The channel address, control and configuration registers can be modified at the inter block boundary. The descriptor structure modifies the channel registers conditionally. Interrupts can be generated on a per block basis or when the end of linked list event occurs.

**XDMAC Block:** An XDMAC block is composed of a programmable number of microblocks. The channel configuration registers remain unchanged at the inter microblock boundary. The source and destination addresses are conditionally updated with a programmable signed number.

**XDMAC Microblock:** The microblock is composed of a programmable number of data. The channel configuration registers remain unchanged at the data boundary. The data address may be fixed (a FIFO location, a peripheral transmit or receive register), incrementing (a memory-mapped area) by a programmable signed number.

**XDMAC Burst and Incomplete Burst:** In order to improve the overall performance when accessing dynamic external memory, burst access is mandatory. Each data of the microblock is considered as a part of a memory burst. The programmable burst value indicates the largest memory burst allowed on a per channel basis. When the microblock length is not an integral multiple of the burst size, an incomplete burst is performed to read or write the last trailing bytes.

**XDMAC Chunk and Incomplete Chunk:** When a peripheral synchronized transfer is activated, the microblock splits into a number of data chunks. The chunk size is programmable. The larger the chunk is, the better the performance is. When the transfer size is not a multiple of the chunk size, the last chunk may be incomplete.

## 16.5.2. Data Striding Diagram

Figure 16.2. Data Striding Diagram

### 16.5.3. Transfer Hierarchy Diagrams

Figure 16.3. XDMAC Memory Transfer Hierarchy

### 16.5.4. Peripheral Synchronized Transfer

A peripheral hardware request interface is used to control the pace of the chunk transfer. When a peripheral is ready to transmit or receive a chunk of data, it asserts its request line and the DMA Controller transfers a data to or from the memory to the peripheral.

#### 16.5.4.1. Peripheral to Memory Transfer

XDMAC reads data from the source peripheral and writes to the destination memory location.

Figure 16.4. Peripheral to Memory Transfer Hierarchy

It is a peripheral synchronized transfer, which means the memory transaction is synchronized with the hardware trigger that comes from the corresponding peripheral. It is also possible to use software trigger to initiate data transfer. Peripheral to memory transfer has a total of five levels of data transactions. They are Host, Block, Microblock, Burst, and Chunk level transactions. Host, Block, Microblock, and Burst level transactions work exactly the same way as explained earlier in

the memory to memory data transfer section. In peripheral to memory data transfer, the burst level transaction is further split into chunk level data transaction to have higher granularity.

**XDMAC Chunk and Incomplete Chunk:** When a peripheral to memory transfer is activated, the burst level transaction is further split into a number of data chunks. The chunk size is configured in CSIZE field of XDMAC Channel Configuration Register (XDMAC\_CCx). The chunk size denotes the number of 'data' to be transferred from the corresponding peripheral receive register to memory. In general, the chunk size is set as '1 data' in most of the peripherals (example: - UART, SPI, TWI, etc.), as the maximum size of their receive register is '1 data'. In specific scenarios, the chunk size is chosen more than 1 data. For example, the data receive/input registers of AES and HSMCI modules can hold more than '1 data'. So, the chunk size can be chosen as '2/4/8/16 data' accordingly. In this case, the larger the chunk size is, the better the performance is. When the amount of data chunks read becomes equal to the memory burst size, the actual data transaction starts (as a memory burst). During 'peripheral to memory' transfer, the data chunks are first read and stored into XDMAC's internal FIFO buffer. If their size becomes equal to the memory burst size, the FIFO buffer gets flushed out automatically, which makes 'memory burst transfer'. When the microblock size is not a multiple of the chunk size, the last chunk being transferred contains the last trailing data.

**Note:** If the chunk size is chosen as more than '1 data' for peripherals like UART, SPI, TWI, etc., XDMAC reads the same data register (receive/input register) multiple times. As a result, multiple copies of the same data are stored in the memory.

#### 16.5.4.2.Memory to Peripheral Transfer

XDMAC reads data from the source memory location and writes to the destination peripheral.

**Figure 16.5.** Memory to Peripheral Transfer Hierarchy

Memory to Peripheral transfer is also a peripheral synchronized transfer. It has a total of four levels of data transactions. They are Host, Block, Microblock, and Chunk level transactions. Host, Block, and Microblock level transactions work exactly the same way as explained earlier in the memory to memory data transfer section. In memory to peripheral data transfer, the burst level transaction is not present. The microblock is directly split into a chunk level data transaction.

**XDMAC Chunk and Incomplete Chunk:** When a memory to peripheral transfer is activated, the microblock level transaction is directly split into a number of data chunks. The chunk size is configured in the CSIZE field of XDMAC Channel Configuration Register (XDMAC\_CCx). The chunk size denotes the number of 'data' to be transferred from memory to the corresponding peripheral transmit register. In general, the chunk size is set as '1 data' in most of the peripherals (example: - UART, SPI, TWI, etc.), as the maximum size of their transmit register is '1 data'. In specific scenarios, the chunk size chosen is more than 1 data. For example, the data transmit/output registers of AES

and HSMCI modules can hold more than '1 data'. So, the chunk size can be chosen as '2/4/8/16 data' accordingly. In this case, the larger the chunk size is, the better the performance. During 'memory to peripheral' transfer, the data chunks are immediately transferred when there is a hardware/software trigger. Memory burst size doesn't play any role here. When the microblock size is not a multiple of the chunk size, the last chunk being transferred contains the last trailing data.

**Note:** In case the chunk size is chosen as more than '1 data' for peripherals like UART, SPI, TWI, etc., then XDMAC will overwrite the same data register (transmit/output register) with multiple data. As a result, only the last data gets transmitted.

#### 16.5.4.3. Software Triggered Synchronized Transfer

The Peripheral hardware request can be software controlled using the SWREQ field of the XDMAC Global Channel Software Request Register (XDMAC\_GSWR). The peripheral synchronized transfer is paced using a processor write access in the XDMAC\_GSWR. Each bit of that register triggers a transfer request. The XDMAC Global Channel Software Request Status Register (XDMAC\_GSWS) indicates the status of the request; when set, the request is still pending.

#### 16.5.5. XDMAC Transfer Software Operation

**Note:** When performing a memory-to-memory transfer, configure the field XDMAC\_CCx.PERID (where 'x' is the index of the channel used for the transfer) to 0x7F.

##### 16.5.5.1. Single Block Transfer With Single Microblock

1. Read the XDMAC Global Channel Status Register (XDMAC\_GS) to select a free channel.
2. Clear the pending Interrupt Status bit(s) by reading the selected XDMAC Channel x Interrupt Status Register (XDMAC\_CISx).
3. Write the XDMAC Channel x Source Address Register (XDMAC\_CSAx) for channel x.
4. Write the XDMAC Channel x Destination Address Register (XDMAC\_CDAx) for channel x.
5. Program field UBLN in the XDMAC Channel x Microblock Control Register (XDMAC\_CUBCx) with the number of data.
6. Program the XDMAC Channel x Configuration Register (XDMAC\_CCx):
  - a. Clear XDMAC\_CCx.TYPE for a memory-to-memory transfer, otherwise set this bit.
  - b. Configure XDMAC\_CCx.MBSIZE to the memory burst size used.
  - c. Configure XDMAC\_CCx.SAM and DAM to Memory Addressing mode.
  - d. Configure XDMAC\_CCx.DSYNC to select the peripheral transfer direction.
  - e. Configure XDMAC\_CCx.CSIZE to configure the channel chunk size (only relevant for peripheral synchronized transfer).
  - f. Configure XDMAC\_CCx.DWIDTH to configure the transfer data width.
  - g. Configure XDMAC\_CCx.SIF, XDMAC\_CCx.DIF to configure the host interface used to read data and write data, respectively.
  - h. Configure XDMAC\_CCx.PERID to select the active hardware request line (only relevant for a peripheral synchronized transfer).
  - i. Set XDMAC\_CCx.SWREQ to use a software request (only relevant for a peripheral synchronized transfer).
7. Clear the following five registers:
  - XDMAC Channel x Next Descriptor Control Register (XDMAC\_CNDCx)
  - XDMAC Channel x Block Control Register (XDMAC\_CBCx)
  - XDMAC Channel x Data Stride Memory Set Pattern Register (XDMAC\_CDS\_MSPx)
  - XDMAC Channel x Source Microblock Stride Register (XDMAC\_CSUSx)
  - XDMAC Channel x Destination Microblock Stride Register (XDMAC\_CDUSx)

This indicates that the linked list is disabled, there is only one block and striding is disabled.

8. Enable the Microblock interrupt by writing a '1' to bit BIE in the XDMAC Channel x Interrupt Enable Register (XDMAC\_CIE<sub>x</sub>). Enable the Channel x Interrupt Enable bit by writing a '1' to bit IEx in the XDMAC Global Interrupt Enable Register (XDMAC\_GIE).
9. Enable channel x by writing a '1' to bit EN<sub>x</sub> in the XDMAC Global Channel Enable Register (XDMAC\_GE). XDMAC\_GS.ST<sub>x</sub> (XDMAC Channel x Status bit) is set by hardware.
10. Once completed, the DMA channel sets XDMAC\_CIS<sub>x</sub>.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.ST<sub>x</sub> is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### 16.5.5.2. Single Block Transfer With Multiple Microblock

1. Read the XDMAC\_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC\_CIS<sub>x</sub> register.
3. Write the XDMAC\_CSA<sub>x</sub> register for channel x.
4. Write the XDMAC\_CDA<sub>x</sub> register for channel x.
5. Program XDMAC\_CUBC<sub>x</sub>.UBLEN with the number of data.
6. Program XDMAC\_CC<sub>x</sub> register (see ["Single Block Transfer With Single Microblock"](#)).
7. Program XDMAC\_CBC<sub>x</sub>.BLEN with the number of microblocks of data.
8. Clear the following registers:
  - XDMAC\_CNDC<sub>x</sub>
  - XDMAC\_CDS\_MSP<sub>x</sub>
  - XDMAC\_CSUS<sub>x</sub> XDMAC\_CDUS<sub>x</sub>

This indicates that the linked list is disabled and striding is disabled.

9. Enable the Block interrupt by writing a '1' to XDMAC\_CIE<sub>x</sub>.BIE, enable the Channel x Interrupt Enable bit by writing a '1' to XDMAC\_GIE<sub>x</sub>.IEx.
10. Enable channel x by writing a '1' to the XDMAC\_GE.EN<sub>x</sub>. XDMAC\_GS.ST<sub>x</sub> is set by hardware.
11. Once completed, the DMA channel sets XDMAC\_CIS<sub>x</sub>.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.ST<sub>x</sub> is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### 16.5.5.3. Host Transfer

1. Read the XDMAC\_GS register to choose a free channel.
2. Clear the pending Interrupt Status bit by reading the chosen XDMAC\_CIS<sub>x</sub> register.
3. Build a linked list of transfer descriptors in memory. The descriptor view is programmable on a per descriptor basis. The linked list items structure must be word aligned. MBR\_UBC.NDE must be configured to 0 in the last descriptor to terminate the list.
4. Configure field NDA in the XDMAC Channel x Next Descriptor Address Register (XDMAC\_CNDA<sub>x</sub>) with the first descriptor address and bit XDMAC\_CNDA<sub>x</sub>.NDAIF with the host interface identifier.
5. Configure the XDMAC\_CNDC<sub>x</sub> register:
  - a. Set XDMAC\_CNDC<sub>x</sub>.NDE to enable the descriptor fetch.
  - b. Set XDMAC\_CNDC<sub>x</sub>.NDSUP to update the source address at the descriptor fetch time, otherwise clear this bit.
  - c. Set XDMAC\_CNDC<sub>x</sub>.NDDUP to update the destination address at the descriptor fetch time, otherwise clear this bit.
  - d. Configure XDMAC\_CNDC<sub>x</sub>.NDVIEW to define the length of the first descriptor.
6. Enable the End of Linked List interrupt by writing a '1' to XDMAC\_CIE<sub>x</sub>.LIE.

7. Enable channel x by writing a '1' to XDMAC\_GE.ENx. XDMAC\_GS.STx is set by hardware.
8. Once completed, the DMA channel sets XDMAC\_CISx.BIS (End of Block Interrupt Status bit) and generates an interrupt. XDMAC\_GS.STx is cleared by hardware. The software can either wait for an interrupt or poll the channel status bit.

#### 16.5.5.4. Disabling A Channel Before Transfer Completion

Under normal operation, the software enables a channel by writing a '1' to XDMAC\_GE.ENx, then the hardware disables a channel on transfer completion by clearing bit XDMAC\_GS.STx. To disable a channel, write a '1' to bit XDMAC\_GD.Dlx and poll the XDMAC\_GS register.

## 16.6. Linked List Descriptor Operation

### 16.6.1. Linked List Descriptor View

#### 16.6.1.1. Channel Next Descriptor View 0–3 Structures

**Bits 30:29 – QOS[1:0] Channel Quality of Service Level**

This field indicates the current quality of service level for the channel. Refer to the section “Bus Matrix (MATRIX)”.

**Bits 28:27 – NVIEW[1:0] Next Descriptor View**

Value	Name	Description
0	NDV0	Next Descriptor View 0
1	NDV1	Next Descriptor View 1
2	NDV2	Next Descriptor View 2
3	NDV3	Next Descriptor View 3

**Bit 26 – NDEN Next Descriptor Destination Update**

Value	Description
0	Destination parameters remain unchanged.
1	Destination parameters are updated when the descriptor is retrieved.

**Bit 25 – NSEN Next Descriptor Source Update**

Value	Description
0	Source parameters remain unchanged.
1	Source parameters are updated when the descriptor is retrieved.

**Bit 24 – NDE Next Descriptor Enable**

Value	Description
0	Descriptor fetch is disabled.
1	Descriptor fetch is enabled.

### Bits 23:0 – UBLEN[23:0] Microblock Length

This field indicates the number of data in the microblock. The microblock contains UBLEN data.

## 16.7. XDMAC Maintenance Software Operations

### 16.7.1. Disabling a Channel

A disable channel request occurs when a write operation is performed in the XDMAC\_GD register. If the channel is source peripheral synchronized (bit XDMAC\_CCx.TYPE is set and bit XDMAC\_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC\_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC\_CISx.DIS is set. XDMAC\_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### 16.7.2. Suspending a Channel

A disable channel request occurs when a write operation is performed in the XDMAC\_GD register. If the channel is source peripheral synchronized (bit XDMAC\_CCx.TYPE is set and bit XDMAC\_CCx.DSYNC is cleared), then pending bytes (bytes located in the FIFO) are written to memory and bit XDMAC\_CISx.DIS is set. If the channel is not source peripheral synchronized, the current channel transaction (read or write) is terminated and XDMAC\_CISx.DIS is set. XDMAC\_GS.STx is cleared by hardware when the current transfer is completed. The channel is no longer active and can be reused.

### 16.7.3. Flushing a Channel

A FIFO flush command is issued by writing to the XDMAC\_SWF register. The content of the FIFO is written to memory. XDMAC\_CISx.FIS (End of Flush Interrupt Status bit) is set when the last byte is successfully transferred to memory. The channel is not disabled. The flush operation is not blocking, meaning that read operation can be scheduled during the flush write operation. The flush operation is only relevant for peripheral to memory transfer where pending peripheral bytes are buffered into the channel FIFO.

### 16.7.4. Maintenance Operation Priority

#### 16.7.4.1. Disable Operation Priority

- When a disable request occurs on a suspended channel, the XDMAC\_GWS.WSx (Channel x Write Suspend bit) is cleared. If the transfer is source peripheral synchronized, the pending bytes are drained to memory. The bit XDMAC\_CISx.DIS is set.
- When a disable request follows a flush request, if the flush last transaction is not yet scheduled, the flush request is discarded and the disable procedure is applied. Bit XDMAC\_CISx.FIS is not set. Bit XDMAC\_CISx.DIS is set when the disable request is completed. If the flush request transaction is already scheduled, the XDMAC\_CISx.FIS is set. XDMAC\_CISx.DIS is also set when the disable request is completed.

#### 16.7.4.2. Flush Operation Priority

- When a flush request occurs on a suspended channel, if there are pending bytes in the FIFO, they are written out to memory, XDMAC\_CISx.FIS is set. If the FIFO is empty, XDMAC\_CISx.FIS is also set.
- If the flush operation is performed after a disable request, the flush command is ignored. XDMAC\_CISx.FIS is not set.

#### 16.7.4.3. Suspend Operation Priority

If the suspend operation is performed after a disable request, the write suspend operation is ignored.

## 16.8. XDMAC Software Requirements

- Write operations to channel registers are not be performed in an active channel after the channel is enabled. If any channel parameters must be reprogrammed, this can only be done after disabling the XDMAC channel.
- XDMAC\_CSx and XDMAC\_CDx channel registers must be programmed with a byte, half-word or word aligned address depending on the Channel x Data Width field (DWIDTH) of the XDMAC Channel x Configuration Register. When a memory-to-peripheral transfer is performed, the XDMAC\_CSx address register has no alignment requirement.
- When a memory-to-memory transfer is performed, configure the field XDMAC\_CCx.PERID (where 'x' is the index of the channel used for the transfer) to peripheral ID 127 (refer to the table "Peripheral Identifiers").
- When XDMAC\_CC.INITD is set to 0, XDMAC\_CUBC.UBLEN and XDMAC\_CNDA.NDA field values are unreliable when the descriptor is being updated. The following procedure applies to get the buffer descriptor identifier and the residual bytes:

```
Read XDMAC_CNDAx.NDA(nda0)
Read XDMAC_CCx.INITD(initd0)
Read XDMAC_CCx.INITD(initd1)
Read XDMAC_CUBCx.UBLEN(ublen)
Read XDMAC_CCx.INITD(initd1)
Read XDMAC_CNDAx.NDA(nda1)
If (nda0 == nda1 && initd0 == 1 && initd1 == 1).
Then the ublen is correct, the buffer id is nda.
Else retry
```

See the figure below.

**Figure 16.6.** INITD Timing Diagram

## 16.9. Register Summary

Bit	7	6	5	4	3	2	1	0
	FIFO_SZ[2:0]			NB_CH[4:0]				
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 22:16 – NB\_REQ[6:0]** Number of Peripheral Requests Minus One

**Bits 15:5 – FIFO\_SZ[10:0]** Number of Bytes

**Bits 4:0 – NB\_CH[4:0]** Number of Channels Minus One

## 16.9.2. XDMAC Global Configuration Register

**Name:** XDMAC\_GCFG  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								BXKBEN
Reset								R/W 0
Bit	7	6	5	4	3	2	1	0
Access					CGDISIF	CGDISFIFO	CGDISPIPE	CGDISREG
Reset					R/W 0	R/W 0	R/W 0	R/W 0

### Bit 8 – BXKBEN Boundary X Kilobyte Enable

Value	Description
0	XDMAC generates a non-sequential attribute on the system bus when address crosses the 1-Kilobyte boundary with a burst access.
1	XDMAC does not generate a non-sequential attribute on the system bus when address crosses the 1-Kilobyte boundary with a burst access.

### Bit 3 – CGDISIF Bus Interface Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the system bus interface.
1	The automatic clock gating is disabled for the system bus interface.

### Bit 2 – CGDISFIFO FIFO Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the main FIFO.
1	The automatic clock gating is disabled for the main FIFO.

### Bit 1 – CGDISPIPE Pipeline Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the main pipeline.
1	The automatic clock gating is disabled for the main pipeline.

### Bit 0 – CGDISREG Configuration Registers Clock Gating Disable

Value	Description
0	The automatic clock gating is enabled for the configuration registers.
1	The automatic clock gating is disabled for the configuration registers.

### 16.9.3. XDMAC Global Weighted Arbiter Configuration Register

**Name:** XDMAC\_GWAC  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	PW3[3:0]				PW2[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	PW1[3:0]				PW0[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:12 – PW3[3:0] Pool Weight 3**

This field indicates the weight of pool 3 in the arbitration scheme of the DMA scheduler.

**Bits 11:8 – PW2[3:0] Pool Weight 2**

This field indicates the weight of pool 2 in the arbitration scheme of the DMA scheduler.

**Bits 7:4 – PW1[3:0] Pool Weight 1**

This field indicates the weight of pool 1 in the arbitration scheme of the DMA scheduler.

**Bits 3:0 – PW0[3:0] Pool Weight 0**

This field indicates the weight of pool 0 in the arbitration scheme of the DMA scheduler.

## 16.9.4. XDMAC Global Interrupt Enable Register

**Name:** XDMAC\_GIE  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	IE7	IE6	IE5	IE4	IE3	IE2	IE1	IE0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – IEx** XDMAC Channel x Interrupt Enable

Value	Description
0	This bit has no effect. The Channel x Interrupt Mask bit (XDMAC_GIM.IMx) is not modified.
1	The corresponding mask bit is set. The XDMAC Channel x Interrupt Status register (XDMAC_GIS) can generate an interrupt.

## 16.9.5. XDMAC Global Interrupt Disable Register

**Name:** XDMAC\_GID

**Offset:** 0x10

**Reset:** –

**Property:** Write-only

Bit	31	30	29	28	27	26	25	24

Access  
Reset

Bit	23	22	21	20	19	18	17	16

Access  
Reset

Bit	15	14	13	12	11	10	9	8
	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – IDx** XDMAC Channel x Interrupt Disable

Value	Description
0	This bit has no effect. The Channel x Interrupt Mask bit (XDMAC_GIM.IMx) is not modified.
1	The corresponding mask bit is reset. The Channel x Interrupt Status register interrupt (XDMAC_GIS) is masked.

## 16.9.6. XDMAC Global Interrupt Mask Register

**Name:** XDMAC\_GIM  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	IM15	IM14	IM13	IM12	IM11	IM10	IM9	IM8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	IM7	IM6	IM5	IM4	IM3	IM2	IM1	IM0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – IMx** XDMAC Channel x Interrupt Mask

Value	Description
0	This bit indicates that the channel x interrupt source is masked. The interrupt line is not raised.
1	This bit indicates that the channel x interrupt source is unmasked.

## 16.9.7. XDMAC Global Interrupt Status Register

**Name:** XDMAC\_GIS  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
	IS15	IS14	IS13	IS12	IS11	IS10	IS9	IS8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	IS7	IS6	IS5	IS4	IS3	IS2	IS1	IS0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – ISx** XDMAC Channel x Interrupt Status

Value	Description
0	This bit indicates that either the interrupt source is masked at the channel level or no interrupt is pending for channel x.
1	This bit indicates that an interrupt is pending for the channel x.

## 16.9.8. XDMAC Global Channel Enable Register

**Name:** XDMAC\_GE  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	EN7	EN6	EN5	EN4	EN3	EN2	EN1	EN0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – ENx** XDMAC Channel x Enable

Value	Description
0	This bit has no effect.
1	Enables channel n. This operation is permitted if the Channel x Status bit (XDMAC_GS.STx) was read as '0'.

16.9.9. XDMAC Global Channel Disable Register

**Name:** XDMAC\_GD  
**Offset:** 0x20  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

	DI7	DI6	DI5	DI4	DI3	DI2	DI1	DI0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – DIx** XDMAC Channel x Disable

Value	Description
0	This bit has no effect.
1	Disables channel x.

16.9.10. XDMAC Global Channel Status Register

**Name:** XDMAC\_GS  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

	ST7	ST6	ST5	ST4	ST3	ST2	ST1	ST0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – STx XDMAC Channel x Status

Value	Description
0	This bit indicates that the channel x is disabled.
1	This bit indicates that the channel x is enabled. If a channel disable request is issued, this bit remains asserted until pending transaction is completed.

## 16.9.11. XDMAC Global Channel Read Suspend Register

**Name:** XDMAC\_GRS  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – SWFx** XDMAC Channel x Software Flush Request

Value	Description
0	No effect.
1	Requests a DMA transfer flush for channel x. This bit is only relevant when the transfer is source peripheral synchronized.

## 16.9.18. XDMAC Channel x Interrupt Enable Register [x=0..15]

**Name:** XDMAC\_CIE  
**Offset:** 0x50 + n\*0x40 [n=0..15]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset

Access		W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–

### Bit 6 – ROIE Request Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enables request overflow error interrupt.

### Bit 5 – WBIE Write Bus Error Interrupt Enable

Value	Description
0	No effect.
1	Enables write bus error interrupt.

### Bit 4 – RBIE Read Bus Error Interrupt Enable

Value	Description
0	No effect.
1	Enables read bus error interrupt.

### Bit 3 – FIE End of Flush Interrupt Enable

Value	Description
0	No effect.
1	Enables end of flush interrupt.

### Bit 2 – DIE End of Disable Interrupt Enable

Value	Description
0	No effect.
1	Enables end of disable interrupt.

**Bit 1 – LIE** End of Linked List Interrupt Enable

Value	Description
0	No effect.
1	Enables end of linked list interrupt.

**Bit 0 – BIE** End of Block Interrupt Enable

Value	Description
0	No effect.
1	Enables end of block interrupt.

### 16.9.19. XDMAC Channel x Interrupt Disable Register [x = 0..15]

**Name:** XDMAC\_CID  
**Offset:** 0x54 + n\*0x40 [n=0..15]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8

Access		W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–

#### Bit 6 – ROID Request Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disables request overflow error interrupt.

#### Bit 5 – WBEID Write Bus Error Interrupt Disable

Value	Description
0	No effect.
1	Disables bus error interrupt.

#### Bit 4 – RBEID Read Bus Error Interrupt Disable

Value	Description
0	No effect.
1	Disables bus error interrupt.

#### Bit 3 – FID End of Flush Interrupt Disable

Value	Description
0	No effect.
1	Disables end of flush interrupt.

#### Bit 2 – DID End of Disable Interrupt Disable

Value	Description
0	No effect.
1	Disables end of disable interrupt.

**Bit 1 – LID** End of Linked List Interrupt Disable

Value	Description
0	No effect.
1	Disables end of linked list interrupt.

**Bit 0 – BID** End of Block Interrupt Disable

Value	Description
0	No effect.
1	Disables end of block interrupt.

## 16.9.20. XDMAC Channel x Interrupt Mask Register [x = 0..15]

**Name:** XDMAC\_CIM  
**Offset:** 0x58 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

### Bit 6 – ROIM Request Overflow Error Interrupt Mask

Value	Description
0	Request overflow interrupt is masked.
1	Request overflow interrupt is activated.

### Bit 5 – WBEIM Write Bus Error Interrupt Mask

Value	Description
0	Bus error interrupt is masked.
1	Bus error interrupt is activated.

### Bit 4 – RBEIM Read Bus Error Interrupt Mask

Value	Description
0	Bus error interrupt is masked.
1	Bus error interrupt is activated.

### Bit 3 – FIM End of Flush Interrupt Mask

Value	Description
0	End of flush interrupt is masked.
1	End of flush interrupt is activated.

### Bit 2 – DIM End of Disable Interrupt Mask

Value	Description
0	End of disable interrupt is masked.
1	End of disable interrupt is activated.

**Bit 1 – LIM** End of Linked List Interrupt Mask

Value	Description
0	End of linked list interrupt is masked.
1	End of linked list interrupt is activated.

**Bit 0 – BIM** End of Block Interrupt Mask

Value	Description
0	Block interrupt is masked.
1	Block interrupt is activated.

## 16.9.21. XDMAC Channel x Interrupt Status Register [x = 0..15]

**Name:** XDMAC\_CIS  
**Offset:** 0x5C + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

		ROIS	WBEIS	RBEIS	FIS	DIS	LIS	BIS
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

### Bit 6 – ROIS Request Overflow Error Interrupt Status

Value	Description
0	Overflow condition has not occurred.
1	Overflow condition has occurred at least once. (This information is only relevant for peripheral synchronized transfers.)

### Bit 5 – WBEIS Write Bus Error Interrupt Status

Value	Description
0	Write bus error condition has not occurred.
1	At least one bus error has been detected in a write access since the last read of the Status register.

### Bit 4 – RBEIS Read Bus Error Interrupt Status

Value	Description
0	Read bus error condition has not occurred.
1	At least one bus error has been detected in a read access since the last read of the Status register.

### Bit 3 – FIS End of Flush Interrupt Status

Value	Description
0	End of flush condition has not occurred.
1	End of flush condition has occurred since the last read of the Status register.

### Bit 2 – DIS End of Disable Interrupt Status

Value	Description
0	End of disable condition has not occurred.

Value	Description
1	End of disable condition has occurred since the last read of the Status register.

#### Bit 1 – LIS End of Linked List Interrupt Status

Value	Description
0	End of linked list condition has not occurred.
1	End of linked list condition has occurred since the last read of the Status register.

#### Bit 0 – BIS End of Block Interrupt Status

Value	Description
0	End of block interrupt has not occurred.
1	End of block interrupt has occurred since the last read of the Status register.

## 16.9.22. XDMAC Channel x Source Address Register [x = 0..15]

**Name:** XDMAC\_CSA  
**Offset:** 0x60 + n\*0x40 [n=0..15]

### Bits 31:2 – NDA[29:0] Channel x Next Descriptor Address

The 30-bit width of the NDA field represents the next descriptor address range 31:2. The descriptor is word-aligned and the two least significant register bits 1:0 are ignored.

### Bit 0 – NDAIF Channel x Next Descriptor Interface

Value	Description
0	The channel descriptor is retrieved through system interface 0.
1	The channel descriptor is retrieved through system interface 1.

**16.9.25. XDMAC Channel x Next Descriptor Control Register [x = 0..15]**

**Name:** XDMAC\_CNDC  
**Offset:** 0x6C + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 6:5 – QOS[1:0] Channel Quality Of Service level**

This field indicates the current quality of service level for the channel. Refer to the section “Bus Matrix (MATRIX)”.

**Bits 4:3 – NDVIEW[1:0] Channel x Next Descriptor View**

Value	Name	Description
0	NDV0	Next Descriptor View 0
1	NDV1	Next Descriptor View 1
2	NDV2	Next Descriptor View 2
3	NDV3	Next Descriptor View 3

**Bit 2 – NDDUP Channel x Next Descriptor Destination Update**

Value	Name	Description
0	DST_PARAMS_UNCHANGED	Destination parameters remain unchanged.
1	DST_PARAMS_UPDATED	Destination parameters are updated when the descriptor is retrieved.

**Bit 1 – NDSUP Channel x Next Descriptor Source Update**

Value	Name	Description
0	SRC_PARAMS_UNCHANGED	Source parameters remain unchanged.
1	SRC_PARAMS_UPDATED	Source parameters are updated when the descriptor is retrieved.

**Bit 0 – NDE Channel x Next Descriptor Enable**

Value	Name	Description
0	DSCR_FETCH_DIS	Descriptor fetch is disabled.

Value	Name	Description
1	DSCR_FETCH_EN	Descriptor fetch is enabled.

## 16.9.26. XDMAC Channel x Microblock Control Register [x = 0..15]

**Name:** XDMAC\_CUBC  
**Offset:** 0x70 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Reset	0	0		0		0	0	0

### Bits 30:24 – PERID[6:0] Channel x Peripheral Hardware Request Line Identifier

This field contains the peripheral hardware request line identifier. PERID refers to identifiers defined in [“DMA Controller Peripheral Connections”](#).

**Note:** When a memory-to-memory transfer is performed, configure PERID to 0x7F.

### Bit 23 – WRIP Write in Progress

Value	Name	Description
0	DONE	No active write transaction on the bus.
1	IN_PROGRESS	A write transaction is in progress.

### Bit 22 – RDIP Read in Progress

Value	Name	Description
0	DONE	No active read transaction on the bus.
1	IN_PROGRESS	A read transaction is in progress.

### Bit 21 – INITD Channel Initialization Done

When set to 0, XDMAC\_CUBC.UBLEN and XDMAC\_CNDA.NDA field values are unreliable each time a descriptor is being updated. See [XDMAC Software Requirements](#).

Value	Name	Description
0	IN_PROGRESS	Channel initialization is in progress.
1	TERMINATED	Channel initialization is completed.

### Bits 19:18 – DAM[1:0] Channel x Destination Addressing Mode

Value	Name	Description
0	FIXED_AM	The address remains unchanged.
1	INCREMENTED_AM	The addressing mode is incremented (the increment size is set to the data size).
2	UBS_AM	The microblock stride is added at the microblock boundary.
3	UBS_DS_AM	The microblock stride is added at the microblock boundary; the data stride is added at the data boundary.

#### Bits 17:16 – SAM[1:0] Channel x Source Addressing Mode

Value	Name	Description
0	FIXED_AM	The address remains unchanged.
1	INCREMENTED_AM	The addressing mode is incremented (the increment size is set to the data size).
2	UBS_AM	The microblock stride is added at the microblock boundary.
3	UBS_DS_AM	The microblock stride is added at the microblock boundary, the data stride is added at the data boundary.

#### Bit 14 – DIF Channel x Destination Interface Identifier

Value	Name	Description
0	AHB_IF0	The data is written through system bus interface 0.
1	AHB_IF1	The data is written through system bus interface 1.

#### Bit 13 – SIF Channel x Source Interface Identifier

Value	Name	Description
0	AHB_IF0	The data is read through system bus interface 0.
1	AHB_IF1	The data is read through system bus interface 1.

#### Bits 12:11 – DWIDTH[1:0] Channel x Data Width

Value	Name	Description
0	BYTE	The data size is set to 8 bits
1	HALFWORD	The data size is set to 16 bits
2	WORD	The data size is set to 32 bits

#### Bits 10:8 – CSIZE[2:0] Channel x Chunk Size

Value	Name	Description
0	CHK_1	1 data transferred
1	CHK_2	2 data transferred
2	CHK_4	4 data transferred
3	CHK_8	8 data transferred
4	CHK_16	16 data transferred

#### Bit 7 – MEMSET Channel x Fill Block of Memory

Value	Name	Description
0	NORMAL_MODE	Memset is not activated.
1	HW_MODE	Sets the block of memory pointed by DA field to the specified value. This operation is performed on 8-, 16- or 32-bit basis.

#### Bit 6 – SWREQ Channel x Software Request Trigger

Value	Name	Description
0	HWR_CONNECTED	Hardware request line is connected to the peripheral request line.
1	SWR_CONNECTED	Software request is connected to the peripheral request line.

#### Bit 4 – DSYNC Channel x Synchronization

Value	Name	Description
0	PER2MEM	Peripheral-to-memory transfer
1	MEM2PER	Memory-to-peripheral transfer

#### Bits 2:1 – MBSIZE[1:0] Channel x Memory Burst Size

Value	Name	Description
0	SINGLE	The memory burst size is set to one.
1	FOUR	The memory burst size is set to four.
2	EIGHT	The memory burst size is set to eight.
3	SIXTEEN	The memory burst size is set to sixteen.

#### Bit 0 – TYPE Channel x Transfer Type

Value	Name	Description
0	MEM_TRAN	Self-triggered mode (memory-to-memory transfer)
1	PER_TRAN	Synchronized mode (peripheral-to-memory or memory-to-peripheral transfer)

### 16.9.29. XDMAC Channel x Data Stride Memory Set Pattern Register [x = 0..15]

**Name:** XDMAC\_CDS\_MSP  
**Offset:** 0x7C + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	DDS_MSP[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	DDS_MSP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SDS_MSP[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SDS_MSP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:16 – DDS\_MSP[15:0] Channel x Destination Data Stride or Memory Set Pattern

When XDMAC\_CCx.MEMSET = 0, this field indicates the destination data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous (see [Data Striding Diagram](#)).

The DDS\_MSP field is only relevant when XDMAC\_CCx.SAM=UBS\_DS\_AM.

When XDMAC\_CCx.MEMSET = 1, this field indicates the memory set pattern.

#### Bits 15:0 – SDS\_MSP[15:0] Channel x Source Data Stride or Memory Set Pattern

When XDMAC\_CCx.MEMSET = 0, this field indicates the source data stride.

Number of bytes for the data stride of channel x (two's complement). If the field is set to zero the data is contiguous (see [Data Striding Diagram](#)).

The SDS\_MSP field is only relevant when XDMAC\_CCx.SAM=UBS\_DS\_AM.

When XDMAC\_CCx.MEMSET = 1, this field indicates the memory set pattern.

### 16.9.30. XDMAC Channel x Source Microblock Stride Register [x = 0..15]

**Name:** XDMAC\_CSUS  
**Offset:** 0x80 + n\*0x40 [n=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DUBS[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DUBS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 23:0 – DUBS[23:0] Channel x Destination Microblock Stride

Number of bytes for the microblock stride for channel x (two's complement). If the field is set to zero the data is contiguous (see [Figure 16.2](#)).

The DUBS field is only relevant when XDMAC\_CCx.SAM=UBS\_AM or XDMAC\_CCx.SAM=UBS\_DS\_AM.

## 17. Boot Strategies

### 17.1. Standard Boot Strategy

#### 17.1.1. Description

The system always boots from the ROM memory at address 0x0.

The ROM code is a boot program contained in the embedded ROM. It is also called “Bootloader”.

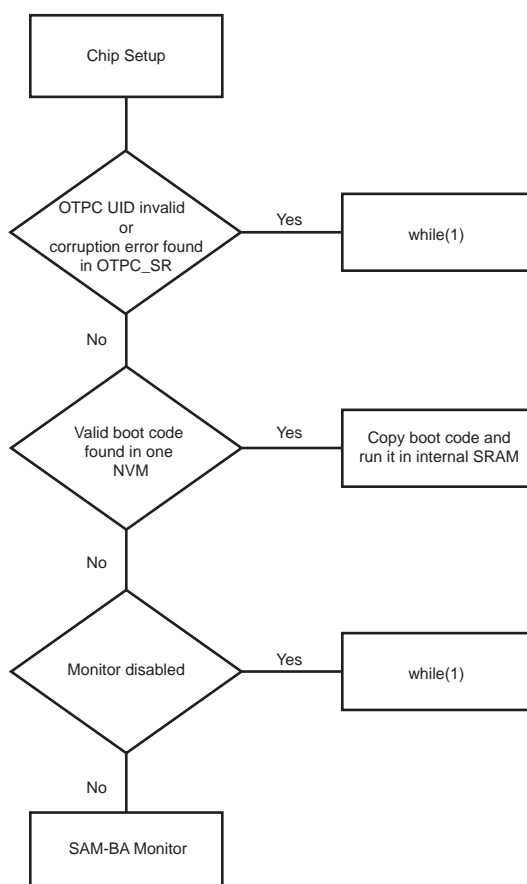

By default, the chip starts in Standard Boot mode. To know how to enable the Secure Boot mode, see [Secure Boot Strategy](#).

**Note:** JTAG access is disabled during execution of the ROM code sequence. It is re-enabled when jumping into SRAM when a valid code has been found on an external Non-Volatile Memory (NVM) at the same time the ROM memory is hidden. If no valid boot has been found on an external NVM, the ROM code enables the USB connection and one UART serial port, starts the standard SAM-BA<sup>®</sup> Monitor, locks access to the ROM memory and re-enables the JTAG connection.

#### 17.1.2. Flow Diagram

The following figure shows the ROM code global flow.

Figure 17.1. ROM Code Flow Diagram

#### 17.1.3. Chip Setup

When the chip is powered on, the processor clock (CPU\_CLK) and the main system bus clock (MCK) source is the Main clock (MAINCK).

The ROM code performs a low-level initialization that follows the steps described below:

1. PLLA initialized at a frequency of 396 MHz.
2. Main system bus clock selection: when the PLLA is stabilized, the main system bus clock source is switched from the main clock to the PLLA clock. The PMC Status register is polled to wait for MCK Ready. Now, the CPU\_CLK frequency is the same as the PLLA clock, whereas the MCK frequency is the quarter of the PLLA clock.

For clock frequencies, see [Table 17.4](#).

**Note:** No external crystal or clock is needed during the external boot memories sequence. An external clock source is checked before the launch of the SAM-BA Monitor to get a more accurate clock signal for USB.

#### 17.1.4. Boot Configuration

The boot sequence is controlled using Boot Configuration Packet, stored in the OTP area and configured through the OTP Controller (OTPC).

##### 17.1.4.1. Default Boot Sequence (Without Boot Configuration Packet)

When no Boot Configuration Packet is available in the OTP area, the ROM code uses an internal default Boot Configuration Packet to configure the DBGU as a console and tries to boot from one of the following memories:

- SDMMC0 (PA15, PA16, PA17, PA18, PA19, PA20)
- SDMMC1 (PA2, PA3, PA4, PA11, PA12, PA13)
- QSPI0 (PB19, PB20, PB21, PB22, PB23, PB24)
- FLEXCOM0 - SPI (PA0, PA1, PA3, PA4)
- NAND Flash (PD0 to PD13)

See [Table 17.5](#) for further details.

If no bootable file is found in these memories, the ROM code goes to the SAM-BA Monitor.

##### 17.1.4.2. Using Boot Configuration Packet

The boot configuration data are stored in the Boot Configuration Packet in the OTP area. These data can be used for various boot sequence customizations:

- Set the IO pin configuration where the external memories used to boot are connected (see [Hardware and Software Constraints](#) for a description of the IO).
- Enable the boot from selected memories.
- Configure the UART port used as a console.
- Enable/disable JTAG used for debug.

See [Boot Configuration User Interface](#) for a detailed description of all the fields in these data.

By default, the values of the Boot Configuration Packet are 0x0. During prototyping phases, those values can be overridden by the content of the emulation memory through OTPC Emulation mode. To enable this feature, the bit BSCR\_CR.EMUL\_EN must be set.

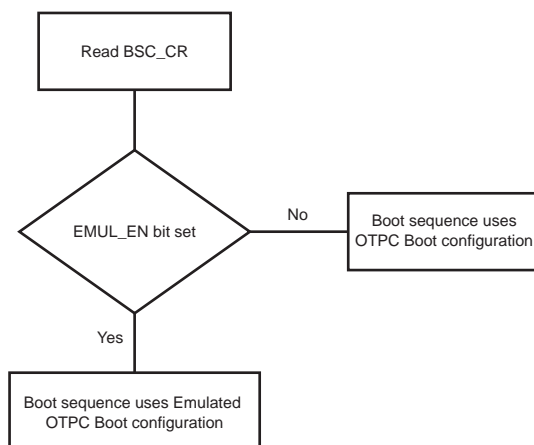

The current running mode of the User area can be observed by reading BSCR\_CR.EMUL\_EN. If this bit is set, the Emulation mode is enabled, otherwise, the Emulation mode is disabled.

After a reset, the ROM code reads the Boot Configuration Packet from the SRAM dedicated to Emulation mode if the bit BSCR\_CR.EMUL\_EN is set to 1. Otherwise the packet is read from the OTP matrix.

Using Emulated OTP enables the user to test several boot configuration options, including Secure Boot mode, without programming the OTP.

**Note:** If Emulation mode is enabled, the emulation SRAM is not backed up. After a power off/on, the configuration and content are lost.

**Figure 17.2.** Boot Configuration Loading

### 17.1.4.3.Boot Sequence Controller Configuration Register

**Name:** BSC\_CR

**Address:** 0xFFFFFE54

#### Bits 31:16 – WPKEY[15:0] Write Protect Key

Value	Name	Description
0x6683	PASSWD	Writing any other value in this field aborts the write operation of the BOOT field. Always reads as 0.

#### Bit 0 – EMUL\_EN Emulation Enable

Value	Description
0	Emulation mode is disabled.
1	The OTP user area is emulated in internal SRAM1.

### 17.1.4.4.Boot Configuration User Interface

**Table 17.1.** Boot Configuration Packet Mapping

Offset	Name	Description
0x00	MON_DIS	Disables the SAM-BA Monitor
0x04	ZERO	Must be filled with zero
0x08	RESERVED	Reserved
0x0C	JTAG_DIS	Disables JTAG
0x10	CONSOLE_PIN	Console pin muxing
0x14-0x48	MEM_CFGx[2]	Two 32-bit words used to set memory configurations for x=0..6 MEM_CFGx[0]: this word contains mandatory options for all connected memories. MEM_CFGx[1]: this word contains mandatory options for specific memories.

17.1.4.4.1. Monitor Disable

Name: MON\_DIS

Bits 31:0 – DISABLE\_MONITOR[31:0] SAM-BA Monitor Disable

Value	Description
0	If no boot file is found, launches the SAM-BA Monitor.
Non-Zero	The SAM-BA Monitor is never launched.

17.1.4.4.2.Boot Configuration Word Disable JTAG

Name: JTAG\_DIS

Bit	31	30	29	28	27	26	25	24
	DISABLE_JTAG[31:24]							
Access

#### 17.1.4.5.NVM Boot Sequence

The ROM code performs the initialization and valid code detection for external memories as described below when the memory interface boot is enabled in the Boot Configuration packet.

**Figure 17.3.** NVM Bootloader Program

**Figure 17.4.** NVM Boot Diagram

The NVM bootloader program first initializes the PIOs related to the NVM device. Then it configures the right peripheral depending on the NVM and tries to access this memory. If the initialization fails, it restores the reset values for the PIO and the peripheral, and then tries to perform the same operations on the next NVM of the sequence.

If the initialization is successful, the NVM bootloader program reads the beginning of the NVM and determines if the NVM contains a valid code.

If the NVM does not contain a valid code, the NVM bootloader program restores the reset value for the peripherals and then tries to perform the same operations on the next NVM of the sequence.

If a valid code is found, this code is loaded from the NVM into the internal SRAM and executed by branching at address 0x0000\_0000 after remap. This code may be the application code or a second-level bootloader.

**Figure 17.5.** Remap Action after Download Completion

#### 17.1.4.6.Valid Bootstrap Code Detection

Two types of valid bootstrap code detection are available, as described in the following sections.

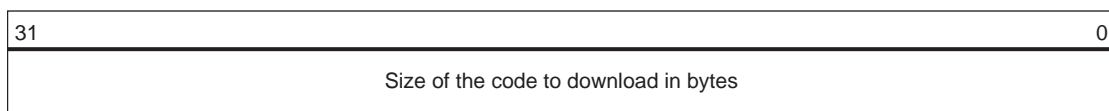

##### 17.1.4.6.1.Arm Exception Vectors Check

The ROM code reads and analyzes the first 28 bytes corresponding to the first seven Arm exception vectors of the bootstrap.

These exception vectors must implement either a branch or a load with PC-relative addressing Arm instructions, except for the 6th vector. Precisely, the ROM code must read either 0xEA or 0xE5 in bytes 3, 7, 11, 15 and 23.

The sixth vector (32 bits), at offset 0x14, must contain the size in bytes of the bootstrap to download from the external NVM into the internal SRAM.

**Figure 17.6.** Arm Vector 6 Structure

The value must be lower than 32 Kbytes.

The following is an example of valid vectors:

00	ea000006	B 0x20
04	eaffffffe	B 0x04
08	eaffffffe	B 0x08
0c	eaffffffe	B 0x0c
10	eaffffffe	B 0x10
14	00001234	← Code size = 4660 bytes
18	eaffffffe	B 0x18

##### 17.1.4.6.2.boot.bin File Check

This method is the one used on FAT-formatted SD Card and eMMC. The boot program must be a file named `boot.bin` written in the file system root directory. Its size must not exceed the maximum size allowed: 32 Kbytes (0x8000). The Arm exception vectors at offset 0 in the “`boot.bin`” file must also pass the test described in [Arm Exception Vectors Check](#).

## 17.1.4.7.Detailed Memory Boot Procedures

### 17.1.4.7.1.NAND Flash Boot: NAND Flash Detection

After the NAND Flash interface configuration, a reset command is sent to the memory.

The reset time of the NAND memory, after this reset command, must not be higher than 100  $\mu$ s.

Hardware ECC detection and correction are provided by the PMECC peripheral. See [Programmable Multibit Error Correction Code Controller \(PMECC\)](#) for more details.

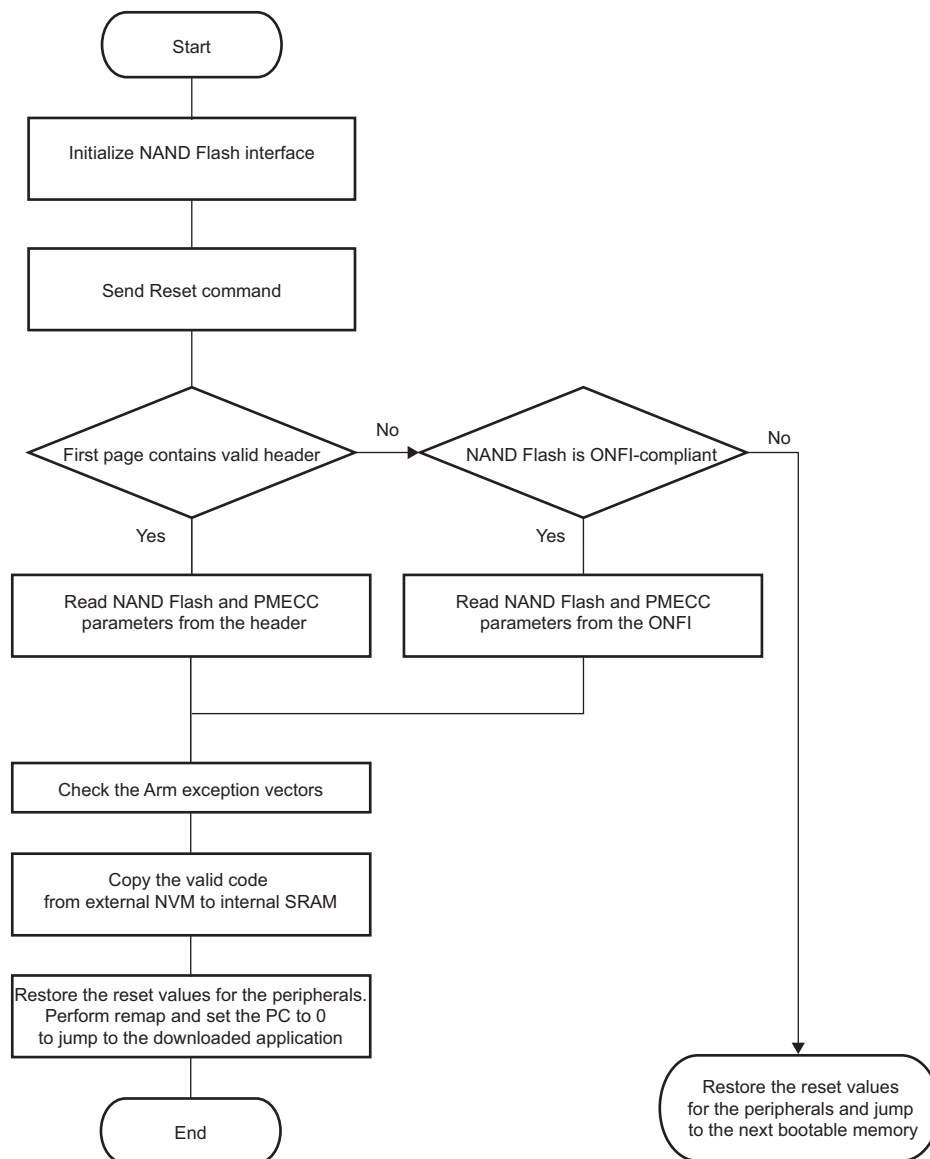

The Boot Program is able to retrieve NAND Flash parameters and ECC requirements using either one of the following methods:

- Method 1 (recommended): [NAND Flash Specific Header Detection](#)
- Method 2: ONFI 2.2 Parameters

It is highly recommended to use Method 1, since it indicates exactly how the PMECC has been configured to read or write the bootable program in the NAND Flash, and does not rely only on the NAND Flash capabilities.

Once the Boot program retrieves the parameter, using one of the above two methods, it reads the first page again, with or without ECC, depending on the usePmecc parameter. Then it looks for a valid code programmed just after the header offset 0xD0. If the code is valid, the program is copied at the beginning of the internal SRAM.

**Note:** Booting on 16-bit NAND Flash is not possible; only 8-bit NAND Flash memories are supported.

**Figure 17.7. Boot NAND Flash Download****Method 1 (recommended): NAND Flash Specific Header Detection**

This is the first method used to determine NAND Flash parameters. After receiving the Initialization and Reset command, the Boot Program reads the first page without an ECC check, to determine whether the NAND parameter header is present. The header is made of 52 times the same 32-bit word (for redundancy reasons) which must contain NAND and PMECC parameters used to correctly perform the read of the rest of the data in the NAND. This 32-bit word is described below.

If the header is valid, the Boot program continues with the detection of a valid code.

## [NAND Flash Specific Header Detection]

**Name:** NAND Flash Specific Header Detection

**Bits 31:28 – key[3:0]** Value 0xC Must be Written here to Validate the Content of the Whole Word

**Bits 26:18 – eccOffset[8:0]** Offset of the First ECC Byte in the Spare Zone  
A value below 2 is not allowed and is considered as 2.

**Bits 17:16 – sectorSize[1:0]** Size of the ECC Sector

Value	Description
0	For 512 bytes
1	For 1024 bytes per sector
Other values	For future use

**Bits 15:13 – eccBitReq[2:0]** Number of ECC Bits Required

Value	Description
0	2-bit ECC
1	4-bit ECC
2	8-bit ECC
3	12-bit ECC
4	24-bit ECC

**Bits 12:4 – spareSize[8:0]** Size of the Spare Zone in Bytes

**Bits 3:1 – nbSectorPerPage[2:0]** Number of Sectors per Page

Value	Description
0	1 sector per page
1	2 sectors per page
2	4 sectors per page
3	8 sectors per page
4	16 sectors per page

**Bit 0 – usePmecc** Use PMECC

Value	Description
0	Do not use PMECC to detect and correct the data.
1	Use PMECC to detect and correct the data.

**17.1.4.7.2.NAND Flash Boot: PMECC Error Detection and Correction**

NAND Flash boot procedure uses PMECC to detect and correct errors during NAND Flash read operations in two cases:

- When the usePmecc flag is set in a specific NAND header. If the flag is not set, no ECC correction is performed during the NAND Flash page read.
- When the NAND Flash has been detected using ONFI parameters.

The ROM memory embeds the Galois field tables. The user does not need to embed them in his/her own software.

The Galois field tables are mapped in the ROM just after the ROM code, as shown in the following figure.

**Figure 17.8.** Galois Field Table Mapping

For a full description and an example of how to use the PMECC detection and correction feature, refer to the software package dedicated to this device on [www.microchip.com](http://www.microchip.com).

**17.1.4.7.3.SD Card/e.MMC Boot**

In the case of activated Card Detect pin in the Boot Configuration packet, and if the level of the Card Detect pin is high, no communication with SD Card/e.MMC is performed (no IOs toggling). Otherwise, the SD Card/e.MMC access is initiated (IOs toggling).

**Supported SD Card Devices**

SD Card Boot supports all SD Card memories compliant with the SD Memory Card Specification V3.0. This includes SDRAM cards.

**e.MMC with Boot Partition**

The ROM code first checks if the e.MMC Boot Partition is enabled. If enabled, the ROM code reads the first 32 Kbytes of the boot partition, and copy them into the internal SRAM0.

## FAT Filesystem Boot

If no boot partition is enabled on an e.MMC, the boot process continues with a standard SD Card/ e.MMC detection, and the ROM code looks for a `boot.bin` file in the root directory of a FAT12/16/32 file system.

### 17.1.4.7.4.SPI Flash Boot

Two types of SPI Flash are supported: SPI Serial Flash and SPI DataFlash.

The SPI Flash bootloader tries to boot on SPI0, first looking for SPI Serial Flash, and then for SPI DataFlash.

It uses only one valid code detection: analysis of Arm exception vectors.

The SPI Flash read is done by means of a Continuous Read command from the address 0x0. This command is 0xE8 for DataFlash devices and 0x0B for Serial Flash devices.

## Supported DataFlash Devices

The SPI Flash Boot program supports the DataFlash devices listed in the following table.

**Table 17.2.** DataFlash Devices

Device	Density	Page Size (bytes)	Number of Pages
AT45DB011	1 Mbit	264	512
AT45DB021	2 Mbits	264	1024
AT45DB041	4 Mbits	264	2048
AT45DB081	8 Mbits	264	4096
AT45DB161	16 Mbits	528	4096
AT45DB321	32 Mbits	528	8192
AT45DB642	64 Mbits	1056	8192
AT45DB641	64 Mbits	264	37768

## Supported Serial Flash Devices

The SPI Flash Boot program supports all SPI Serial Flash devices responding correctly to both Get Status and Continuous Read commands.

### 17.1.4.7.5.QSPI NOR Flash Boot

#### Hardware Considerations

The ROM code configures the hardware so that:

- the QSPI controller uses SPI Mode 0 (CPOL = 0 and CPHA = 0),
- the QSPi<sub>SCK</sub> clock frequency is  $\leq 50$  MHz,
- QSPi<sub>SCK</sub> and QSPi<sub>CS</sub> do not use any internal pull-up/pull-down resistor,
- each QSPi<sub>IO</sub>{0,1,2,3} uses the PIO controller's internal pull-up resistor.

#### Software Considerations

Before reading any data, the ROM code sends a software reset to the QSPI NOR memory. Then the ROM code looks for the Serial Flash Discoverable Parameters (SFDP) of the QSPI NOR memory, if available, to learn the parameters (instruction op code, timing settings) required to read the user-programmed boot file.

If SFDP tables are not available, the ROM code uses hard-coded values as fallback settings to read the boot file.

The ROM code supports any QSPI NOR memory which can provide its Serial Flash Discoverable Parameters (SFDP) as defined in the JEDEC JESD216B standard.

The supported revisions of this JEDEC standard are:

- JESD216 (version 1.0)
- JESD216 rev. A (version 1.5)
- JESD216 rev. B (version 1.6)

Refer to the QSPI NOR memory data sheet to check compliance with any of the above JEDEC JESD216 standard revisions/versions.

### QSPI NOR memories with SFDP (JEDEC JESD216x compliant)

The ROM code reads the memory SFDP tables to learn the factory settings (instruction op code, number of dummy cycles, etc.). The ROM code also reads bits[22:20] in DWORD15 from the Basic Flash Parameter table (refer to JEDEC JESD216B specification) to select and then execute the relevant procedure, if any, to set the Quad Enable (QE) bit in some internal register of the QSPI NOR memory.

For most memory manufacturers, this QE bit is nonvolatile and must be set before performing any Quad SPI command. This is the only persistent setting that the ROM code may change in the internal registers of the QSPI NOR memory. All other settings are kept unchanged.

Refer to the QSPI NOR memory data sheet to find which value was chosen by the memory manufacturer and written into the SFDP tables.

Finally, the ROM code reads the boot file from the data area of the QSPI NOR memory, and then continues its boot procedure.

### QSPI NOR memories without SFDP

This section only applies when the ROM code fails to read the SFDP tables from the QSPI NOR memory.

The ROM code reads the JEDEC ID of the QSPI NOR memory, and then selects the read settings based on the manufacturer ID (first byte of the JEDEC ID) from the following hard-coded values:

	Cypress (01h)	Micron (20h)	Macronix (C2h)	Winbond (EFh)	Others
Fast Read protocol	SPI 1-4-4	SPI 1-4-4	SPI 1-4-4	SPI 1-4-4	SPI 1-1-1
Fast Read op code	EBh	EBh	EBh	EBh	0Bh
Address width	24 bits	24 bits	24 bits	24 bits	24 bits
Number of mode clock cycles	2	1	2	2	0
Number of wait states	4	9	4	4	8
Value of mode cycles to enter the 0-4-4 mode (XIP)	A0h	0h The ROM code first sets XIP bit[3] in the Volatile Configuration Register (VCR)	0Fh	A5h	N/A
Value of mode cycles to exit the 0-4-4 mode (normal read)	00h	1h	00h	FFh	N/A
XIP supported	yes	yes	yes	yes	no

Those hard-coded parameters give a last chance to the ROM code to boot from a QSPI NOR memory in either normal mode or XIP (Continuous Read) mode.

**Table 17.3.** QSPI NOR Memories Tested with and Supported by ROM Code (non-exhaustive)

Manufacturer	Memories
Microchip (SST)	SST26VF016B SST26VF032B SST26VF032BA SST26VF064B

.....continued

Manufacturer	Memories
Micron	N25Q128A N25Q128A13ESF N25Q256A13ESF N25Q512A13 MT25QL01G
Macronix	MX25V4035FM2I MX25V8035FM2I MX25V1635FM2I MX25L3233FM2I-08G MX25L3273FM2I-08G MX25L6433FM2I-08G MX25L6473FM2I-08G MX25L12835FM2I-10G MX25L12845GMI-08G MX25L12873GM2I-08G MX25L25645G MX25L25673G MX25L51245GMI-10G MX66L1G45GMI-08G
Spansion	S25FL127 (normal boot only; XIP fails) S25FL164 S25FL512
Winbond	W25M512

**Note:** For an updated list of memories, refer to the "Booting from External Non-Volatile Memory (NVM) on SAM9X60 MPU" (AN3763) application note, available on [www.microchip.com](http://www.microchip.com).

#### 17.1.4.8. Hardware and Software Constraints

The table below provides clock frequencies configured by the ROM code during boot.

**Table 17.4.** Clock Frequencies During External Memory Boot Sequence

Clock	Frequency
PLLA	396 MHz
CPU_CLK	396 MHz
MCK	99 MHz
SDMMC (init/operational)	400 kHz / 25 MHz
SPI	11 MHz
QSPI	33 MHz

The NVM drivers use several PIOs in Peripheral mode to communicate with external memory devices. Care must be taken when these PIOs are used by the application. The connected devices could be unintentionally driven at boot time, and thus electrical conflicts between the output pins used by the NVM drivers and the connected devices could occur.

The following table contains a list of pins that are driven during the boot program execution. These pins are driven during the boot sequence for a period of less than 1 second if no correct boot program is found. The drive strength of PULL-UP I/O pins is set to High while the pins are used in Peripheral mode by the ROM code.

Before performing the jump to the application in the internal SRAM, all the PIOs and peripherals used in the boot program are set to their reset state.

**Table 17.5.** PIO Driven during Boot Program Execution

NVM Bootloader	Peripheral	IO Set	Signal	PIO Line	Pull-up
SD Card/e.MMC	SDMMC_0	1	SDMMC0_DAT0	PIO_PA15A	X
			SDMMC0_CMD	PIO_PA16A	X
			SDMMC0_CK	PIO_PA17A	-
			SDMMC0_DAT1	PIO_PA18A	X

### 17.1.5. SAM-BA Monitor

This part of the ROM code is executed when no valid code is found in any NVM during the NVM boot sequence, and if the MON\_DIS field is not set to 1 in the Boot Configuration packet.

The main RC oscillator is used as the Main Clock. To configure the USB clock, the Main Oscillator is enabled by setting the CKGR\_MOR.MOSCXTEN and CKGR\_MOR.MOSCSEL bits. Then the external quartz detection is started. This detection is successful when the MOSCXTS bit rises, else the USB is not activated and only UART is used in SAM-BA Monitor.

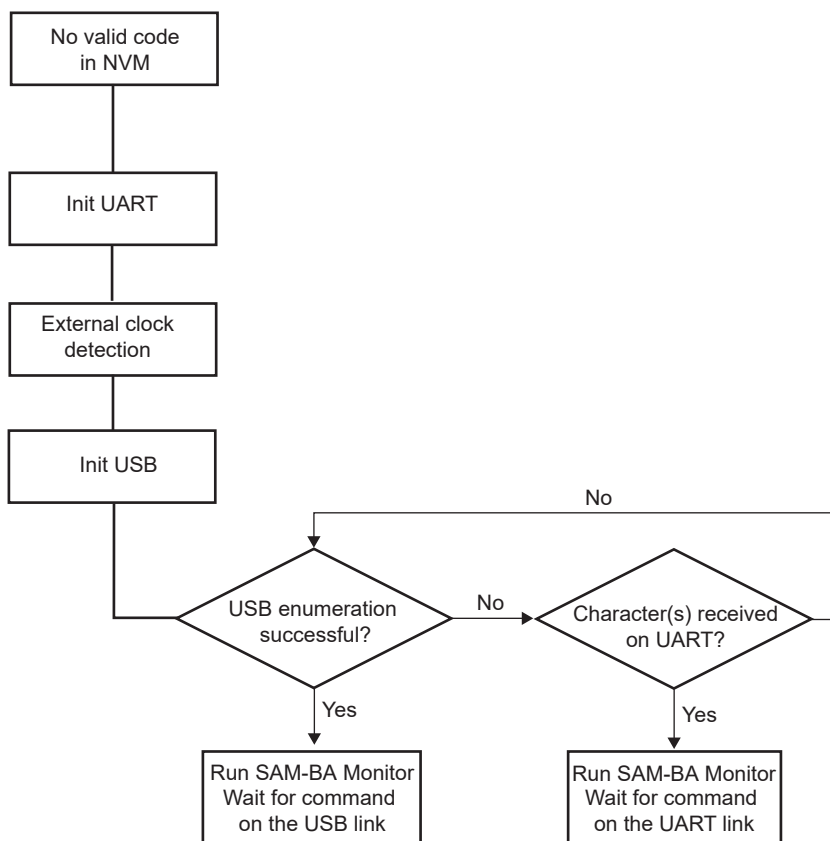

If an external clock or crystal frequency is found, then the UPLL is configured to allow communication on the USB link for the SAM-BA Monitor.

The SAM-BA Monitor steps are:

- Initialize UART and USB.
- Check if USB Device enumeration occurred.
- Check if characters are received on the UART.

Once the communication interface is identified, the application runs in an infinite loop waiting for different commands as listed in [Table 17.6](#).

Figure 17.9. SAM-BA Monitor

### 17.1.5.1.Command List

Table 17.6. Commands Available through SAM-BA Monitor

Command	Action	Argument(s)	Example
<b>N</b>	Set Normal mode	No argument	<b>N</b> #
<b>T</b>	Set Terminal mode	No argument	<b>T</b> #
<b>O</b>	Write a byte	Address, Value#	<b>O</b> 200001,CA#
<b>o</b>	Read a byte	Address,#	<b>o</b> 200001,#
<b>H</b>	Write a halfword	Address, Value#	<b>H</b> 200002,CAFE#
<b>h</b>	Read a halfword	Address,#	<b>h</b> 200002,#
<b>W</b>	Write a word	Address, Value#	<b>W</b> 200000,CAFEDECA#
<b>w</b>	Read a word	Address,#	<b>w</b> 200000,#
<b>S</b>	Send a file	Address,#	<b>S</b> 200000,#
<b>R</b>	Receive a file	Address, NbOfBytes#	<b>R</b> 200000,1234#
<b>G</b>	Go	Address#	<b>G</b> 200200#
<b>V</b>	Display version	No argument	<b>V</b> #

- Mode commands:
  - Normal mode configures SAM-BA Monitor to send/receive data in binary format.
  - Terminal mode configures SAM-BA Monitor to send/receive data in ASCII format.
- Write commands: Writes a byte (**O**), a halfword (**H**) or a word (**W**) to the target.
  - Address: address in hexadecimal

- Value: byte, halfword or word to write in hexadecimal
- Output: '>'
- Read commands: Reads a byte (**o**), a halfword (**h**) or a word (**w**) from the target.
  - Address: address in hexadecimal
  - Output: the byte, halfword or word read in hexadecimal followed by '>'
- Send a file (**S**): Sends a file to a specified address.
  - Address: address in hexadecimal
  - Output: '>'
  - Note:** A timeout on this command is reached when the prompt '>' appears before the end of the command execution.
- Receive a file (**R**): Receives data into a file from a specified address.
  - Address: address in hexadecimal
  - NbOfBytes: number of bytes in hexadecimal to receive
  - Output: '>'
- Go (**G**): Jumps to a specified address and executes the code.
  - Address: address to jump to in hexadecimal
  - Output: '>' once returned from the program execution. If the executed program does not handle the link register at its entry and does not return, the prompt is not displayed.
- Get Version (**V**): Returns the Boot Program version.
  - Output: version, date and time of ROM code followed by '>'

#### 17.1.5.2.DBGU/UART Console Port

Communication is performed through the DBGU/UART port initialized to 115,200 bauds: 8 bits of data, no parity, 1-stop bit.

##### 17.1.5.2.1.Xmodem Protocol

The Send and Receive File commands use the Xmodem protocol to communicate. Any terminal using this protocol can be used to send the application file to the target. The size of the binary file to send depends on the SRAM size embedded in the product. In all cases, the size of the binary file must be lower than the SRAM size because the Xmodem protocol requires some SRAM memory in order to work.

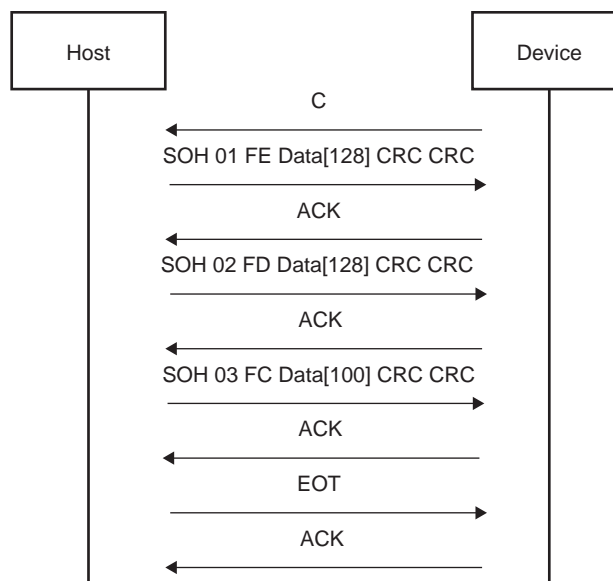

The Xmodem protocol supported is the 128-byte length block. This protocol uses a two-character CRC16 to guarantee detection of maximum bit errors.

Xmodem protocol with CRC is supported by successful transmission reports provided both by a sender and by a receiver. Each transfer block is as follows:

<SOH><blk #><255-blk #><--128 data bytes--><checksum> in which:

- <SOH> = 01 hex
- <blk #> = binary number, starts at 01, increments by 1, and wraps 0FFH to 00H (not to 01)
- <255-blk #> = 1's complement of the blk#.
- <checksum> = 2-byte CRC16

The following figure shows a transmission using this protocol.

**Figure 17.10.** Xmodem Transfer Example

### 17.1.5.3.USB Device Port

#### 17.1.5.3.1.Supported External Crystal / External Clocks

The SAM-BA Monitor supports an external crystal or external clock frequency at 12 MHz, 16 MHz, 24 MHz or 48 MHz to allow USB communication.

#### 17.1.5.3.2.USB Class

The device uses the USB Communication Device Class (CDC) drivers to take advantage of the installed PC Serial Communication software to talk over the USB. The CDC is implemented in all releases of Microsoft Windows®, starting from Windows 98SE®. The CDC document, available at [www.usb.org](http://www.usb.org), describes how to implement devices such as ISDN modems and virtual COM ports.

The vendor ID is 0x03EB. The product ID is 0x6124. These references are used by the host operating system to mount the correct driver. On Windows systems, INF files contain the correspondence between vendor ID and product ID.

#### 17.1.5.3.3.Enumeration Process

The USB protocol is a host/client protocol. The host starts the enumeration, sending requests to the device through the control endpoint. The device handles standard requests as defined in the USB Specification.

**Table 17.7.** Handled Standard Requests

Request	Definition
GET_DESCRIPTOR	Returns the current device configuration value
SET_ADDRESS	Sets the device address for all future device accesses
SET_CONFIGURATION	Sets the device configuration
GET_CONFIGURATION	Returns the current device configuration value
GET_STATUS	Returns status for the specified recipient
SET_FEATURE	Used to set or enable a specific feature
CLEAR_FEATURE	Used to clear or disable a specific feature

The device also handles some class requests defined in the CDC class.

**Table 17.8.** Handled Class Requests

Request	Definition
SET_LINE_CODING	Configures DTE rate, stop bits, parity and number of character bits
GET_LINE_CODING	Requests current DTE rate, stop bits, parity and number of character bits
SET_CONTROL_LINE_STATE	RS-232 signal used to indicate to the DCE device that the DTE device is now present

Unhandled requests are stalled.

#### 17.1.5.3.4. Communication Endpoints

Endpoint 0 is used for the enumeration process.

Endpoint 1 (64-byte Bulk OUT) and endpoint 2 (64-byte Bulk IN) are used as communication endpoints.

SAM-BA Boot commands are sent by the host through Endpoint 1. If required, the message is split into several data payloads by the host driver.

If the command requires a response, the host sends IN transactions to pick up the response.

## 17.2. Secure Boot Strategy

### 17.2.1. Description

The Secure Boot mode authenticates and deciphers a boot file stored in an external Non-Volatile Memory (NVM) prior to its execution. The boot file can be a bootstrap code or the user application. The secure boot ensures that only authorized code is executed, thus protecting the customer IP and providing a Root of Trust (RoT) in the hardware.

When the Secure Boot mode is enabled, the chip only allows booting on an authenticated and ciphered boot file. The boot file can be authenticated and deciphered in two ways:

- AES-CBC-CMAC mode:
  - Authentication is performed using the customer private CMAC key stored in the OTP memory and the AES-CMAC algorithm.
  - Boot file decryption is performed using the customer private CBC key stored in the OTP memory and the AES-CBC algorithm.
- AES-CBC-RSA mode:
  - Authentication is performed using the customer public key contained in the last X.509 certificate chain stored after the boot file.
  - Boot file decryption is performed using the customer private CBC key stored in the OTP memory and the AES-CBC algorithm.

Encryption is supported by an AES (using HW acceleration); in addition, either symmetric (AES-CMAC) or asymmetric (RSA-based using an X.509 certificate chain) authentication is supported.

### 17.2.2. Secure Boot Configuration

In addition to the Boot Configuration Packet content, the secure part of the boot sequence flow is controlled with data stored in the Secure Boot Configuration Packet.

The Secure Boot Configuration, stored in the Secure Boot Configuration Packet in the OTP user area, contains all the information required to boot in Secure mode:

- Secure Boot mode enable
- Authentication mode (AES-CMAC or RSA)
- Addresses of the customer key packets and root certificate hash

See [Secure Boot Configuration Packet](#) for a detailed description of the fields in the Secure Boot Configuration Packet.

During the prototyping phase, the OTPC Emulation mode can be used to test several configurations and the Secure Boot Mode without burning real OTP bits in the OTP matrix. See [Boot Configuration Packet](#) for more details.

### 17.2.3. Secure Boot Configuration Packet

**Table 17.9.** Secure Boot Configuration Packet Content

Offset	Name	Description
0x00	SEC_MODE_EN	Secure Boot mode enabled
0x04	AUTH_MODE	Authentication mode selection
0x08	DNU	Do Not Use (keep 0x0 value)
0x0C	KEY_WRITTEN	Key written
0x10	IV	AES Initialization Vector packet address
0x14	RSA_HASH	RSA root certificate public key hash packet address
0x18	CBC_KEY	AES CBC key packet address
0x1C	CMAC_KEY	AES CMAC key packet address

17.2.3.1.Secure Boot Mode Enable

Name: SEC\_BOOT\_MODE\_EN

Bits 31:0 – SECURE\_BOOT\_MODE\_ENABLE[31:0]

Value	Description
0	Secure Boot mode is disabled.
Different from 0	Secure Boot mode is enabled.

17.2.3.2.Authentication Mode

Name: AUTH\_MODE

Bits 31:0 – AUTHENTICATION\_MODE[31:0]

Value	Description
0	AES-CMAC is used for authentication.
1	RSA signature verification is used for authentication.

17.2.3.3.Key Written

Name: KEY\_WRITTEN

Bits 31:0 – KEY\_WRITTEN[31:0]

Value	Description
0	Customer secret keys are not written in the OTP memory.
Different from 0	Customer secret keys are written in the OTP memory.

17.2.3.4.Initialization Vector Address

**Bits 31:0 – IV\_ADDRESS[31:0]**  
Address of the OTP packet containing the AES Initialization Vector

17.2.3.5.RSA Public Key Hash Address

Name:		RSA_HASH							
Bit	31	30	29	28	27	26	25	24	
	RSA_HASH_ADDRESS[31:24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	RSA_HASH_ADDRESS[23:16]								
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
	RSA_HASH_ADDRESS[15:8]								
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
	RSA_HASH_ADDRESS[7:0]								
Access									
Reset									

**Bits 31:0 – RSA\_HASH\_ADDRESS[31:0]**  
Address of the OTP packet containing the hash of the root certificate CA

17.2.3.6.AES-CBC Key Address

Name:		CBC_KEY							
Bit	31	30	29	28	27	26	25	24	
	AES_CBC_KEY_ADDRESS[31:24]								
Access									
Reset									
Bit	23	22	21	20	19	18	17	16	
	AES_CBC_KEY_ADDRESS[23:16]								
Access									
Reset									
Bit	15	14	13	12	11	10	9	8	
	AES_CBC_KEY_ADDRESS[15:8]								
Access									
Reset									
Bit	7	6	5	4	3	2	1	0	
	AES_CBC_KEY_ADDRESS[7:0]								
Access									
Reset									

**Bits 31:0 – AES\_CBC\_KEY\_ADDRESS[31:0]**  
Address of the OTP packet containing the secret key for AES-CBC

### 17.2.3.7. AES-CMAC Key Address Register

**Name:** CMAC\_KEY

Bit	31	30	29	28	27	26	25	24
	AES_CMACH_KEY_ADDRESS[31:24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	AES_CMACH_KEY_ADDRESS[23:16]							
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	AES_CMACH_KEY_ADDRESS[15:8]							
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	AES_CMACH_KEY_ADDRESS[7:0]							
Access								
Reset								

#### Bits 31:0 – AES\_CMACH\_KEY\_ADDRESS[31:0]

Address of the OTP packet containing the secret key for AES-CMAC

### 17.2.4. Valid Code Detection in Secure Boot Mode

The valid code detection in Secure Boot mode is similar to the one in Standard Boot mode. However, additional checks and operations are performed.

If the initialization of NVM is successful, the ROM code reads and deciphers the first 32 bytes of the potential secure boot file to find a valid Arm exception vector table (see [Arm Exception Vectors Check](#)). From the sixth vector, the ROM code extracts the size of the boot file including its signature. When the AUTH\_MODE field is set to 1 in the Secure Boot Configuration Packet, the size of the X.509 certificate chain is also extracted. The boot file size must be 16 bytes aligned (AES block size). The sum of the boot file size and the certificate chain size must be lower than the maximum bootstrap size. If these first validations fail, the ROM code restores the memory interface PIO and its settings to their reset values and then tries to boot on the next NVM in the boot sequence.

Otherwise, the total size is used to copy the boot file, its signature and the X.509 certificate chain from the NVM into the internal SRAM.

Next, depending on the AUTH\_MODE field in the Secure Boot Configuration Packet, either the AES-CMAC digest or the RSA signature of the boot file is checked. As usual, if this final validation fails, the peripheral is reset and the ROM code jumps to the next NVM in the boot sequence.

If the boot file verification passes, the ROM code deciphers the boot file stored in the internal SRAM.

Since the NVM interface is no longer needed, the ROM code restores the memory interface PIO and its settings to their reset values.

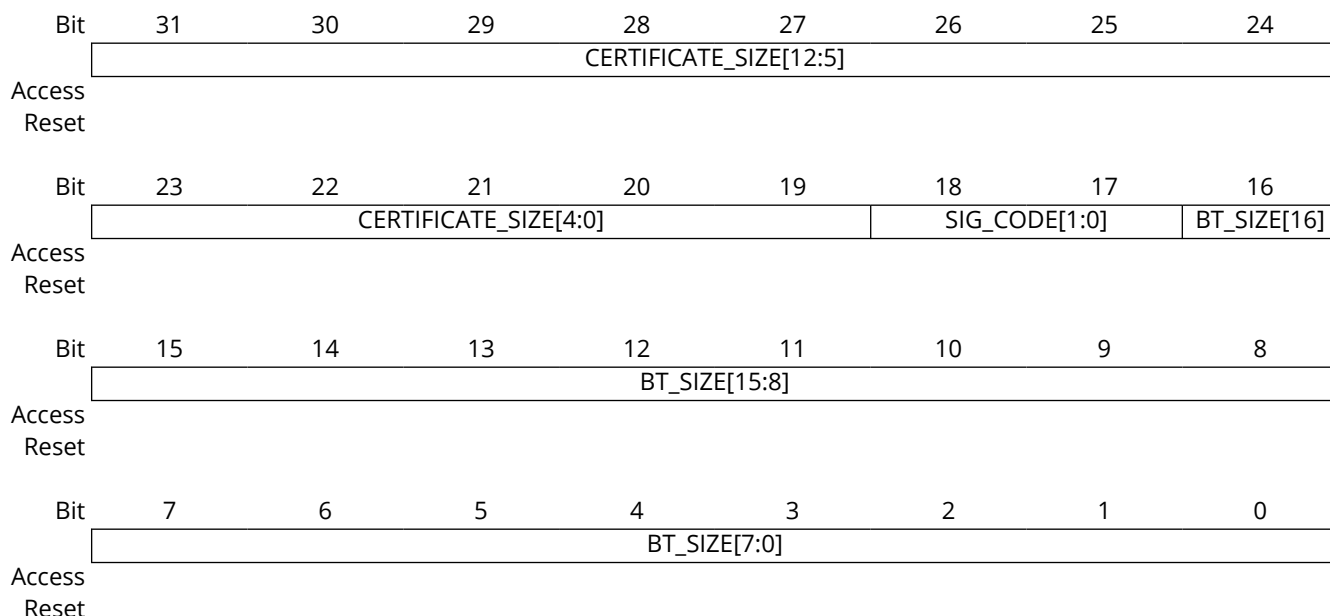

Finally, the ROM code locks access to the ROM area, enables JTAG and then branches to the beginning of the SRAM to execute the deciphered bootstrap.

### 17.2.4.1.6th Vector Format

When the AUTH\_MODE field is cleared in the Secure Boot Configuration Packet, the sixth entry of the Arm exception vector table stores the size of the boot file in bytes, including the 16 bytes of its AES-CMAC signature.

When the AUTH\_MODE field is set to 1 in the Boot Configuration word, the sixth entry of the Arm exception vector table stores both the size of the boot file including its RSA signature and the size of the X.509 certificate chain. The size of the RSA signature is also encoded.

**Bits 31:19 – CERTIFICATE\_SIZE[12:0]** Size of the of X.509 certificate chain, in bytes

**Bits 18:17 – SIG\_CODE[1:0]** Code for the RSA signature length

Value	Description
00	2048 bits
01	3072 bits
10	4096 bits
11	RFU

**Bits 16:0 – BT\_SIZE[16:0]** Boot file size, in bytes

### 17.2.4.2.e.MMC/SD Card File System

In Secure Boot mode, the ROM code looks for a `boot.cip` file in the root directory of a FAT12/16/32 file system. The `boot.cip` file must contain the ciphered bootstrap, its signature and the chain of X.509 certificates, in this order.

### 17.2.5. Encryption, Decryption and Authentication

For security reasons, the customer's two 256-bit secret keys are transferred only through the Host Key Bus from the OTPC key packet to the AES IP. The customer's AES Initialization Vector read from the OTP User area and the first key are used in the AES-CBC algorithm, whereas the second is dedicated to the AES-CMAC computation.

Encryption and decryption are processed using the NIST-recommended AES-CBC mode defined in NIST Special Publication 800-38A [NIST\_MODE\_OP].

When selected, the Message Authentication Code is processed using the NIST-recommended CMAC. The CMAC used as a Message Authentication Code (MAC) is the CMAC based on the AES. The AES-CMAC outputs a 128-bit digest.

Otherwise, the authentication is secured by an RSA signature. The public key cryptographic implementation then relies on X.509 certificates. These certificates are chained and stored right after the boot file and its signature in the NVM.

The first certificate in the chain (at the lowest address in memory) is called the “root certificate”. The modulus and the exponent are extracted from the public key stored in the root certificate. A SHA-256 digest is computed on the concatenation of the modulus and the exponent. This 256-bit digest is compared to the “RSA hash” to validate the root certificate.

Then, except for the root certificate, every certificate is signed by the private key associated with the previous certificate in the chain. So, its previous certificate is used to validate a certificate in a recursive process.

Finally, the boot file is signed with the private key associated with the last certificate. So, the last certificate is used to validate the boot file signature.

### 17.2.6. Secure Monitor

When no bootable program is found in any external NVM memory during the boot sequence and Secure Boot mode is enabled, the ROM code executes the Secure Monitor.

The set of commands implemented in the Secure Monitor enables the user to send commands to configure the Secure Boot mode, to write the customer key and the RSA root certificate public key hash, and to execute secure applets.

### 17.2.6.1.Generic Commands

The command format is composed of an opcode and arguments, and ends with a '#' character. Depending on the command, a data payload can be added after the command. In this case, the payload must be sent after the Secure Monitor has acknowledged the command and instructed how the data payload must be split (size of the payload).

#### 17.2.6.2.Command Format

The commands are formatted as follows:

A horizontal line with four vertical tick marks. At the far right end of the line, there is a hash symbol (#).

```
opcode addr length not used rw
```

where:

- `opcode`—4 characters of the command.
- `addr`—the address field is max 8 characters long, and contains the hexadecimal address value without '0x'.
- `length`—in case of a write command, this field indicates the size of the data to be sent, in hexadecimal format without '0x'.
- `not_used`—this field is not used for the moment.
- `rw`—indicates a read or write operation (00 for read, 01 for write).

**Table 17.10.** Read Version Command

Command	Description
RVER	Read ROM code version

**Table 17.11.** Key Management Commands

Command	Description
WCKY	Send customer keys and initialization vector (640 bits) for AES-CMAC
WRHA	Send RSA hash of root certificate public key for AES-RSA authentication mode

**Table 17.12.** Applet-Related Commands

Command	Description
SAPT	Send applet
SMBX	Send applet mailbox content
RMBX	Read applet mailbox content
EAPP	Execute applet
SFIL	Send file to an already loaded applet
RFIL	Read file from the buffer filled by an applet after its execution

**17.2.6.3. Monitor Answer**

The Secure SAM-BA Monitor answers any command with an acknowledgement message formatted as follows:

\_\_\_\_\_,\_\_\_\_\_,\_\_\_\_\_#[<payload>]

opcode errcode length

where:

- **opcode**—4 characters of the command
- **errcode**—value of the error code
- **length**—in cases where the Monitor must send data, this field shows how much data is in the payload, thus how much data the host computer has to read.
- **payload**—optional data, depends on the command.

**Table 17.13.** Command List

Command	Full Name	Description
CACK	SEND_CMD_ACK	Returns an acknowledgment after receiving a command
ASTA	SEND_APPLET_STATUS	Returns the status after execution of an applet
SVER	SEND_ROM_VERSION	Returns the ROM code version

**Table 17.14.** Error Code

Error Name	Hex Value	Description
secCmdOK	0x00000000	Command OK
secCmdTooLong	0xFFFFFFFF	Whole command size too long
secCmdOpcodeSizeErr	0xFFFFFFFFE	Opcode size too long
secCmdAddrSizeErr	0xFFFFFFFFD	Address field size too long
secCmdLenSizeErr	0xFFFFFFFFC	Length field size too long
secCmdRWSizeErr	0xFFFFFFFFA	RW field size too long
secCmdOpcodeUnknown	0xFFFFFFFF9	Unknown command opcode
secCmdCustKeyLengthErr	0xFFFFFFFF8	Customer key payload message size error
secCmdCustKeyNotWritten	0xFFFFFFFF7	Customer key not written in OTP
secCmdCustKeyAlreadyWritten	0xFFFFFFFF6	Customer key already written in OTP
secCmdCmacErr	0xFFFFFFFF5	Error during message CMAC verification
secCmdDecryptErr	0xFFFFFFFF4	Error during message decryption
secCmdRsaHashAlreadyWritten	0xFFFFFFFFE	RSA hash already written in OTP

## 17.2.6.4.Command Description

### 17.2.6.4.1.Read ROM Code Version

For this specific command, the Secure SAM-BA Monitor replies with the SVER opcode, and indicates that the ROM code version string length is 30 bytes, so the external tool knows how many characters should be received.

(PC to device) >> RVER, 0, 0, 0, 00#

(Device to PC) << SVER, 00000000, 00000030#v1.0.p1.Feb 23 2021.18:35:56...

### 17.2.6.4.2.Write Customer Key

Sending the customer key to the chip involves sending a binary payload (the ciphered message containing the customer key). This payload must be sent by the tool after receiving acknowledgment from the Monitor, showing how many bytes are expected.

(PC to device) >> WCKY, 0, 70, 0, 01#

(Device to PC) << CACK, 00000000, 00000070#

(PC to device) >> <key\_file.cip>

(Device to PC) << CACK, 00000000, 00000000#

### 17.2.6.4.3.Running a Secure Applet

Secure applets are small programs allowed by the ROM code to run in the internal SRAM of the device. They are ciphered and signed, and only provided by Microchip as part of the SAM-BA tool. They give the possibility to perform more operations than the one provided by the simple Secure Monitor commands.

Several applets are available. For example, external memories can be programmed using memory-programming algorithm applets, the Boot Configuration and Secure Boot Configuration Packets can be programmed using dedicated applet, etc.

The first step is to send the ciphered applet to the target. This is done through the Send Applet command:

(Device to PC) >> SAPT, 0, 9870, 0, 01#

(Device to PC) << CACK, 00000000, 00009870#

(PC to device) >> <applet\_binary.cip>

(Device to PC) << CACK, 00000000, 00000000#

In the example above, the host computer requests sending an applet of size 0x9870, and this is acknowledged by the Secure Monitor. Then the host computer sends the applet ciphered binary file (applet\_binary.cip), and after checking the signature and deciphering the applet in SRAM, the Secure Monitor sends the acknowledgment message and error code (CACK and error code 0x0: successful).

Once the applet is in the SRAM, before executing its code, its mailbox must be filled. The mailbox is a 32-word buffer used to exchange commands and arguments with the applet.

The number of commands and arguments in the mailbox can differ from one applet to another, depending on each applet purpose.

To do so, the Send Applet Mailbox command must be issued.

The mailbox is not ciphered, and is automatically written at the correct address by the ROM code.

(PC to device) >> SMBX, 0, 80, 0, 01#

(Device to PC) << CACK, 00000000, 00000080#

(PC to device) >> <applet\_init\_mailbox.bin>

(Device to PC) << CACK,00000000,00000000#

Now the applet can be run with the Execute Applet command:

(PC to device) >> EAPP,0,0,0,00#

(Device to PC) << ASTA,00000000,00000000#

The Secure Monitor replies with an acknowledgment and a status of the applet execution (0x0: successful).

During this step, the ROM code retrieves the information that will be used when receiving the next Write File command:

- Status of the applet execution
- If applicable, address and size of a data buffer for data exchange between the host computer and the applet (for applets intended to program external Flash memories, for example)

A Send File command can then be issued, with the size:

(PC to device) >> SFIL,0,5000,0,01#

(Device to PC) << CACK,00000000,00004000#

(PC to device) >> <first 0x4000 bytes of the file to be programmed>

(Device to PC) << CACK,00000000,00001000#

(PC to device) >> <next file chunk of 0x1000 bytes>

(Device to PC) << CACK,00000000,00000000#

### 17.2.7. Secure Boot Mode Recommendations

This section provides recommendations to ensure a good security level when configuring and using the Secure Boot mode, and some bootstrap development information.

#### 17.2.7.1. Configuring Secure Boot Mode

The recommended procedure to configure the Secure Boot mode, using the SAM-BA tool (available on [www.microchip.com](http://www.microchip.com)), is the following:

1. Write the Boot Configuration Packet, with the required boot settings and boot memory interface.
2. Set the Secure Boot mode.
3. Send the customer key.
4. Send the root certificate hash (in case an RSA signature is used).
5. Program the ciphered bootstrap.
6. Program the other application files.
7. **Disable invalidation of the Boot and Secure Boot Configuration Packets** by writing the corresponding bits in the User Hardware Configuration Packet (see [OTP Memory Controller \(OTPC\)](#)).
8. **Lock the Boot Configuration Packet and the Secure Boot Configuration Packet.**
9. **Disable the Secure SAM-BA Monitor** to avoid any further access.

**Note:** Keeping the Secure Monitor enabled in order to update the bootstrap in the field or in house is not recommended.

#### 17.2.7.2. Bootstrap Development and Updates

This section provides information about the bootstrap and how to update the ciphered bootstrap on a system already provisioned and having the Secure Monitor disabled.

In order to protect the CBC-ciphered bootstrap from known plain text attacks, it is strongly recommended to follow several common rules:

- Avoid compiling and linking “as is” source code that is publicly available.
- Apply secure software development basic principles (add custom parts, add random data, change objects order, etc.).
- Keep bootstrap sources (binary and ciphered versions) in safe places.
- Keep bootstrap as small and robust as possible to reduce the number of updates.

#### 17.2.7.2.1.Bootstrap Ciphering

Before update, the bootstrap must be ciphered and signed in accordance with the Secure Boot mode selected.

The bootstrap can be prepared using the Secure SAM-BA Cipher tool, and then deployed for an update on all devices.

##### Securing \*.cip files

Microchip's Secure SAM-BA Cipher utility outputs encrypted \*.cip files for use in provisioning at final manufacturing. As these files contain both customer keys and firmware, they must be securely stored with restricted and controlled access.

#### 17.2.7.2.2.Bootstrap Update in the Field

##### **Case 1: SAM-BA Monitor is disabled (the “MON\_DIS” word is filled in the Boot Configuration Packet)**

In this case, the bootstrap itself or the customer application must be in charge to update the bootstrap, by writing the new bootstrap in the boot memory in replacement of the existing one.

To do so, the program in charge of the update must be able to:

- retrieve the new ciphered bootstrap,
- erase the existing one,
- program the new one.

**Important:** The last two operations must not be interrupted, otherwise the boot process could be broken.

##### **Case 2: Secure SAM-BA Monitor is still available (the “MON\_DIS” word is zeroed in the Boot Configuration Packet - not recommended for systems in production)**

1. Disable the access to the external boot memory (Chip Select pin, Card Detect pin, etc., depending on the chosen boot memory) to prevent its access by the ROM code on the next reboot.
2. Connect a USB cable on the USB device port, or on the UART used as SAM-BA Monitor console terminal.
3. Reset the chip.
4. Enable access to the external boot memory.
5. Program the bootstrap using the SAM-BA tool.

#### 17.2.7.3.Monitor Disabling by the Bootstrap

It is highly recommended to disable the Secure Monitor feature for systems in production. To do so, the MON\_DIS word must be filled and the Boot Configuration Packet must be locked at the production stage.

If that has not been done, writing the “MON\_DIS” word can be performed by the bootstrap or by the customer application, but only if the Boot Configuration Packet has not been locked.

To write the “MON\_DIS” word and lock the packet, an update of the Boot Configuration Packet in the OTP memory is required. In the section [OTP Memory Controller \(OTPC\)](#), refer to:

- [Updating an Existing Packet from the User Interface](#)
- [Locking a Packet](#)

# Memories

## 18. Overview

### 18.1. Embedded Memories

#### 18.1.1. Internal SRAM

The SAM9X60 embeds 68 Kbytes of high-speed SRAM, SRAM0. SRAM0 is always accessible at address 0x0030 0000. After remap, SRAM0 is also available at address 0x0000 0000. A 4-Kbyte SRAM memory, SRAM1, is used for OTP emulation and is always accessible at address 0x0040 0000.

#### 18.1.2. Internal ROM

The ROM contains a bootloader program mapped at address 0 after reset and the BCH (Bose, Chaudhuri and Hocquenghem) code table mapped at address 0x0010\_0000 for NAND Flash ECC correction.

#### 18.1.3. Boot Strategies

For standard boot strategies, refer to [Standard Boot Strategy](#).

For secure boot strategies, refer to [Secure Boot Strategy](#).

### 18.2. External Memory

The SAM9X60 offers connections to a wide range of external memories or to parallel peripherals.

#### 18.2.1. External Bus Interface

The External Bus Interface (EBI), described in [External Bus Interface \(EBI\)](#), is an interface that features:

- Four external memory controllers:
  - a Static Memory Controller (SMC),
  - a NAND Flash Controller (NFC)
  - a Multi-Port DDR-SDRAM Controller (MPDDRC) to drive DDR2 and LPDDR
  - SDRAM controller to drive SDRAM and LPDDR devices
- 8-, 16-, or 32-bit data bus
- Up to 26-bit address bus
- Up to six chip selects with configurable assignment:
  - Static Memory Controller on NCS0, NCS1, NCS2, NCS3, NCS4, NCS5
  - MPDDRC/SDRAMC (SDCS) or Static Memory Controller on NCS1
  - Optional NAND Flash support on NCS3

The drive levels are configured in the EBI I/O Drive Configuration register (SFR\_CCFG\_EBICSA.EBI\_DRIVE) in section [Special Function Registers \(SFR\)](#). At reset, the selected drive is low. The user must make sure to program the correct drive. Refer to [Electrical Characteristics](#).

#### 18.2.2. Supported Memories on MPDDRC/SDRAMC Interface

The MPDDRC and SDRAMC support the following memories:

- 4/2-bank SDR-SDRAM and LPDDR-SDRAM with 16 or 32-bit data path

- 8/4-bank DDR2-SDRAM and 4/2-bank LPDDR1-SDRAM with 16-bit data path
- 2K, 4K, 8K, 16K row address memory parts

### 18.2.3. Supported Memories on Static Memories and NAND Flash Interfaces

The SMC supports:

- Asynchronous SRAM-like memories and parallel peripherals
- 8-, 16- or 32-bit data bus

The NFC supports:

- 8-bit NAND Flash (SLC)
- Programmable Multi-bit Error Correcting Code (PMECC) based on BCH codes

## 18.3. Product Dependencies

### 18.3.1. Clocks

Memory clocks are not controlled by the PMC.

### 18.3.2. Interrupts

Refer to the table [Peripheral Identifiers](#).

### 18.3.3. Reset

SMC and NFC are connected to the processor and peripherals reset line.

### 18.3.4. I/Os

The EBI I/Os are shared on two power rails: VDDIOM and VDDNF. Two I/O types (DDRIO and GPIO) are used.

## 18.4. Special Functions in SFR

The Special Function Register [SFR\\_CCFG\\_EBICSA](#) contains various fields to control the EBI operation (DDR I/O drive strength, MPDDRC Multi-port enable/disable, etc.).

## 19. External Bus Interface (EBI)

### 19.1. Description

The External Bus Interface (EBI) is designed to ensure the successful data transfer between several external devices and the embedded Memory Controller of the SAM9X60.

The Static Memory, MPDDR, SDRAM and ECC Controllers are all featured external Memory Controllers on the EBI. These external Memory Controllers are capable of handling several types of external memory and peripheral devices, such as SRAM, PROM, EPROM, EEPROM, Flash and (DDR2-/LPDDR-/SDR-/LPDDR-) SDRAM. The EBI operates with 1.8V or 3.3V Power Supplies (VDDIOM and VDDNF).

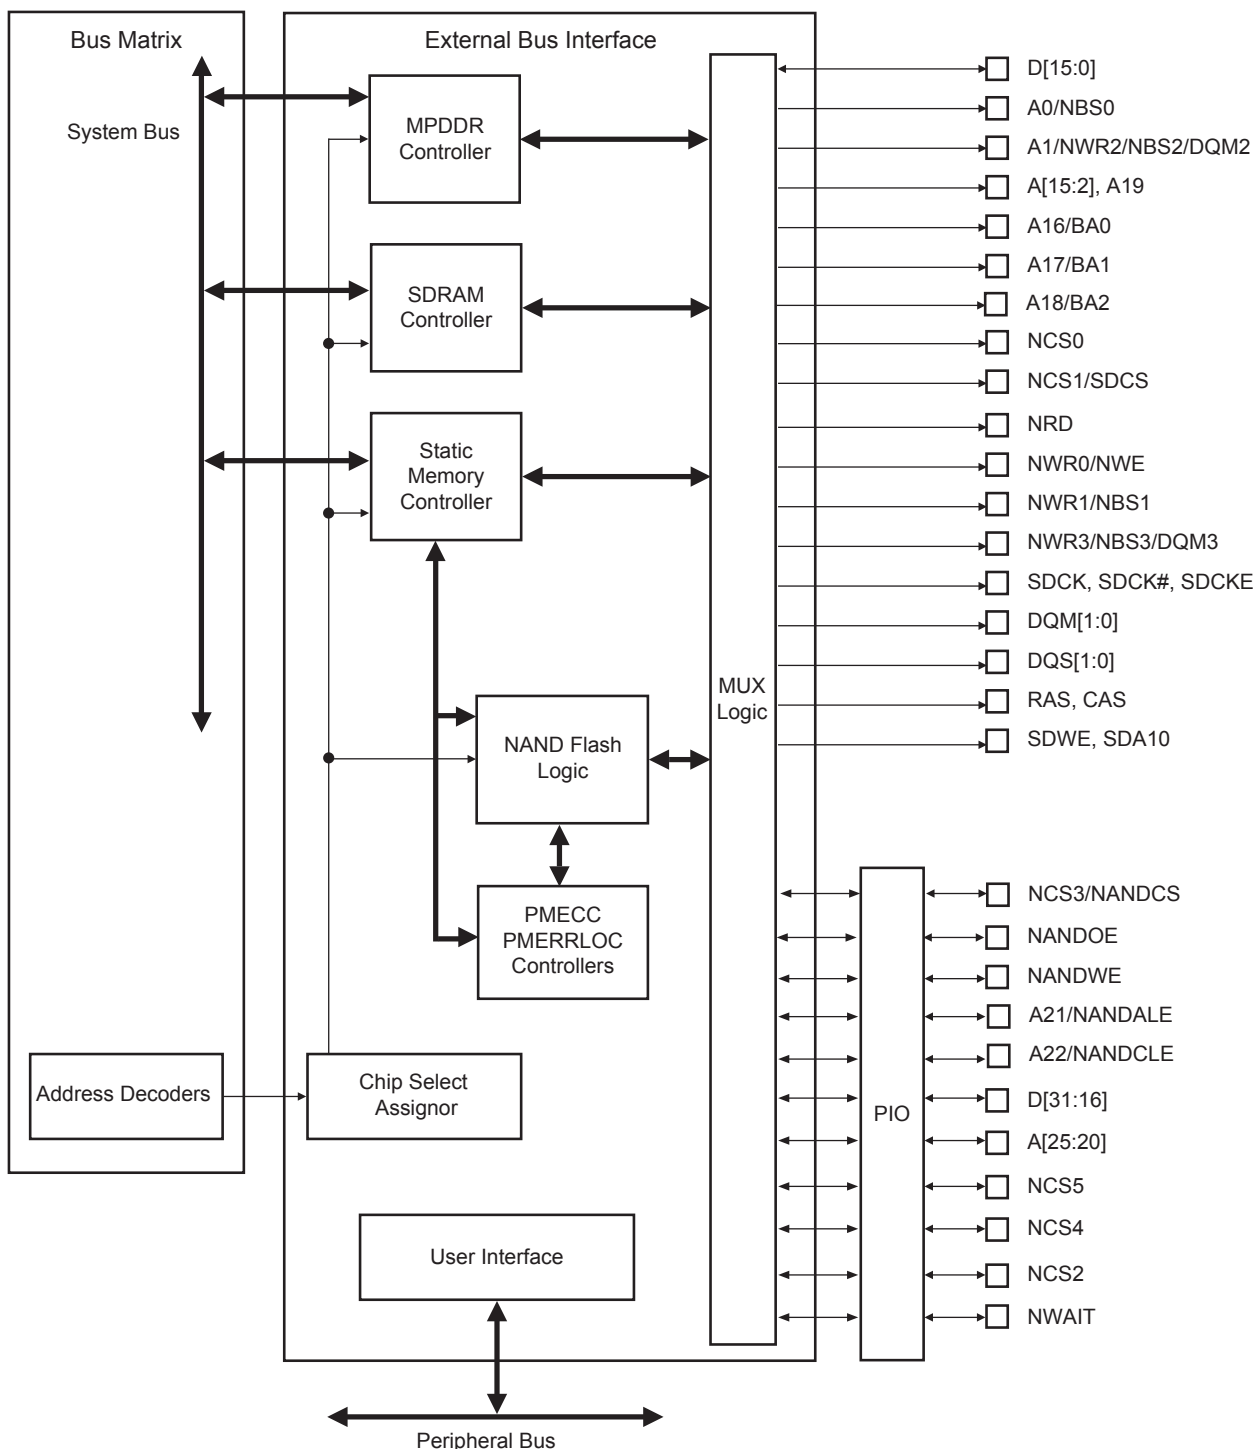

The EBI also supports the NAND Flash protocols via integrated circuitry that greatly reduces the requirements for external components. Furthermore, the EBI handles data transfers with up to six external devices, each assigned to six address spaces defined by the embedded Memory Controller. Data transfers are performed through a 16-bit or 32-bit data bus, an address bus of up to 26 bits, up to six chip select lines (NCS[5:0]) and several control pins that are generally multiplexed between the different external Memory Controllers.

### 19.2. Embedded Characteristics

- Integrates Four External Memory Controllers:
  - Static memory controller
  - MPDDR controller
  - SDRAM controller
  - 8-bit NAND Flash ECC controller
- Up to 26-bit Address Bus (up to 64 Mbytes linear per chip select)
- Up to Six Chip Selects with Configurable Assignment:
  - Static memory controller on NCS0, NCS1, NCS2, NCS3, NCS4, NCS5
  - MPDDR / SDRAM controller (SDCS) or static memory controller on NCS1
  - NAND Flash support on NCS3

## 19.3. EBI Block Diagram

Figure 19.1. External Bus Interface Organization

## 19.4. I/O Lines Description

**Table 19.1.** EBI I/O Lines Description

Name	Function	Type	Active Level
<b>EBI</b>			
EBI_D[31:0]	Data Bus	I/O	–
EBI_A[25:0]	Address Bus	Output	–
EBI_NWAIT	External Wait Signal	Input	Low

**Notes:**

1. D[31:24] and A20, A[25:23], NCS2, NCS4, NCS5 are multiplexed on PD[21:15].
2. NBS0 and NBS1 enable respectively lower and upper bytes of the lower 16-bit word.
3. NWRx enables corresponding byte x writes (x = 0, 1, 2 or 3).
4. NBS2 and NBS3 enable respectively lower and upper bytes of the upper 16-bit word.
5. NWR1 enables upper byte writes. NWR0 enables lower byte writes.

**Note:**

1. The switch NFD0\_ON\_D16 is used to select the NAND Flash path on D0–D7 or D16–D23, depending on memory power supplies. This switch is located in the SFR\_CCFG\_EBICSA register in the Special Function Register.

**19.5.2. Product Dependencies****19.5.2.1. I/O Lines**

The pins used for interfacing the External Bus Interface may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the External Bus Interface pins to their peripheral function. If I/O lines of the External Bus Interface are not used by the application, they can be used for other purposes by the PIO Controller.

### 19.5.3. Functional Description

The EBI transfers data between the internal AHB Bus (handled by the Bus Matrix) and the external devices (memories, FPGA, etc.). It controls the waveforms and the parameters of the external address, data and control buses and is composed of the following elements:

- Static Memory Controller (SMC)
- MPDDR and SDRAM Controllers (MPDDRC and SDRAMC)
- Programmable Multibit ECC Controller (PMECC)
- A chip select assignment feature that assigns an AHB address space to the external devices
- A multiplex controller circuit that shares the pins between the different Memory Controllers
- Programmable NAND Flash support logic

#### 19.5.3.1. Bus Multiplexing

The EBI offers a complete set of control signals that share the 32-bit data lines, the address lines of up to 26 bits and the control signals through a multiplex logic operating in function of the memory area requests.

Multiplexing is specifically organized in order to guarantee the maintenance of the address and output control lines at a stable state while no external access is being performed. Multiplexing is also designed to respect the data float times defined in the Memory Controllers. Furthermore, refresh cycles of the DDR2, LP-DDR and SDRAM are executed independently by the MPDDRC or SDRAMC without delaying the other external Memory Controller accesses.

#### 19.5.3.2. Pull-up and Pull-down Control

The SFR\_CCFG\_EBICSA register in the Special Function Register User Interface enable on-chip pull-up and pull-down resistors on data bus lines not multiplexed with the PIO Controller lines. The pull-down resistors are enabled after reset. The bits, EBIX\_DBPUC and EBI\_DBPDC, control the pull-up and pull-down resistors on the D[15:0] lines. Pull-up or pull-down resistors on the D[31:16] lines can be performed by programming the appropriate PIO controller.

#### 19.5.3.3. Voltage Level Control

The EBI I/Os accept two voltage level ranges: 1.7V to 1.9V range or 3.0V to 3.6V range. The EBI I/O circuits must be programmed to accommodate the voltage level in each application:

- 1.7V to 1.9V range: the SFR\_CCFG\_EBICSA.EBI\_DRIVE must be programmed to HIGH\_DRIVE (1).
- 3.0V to 3.6V range: the SFR\_CCFG\_EBICSA.EBI\_DRIVE must be programmed to LOW\_DRIVE (0).

At reset output, the drive selection defaults to LOW\_DRIVE.

This setting is applied to all the device I/Os with “DDRIO” type as defined in the [Pin Description](#) table. Other EBI I/Os with the “GPIO” type must be programmed according to the recommendations for the GPIO DRIVE and SLEWRATE controls in the PIO user interface.

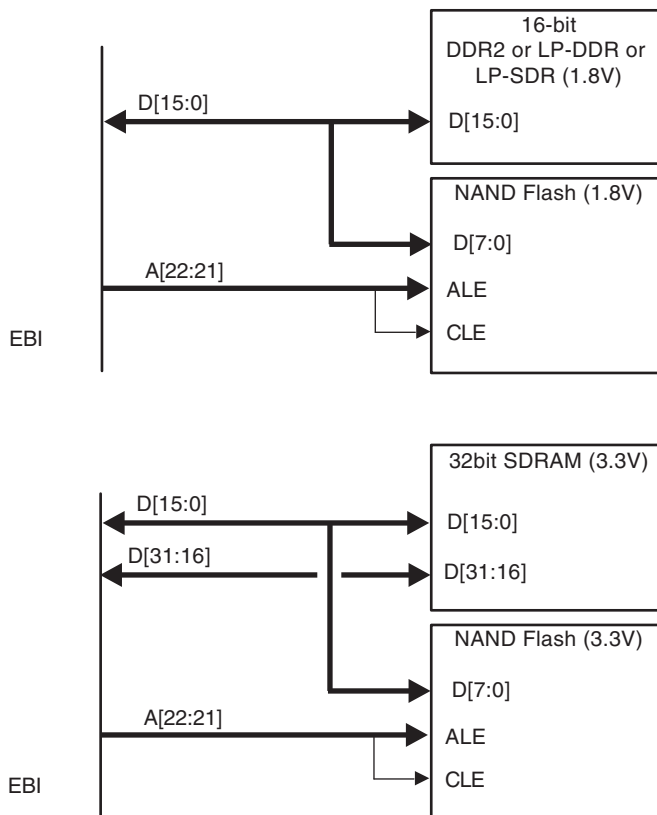

#### 19.5.3.4. Power Supplies

The product embeds a dual power supply for the EBI: VDDNF for NAND Flash signals, and VDDIOM for other signals. This makes it possible to use a 1.8V or 3.3V NAND Flash independently of the SDRAM power supply.

The switch NFD0\_ON\_D16 is used to select the NAND Flash path on D0–D7 or D16–D23 depending on memory power supplies. This switch is located in the SFR\_CCFG\_EBICSA register (refer to [Special Function Registers \(SFR\)](#)).

The following figure illustrates an example of the NAND Flash and the external RAM (DDR2 or LP-DDR or 16-bit LP-SDR) in the same power supply range (NFD0\_ON\_D16 = default).

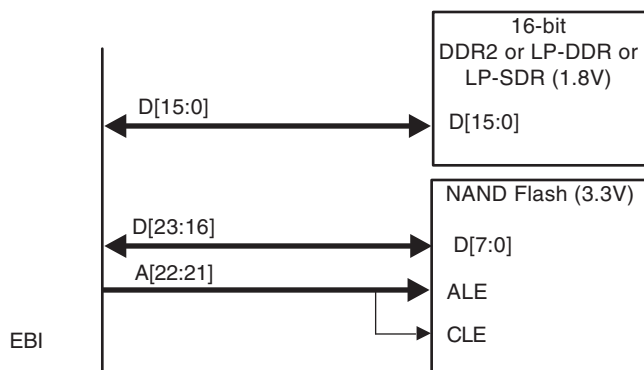

**Figure 19.2.** NAND Flash and External RAM in Same Power Supply Range (NFD0\_ON\_D16 = default)

The following figure illustrates an example of the NAND Flash and the external RAM (DDR2 or LP-DDR or 16-bit LP-SDR) NOT in the same power supply range (NFD0\_ON\_D16 = 1).

This can be used if the SMC connects to the NAND Flash only. Using this function with another device on the SMC will lead to an unpredictable behavior of that device. In that case, the default value must be selected.

**Figure 19.3.** NAND Flash and External RAM Not in Same Power Supply Range (NFD0\_ON\_D16 = 1)

At reset NFD0\_ON\_D16 = 0 and the NAND Flash bus is connected to D[7:0].

#### 19.5.3.5. Static Memory Controller

For information on the Static Memory Controller, refer to the section [“Static Memory Controller \(SMC\)”](#).

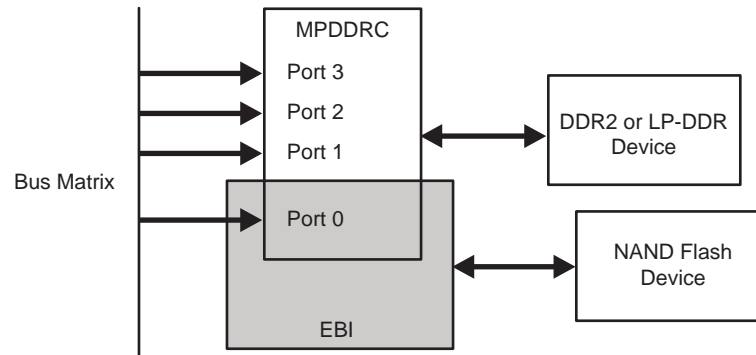

### 19.5.3.6. Multi-Port DDR and SDRAM Controllers

The product embeds a multi-port DDR Controller. This allows to use three additional ports on the MPDDRC to lessen the EBI load from a part of SDRAM accesses. This increases the bandwidth when DDR2 and NAND Flash devices are used. This feature is used with DDR2, LPDDR1 and SDR-SDRAM devices in Address/data or Address/data/command multiplexed mode.

It is controlled by the DDR\_MP\_EN bit in EBI Chip Select Assignment Register.

**Figure 19.4.** Multi-Port Enabled MPDDRC (DDR\_MP\_EN = 1)

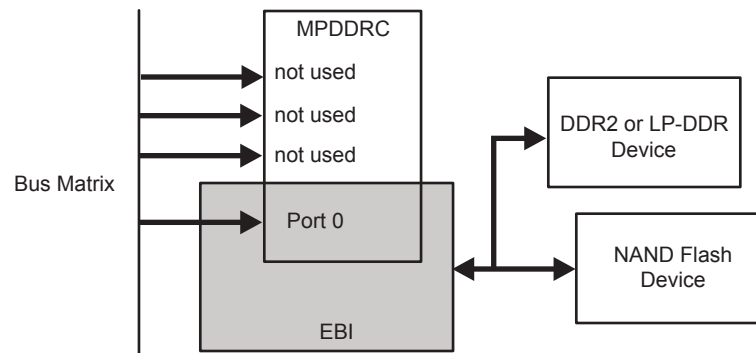

When:

- a NAND Flash memory is connected to D[23:16] and
- a DDR2-SDRAM or LPDDR-SDRAM is connected to D[15:0],

the bits SFR\_CCFG\_EBICSA.DDR\_MP\_EN and SFR\_CCFG\_EBICSA.NFD0\_ON\_D16 must both be set before performing the SDRAM initialization.

**Figure 19.5.** Multi-Port Disabled MPDDRC (DDR\_MP\_EN = 0)

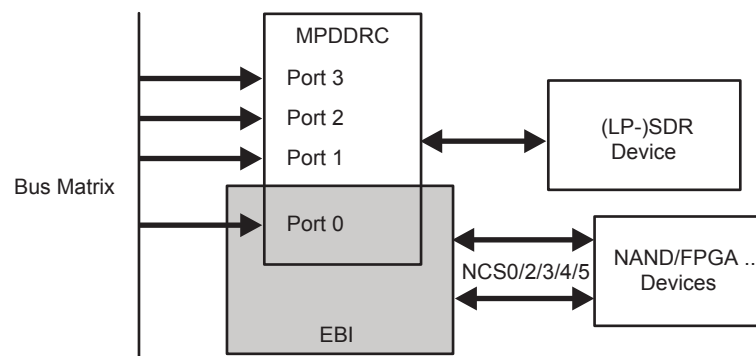

Set DQIEN\_F to 1: force EBI D0-D15 data pads in Input mode. Mandatory when EBI D[15:0] is shared between DDR-DRAM (LPDDR/DDR2) and static memory (via MPDDRC and SMC).

**Figure 19.6.** Multi-Port Disabled SDRAMC (DDR\_MP\_EN = 0)

**Figure 19.7.** Multiplexed Mode Multi-Port Enabled SDRAMC (DDR\_MP\_EN = 1) (With Addr/Data/Cmd Multiplexed Mode)

The product embeds a multi-port SDR Controller in Address/Data or Address/Data/Command multiplexed mode. This allows to use three additional ports on the SDRAMC to remove SDRAM accesses from the EBI load. This increases the bandwidth when SDR-SDRAM and a full SMC are used. This configuration allows to support up to five chip selects on SMC.

### 19.5.3.7. Programmable Multibit ECC Controller

For information on the PMECC Controller, refer to [Programmable Multibit Error Correction Code Controller \(PMECC\)](#) and [Programmable Multibit ECC Error Location Controller \(PMERRLOC\)](#). Also refer to [NAND Flash Boot: PMECC Error Detection and Correction](#).

### 19.5.3.8. NAND Flash Support

External Bus Interfaces integrate circuitry that interfaces to NAND Flash devices.

#### *External Bus Interface*

The NAND Flash logic is driven by the Static Memory Controller on the NCS3 address space. Programming the EBI\_CS3A field in the SFR\_CCFG\_EBICSA Register in the SFR User Interface to the appropriate value enables the NAND Flash logic. For details on this register, refer to [Special Function Registers \(SFR\)](#). Access to an external NAND Flash device is then made by accessing the address space reserved to NCS3 (i.e., between 0x4000 0000 and 0x4FFF FFFF).

The NAND Flash Logic drives the read and write command signals of the SMC on the NANDOE and NANDWE signals when the NCS3 signal is active. NANDOE and NANDWE are invalidated as soon as the transfer address fails to lie in the NCS3 address space. See the figure below for more information. For details on these waveforms, refer to [Static Memory Controller \(SMC\)](#).

### NAND Flash Signals

The address latch enable and command latch enable signals on the NAND Flash device are driven by address bits A22 and A21 of the EBI address bus. The command, address or data words on the data bus of the NAND Flash device are distinguished by using their addresses within the NCSx address space. The chip enable (CE) signal of the device and the ready/busy (R/B) signals are connected to PIO lines. The CE signal then remains asserted even when NCSx is not selected, preventing the device from returning to Standby mode.

**Figure 19.8.** NAND Flash Application Example

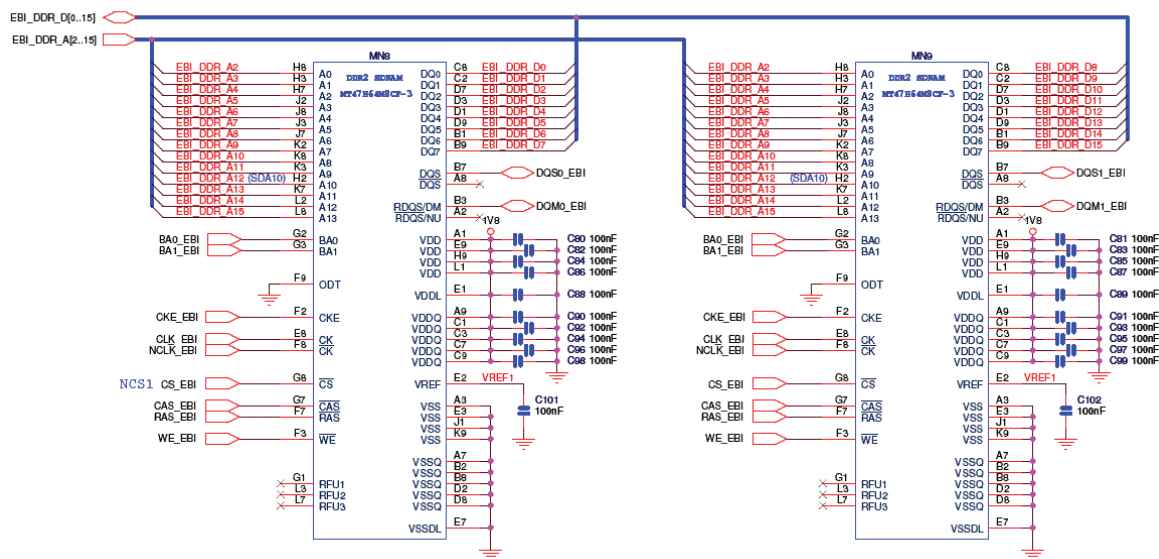

**Note:** The CE signal of the NAND Flash must be connected to PIOD4 (NCS3/NANDCS) if the user's system boots out of NAND Flash.

#### 19.5.4. Implementation Examples

The following hardware configurations are given for illustration only. The user should refer to the memory manufacturer web site to check current device availability.

## 19.5.4.1.2x8-bit DDR2 on EBI

### 19.5.4.1.1.Hardware Configuration

### 19.5.4.1.2.Software Configuration

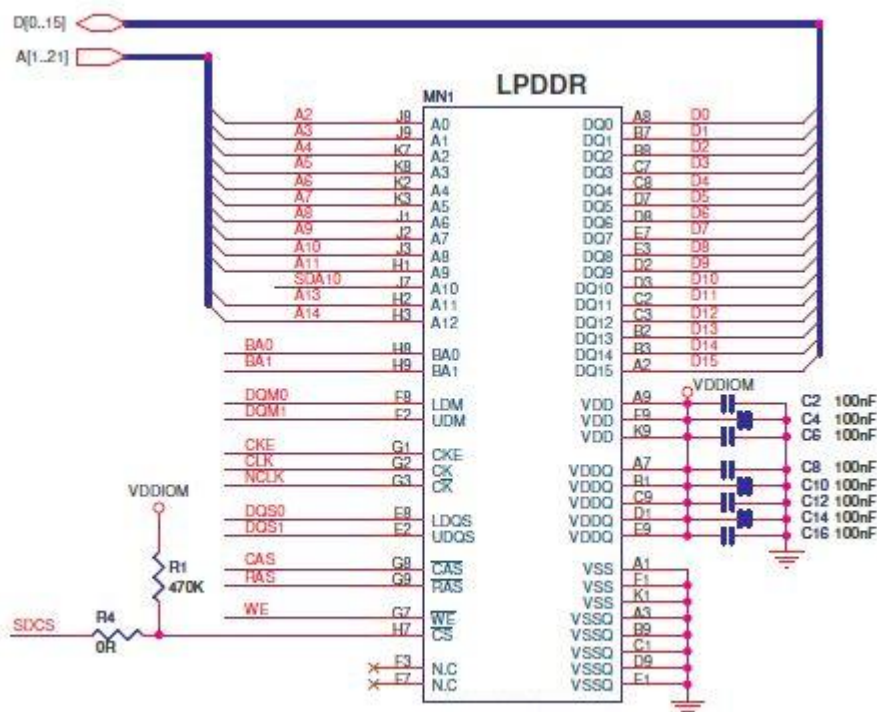

- Assign EBI\_CS1 to the MPDDRC controller by setting the EBI\_CS1A bit in the SFR\_CCFCG\_EBICSA register.
- Initialize the MPDDR Controller depending on the DDR2 device and system bus frequency.

The DDR2 initialization sequence is described in [DDR2-SDRAM Initialization](#).

In this case, VDDNF can be different from VDDIOM. The NAND Flash device can be 3.3V or 1.8V and wired on the D[23:16] data bus. NFD0\_ON\_D16 is to be set to 1.

### 19.5.4.2.16-bit LPDDR on EBI

#### 19.5.4.2.1.Hardware Configuration

#### 19.5.4.2.2.Software Configuration

The following configuration must be performed:

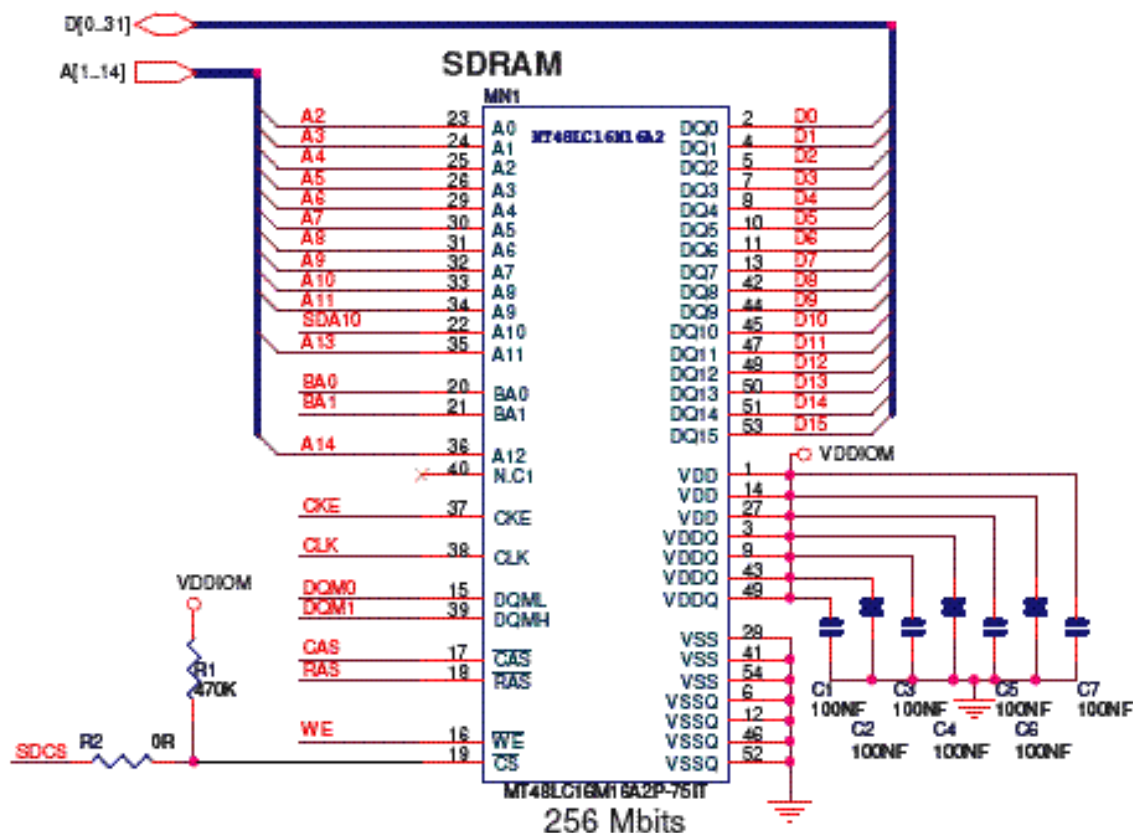

- Assign EBI\_CS1 to the MPDDR controller by setting the bit EBI\_CS1A bit in the SFR\_CCFG\_EBICSA register.
- Initialize the MPDDR Controller depending on the LP-DDR device and system bus frequency.

The LP-DDR initialization sequence is described in the section “Low-power DDR1-SDRAM Initialization” in the MPDDRC section.

In this case, VDDNF can be different from VDDIOM. The NAND Flash device can be 3.3V or 1.8V and wired on the D[23:16] data bus. NFD0\_ON\_D16 is to be set to 1.

### 19.5.4.3.16-bit SDRAM on EBI

#### 19.5.4.3.1.Hardware Configuration

#### 19.5.4.3.2.Software Configuration

The following configuration must be performed:

- Assign the EBI CS1 to the SDRAM controller by setting the EBI\_CS1A bit in the SFR\_CCFG\_EBICSA register.
- Initialize the SDRAM Controller depending on the SDRAM device and system bus frequency.

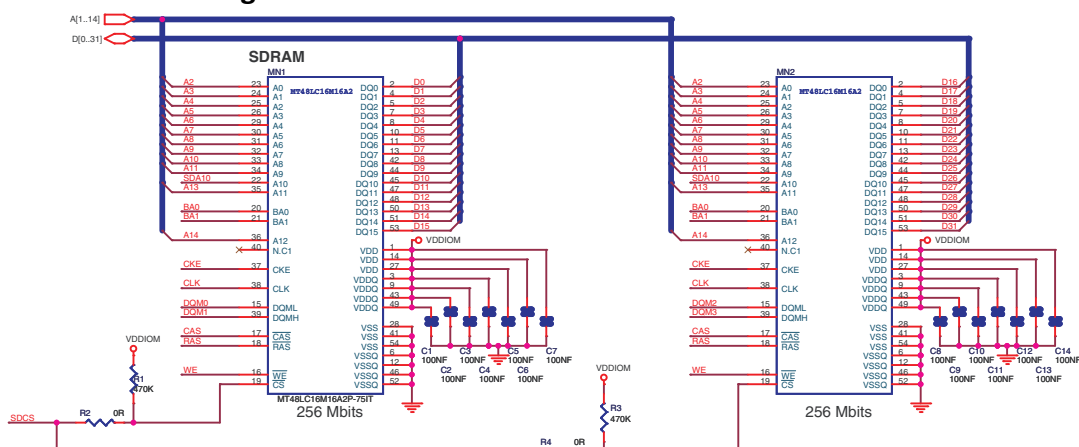

Program the Data Bus Width to 16 bits.

The SDRAM initialization sequence is described in the section “SDRAM Device Initialization” in “SDRAM Controller (SDRAMC)”.

In this case, VDDNF can be different from VDDIOM. The NAND Flash device can be 3.3V or 1.8V and wired on the D[23:16] data bus. NFD0\_ON\_D16 is to be set to 1.

## 19.5.4.4.2x16-bit SDRAM on EBI

### 19.5.4.4.1.Hardware Configuration

### 19.5.4.4.2.Software Configuration

The following configuration must be performed:

- Assign the EBI CS1 to the SDRAM controller by setting the EBI\_CS1A bit in the SFR\_CCFG\_EBICSA register.
- Initialize the SDRAM Controller depending on the SDRAM device and system bus frequency.

Program the Data Bus Width to 32 bits. The data lines D[16:31] are multiplexed with PIO lines and thus the dedicated PIOs must be programmed in Peripheral mode in the PIO controller.

The SDRAM initialization sequence is described in the section “SDRAM Device Initialization” in “SDRAM Controller (SDRAMC)”.

In this case, VDDNF must be equal to VDDIOM. The NAND Flash device must be 3.3V and wired on the D[7:0] data bus. NFD0\_ON\_D16 is to be set to 0.

### 19.5.4.5.8-bit NAND Flash with NFD0\_ON\_D16 = 0

#### 19.5.4.5.1.Hardware Configuration

<sup>(1)</sup> The CE must be connected to NCS3 PIOD4 if the NAND Flash is used by the ROM code.

**Note:** The CE signal of the NAND Flash must be connected to PIOD4 (NCS3/NANDCS) if the user's system boots out of NAND Flash.

#### 19.5.4.5.2.Software Configuration

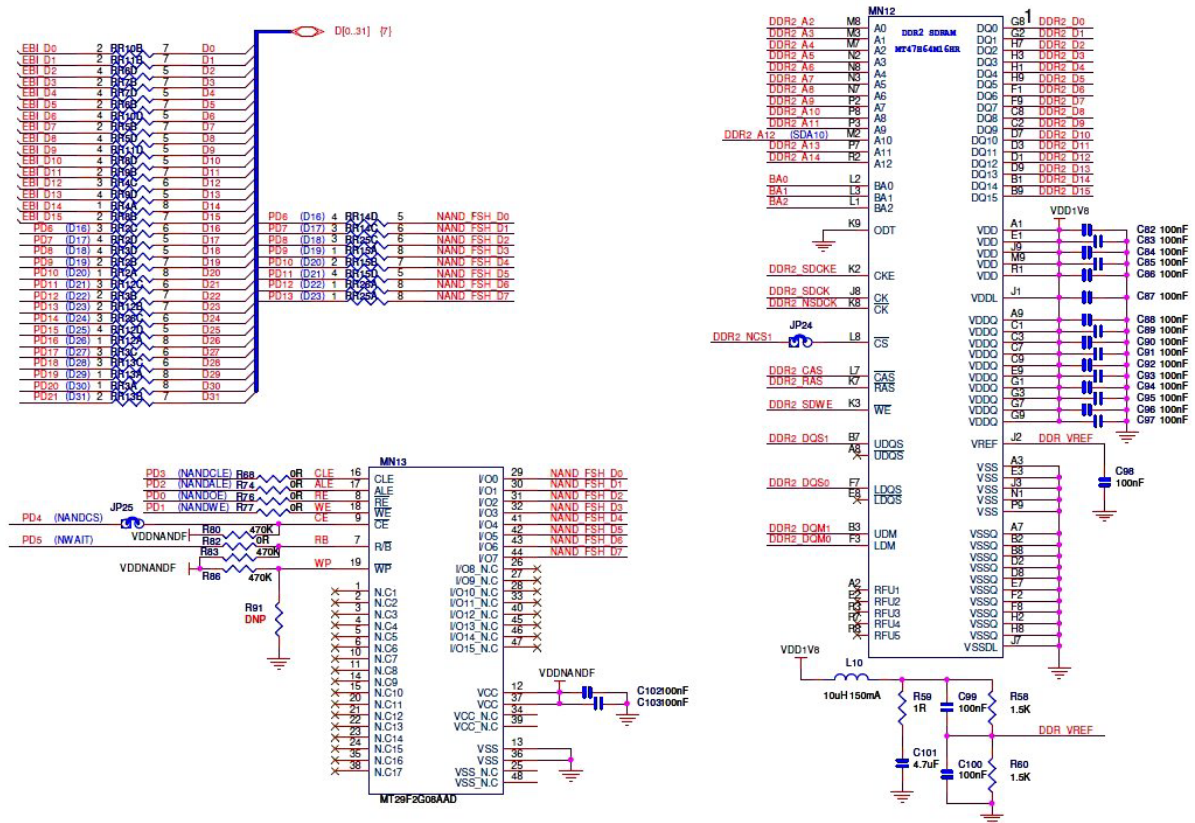

The following configuration has to be performed:

- Set NFD0\_ON\_D16 = 0 in the SFR\_CCFG\_EBICSA register
- Assign the EBI CS3 to the NAND Flash by setting the EBI\_CS3A bit in the SFR\_CCFG\_EBICSA register
- Reserve A21/A22 for ALE/CLE functions. Address and Command Latches are controlled respectively by setting to 1 the address bits A21 and A22 during accesses.
- Configure a PIO line as an input to manage the Ready/Busy signal.
- Configure Static Memory Controller CS3 Setup, Pulse, Cycle and Mode according to NAND Flash timings, data bus width and system bus frequency.

## 19.5.4.6.8-bit NAND Flash with NFD0\_ON\_D16 = 1

### 19.5.4.6.1.Hardware Configuration

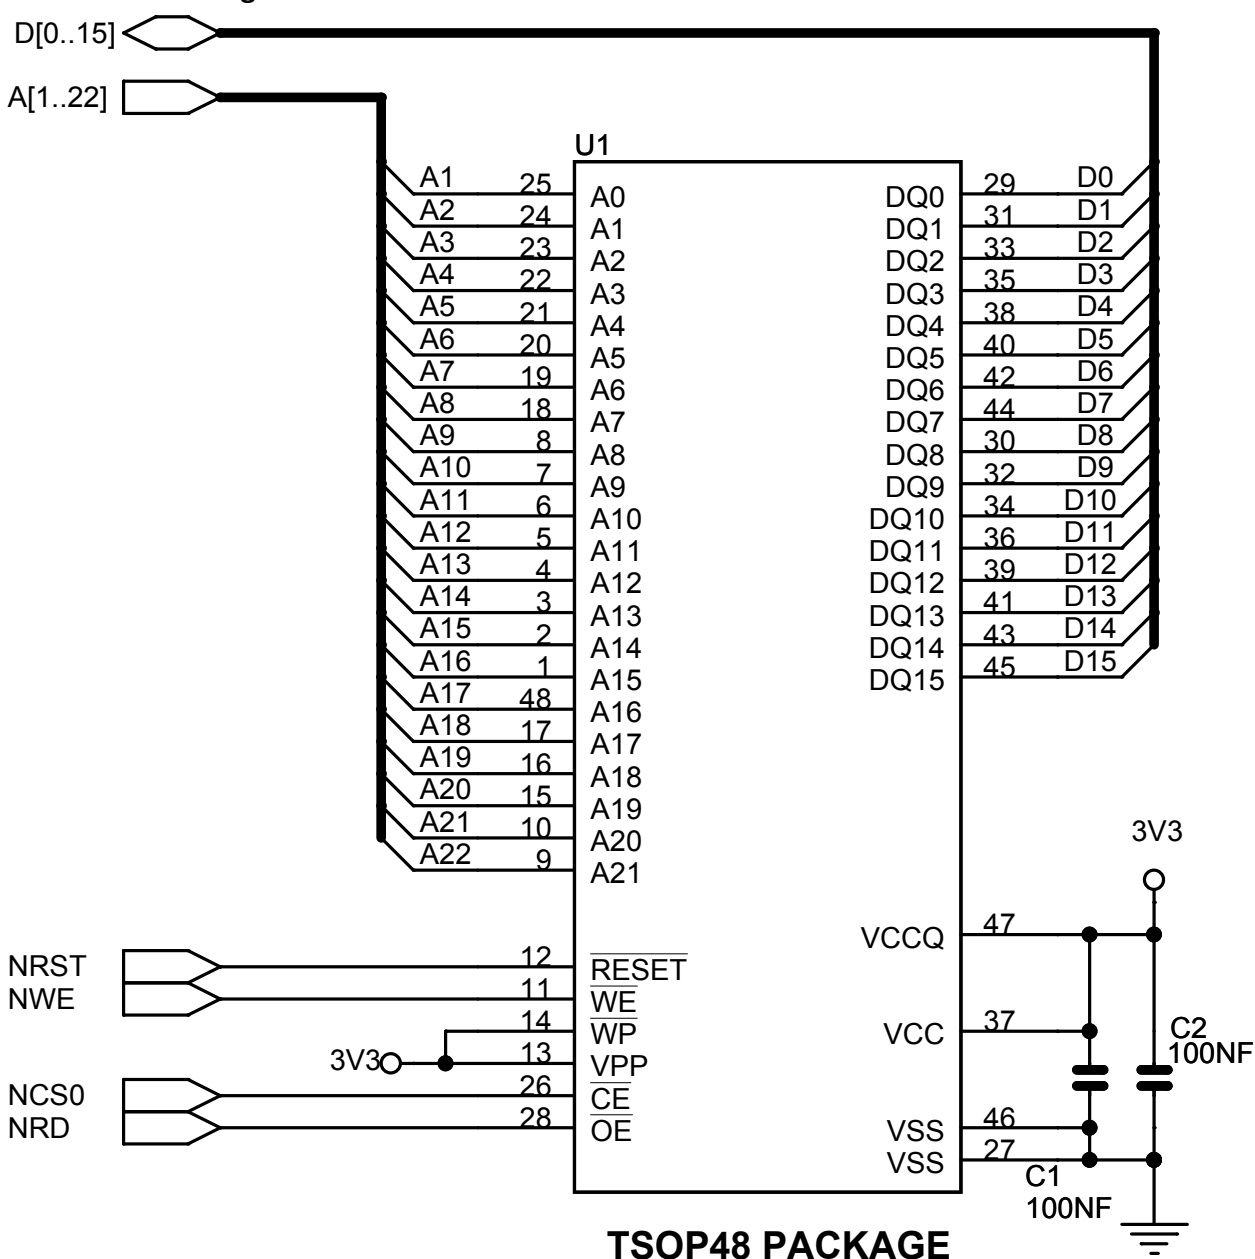

### 19.5.4.6.2.Software Configuration

The following configuration must be performed:

- Set NFD0\_ON\_D16 = 1 in the SFR\_CCFG\_EBICSA register.
- Assign the EBI CS3 to the NAND Flash by setting the EBI\_CS3A bit in the SFR\_CCFG\_EBICSA register.
- Reserve A21 / A22 for ALE / CLE functions. Address and Command Latches are controlled respectively by setting to 1 the address bits A21 and A22 during accesses.
- Configure a PIO line as an input to manage the Ready/Busy signal.
- Configure Static Memory Controller CS3 Setup, Pulse, Cycle and Mode according to NAND Flash timings, data bus width and system bus frequency.

### 19.5.4.7.NOR Flash on NCS0

#### 19.5.4.7.1.Hardware Configuration

#### 19.5.4.7.2.Software Configuration

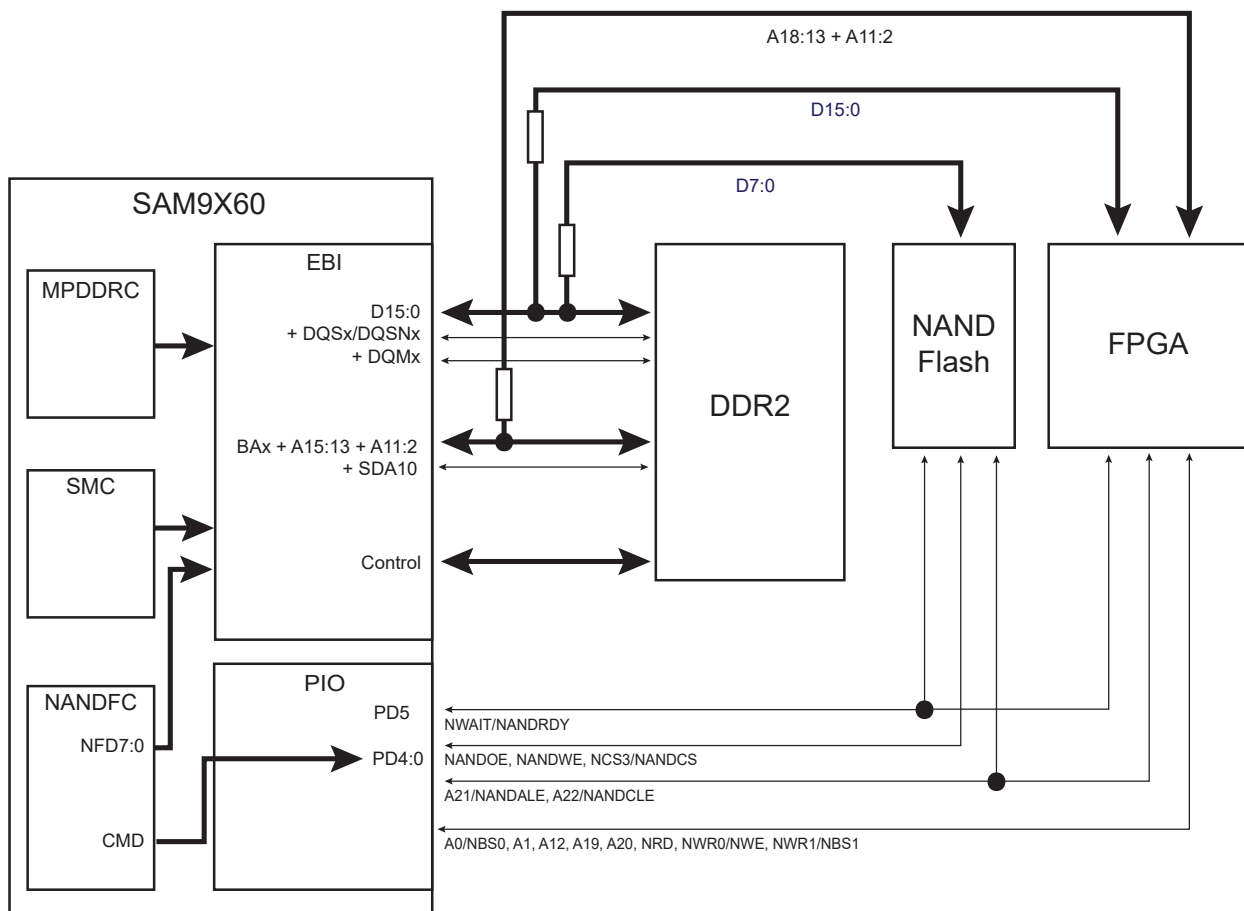

The default configuration for the Static Memory Controller, Byte Select mode, 16-bit data bus, Read/Write controlled by Chip Select, allows boot on 16-bit non-volatile memory at slow clock.

For another configuration, configure the Static Memory Controller CS0 Setup, Pulse, Cycle and Mode depending on Flash timings and system bus frequency.

#### 19.5.4.8.Device (FPGA, Static Memory, etc.) on NCS0, DDR on NCS1 and NAND Flash on NCS2

In this configuration, the device on NCS0, DDR2-SDRAM and NAND Flash are on the same data bus and use the same power supply. As DDR2-SDRAM is used, all components attached to the EBI must be 1.8V powered. NFD0\_ON\_D16 must be set to 0 in this configuration (NFD0\_ON\_D16 = 1 is a forbidden configuration with three devices on the EBI). As a few control signals are powered by the

**Figure 19.9.** Configuration Example: FPGA on NCS0, DDR on NCS1 and NAND Flash on NCS3

**Note:** For signal integrity purposes, it is good practice to give priority on the PCB layout to the Processor - DDR2 interface and to isolate this interface from the FPGA and the NAND Flash with serial resistors in the 50 to 200 Ohms range. This configuration implies speed limitation on both the DDR2 interface depending on the layout performance and the device connected to the bus. A signal integrity board simulation must be performed to assess the expected speed operation.

## 20. Static Memory Controller (SMC)

### 20.1. Description

The Static Memory Controller (SMC) generates the signals that control the access to the external memory devices or peripheral devices. It has 6 Chip Selects and a 26-bit address bus. The 32-bit data bus can be configured to interface with 8-, 16-, or 32-bit external devices. Separate read and write control signals allow for direct memory and peripheral interfacing. Read and write signal waveforms are fully parametrizable.

The SMC can manage wait requests from external devices to extend the current access. The SMC is provided with an automatic Slow Clock mode. In Slow Clock mode, it switches from user-programmed waveforms to slow-rate specific waveforms on read and write signals. The SMC supports asynchronous burst read in Page mode access for page sizes up to 32 bytes.

### 20.2. Embedded Characteristics

- 6 Chip Selects Available
- 64-Mbyte Address Space per Chip Select
- 8-, 16-, or 32-bit Data Bus
- Word, Halfword, Byte Transfers
- Byte Write or Byte Select Lines
- Programmable Setup, Pulse And Hold Time for Read Signals per Chip Select
- Programmable Setup, Pulse And Hold Time for Write Signals per Chip Select
- Programmable Data Float Time per Chip Select
- External Wait Request
- Automatic Switch to Slow Clock Mode
- Asynchronous Read in Page Mode Supported: Page Size Ranges from 4 to 32 Bytes
- Functional Safety - Protection, Monitors and Reports:
  - Register Write Protection
  - Abnormal Software Access and Sequencer Integrity Error Reports

### 20.3. I/O Lines Description

Table 20.1. I/O Lines Description

Name	Description	Type	Active Level
NCS[5:0]	Static Memory Controller Chip Select Lines	Output	Low
NRD	Read Signal	Output	Low
NWR0/NWE	Write 0/Write Enable Signal	Output	Low
A0/NBS0	Address Bit 0/Byte 0 Select Signal	Output	Low
NWR1/NBS1	Write 1/Byte 1 Select Signal	Output	Low
A1/NWR2/NBS2	Address Bit 1/Write 2/Byte 2 Select Signal	Output	Low
NWR3/NBS3	Write 3/Byte 3 Select Signal	Output	Low
A[25:2]	Address Bus	Output	–
D[31:0]	Data Bus	I/O	–
NWAIT	External Wait Signal	Input	Low

## 20.4. Interrupt Source

The SMC has an interrupt line connected to the interrupt line of the external bus interface. The external bus interface (SMC, SDRAMC, MPDDRC) interrupt line is connected to the interrupt controller. The external bus interface interrupt line can be triggered by SMC or SDRAMC/MPDDRC.

## 20.5. Multiplexed Signals

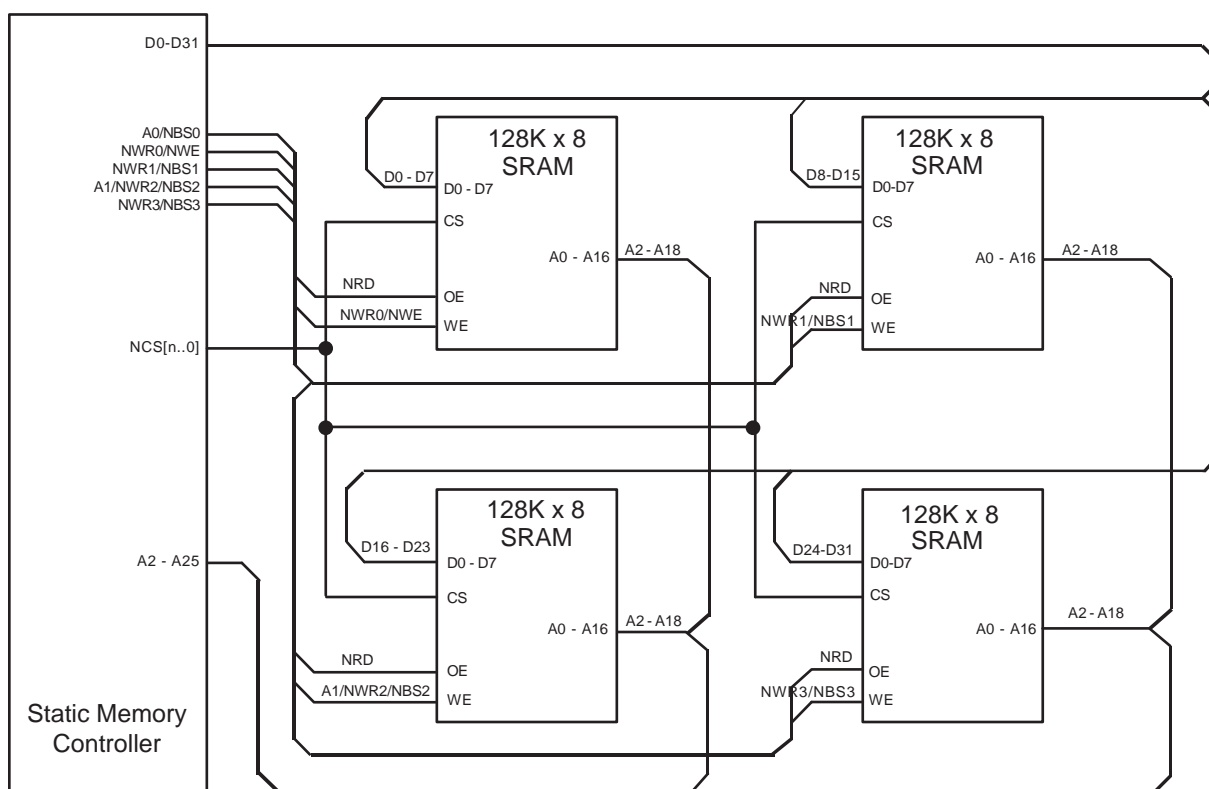

**Table 20.2.** Static Memory Controller (SMC) Multiplexed Signals

Multiplexed Signals			Related Function
NWR0	NWE	–	Byte-write or byte-select access, see <a href="#">Byte Write or Byte Select Access</a>
A0	NBS0	–	8-bit or 16-/32-bit data bus, see <a href="#">Data Bus Width</a>
NWR1	NBS1	–	Byte-write or byte-select access, see <a href="#">Byte Write or Byte Select Access</a>
A1	NWR2	NBS2	8-/16-bit or 32-bit data bus, see <a href="#">Data Bus Width</a> . Byte-write or byte-select access, see <a href="#">Byte Write or Byte Select Access</a>
NWR3	NBS3	–	Byte-write or byte-select access, see <a href="#">Byte Write or Byte Select Access</a>

## 20.6. Application Example

### 20.6.1. Hardware Interface

**Figure 20.1.** SMC Connections to Static Memory Devices

## 20.7. Product Dependencies

### 20.7.1. I/O Lines

The pins used for interfacing the Static Memory Controller may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the Static Memory Controller pins to their peripheral function. If I/O Lines of the SMC are not used by the application, they can be used for other purposes by the PIO controller.

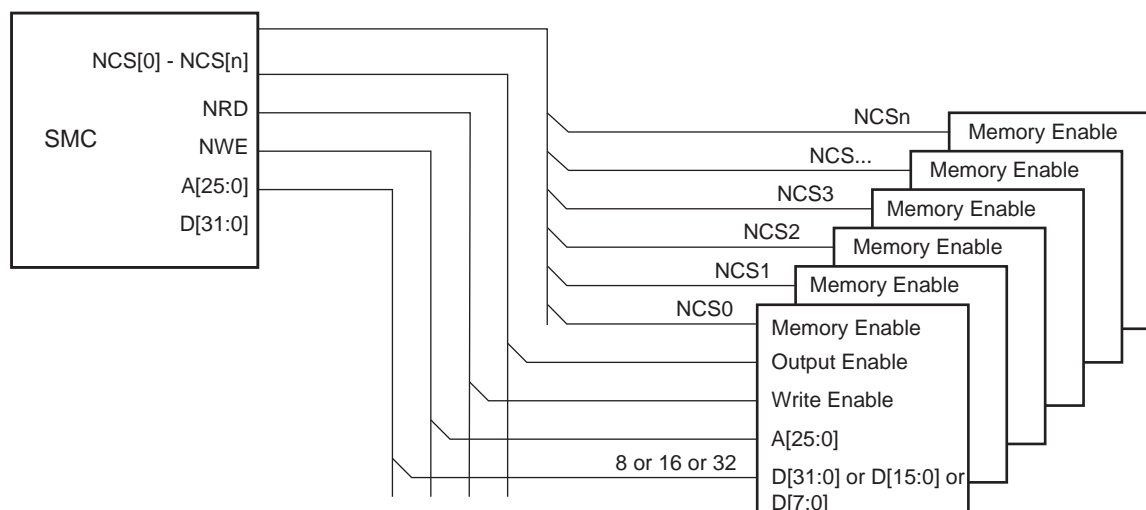

## 20.8. External Memory Mapping

The SMC provides up to 26 address lines, A[25:0]. This allows each chip select line to address up to 64 Mbytes of memory.

If the physical memory device connected on one chip select is smaller than 64 Mbytes, it wraps around and appears to be repeated within this space. The SMC correctly handles any valid access to the memory device within the page (see the figure below).

A[25:0] is only significant for an 8-bit memory, A[25:1] is used for a 16-bit memory; A[25:2] is used for a 32-bit memory.

**Figure 20.2.** Memory Connections for External Devices

## 20.9. Connection to External Devices

### 20.9.1. Data Bus Width

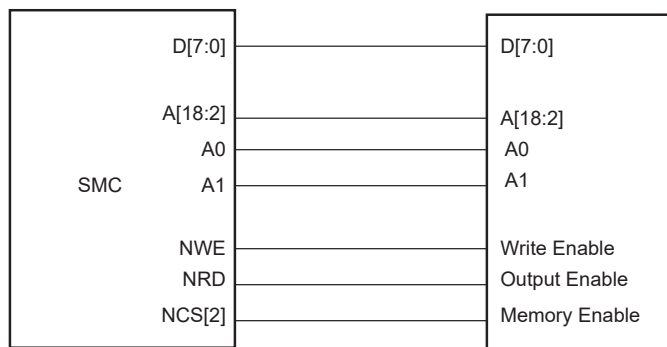

A data bus width of 8, 16, or 32 bits can be selected for each chip select. This option is controlled by the field DBW in the Mode register (SMC\_MODE) for the corresponding chip select.

- [Figure 20.3](#) illustrates how to connect a 512K x 8-bit memory on NCS2.
- [Figure 20.4](#) illustrates how to connect a 512K x 16-bit memory on NCS2.
- [Figure 20.5](#) shows two 16-bit memories connected as a single 32-bit memory.

### 20.9.2. Byte Write or Byte Select Access

Each chip select with a 16-bit or 32-bit data bus can operate with one of two different types of write access: byte write or byte select access. This is controlled by the BAT field of the SMC\_MODE register for the corresponding chip select.

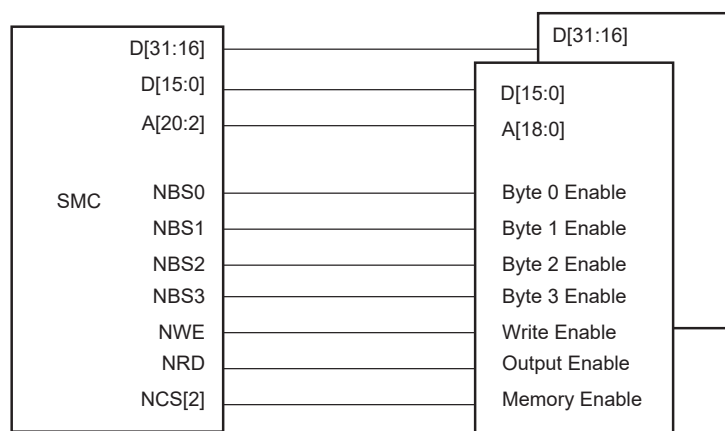

**Figure 20.3.** Memory Connection for an 8-bit Data Bus

**Figure 20.4.** Memory Connection for a 16-bit Data Bus

**Figure 20.5.** Memory Connection for a 32-bit Data Bus

### 20.9.2.1. Byte Write Access

Byte Write Access supports one byte write signal per byte of the data bus and a single read signal.

Note that the SMC does not allow boot in Byte Write Access mode.

- For 16-bit devices: the SMC provides NWR0 and NWR1 write signals for respectively byte0 (lower byte) and byte1 (upper byte) of a 16-bit bus. One single read signal (NRD) is provided. Byte Write Access is used to connect 2 x 8-bit devices as a 16-bit memory.
- For 32-bit devices: NWR0, NWR1, NWR2 and NWR3, are the write signals of byte0 (lower byte), byte1, byte2 and byte 3 (upper byte) respectively. One single read signal (NRD) is provided. Byte Write Access is used to connect 4 x 8-bit devices as a 32-bit memory.

The Byte Write option is illustrated in [Figure 20.6](#).

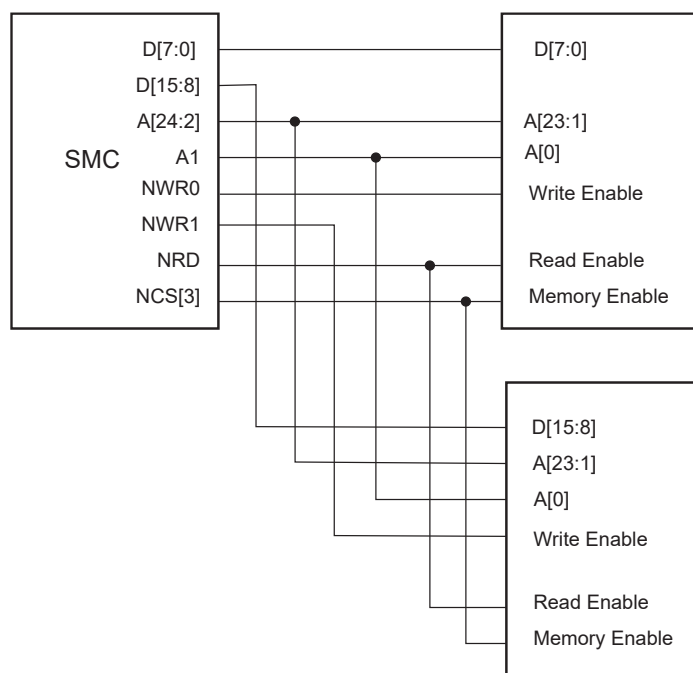

### 20.9.2.2. Byte Select Access

In this mode, read/write operations can be enabled/disabled at a byte level. One byte-select line per byte of the data bus is provided. One NRD signal and one NWE signal control read and write.

- For 16-bit devices: the SMC provides NBS0 and NBS1 selection signals for respectively byte0 (lower byte) and byte1 (upper byte) of a 16-bit bus.  
Byte Select Access is used to connect one 16-bit device.
- For 32-bit devices: NBS0, NBS1, NBS2 and NBS3 are the selection signals of byte0 (lower byte), byte1, byte2 and byte 3 (upper byte) respectively. Byte Select Access is used to connect two 16-bit devices.

Figure 20.7 shows how to connect two 16-bit devices on a 32-bit data bus in Byte Select Access mode, on NCS3 (BAT = Byte Select Access).

**Figure 20.6.** Connection of 2 x 8-bit Devices on a 16-bit Bus: Byte Write Option

### 20.9.2.3. Signal Multiplexing

Depending on the Byte Access Type (BAT), only the write signals or the byte select signals are used. To save IOs at the external bus interface, control signals at the SMC interface are multiplexed. The table below shows signal multiplexing depending on the data bus width and the byte access type.

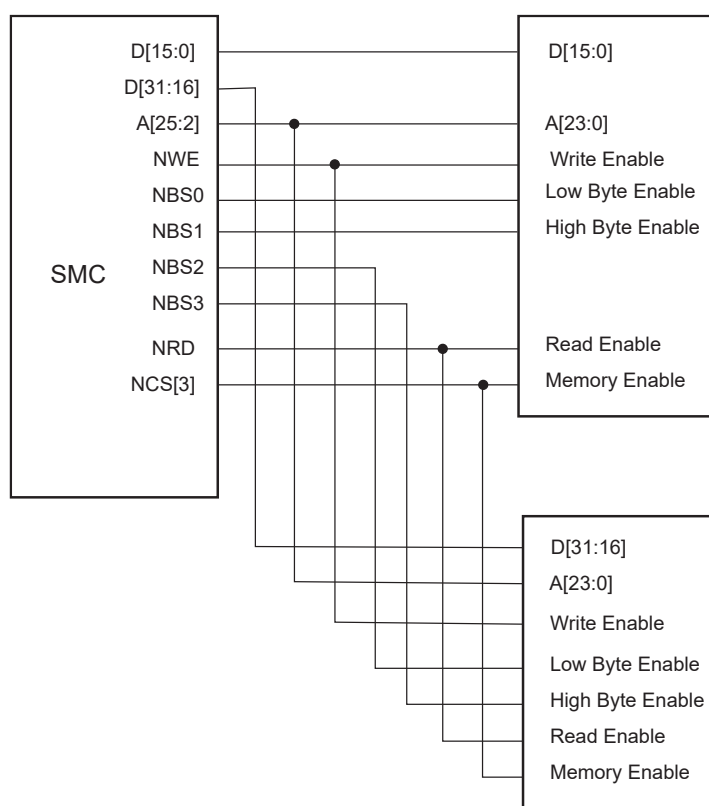

**Table 20.3.** SMC Multiplexed Signal Translation

Signal Name	32-bit Bus			16-bit Bus		8-bit Bus
Device Type	1 x 32-bit	2 x 16-bit	4 x 8-bit	1 x 16-bit	2 x 8-bit	1 x 8-bit
Byte Access Type (BAT)	Byte Select	Byte Select	Byte Write	Byte Select	Byte Write	–
NBS0_A0	NBS0	NBS0	–	NBS0	–	A0
NWE_NWR0	NWE	NWE	NWR0	NWE	NWR0	NWE
NBS1_NWR1	NBS1	NBS1	NWR1	NBS1	NWR1	–
NBS2_NWR2_A1	NBS2	NBS2	NWR2	A1	A1	A1
NBS3_NWR3	NBS3	NBS3	NWR3	–	–	–

For 32-bit devices, bits A0 and A1 are unused. For 16-bit devices, bit A0 of address is unused. When the Byte Select option is selected, NWR1 to NWR3 are unused. When the Byte Write option is selected, NBS0 to NBS3 are unused.

**Figure 20.7.** Connection of 2x16-bit Data Bus on a 32-bit Data Bus (Byte Select Option)

## 20.10. Standard Read and Write Protocols

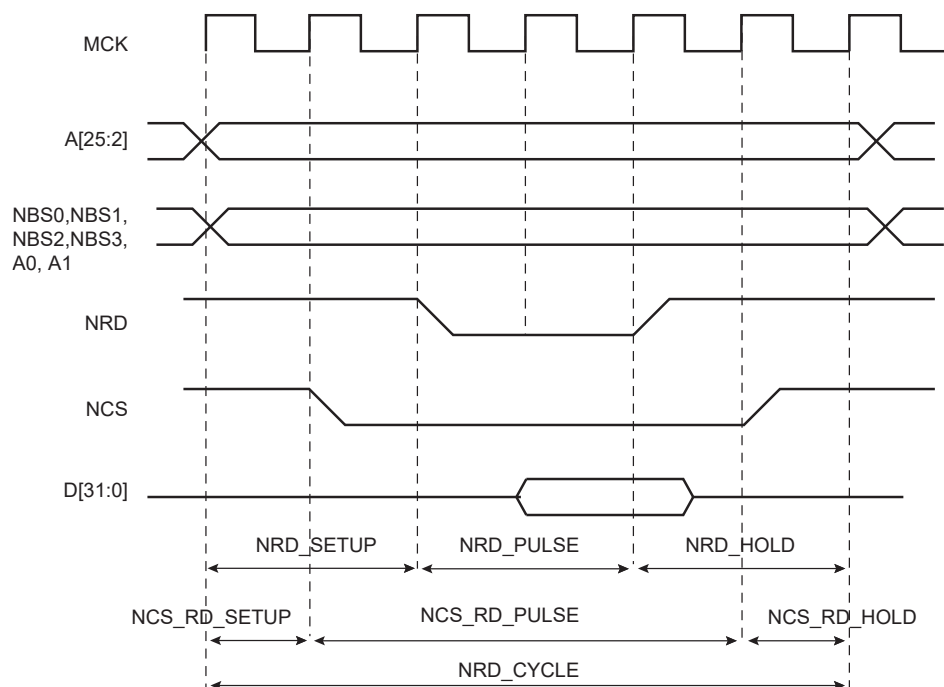

In the following sections, the byte access type is not considered. Byte select lines (NBS0 to NBS3) always have the same timing as the A address bus. NWE represents either the NWE signal in byte select access type or one of the byte write lines (NWR0 to NWR3) in byte write access type. NWR0 to NWR3 have the same timings and protocol as NWE. In the same way, NCS represents one of the NCS[0..5] chip select lines.

### 20.10.1. Read Waveforms

The following figure shows the read cycle. The read cycle starts with the address setting on the memory address bus:

- {A[25:2], A1, A0} for 8-bit devices
- {A[25:2], A1} for 16-bit devices
- {A[25:2]} for 32-bit devices

**Figure 20.8.** Standard Read Cycle

#### 20.10.1.1.NRD Waveform

The NRD signal is characterized by a setup timing, a pulse width and a hold timing:

- NRD\_SETUP—NRD setup time is defined as the setup of address before the NRD falling edge.
- NRD\_PULSE—NRD pulse length is the time between NRD falling edge and NRD rising edge.
- NRD\_HOLD—NRD hold time is defined as the hold time of address after the NRD rising edge.

#### 20.10.1.2.NCS Waveform

Similar to the NRD signal, the NCS signal can be divided into a setup time, pulse length and hold time:

- NCS\_RD\_SETUP—NCS setup time is defined as the setup time of address before the NCS falling edge.
- NCS\_RD\_PULSE—NCS pulse length is the time between NCS falling edge and NCS rising edge;
- NCS\_RD\_HOLD—NCS hold time is defined as the hold time of address after the NCS rising edge.

#### 20.10.1.3.Read Cycle

The NRD\_CYCLE time is defined as the total duration of the read cycle, that is, from the time where address is set on the address bus to the point where address may change. The total read cycle time is defined as:

- $\text{NRD\_CYCLE} = \text{NRD\_SETUP} + \text{NRD\_PULSE} + \text{NRD\_HOLD}$

as well as

- $\text{NRD\_CYCLE} = \text{NCS\_RD\_SETUP} + \text{NCS\_RD\_PULSE} + \text{NCS\_RD\_HOLD}$

All NRD and NCS timings are defined separately for each chip select as an integer number of the main system bus clock cycles. The NRD\_CYCLE field is common to both the NRD and NCS signals, thus the timing period is of the same duration.

NRD\_CYCLE, NRD\_SETUP, and NRD\_PULSE implicitly define the NRD\_HOLD value as:

- $\text{NRD\_HOLD} = \text{NRD\_CYCLE} - \text{NRD\_SETUP} - \text{NRD\_PULSE}$

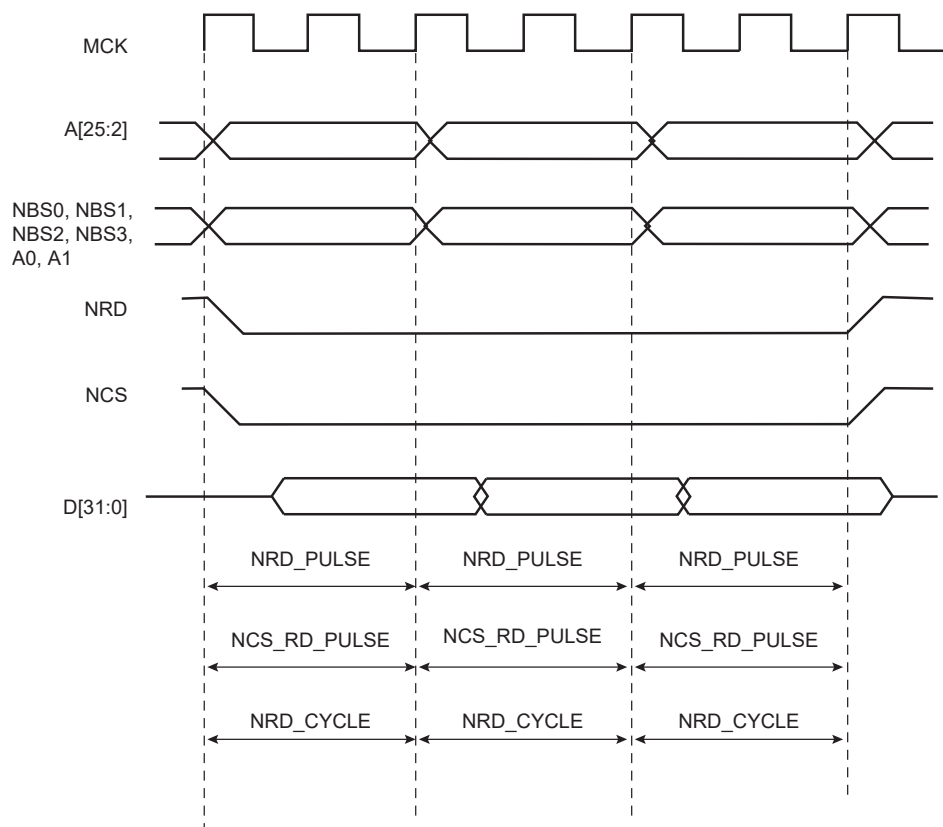

NRD\_CYCLE, NCS\_RD\_SETUP, and NCS\_RD\_PULSE implicitly define the NCS\_RD\_HOLD value as:

- $NCS\_RD\_HOLD = NRD\_CYCLE - NCS\_RD\_SETUP - NCS\_RD\_PULSE$

#### 20.10.1.4. Null Delay Setup and Hold

If null setup and hold parameters are programmed for NRD and/or NCS, NRD and NCS remain active continuously in case of consecutive read cycles in the same memory. See the following figure.

**Figure 20.9.** No Setup, No Hold On NRD and NCS Read Signals

#### 20.10.1.5. Null Pulse

Programming a null pulse is not permitted. Pulse must be at least set to 1. A null value leads to unpredictable behavior.

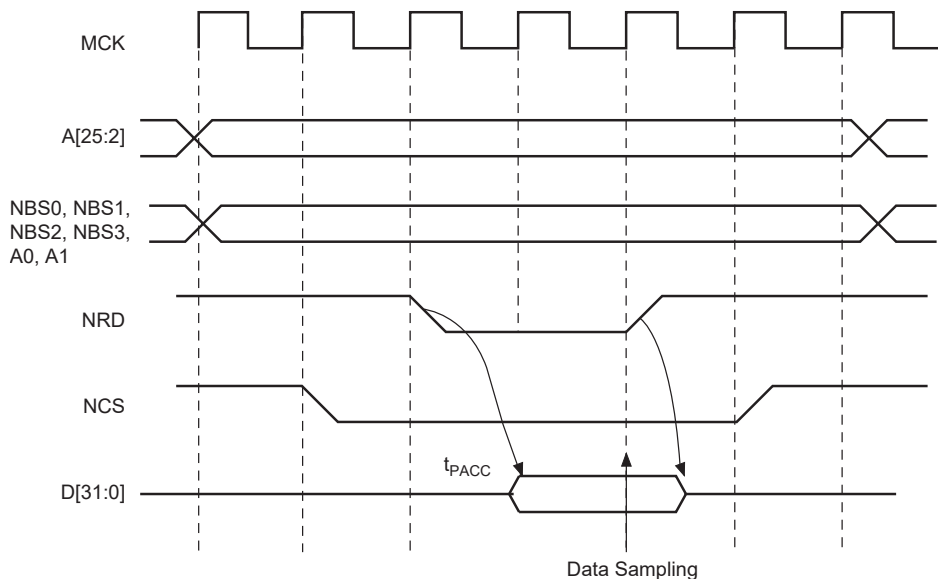

#### 20.10.2. Read Mode

As NCS and NRD waveforms are defined independently of one other, the SMC needs to know when the read data is available on the data bus. The SMC does not compare NCS and NRD timings to know which signal rises first. The READ\_MODE parameter in the SMC\_MODE register of the corresponding chip select indicates which signal of NRD and NCS controls the read operation.

##### 20.10.2.1. Read is Controlled by NRD (READ\_MODE = 1)

The following figure shows the waveforms of a read operation of a typical asynchronous RAM. The read data is available  $t_{PACC}$  after the falling edge of NRD, and turns to 'Z' after the rising edge of NRD. In this case, the READ\_MODE must be set to 1 (read is controlled by NRD), to indicate that data is available with the rising edge of NRD. The SMC samples the read data internally on the rising edge of the main system bus clock that generates the rising edge of NRD, regardless of the NCS programmed waveform.

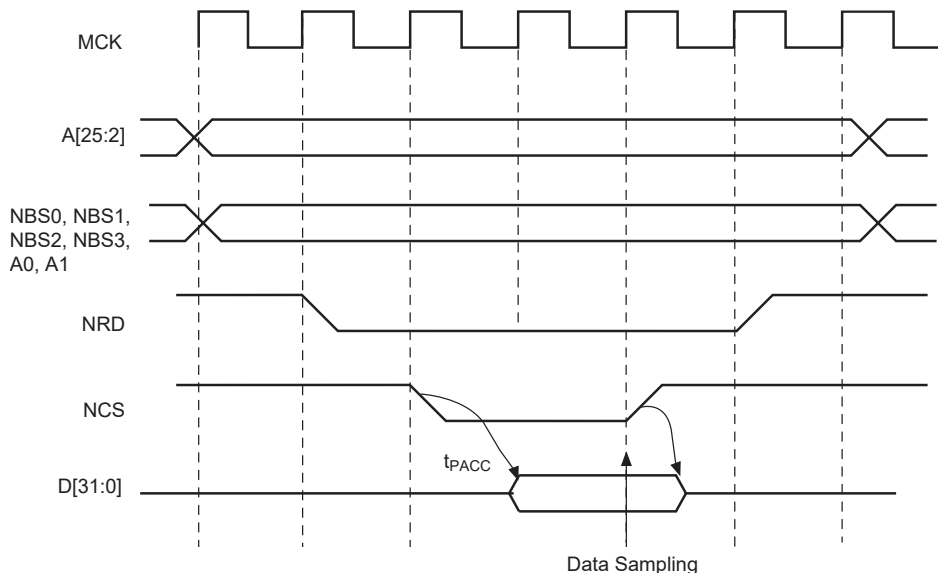

**Figure 20.10.** READ\_MODE = 1 (Data sampled by SMC before rising edge of NRD)

### 20.10.2.2. Read is Controlled by NCS (READ\_MODE = 0)

The following figure shows the typical read cycle of an LCD module. The read data is valid  $t_{PACC}$  after the falling edge of the NCS signal and remains valid until the rising edge of NCS. Data must be sampled when NCS is raised. In that case, READ\_MODE must be set to 0 (read is controlled by NCS); the SMC internally samples the data on the rising edge of the main system bus clock that generates the rising edge of NCS, regardless of the NRD programmed waveform.

**Figure 20.11.** READ\_MODE = 0 (Data sampled by SMC before rising edge of NCS)

### 20.10.3. Write Waveforms

The write protocol (depicted in [Figure 20.12](#)) is similar to the read protocol. The write cycle starts with the address setting on the memory address bus.

#### 20.10.3.1. NWE Waveforms

The NWE signal is characterized by a setup timing, a pulse width and a hold timing.

- **NWE\_SETUP**—NWE setup time is defined as the setup of address and data before the NWE falling edge.
- **NWE\_PULSE**—NWE pulse length is the time between NWE falling edge and NWE rising edge.
- **NWE\_HOLD**—NWE hold time is defined as the hold time of address and data after the NWE rising edge.

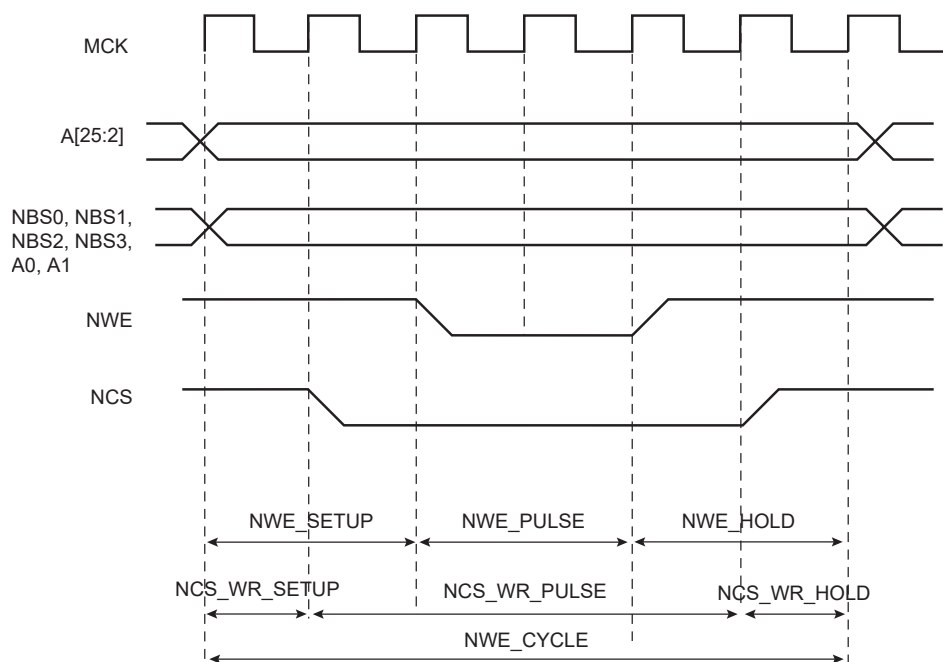

The NWE waveforms apply to all byte-write lines in Byte Write Access mode: NWR0 to NWR3.

### 20.10.3.2.NCS Waveforms

The NCS signal waveforms in write operations are not the same than those applied in read operations, but are defined separately:

- **NCS\_WR\_SETUP**—NCS setup time is defined as the setup time of address before the NCS falling edge.
- **NCS\_WR\_PULSE**—NCS pulse length is the time between NCS falling edge and NCS rising edge.
- **NCS\_WR\_HOLD**—NCS hold time is defined as the hold time of address after the NCS rising edge.

**Figure 20.12.** Write Cycle

### 20.10.3.3. Write Cycle

The write\_cycle time is defined as the total duration of the write cycle, that is, from the time where address is set on the address bus to the point where address may change. The total write cycle time is defined as:

- $NWE\_CYCLE = NWE\_SETUP + NWE\_PULSE + NWE\_HOLD$

as well as

- $NWE\_CYCLE = NCS\_WR\_SETUP + NCS\_WR\_PULSE + NCS\_WR\_HOLD$

All NWE and NCS (write) timings are defined separately for each chip select as an integer number of the main system bus clock cycles. The NWE\_CYCLE field is common to both the NWE and NCS signals, thus the timing period is of the same duration.

NWE\_CYCLE, NWE\_SETUP, and NWE\_PULSE implicitly define the NWE\_HOLD value as:

- $NWE\_HOLD = NWE\_CYCLE - NWE\_SETUP - NWE\_PULSE$

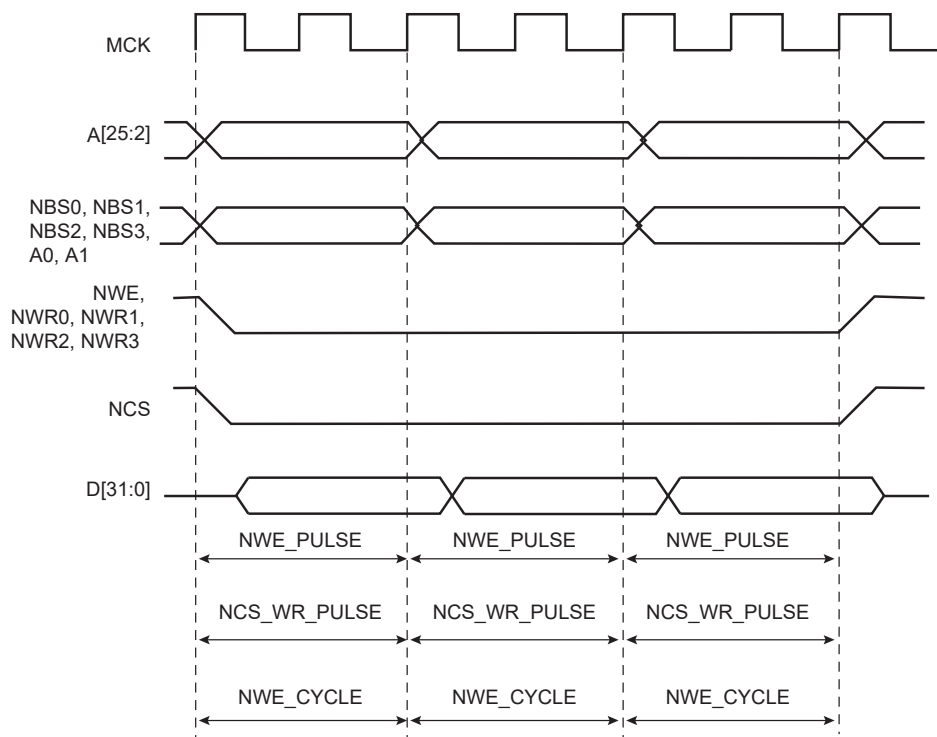

$NWE\_CYCLE$ ,  $NCS\_WR\_SETUP$ , and  $NCS\_WR\_PULSE$  implicitly define the  $NCS\_WR\_HOLD$  value as:

- $NCS\_WR\_HOLD = NWE\_CYCLE - NCS\_WR\_SETUP - NCS\_WR\_PULSE$

#### 20.10.3.4. Null Delay Setup and Hold

If null setup parameters are programmed for NWE and/or NCS, NWE and/or NCS remain active continuously in case of consecutive write cycles in the same memory. See the following figure. However, for devices that perform write operations on the rising edge of NWE or NCS, such as SRAM, either a setup or a hold must be programmed.

**Figure 20.13.** Null Setup and Hold Values of NCS and NWE in Write Cycle

#### 20.10.3.5. Null Pulse

Programming a null pulse is not permitted. Pulse must be at least set to 1. A null value leads to unpredictable behavior.

#### 20.10.4. Write Mode

The **WRITE\_MODE** parameter in the **SMC\_MODE** register of the corresponding chip select indicates which signal controls the write operation.

##### 20.10.4.1. Write is Controlled by NWE (**WRITE\_MODE = 1**)

The following figure shows the waveforms of a write operation with **WRITE\_MODE** set to 1. The data is put on the bus during the pulse and hold steps of the NWE signal. The internal data buffers are switched to Output mode after the **NWE\_SETUP** time, and until the end of the write cycle, regardless of the programmed waveform on NCS.

**Figure 20.14.** WRITE\_MODE = 1 (Write Operation Controlled by NWE)

#### 20.10.4.2. Write is Controlled by NCS (WRITE\_MODE = 0)

The following figure shows the waveforms of a write operation with WRITE\_MODE set to 0. The data is put on the bus during the pulse and hold steps of the NCS signal. The internal data buffers are switched to Output mode after the NCS\_WR\_SETUP time, and until the end of the write cycle, regardless of the programmed waveform on NWE.

**Figure 20.15.** WRITE\_MODE = 0 (Write Operation Controlled by NCS)

#### 20.10.5. Coding Timing Parameters

All timing parameters are defined for one chip select and are grouped together in one SMC\_REGISTER according to their type.

The SMC\_SETUP register groups the definition of all setup parameters:

- NRD\_SETUP, NCS\_RD\_SETUP, NWE\_SETUP, NCS\_WR\_SETUP

The SMC\_PULSE register groups the definition of all pulse parameters:

- NRD\_PULSE, NCS\_RD\_PULSE, NWE\_PULSE, NCS\_WR\_PULSE

The SMC\_CYCLE register groups the definition of all cycle parameters:

- NRD\_CYCLE, NWE\_CYCLE

The following table shows how the timing parameters are coded and their permitted range.

**Table 20.4.** Coding and Range of Timing Parameters

Coded Value	Number of Bits	Effective Value	Permitted Range	
			Coded Value	Effective Value
setup [5:0]	6	$128 \times \text{setup}[5] + \text{setup}[4:0]$	$0 \leq 31$	$0 \leq 128 + 31$
pulse [6:0]	7	$256 \times \text{pulse}[6] + \text{pulse}[5:0]$	$0 \leq 63$	$0 \leq 256 + 63$
cycle [8:0]	9	$256 \times \text{cycle}[8:7] + \text{cycle}[6:0]$	$0 \leq 127$	$0 \leq 256 + 127$
				$0 \leq 512 + 127$
				$0 \leq 768 + 127$

### 20.10.6. Reset Values of Timing Parameters

For the default values of timing parameters at reset, see [SMC\\_SETUPx](#), [SMC\\_PULSEx](#) and [SMC\\_CYCLEx](#).

### 20.10.7. Usage Restriction

The SMC does not check the validity of the user-programmed parameters. If the sum of SETUP and PULSE parameters is larger than the corresponding CYCLE parameter, this leads to unpredictable behavior of the SMC.

- For read operations:  
Null but positive setup and hold of address and NRD and/or NCS can not be guaranteed at the memory interface because of the propagation delay of these signals through external logic and pads. If positive setup and hold values must be verified, then it is strictly recommended to program non-null values so as to cover possible skews between address, NCS and NRD signals.
- For write operations:  
If a null hold value is programmed on NWE, the SMC can guarantee a positive hold of address, byte select lines, and NCS signal after the rising edge of NWE. This is true for WRITE\_MODE = 1 only. See [Early Read Wait State](#).
- For read and write operations:  
A null value for pulse parameters is forbidden and may lead to unpredictable behavior.  
In read and write cycles, the setup and hold time parameters are defined in reference to the address bus. For external devices that require setup and hold time between NCS and NRD signals (read), or between NCS and NWE signals (write), these setup and hold times must be converted into setup and hold times in reference to the address bus.

## 20.11. Automatic Wait States

Under certain circumstances, the SMC automatically inserts idle cycles between accesses to avoid bus contention or operation conflict.

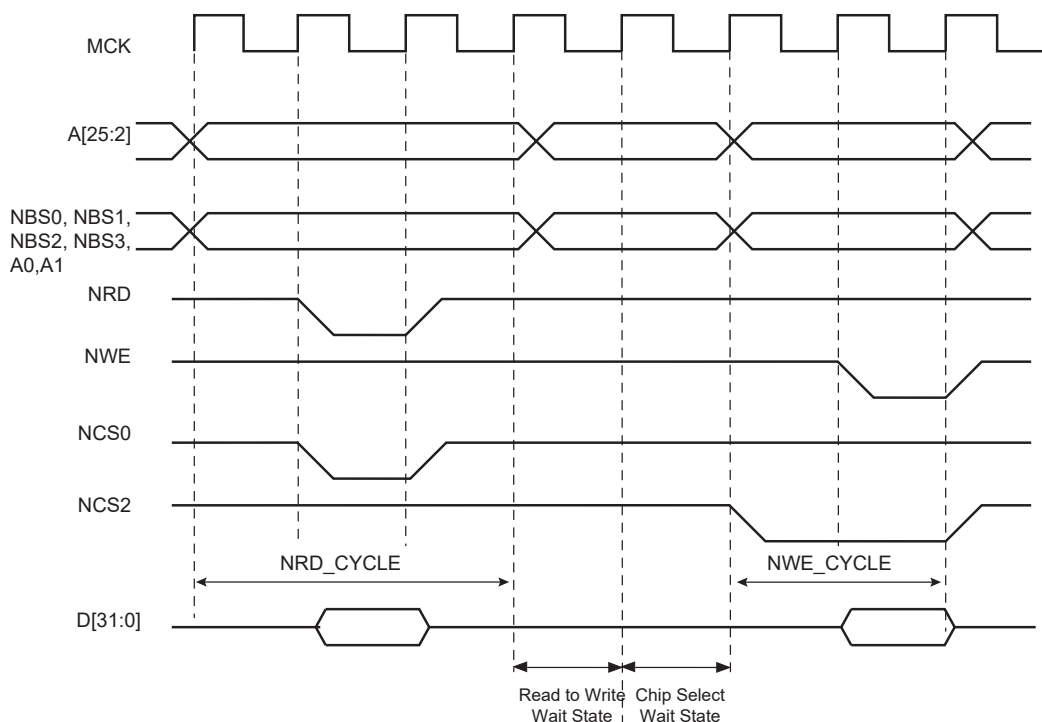

### 20.11.1. Chip Select Wait States

The SMC always inserts an idle cycle between two transfers on separate chip selects. This idle cycle ensures that there is no bus contention between the de-activation of one device and the activation of the next one.

During Chip Select Wait state, all control lines are turned inactive: NBS0 to NBS3, NWR0 to NWR3, NCS[0..5], NRD lines are all set to 1.

The following figure illustrates a Chip Select Wait state between accesses on Chip Select 0 and Chip Select 2.

**Figure 20.16.** Chip Select Wait State between a Read Access on NCS0 and a Write Access on NCS2

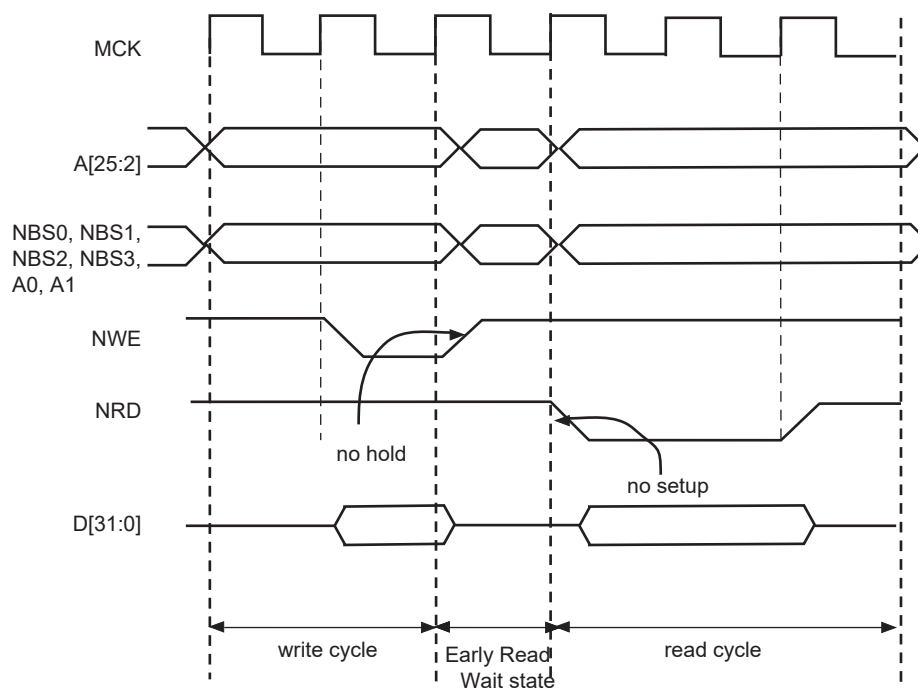

### 20.11.2. Early Read Wait State

In some cases, the SMC inserts a Wait state cycle between a write access and a read access to allow time for the write cycle to end before the subsequent read cycle begins. This Wait state is not generated in addition to a Chip Select Wait state. The early read cycle thus only occurs between a write and read access to the same memory device (same chip select).

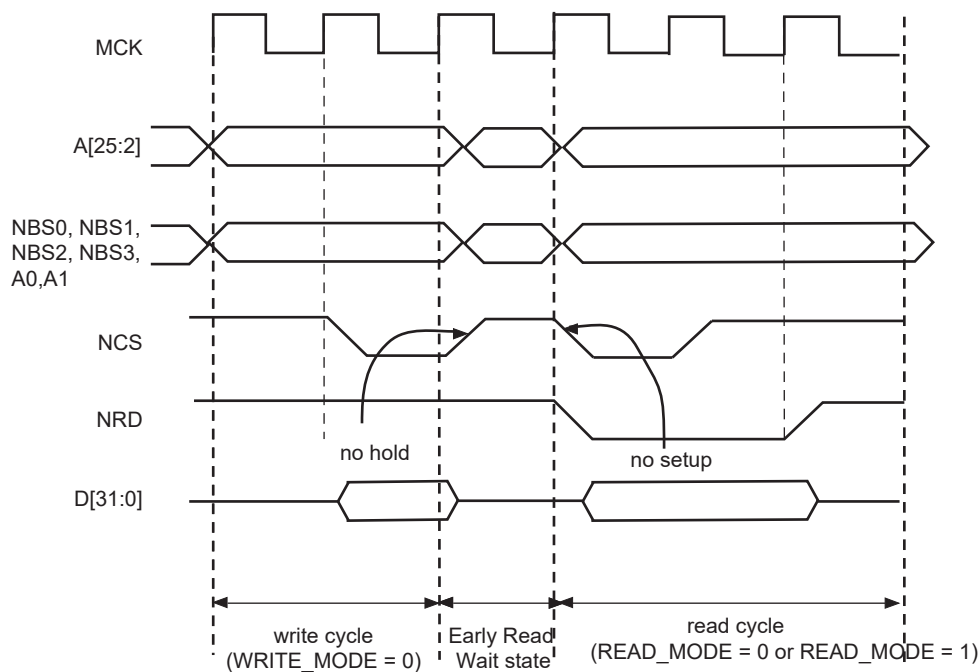

An Early Read Wait state is automatically inserted if at least one of the following conditions is valid:

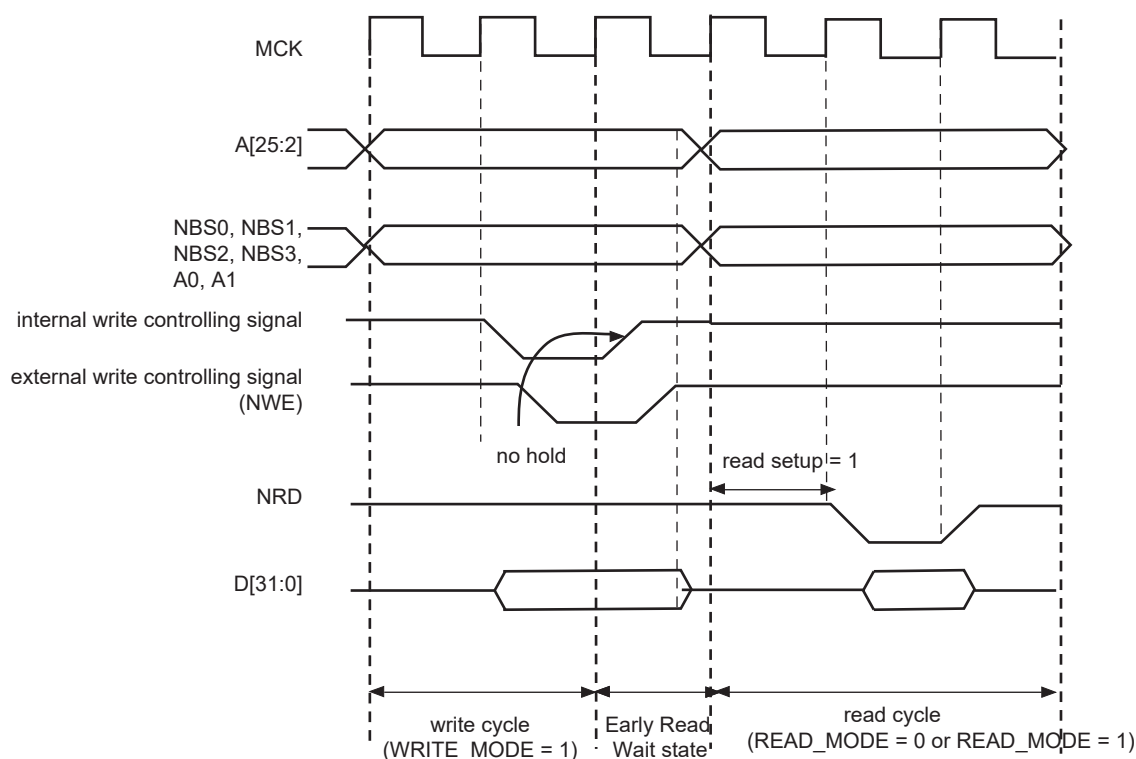

- The write controlling signal has no hold time and the read controlling signal has no setup time ([Figure 20.17](#)).
- In NCS Write Controlled mode (`WRITE_MODE = 0`), there is no hold timing on the NCS signal and the `NCS_RD_SETUP` parameter is set to 0, regardless of the read mode ([Figure 20.18](#)). The write operation must end with a NCS rising edge. Without an Early Read Wait State, the write operation could not complete properly.
- In NWE Controlled mode (`WRITE_MODE = 1`) and if there is no hold timing (`NWE_HOLD = 0`), the feedback of the write control signal is used to control address, data, chip select and byte select lines. If the external write control signal is not inactivated as expected due to load capacitances, an Early Read Wait State is inserted and address, data and control signals are maintained one more cycle. See [Figure 20.19](#).

**Figure 20.17.** Early Read Wait State: Write with No Hold Followed by Read with No Setup

**Figure 20.18.** Early Read Wait State: NCS Controlled Write with No Hold Followed by a Read with No NCS Setup

**Figure 20.19.** Early Read Wait State: NWE-controlled Write with No Hold Followed by a Read with one Set-up Cycle

### 20.11.3. Reload User Configuration Wait State

The user may change any of the configuration parameters by writing the SMC user interface.

When detecting that a new user configuration has been written in the user interface, the SMC inserts a wait state before starting the next access. The so called “Reload User Configuration Wait State” is used by the SMC to load the new set of parameters to apply to next accesses.

The Reload Configuration Wait State is not applied in addition to the Chip Select Wait State. If accesses before and after re-programming the user interface are made to different devices (Chip Selects), then one single Chip Select Wait State is applied.

On the other hand, if accesses before and after writing the user interface are made to the same device, a Reload Configuration Wait State is inserted, even if the change does not concern the current Chip Select.

#### 20.11.3.1. User Procedure

To insert a Reload Configuration Wait State, the SMC detects a write access to any SMC\_MODE register of the user interface. If the user only modifies timing registers (SMC\_SETUP, SMC\_PULSE, SMC\_CYCLE registers) in the user interface, he must validate the modification by writing the SMC\_MODE, even if no change was made on the mode parameters.

The user must not change the configuration parameters of an SMC Chip Select (Setup, Pulse, Cycle, Mode) if accesses are performed on this CS during the modification. Any change of the Chip Select parameters, while fetching the code from a memory connected on this CS, may lead to unpredictable behavior. The instructions used to modify the parameters of an SMC Chip Select can be executed from the internal RAM or from a memory connected to another CS.

### 20.11.3.2.Slow Clock Mode Transition

A Reload Configuration Wait state is also inserted when the Slow Clock mode is entered or exited, after the end of the current transfer (see [Slow Clock Mode](#)).

### 20.11.4. Read to Write Wait State

Due to an internal mechanism, a wait cycle is always inserted between consecutive read and write SMC accesses.

This wait cycle is referred to as a Read to Write Wait state in this document.

This wait cycle is applied in addition to chip select and reload user configuration Wait states when they are to be inserted. See [Figure 20.16](#).

## 20.12. Data Float Wait States

Some memory devices are slow to release the external bus. For such devices, it is necessary to add wait states (data float wait states) after a read access:

- before starting a read access to a different external memory
- before starting a write access to the same device or to a different external one.

The Data Float Output Time ( $t_{DF}$ ) for each external memory device is programmed in the TDF\_CYCLES field of the SMC\_MODE register for the corresponding chip select. The value of TDF\_CYCLES indicates the number of data float wait cycles (between 0 and 15) before the external device releases the bus, and represents the time allowed for the data output to go to high impedance after the memory is disabled.

Data float wait states do not delay internal memory accesses. Hence, a single access to an external memory with long  $t_{DF}$  will not slow down the execution of a program from internal memory.

The data float wait states management depends on the READ\_MODE and the TDF\_MODE fields of the SMC\_MODE register for the corresponding chip select.

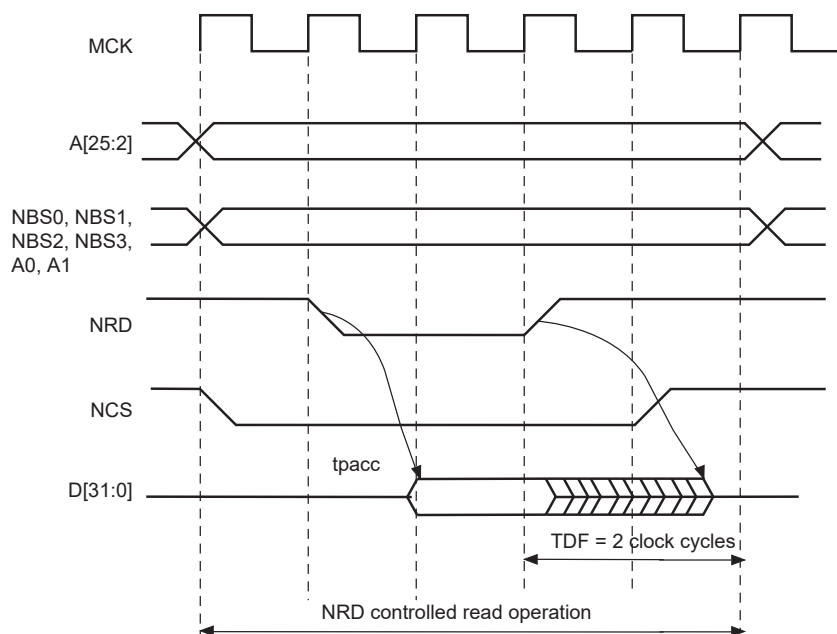

### 20.12.1. READ\_MODE

Setting READ\_MODE to 1 indicates to the SMC that the NRD signal is responsible for turning off the tri-state buffers of the external memory device. The Data Float Period then begins after the rising edge of the NRD signal and lasts TDF\_CYCLES MCK cycles.

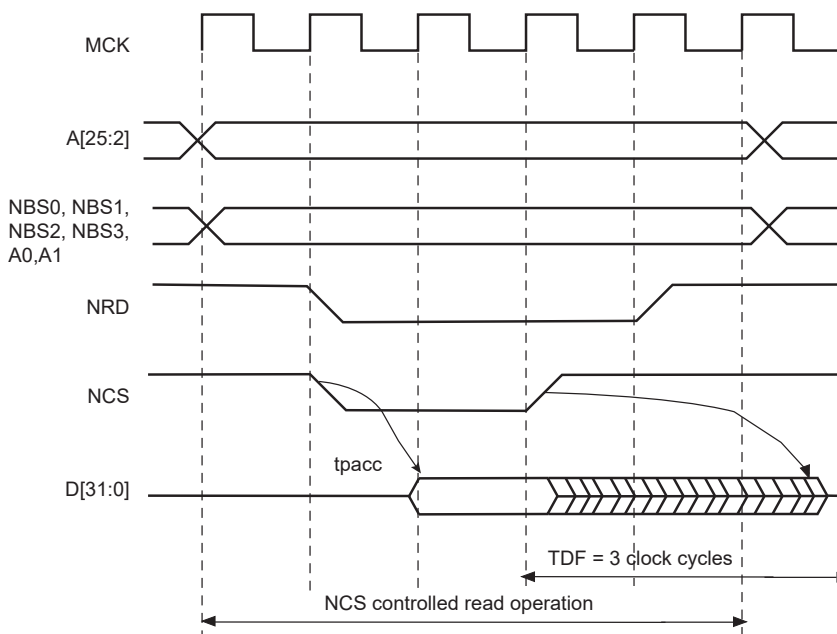

When the read operation is controlled by the NCS signal (READ\_MODE = 0), the TDF field gives the number of MCK cycles during which the data bus remains busy after the rising edge of NCS.

[Figure 20.20](#) illustrates the Data Float Period in NRD-controlled mode (READ\_MODE = 1), assuming a data float period of two cycles (TDF\_CYCLES = 2). [Figure 20.21](#) shows the read operation when controlled by NCS (READ\_MODE = 0) and the TDF\_CYCLES parameter equals 3.

**Figure 20.20.** TDF Period in NRD Controlled Read Access (TDF = 2)

**Figure 20.21.** TDF Period in NCS Controlled Read Operation (TDF = 3)

### 20.12.2. TDF Optimization Enabled (TDF\_MODE = 1)

When SMC\_MODE.TDF\_MODE is set to 1 (TDF optimization enabled), the SMC takes advantage of the setup period of the next access to optimize the number of Wait state cycles to insert.

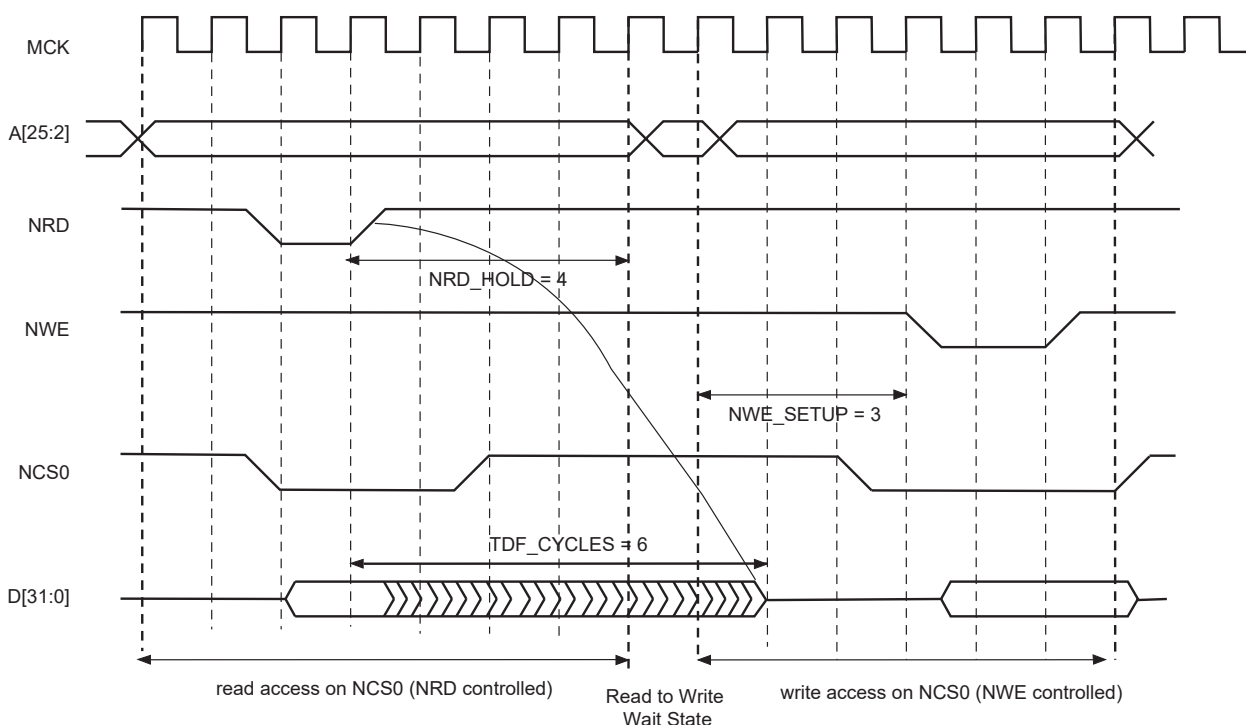

The following figure shows a read access controlled by NRD, followed by a write access controlled by NWE, on Chip Select 0. Chip Select 0 has been programmed with:

NRD\_HOLD = 4; READ\_MODE = 1 (NRD controlled)

NWE\_SETUP = 3; WRITE\_MODE = 1 (NWE controlled)

TDF\_CYCLES = 6; TDF\_MODE = 1 (optimization enabled).

**Figure 20.22.** TDF Optimization: No TDF Wait states are inserted if the TDF period is over when the next access begins

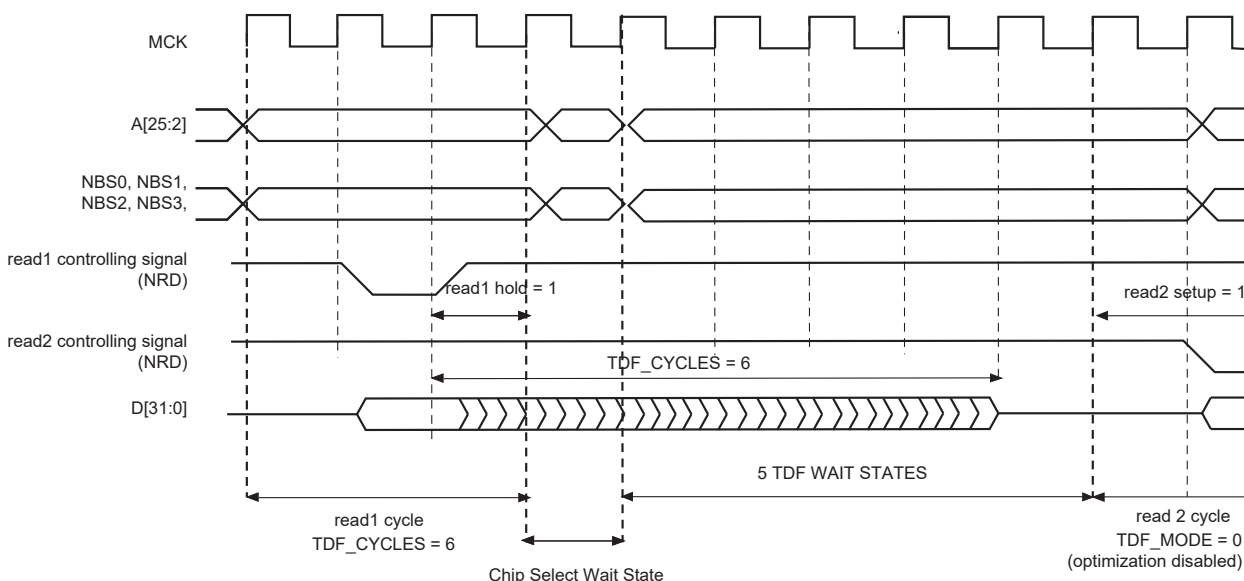

### 20.12.3. TDF Optimization Disabled (TDF\_MODE = 0)

When optimization is disabled, TDF Wait states are inserted at the end of the read transfer, so that the data float period is ended when the second access begins. If the hold period of the read1 controlling signal overlaps the data float period, no additional TDF Wait states will be inserted.

Figure 20.23, Figure 20.24 and Figure 20.25 illustrate the following cases, with no TDF optimization:

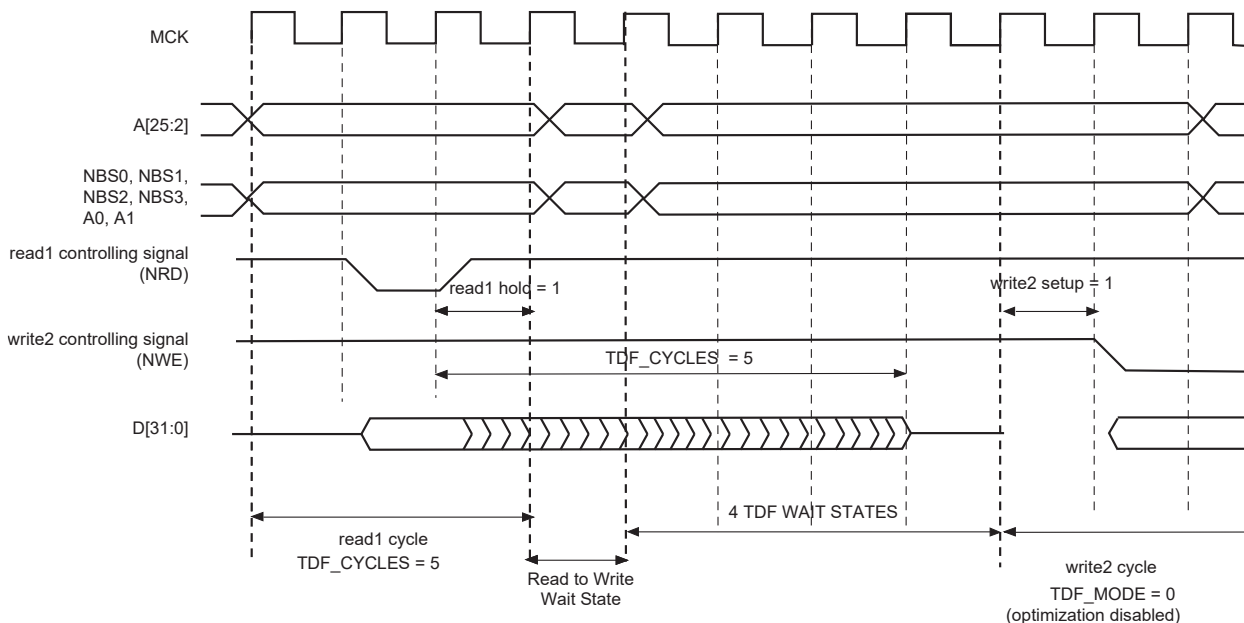

- Read access followed by a read access on another chip select
- Read access followed by a write access on another chip select
- Read access followed by a write access on the same chip select

**Figure 20.23.** TDF Optimization Disabled (TDF Mode = 0): TDF Wait states between 2 read accesses on different chip selects

**Figure 20.24.** TDF Mode = 0: TDF Wait states between read and write accesses on different chip selects

**Figure 20.25.** TDF Mode = 0: TDF Wait states between read and write accesses on the same chip select

## 20.13. External Wait

Any access can be extended by an external device using the NWAIT input signal of the SMC. The EXNW\_MODE field of the SMC\_MODE register on the corresponding chip select must be set to either to '10' (Frozen mode) or '11' (Ready mode). When the EXNW\_MODE is set to '00' (disabled), the NWAIT signal is simply ignored on the corresponding chip select. The NWAIT signal delays the read or write operation in regards to the read or write controlling signal, depending on the read and write modes of the corresponding chip select.

### 20.13.1. Restriction

When one of the EXNW\_MODE is enabled, at least one hold cycle must be programmed for the read/write controlling signal. For that reason, the NWAIT signal cannot be used in Page mode (see [Asynchronous Page Mode](#)) nor in Slow Clock mode (see [Slow Clock Mode](#)).

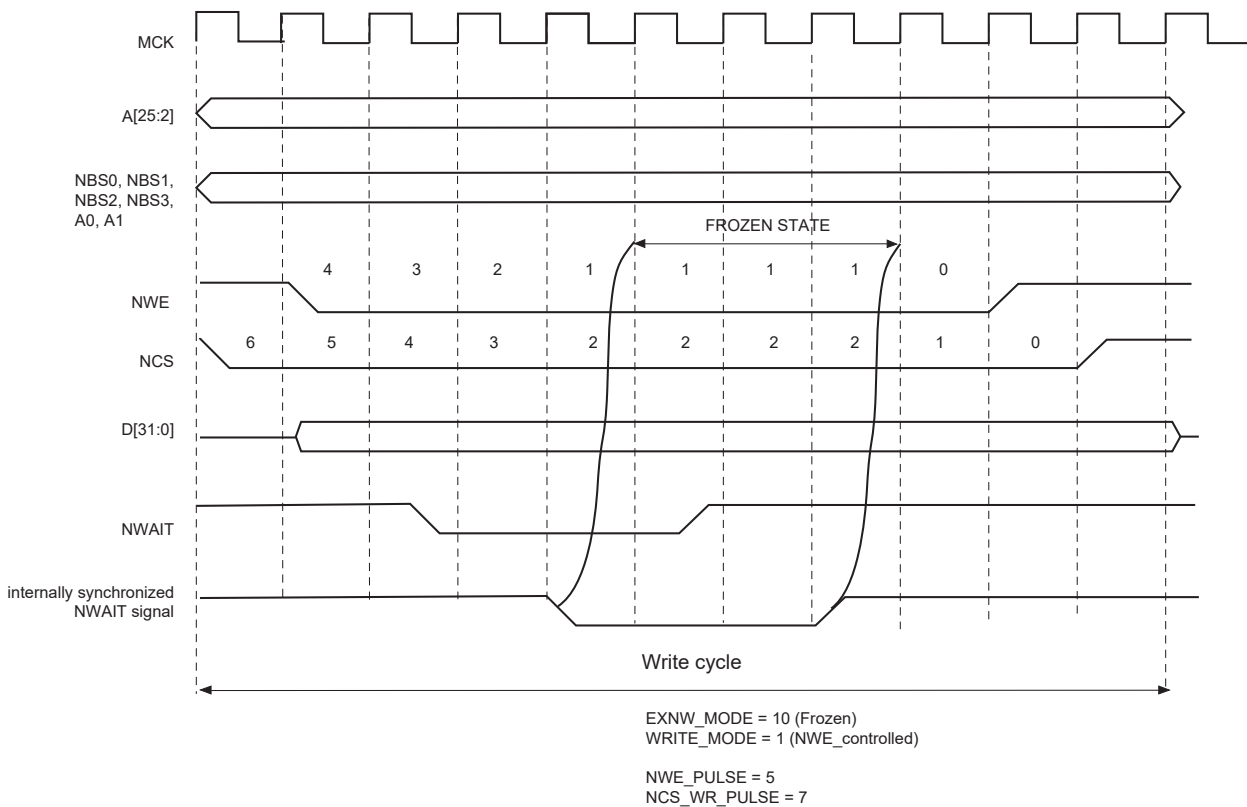

The NWAIT signal is assumed to be a response of the external device to the read/write request of the SMC. Then NWAIT is examined by the SMC only in the Pulse state of the read or write controlling signal. The assertion of the NWAIT signal outside the expected period has no impact on SMC behavior.

### 20.13.2. Frozen Mode

When the external device asserts the NWAIT signal (active low), and after internal synchronization of this signal, the SMC state is frozen, i.e., SMC internal counters are frozen, and all control signals remain unchanged. When the resynchronized NWAIT signal is deasserted, the SMC completes the access, resuming the access from the point where it was stopped. See the following figure. This mode must be selected when the external device uses the NWAIT signal to delay the access and to freeze the SMC.

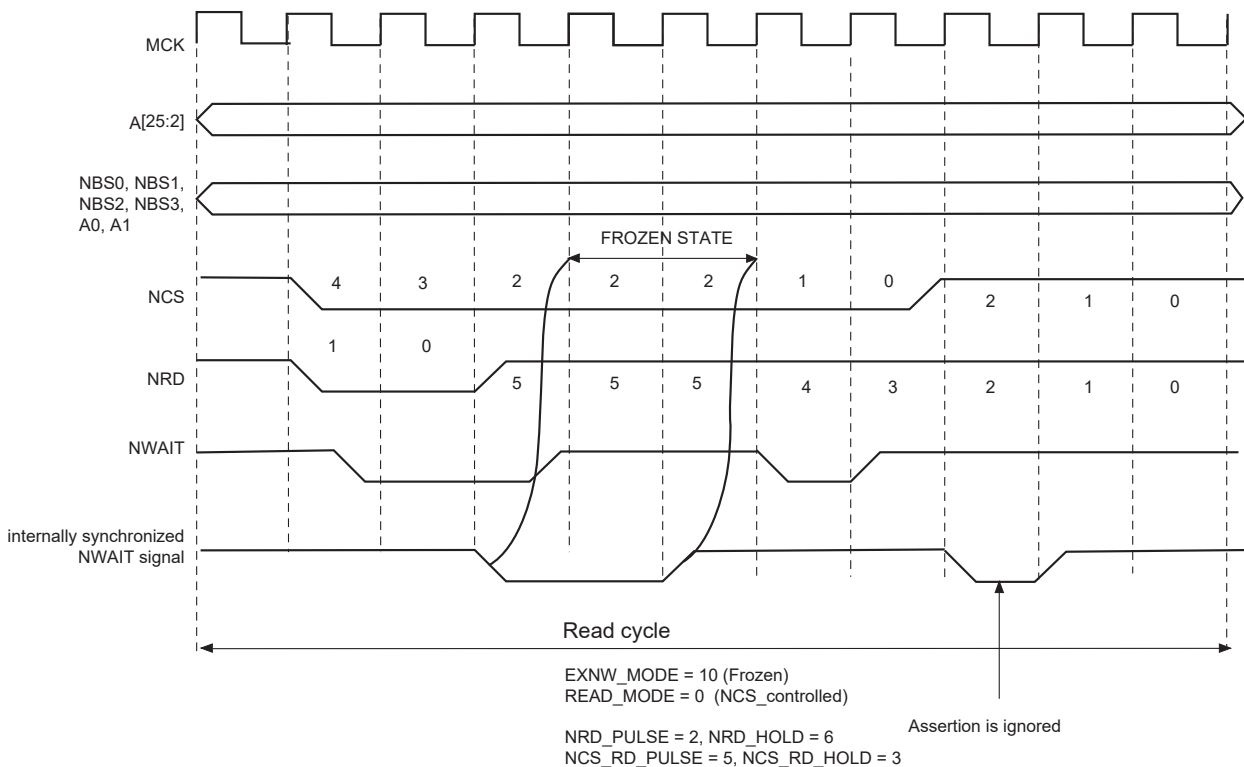

**Figure 20.26.** Write Access with NWAIT Assertion in Frozen Mode (EXNW\_MODE = 10)

The assertion of the NWAIT signal outside the expected period is ignored as illustrated in the figure below.

**Figure 20.27.** Read Access with NWAIT Assertion in Frozen Mode (EXNW\_MODE = 10)

### 20.13.3. Ready Mode

In Ready mode (EXNW\_MODE = 11), the SMC behaves differently. Normally, the SMC begins the access by down counting the setup and pulse counters of the read/write controlling signal. In the last cycle of the pulse phase, the resynchronized NWAIT signal is examined.

If asserted, the SMC suspends the access as shown in the figures [Figure 20.28](#) and [Figure 20.29](#). After deassertion, the access is completed: the hold step of the access is performed.

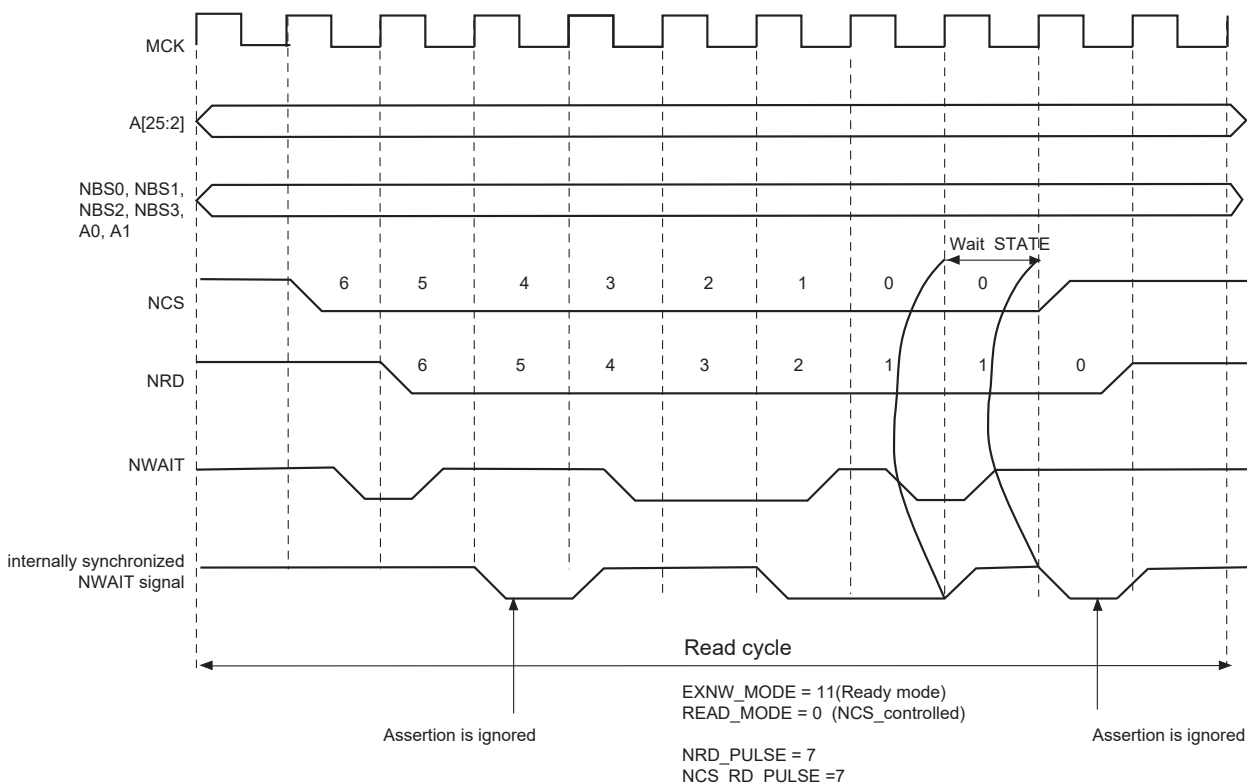

This mode must be selected when the external device uses deassertion of the NWAIT signal to indicate its ability to complete the read or write operation.

If the NWAIT signal is deasserted before the end of the pulse, or asserted after the end of the pulse of the controlling read/write signal, it has no impact on the access length as shown in [Figure 20.29](#).

**Figure 20.28.** NWAIT Assertion in Write Access: Ready Mode (EXNW\_MODE = 11)

**Figure 20.29.** NWAIT Assertion in Read Access: Ready Mode (EXNW\_MODE = 11)

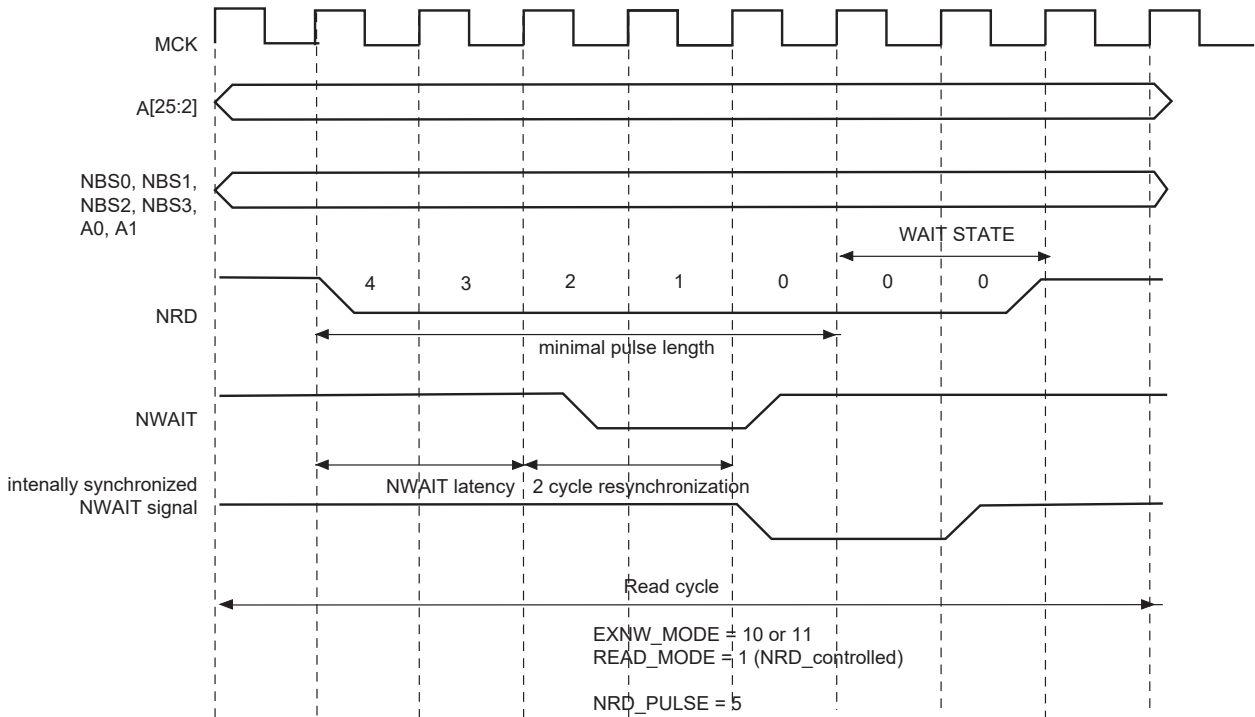

#### 20.13.4. NWAIT Latency and Read/Write Timings

There may be a latency between the assertion of the read/write controlling signal and the assertion of the NWAIT signal by the device. The programmed pulse length of the read/write controlling signal must be at least equal to this latency plus the 2 resynchronization cycles + 1 cycle. Otherwise, the SMC may enter the Hold state of the access without detecting the NWAIT signal assertion. This is true in Frozen mode as well as in Ready mode. This is illustrated in the following figure.

When EXNW\_MODE is enabled (Ready or Frozen), the user must program a pulse length of the read and write controlling signal of at least:

minimal pulse length = NWAIT latency + 2 resynchronization cycles + 1 cycle

**Figure 20.30.** NWAIT Latency

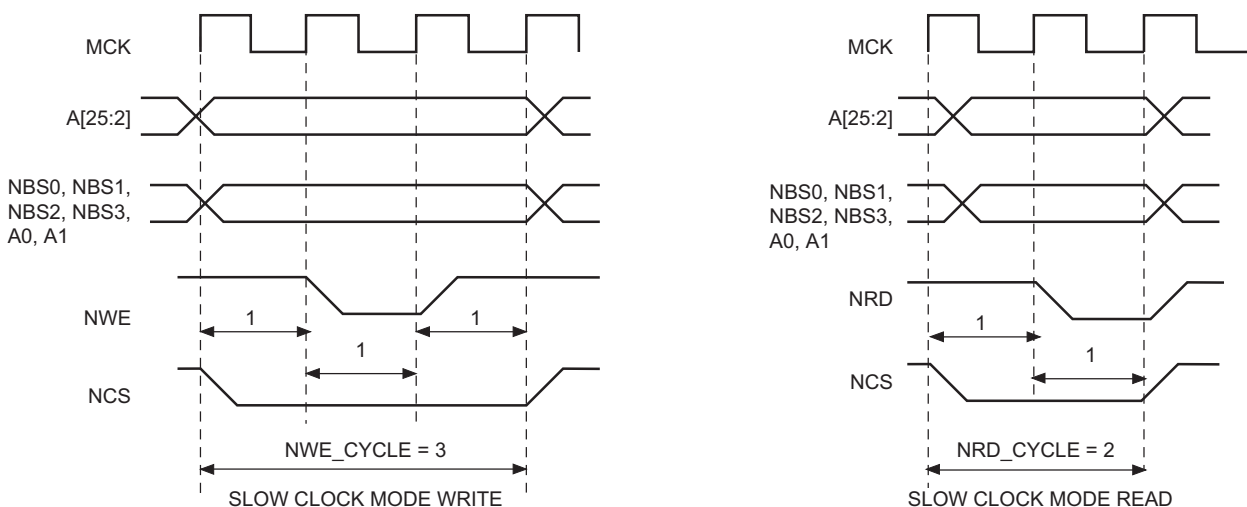

#### 20.14. Slow Clock Mode

The SMC is able to automatically apply a set of “Slow Clock mode” read/write waveforms when an internal signal driven by the Power Management Controller is asserted because MCK has been configured to a very slow clock rate (typically, 32 kHz). In this mode, the user-programmed waveforms are ignored and the Slow Clock mode waveforms are applied. This mode is provided to avoid reprogramming the User Interface with appropriate waveforms at very slow clock rates. When activated, Slow Clock mode is active on all chip selects.

##### 20.14.1. Slow Clock Mode Waveforms

The figure below illustrates the read and write operations in Slow Clock mode. They are valid on all chip selects. The following table indicates the value of read and write parameters in Slow Clock mode.

**Figure 20.31. Read/Write Cycles in Slow Clock Mode**

**Table 20.5. Read and Write Timing Parameters in Slow Clock Mode**

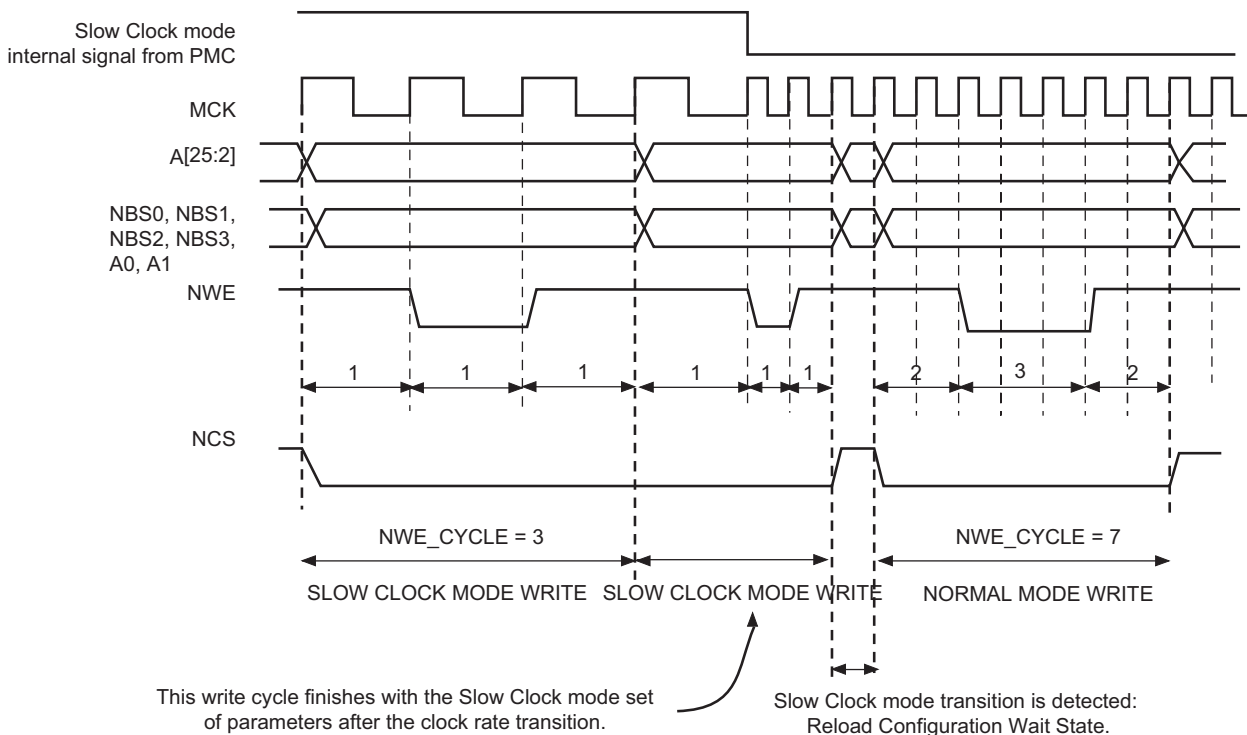

Read Parameters	Duration (cycles)	Write Parameters	Duration (cycles)
NRD_SETUP	1	NWE_SETUP	1
NRD_PULSE	1	NWE_PULSE	1
NCS_RD_SETUP	0	NCS_WR_SETUP	0
NCS_RD_PULSE	2	NCS_WR_PULSE	3
NRD_CYCLE	2	NWE_CYCLE	3

#### 20.14.2. Switching from (to) Slow Clock Mode to (from) Normal Mode

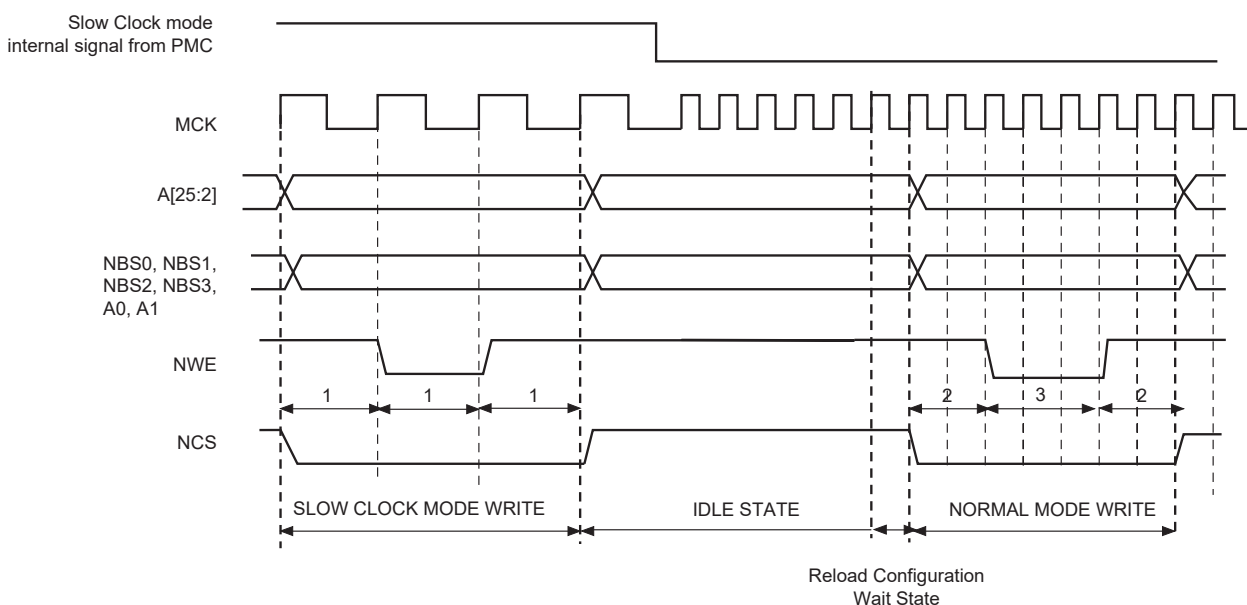

When switching from Slow Clock mode to Normal mode, the current Slow Clock mode transfer is completed at high clock rate, with the set of Slow Clock mode parameters. See [Figure 20.32](#). The external device may not be fast enough to support such timings.

[Figure 20.33](#) illustrates the recommended procedure to properly switch from one mode to the other.

**Figure 20.32.** Clock Rate Transition Occurs while the SMC is Performing a Write Operation

**Figure 20.33.** Recommended Procedure to Switch from Slow Clock Mode to Normal Mode or from Normal Mode to Slow Clock Mode

## 20.15. Asynchronous Page Mode

The SMC supports asynchronous burst reads in Page mode, providing that the Page mode is enabled in the SMC\_MODE register (PMEN field). The page size must be configured in the SMC\_MODE register (PS field) to 4, 8, 16 or 32 bytes.

The page defines a set of consecutive bytes into memory. A 4-byte page (resp. 8-, 16-, 32-byte page) is always aligned to 4-byte boundaries (resp. 8-, 16-, 32-byte boundaries) of memory. The MSB of

data address defines the address of the page in memory, the LSB of address define the address of the data in the page as detailed in the table below.

With Page mode memory devices, the first access to one page ( $t_{pa}$ ) takes longer than the subsequent accesses to the page ( $t_{sa}$ ) as shown in Figure 20.34. When in Page mode, the SMC enables the user to define different read timings for the first access within one page, and next accesses within the page.

**Table 20.6.** Page Address and Data Address Within a Page

Page Size	Page Address <sup>(1)</sup>	Data Address in the Page <sup>(2)</sup>
4 bytes	A[25:2]	A[1:0]
8 bytes	A[25:3]	A[2:0]
16 bytes	A[25:4]	A[3:0]
32 bytes	A[25:5]	A[4:0]

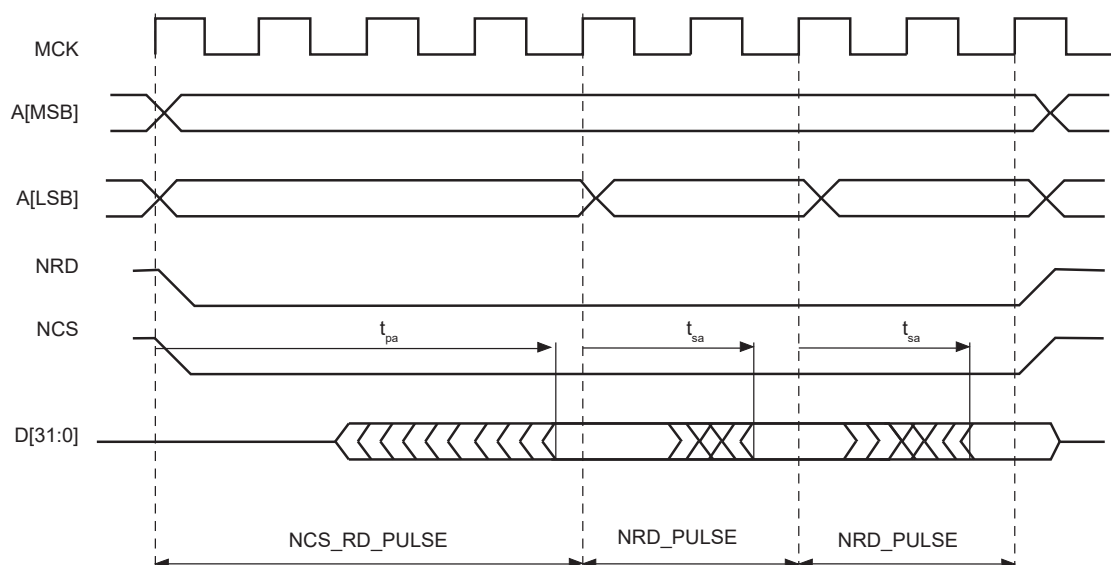

**Notes:**

1. 'A' denotes the address bus of the memory device.
2. For 16-bit devices, bit 0 of the address is ignored. For 32-bit devices, bits [1:0] are ignored.

### 20.15.1. Protocol and Timings in Page Mode

The following figure shows the NRD and NCS timings in Page mode access. For the address MSB and LSB, see Table 20.6.

**Figure 20.34.** Page Mode Read Protocol

The NRD and NCS signals are held low during all read transfers, whatever the programmed values of the setup and hold timings in the User Interface may be. Moreover, the NRD and NCS timings are identical. The pulse length of the first access to the page is defined with the NCS\_RD\_PULSE field of the SMC\_PULSE register. The pulse length of subsequent accesses within the page are defined using the NRD\_PULSE parameter.

Programming of the read timings in Page mode is described in the following table.

**Table 20.7.** Programming of Read Timings in Page Mode

Parameter	Value	Definition
READ_MODE	'X'	No impact

.....continued

Parameter	Value	Definition
NCS_RD_SETUP	'X'	No impact
NCS_RD_PULSE	$t_{pa}$	Access time of first access to the page
NRD_SETUP	'X'	No impact
NRD_PULSE	$t_{sa}$	Access time of subsequent accesses in the page
NRD_CYCLE	'X'	No impact

The SMC does not check the coherency of timings. It will always apply the NCS\_RD\_PULSE timings as page access timing ( $t_{pa}$ ) and the NRD\_PULSE for accesses to the page ( $t_{sa}$ ), even if the programmed value for  $t_{pa}$  is shorter than the programmed value for  $t_{sa}$ .

### 20.15.2. Byte Access Type in Page Mode

The byte access type (BAT) configuration remains active in Page mode. For 16-bit or 32-bit Page mode devices that require byte selection signals, write a 0 to the BAT bit in the SMC Mode register (SMC\_MODE) to select the byte select access type.

### 20.15.3. Page Mode Restriction

The Page mode is not compatible with the use of the NWAIT signal. Using the Page mode and the NWAIT signal may lead to unpredictable behavior.

### 20.15.4. Sequential and Non-Sequential Accesses

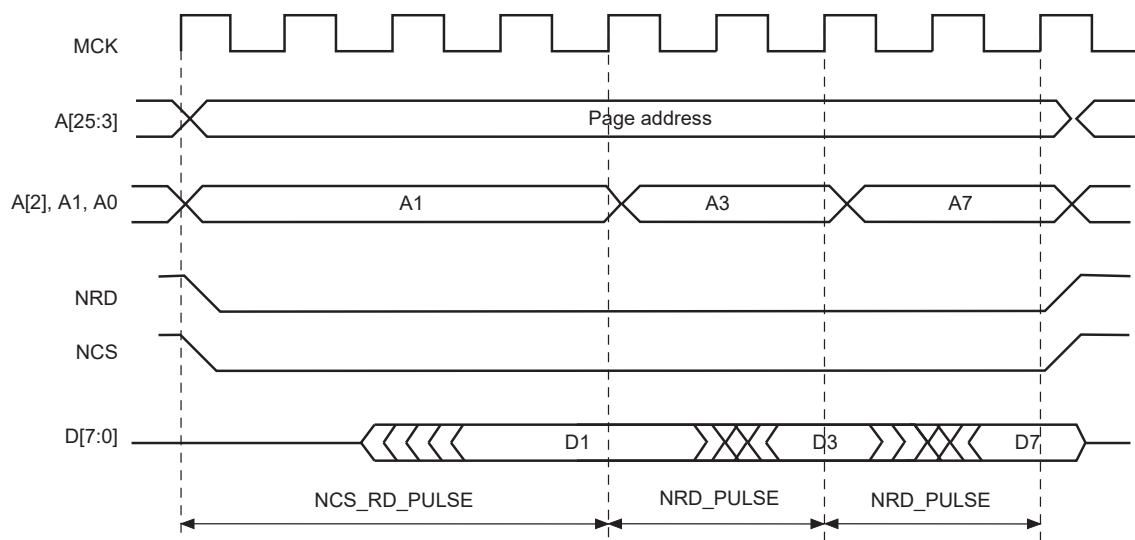

If the chip select and the MSB of addresses as defined in [Table 20.6](#) are identical, then the current access lies in the same page as the previous one, and no page break occurs.

Using this information, all data within the same page, sequential or not sequential, are accessed with a minimum access time ( $t_{sa}$ ). The following figure illustrates access to an 8-bit memory device in Page mode, with 8-byte pages. Access to D1 causes a page access with a long access time ( $t_{pa}$ ). Accesses to D3 and D7, though they are not sequential accesses, only require a short access time ( $t_{sa}$ ).

If the address MSBs differ, the SMC performs the access of a new page. In the same way, if the chip select is different from the previous access, a page break occurs. If two sequential accesses are made to the Page mode memory, but separated by an other internal or external peripheral access, a page break occurs on the second access because the chip select of the device was deasserted between both accesses.

**Figure 20.35.** Access to Non-sequential Data within the Same Page

## 20.16. Register Write Protection

To prevent any single software error from corrupting SMC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [Write Protection Mode Register](#) (SMC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [Write Protection Status Register](#) (SMC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SMC\_WPSR.

The following registers can be write-protected:

- [SMC Setup Register](#)
- [SMC Pulse Register](#)
- [SMC Cycle Register](#)
- [SMC Mode Register](#)
- [SMC Off-Chip Memory Scrambling Register](#)
- [SMC Safety Report Interrupt Enable Register](#)

## 20.17. Security and Safety Analysis and Reports

Several types of checks are performed when the SMC is reading or writing an external memory.

The internal sequencer of the SMC is monitored for integrity and if an abnormal state is detected, the flag SMC\_WPSR.SEQ is set. This flag is not set under normal operating conditions.

The software accesses to the SMC are monitored and if an incorrect access is performed, the flag SMC\_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the SMC\_WPSR.SWETYP field (see [SMC Write Protection Status Register](#) for details). The flags SEQ, SWE and WPVS are automatically cleared when SMC\_WPSR is read.

If one of these flags is set, an interrupt can be triggered if the SMC\_SRIER.SRIE bit is '1'.

## 20.18. Scrambling/Unscrambling Function

The external data bus can be scrambled to make more difficult the recovery of intellectual property data located in off-chip memories by means of data analysis at the package pin level of either the microcontroller or the memory device.

The scrambling and unscrambling are performed on-the-fly without additional wait states.

The scrambling/unscrambling function can be enabled or disabled by configuring the CSxSE bits in the SMC Off-Chip Memory Scrambling Register (SMC\_OCMS).

When multiple chip selects are handled, the scrambling function per chip select is configurable using the CSxSE bits in the SMC\_OCMS register.

The scrambling method depends on two user-configurable key registers, SMC\_KEY1 and SMC\_KEY2 plus a random value depending on device processing characteristics. These key registers cannot be read. They can be written once after a system reset.

The scrambling user key or the seed for key generation must be securely stored in a reliable non-volatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

### 20.19. Clearing Scrambling Keys on a Tamper Event

On a tamper detection event on WKUP pins, it is possible to perform an immediate clear of the scrambling keys (SMC\_KEY1 and SMC\_KEY2) if SMC\_OCMS.TAMPCLR is set.

## 20.20. Register Summary

The SMC is programmed using the registers listed below. For each chip select, a set of four registers is used to program the parameters of the external device connected on it. The number of SMC\_SETUP, SMC\_PULSE, SMC\_CYCLE and SMC\_MODE registers depends on the number of chip selects. Sixteen bytes (0x10) are required per chip select.

**Note:** The user must confirm the SMC configuration by writing any one of the SMC\_MODE registers.

## 20.20.1. SMC Setup Register

**Name:** SMC\_SETUPx  
**Offset:** 0x00 + x\*0x10 [x=0..5]  
**Reset:** 0x01010101  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Note:** The number of SMC\_SETUP registers depends on the chip select number.

Bit	31	30	29	28	27	26	25	24
			NCS_RD_SETUP[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	1
Bit	23	22	21	20	19	18	17	16
			NRD_SETUP[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8
			NCS_WR_SETUP[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0
			NWE_SETUP[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	1

### Bits 29:24 – NCS\_RD\_SETUP[5:0] NCS Setup Length in READ Access

In READ access, the NCS signal setup length is defined as:

NCS setup length = (128 \* NCS\_RD\_SETUP[5] + NCS\_RD\_SETUP[4:0]) clock cycles

### Bits 21:16 – NRD\_SETUP[5:0] NRD Setup Length

The NRD signal setup length is defined in clock cycles as:

NRD setup length = (128 \* NRD\_SETUP[5] + NRD\_SETUP[4:0]) clock cycles

### Bits 13:8 – NCS\_WR\_SETUP[5:0] NCS Setup Length in WRITE Access

In WRITE access, the NCS signal setup length is defined as:

NCS setup length = (128 \* NCS\_WR\_SETUP[5] + NCS\_WR\_SETUP[4:0]) clock cycles

### Bits 5:0 – NWE\_SETUP[5:0] NWE Setup Length

The NWE signal setup length is defined as:

NWE setup length = (128 \* NWE\_SETUP[5] + NWE\_SETUP[4:0]) clock cycles

## 20.20.2. SMC Pulse Register

**Name:** SMC\_PULSEx  
**Offset:** 0x04 + x\*0x10 [x=0..5]  
**Reset:** 0x01010101  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Note:** The number of SMC\_PULSE registers depends on the chip select number.

Bit	31	30	29	28	27	26	25	24
	NCS_RD_PULSE[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	1
Bit	23	22	21	20	19	18	17	16
	NRD_PULSE[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8
	NCS_WR_PULSE[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0
	NWE_PULSE[6:0]							
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	1

### Bits 30:24 – NCS\_RD\_PULSE[6:0] NCS Pulse Length in READ Access

In standard read access, the NCS signal pulse length is defined as:

$\text{NCS pulse length} = (256 * \text{NCS\_RD\_PULSE}[6] + \text{NCS\_RD\_PULSE}[5:0]) \text{ clock cycles}$

The NCS pulse length must be at least 1 clock cycle.

In Page mode read access, the NCS\_RD\_PULSE parameter defines the duration of the first access to one page.

### Bits 22:16 – NRD\_PULSE[6:0] NRD Pulse Length

In standard read access, the NRD signal pulse length is defined in clock cycles as:

$\text{NRD pulse length} = (256 * \text{NRD\_PULSE}[6] + \text{NRD\_PULSE}[5:0]) \text{ clock cycles}$

The NRD pulse length must be at least 1 clock cycle.

In Page mode read access, the NRD\_PULSE parameter defines the duration of the subsequent accesses in the page.

### Bits 14:8 – NCS\_WR\_PULSE[6:0] NCS Pulse Length in WRITE Access

In write access, the NCS signal pulse length is defined as:

$\text{NCS pulse length} = (256 * \text{NCS\_WR\_PULSE}[6] + \text{NCS\_WR\_PULSE}[5:0]) \text{ clock cycles}$

The NCS pulse length must be at least 1 clock cycle.

### Bits 6:0 – NWE\_PULSE[6:0] NWE Pulse Length

The NWE signal pulse length is defined as:

$\text{NWE pulse length} = (256 * \text{NWE\_PULSE}[6] + \text{NWE\_PULSE}[5:0]) \text{ clock cycles}$

The NWE pulse length must be at least 1 clock cycle.

### 20.20.3. SMC Cycle Register

**Name:** SMC\_CYCLEx  
**Offset:** 0x08 + x\*0x10 [x=0..5]  
**Reset:** 0x00030003  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

**Note:** The number of SMC\_CYCLE registers depends on the chip select number.

Bit	31	30	29	28	27	26	25	24
								NRD_CYCLE[8]
Access								R/W
Reset								0
Bit	23	22	21	20	19	18	17	16
								NRD_CYCLE[7:0]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	1	1
Bit	15	14	13	12	11	10	9	8
								NWE_CYCLE[8]
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
								NWE_CYCLE[7:0]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	1	1

#### Bits 24:16 – NRD\_CYCLE[8:0] Total Read Cycle Length

The total read cycle length is the total duration in clock cycles of the read cycle. It is equal to the sum of the setup, pulse and hold steps of the NRD and NCS signals. It is defined as:

Read cycle length = (NRD\_CYCLE[8:7] \* 256 + NRD\_CYCLE[6:0]) clock cycles

#### Bits 8:0 – NWE\_CYCLE[8:0] Total Write Cycle Length

The total write cycle length is the total duration in clock cycles of the write cycle. It is equal to the sum of the setup, pulse and hold steps of the NWE and NCS signals. It is defined as:

Write cycle length = (NWE\_CYCLE[8:7] \* 256 + NWE\_CYCLE[6:0]) clock cycles

## 20.20.4. SMC Mode Register

**Name:** SMC\_MODEx  
**Offset:** 0x0C + x\*0x10 [x=0..5]  
**Reset:** 0x10001000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

The user must confirm the SMC configuration by writing any one of the SMC\_MODE registers.

**Note:** The number of SMC\_MODE registers depends on the chip select number.

Bit	31	30	29	28	27	26	25	24
			PS[1:0]					PMEN
Access			R/W	R/W				R/W
Reset			0	1				0

Bit	23	22	21	20	19	18	17	16
				TDF_MODE	TDF_CYCLES[3:0]			
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			DBW[1:0]					BAT
Access			R/W	R/W				R/W
Reset			0	1				0

Bit	7	6	5	4	3	2	1	0
			EXNW_MODE[1:0]				WRITE_MODE	READ_MODE
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

### Bits 29:28 – PS[1:0] Page Size

If Page mode is enabled, this field indicates the size of the page in bytes.

Value	Name	Description
0	BYTE_4	4-byte page
1	BYTE_8	8-byte page
2	BYTE_16	16-byte page
3	BYTE_32	32-byte page

### Bit 24 – PMEN Page Mode Enabled

Value	Description
1	Asynchronous burst read in Page mode is applied on the corresponding chip select.
0	Standard read is applied.

### Bit 20 – TDF\_MODE TDF Optimization

Value	Description
1	TDF optimization enabled—The number of TDF Wait states is optimized using the setup period of the next read/write access.
0	TDF optimization disabled—The number of TDF Wait states is inserted before the next access begins.

**Bits 19:16 – TDF\_CYCLES[3:0]** Data Float Time

This field gives the integer number of clock cycles required by the external device to release the data after the rising edge of the read controlling signal. The SMC always provides one full cycle of bus turnaround after the TDF\_CYCLES period. The external bus cannot be used by another chip select during TDF\_CYCLES + 1 cycles. From 0 up to 15 TDF\_CYCLES can be set.

**Bits 13:12 – DBW[1:0]** Data Bus Width

Value	Name	Description
0	BIT_8	8-bit bus
1	BIT_16	16-bit bus
2	BIT_32	32-bit bus
3	—	Reserved

**Bit 8 – BAT** Byte Access Type

This field is used only if DBW defines a 16 or 32-bit data bus.

Value	Name	Description
0	BYTE_SELECT	Byte select access type: <ul style="list-style-type: none"> <li>Write operation is controlled using NCS, NWE, NBS0, NBS1, NBS2 and NBS3</li> <li>Read operation is controlled using NCS, NRD, NBS0, NBS1, NBS2 and NBS3</li> </ul>
1	BYTE_WRITE	Byte write access type: <ul style="list-style-type: none"> <li>Write operation is controlled using NCS, NWR0, NWR1, NWR2, NWR3</li> <li>Read operation is controlled using NCS and NRD</li> </ul>

**Bits 5:4 – EXNW\_MODE[1:0]** NWAIT Mode

The NWAIT signal is used to extend the current read or write signal. It is only taken into account during the pulse phase of the read and write controlling signal. When the use of NWAIT is enabled, at least one cycle hold duration must be programmed for the read and write controlling signal.

Value	Name	Description
0	DISABLED	Disabled Mode—The NWAIT input signal is ignored on the corresponding Chip Select.
1	—	Reserved
2	FROZEN	Frozen Mode—If asserted, the NWAIT signal freezes the current read or write cycle. After deassertion, the read/write cycle is resumed from the point where it was stopped.
3	READY	Ready Mode—The NWAIT signal indicates the availability of the external device at the end of the pulse of the controlling read or write signal, to complete the access. If high, the access normally completes. If low, the access is extended until NWAIT returns high.

**Bit 1 – WRITE\_MODE** Selection of the Control Signal for Write Operation

Value	Name	Description
0	NCS_CTRL	Write operation controlled by NCS signal—If TDF optimization is enabled (TDF_MODE = 1), TDF Wait states will be inserted after the setup of NCS.
1	NWE_CTRL	Write operation controlled by NWE signal—If TDF optimization is enabled (TDF_MODE = 1), TDF Wait states will be inserted after the setup of NWE.

**Bit 0 – READ\_MODE** Selection of the Control Signal for Read Operation

Value	Name	Description
0	NCS_CTRL	Read operation controlled by NCS signal <ul style="list-style-type: none"> <li>If TDF cycles are programmed, the external bus is marked busy after the rising edge of NCS.</li> <li>If TDF optimization is enabled (TDF_MODE = 1), TDF Wait states are inserted after the setup of NCS.</li> </ul>
1	NRD_CTRL	Read operation controlled by NRD signal <ul style="list-style-type: none"> <li>If TDF cycles are programmed, the external bus is marked busy after the rising edge of NRD.</li> <li>If TDF optimization is enabled (TDF_MODE = 1), TDF Wait states are inserted after the setup of NRD.</li> </ul>

## 20.20.5. SMC Off-Chip Memory Scrambling Register

**Name:** SMC\_OCMS  
**Offset:** 0x80  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			CS5SE	CS4SE	CS3SE	CS2SE	CS1SE	CS0SE
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
				TAMPCLR				SMSE
Access				R/W				R/W
Reset				0				0

### Bits 8, 9, 10, 11, 12, 13 – CSSE Chip Select Scrambling Enable

Value	Description
0	Disables scrambling for CSx.
1	Enables scrambling for CSx.

### Bit 4 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on SMC scrambling keys.
1	A tamper detection event immediately clears SMC scrambling keys.

### Bit 0 – SMSE Static Memory Controller Scrambling Enable

Value	Description
0	Disables scrambling for SMC access.
1	Enables scrambling for SMC access.

## 20.20.6. SMC Off-Chip Memory Scrambling Key1 Register

**Name:** SMC\_KEY1  
**Offset:** 0x84  
**Reset:** 0x00000000  
**Property:** Write-only

This register is a 'Write-once' register: the first write access after a system reset prevents any further modification of the register value.

This register is erased if a tamper is detected on fast wakeup pins and bit SMC\_OCMS.TAMPCLR = 1.

Bit	31	30	29	28	27	26	25	24
	KEY1[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	KEY1[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	KEY1[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	KEY1[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – KEY1[31:0] Off-Chip Memory Scrambling (OCMS) Key Part 1

When off-chip memory scrambling is enabled, KEY1 and KEY2 values determine data scrambling.

## 20.20.7. SMC Off-Chip Memory Scrambling Key2 Register

**Name:** SMC\_KEY2  
**Offset:** 0x88  
**Reset:** 0x00000000  
**Property:** Write-only

This register is a 'Write-once' register: the first write access after a system reset prevents any further modification of the register value.

This register is erased if a tamper is detected on fast wakeup pins and bit SMC\_OCMS.TAMPCLR = 1.

Bit	31	30	29	28	27	26	25	24
	KEY2[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	KEY2[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	KEY2[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	KEY2[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – KEY2[31:0] Off-Chip Memory Scrambling (OCMS) Key Part 2

When off-chip memory scrambling is enabled, KEY1 and KEY2 values determine data scrambling.

## 20.20.8. SMC Safety Report Interrupt Enable Register

**Name:** SMC\_SRIER  
**Offset:** 0x90  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								SRIE
Access								R/W
Reset								0

### Bit 0 – SRIE Safety Report Interrupt Enable

Value	Description
0	Disables the SMC safety report interrupt from External Bus Interface.
1	Enables the SMC safety report interrupt from External Bus Interface.

## 20.20.9. SMC Write Protection Mode Register

**Name:** SMC\_WPMR**Offset:** 0xE4**Reset:** 0x00000000**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

Value	Name	Description
0x534D43	PASSWD	Writing any other value in this field aborts the write operation of bit WPEN. Always reads as 0.

**Bit 0 – WPEN** Write Protection EnableSee [Register Write Protection](#) for list of write-protected registers.

Value	Description
0	Disables write protection if WPKEY value corresponds to 0x534D43 ("SMC" in ASCII).
1	Enables write protection if WPKEY value corresponds to 0x534D43 ("SMC" in ASCII).

## 20.20.10.SMC Write Protection Status Register

**Name:** SMC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
							SWETYP[1:0]	
Access							R	R
Reset							0	0

Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					SWE	SEQE		WPVS
Access					R	R		R
Reset					0	0		0

**Bits 25:24 – SWETYP[1:0]** Software Error Type (Cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read.
1	WRITE_WO	A write access has been performed on a read-only register.
2	UNDEF_RW	Access to an undefined address.

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 3 – SWE** Software Control Error (Cleared on read)

Value	Description
0	No software error has occurred since the last read of SMC_WPSR.
1	A software error has occurred since the last read of SMC_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error (Cleared on read)

Value	Description
0	No internal sequencer error has occurred since the last read of SMC_WPSR.
1	An internal sequencer error has occurred since the last read of SMC_WPSR. This flag can only be set under abnormal operating conditions.

**Bit 0 – WPVS** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the SMC_WPSR.

Value	Description
1	A write protection violation occurred since the last read of the SMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 21. Programmable Multibit Error Correction Code Controller (PMECC)

### 21.1. Description

The Programmable Multibit Error Correction Code Controller (PMECC) is a programmable binary BCH (Bose, Chaudhuri and Hocquenghem) encoder/decoder. This controller can be used to generate redundancy information for both Single-Level Cell (SLC) and Multi-level Cell (MLC) NAND Flash devices. It supports redundancy for correction of 2, 4, 8, 12 or 24 bits of error per sector of data.

### 21.2. Embedded Characteristics

- 8-bit NAND Flash Data Bus Support
- Multibit Error Correcting Code
- Algorithm Based on Binary Shortened Bose, Chaudhuri and Hocquenghem (BCH) Codes
- Programmable Error Correcting Capability: 2, 4, 8, 12 and 24 Bits of Error per Sector
- Programmable Sector Size: 512 Bytes or 1024 Bytes
- Programmable Number of Sectors per Page: 1, 2, 4 or 8 Sectors of Data per Page
- Programmable Spare Area Size
- Supports Spare Area ECC Protection
- Supports 8 Kbytes Page Size Using 1024 Bytes per Sector and 4 Kbytes Page Size Using 512 Bytes per Sector
- Configurable through APB Interface
- Interrupt-Driven Multibit Error Detection

## 21.3. Block Diagram

Figure 21.1. PMECC Block Diagram

## 21.4. Functional Description

The NAND Flash sector size is programmable and can be set to 512 bytes or 1024 bytes. The PMECC module generates redundancy at encoding time, when a NAND write page operation is performed. The redundancy is appended to the page and written in the spare area. This operation is performed by the processor. It moves the content of the PMECCx registers into the NAND Flash memory. The number of registers depends on the selected error correction capability (see [Table 21.1](#)). This operation is executed for each sector. At decoding time, the PMECC module generates the remainder of the received codeword by minimal polynomials. When all polynomial remainders for a given sector are set to zero, no error occurred. When the polynomial remainders are other than zero, the codeword is corrupted and further processing is required.

The PMECC generates an interrupt indicating that an error occurred. The processor must read the Interrupt Status register (PMECC\_ISR). This register indicates which sector is corrupted.

To find the error location within a sector, the processor must execute the following decoding steps:

1. Syndrome computation
2. Find the error locator polynomials
3. Find the roots of the error locator polynomial

All decoding steps involve finite field computation, for which a library of finite field arithmetic must be available to perform addition, multiplication and inversion. The finite field arithmetic operations can be performed through the use of a memory mapped lookup table, or direct software implementation. The software implementation presented is based on lookup tables. Two tables named `gf_log` and `gf_antilog` are used. If  $\alpha$  is the primitive element of the field, then a power of

$\alpha$  is in the field. Assume  $\beta = \alpha^{\text{index}}$ , then  $\beta$  belongs to the field, and  $\text{gf\_log}(\beta) = \text{gf\_log}(\alpha^{\text{index}}) = \text{index}$ . The  $\text{gf\_antilog}$  tables provide exponent inverse of the element, if  $\beta = \alpha^{\text{index}}$ , then  $\text{gf\_antilog}(\text{index}) = \beta$ .

The first step consists of the syndrome computation. The PMECC computes the remainders and software must substitute the power of the primitive element.

The procedure implementation is described in [Remainder Substitution Procedure](#).

The second step is the most software intensive. It is the Berlekamp's iterative algorithm for finding the error-location polynomial.

The procedure implementation is described in [Find the Error Location Polynomial  \$\Sigma\(x\)\$](#) .

The last step is finding the root of the error location polynomial. This step can be very software intensive, as there is no straightforward method of finding the roots, except by evaluating each element of the field in the error location polynomial. However, a hardware accelerator can be used to find the roots of the polynomial. The Programmable Multibit Error Correction Code Location (PMERRLOC) module provides this type of hardware acceleration.

**Figure 21.2.** Software/Hardware Multibit Error Correction Dataflow

#### 21.4.1. MLC/SLC Write Page Operation using PMECC

When an MLC write page operation is performed, the PMECC controller is configured with the NANDWR bit in the Configuration register (PMECC\_CFG) set to one. When the NAND spare area contains file system information and redundancy (PMECCx), the spare area is error protected,

then PMECC\_CFG.SPAREEN is set to '1'. When the NAND spare area contains only redundancy information, SPAREEN is set to '0'.

When the write page operation is terminated, the user writes the redundancy in the NAND spare area. This operation can be done with DMA assistance.

**Table 21.1.** Relevant Redundancy Registers

BCH_ERR Field	Sector Size Set to 512 Bytes	Sector Size Set to 1024 Bytes
0	PMECC_ECC0	PMECC_ECC0
1	PMECC_ECC0, PMECC_ECC1	PMECC_ECC0, PMECC_ECC1
2	PMECC_ECC0, PMECC_ECC1, PMECC_ECC2, PMECC_ECC3	PMECC_ECC0, PMECC_ECC1, PMECC_ECC2, PMECC_ECC3
3	PMECC_ECC0, PMECC_ECC1, PMECC_ECC2, PMECC_ECC3, PMECC_ECC4, PMECC_ECC5, PMECC_ECC6	PMECC_ECC0, PMECC_ECC1, PMECC_ECC2, PMECC_ECC3, PMECC_ECC4, PMECC_ECC5, PMECC_ECC6
4	PMECC_ECC0, PMECC_ECC1, PMECC_ECC2, PMECC_ECC3, PMECC_ECC4, PMECC_ECC5, PMECC_ECC6, PMECC_ECC7, PMECC_ECC8, PMECC_ECC9	PMECC_ECC0, PMECC_ECC1, PMECC_ECC2, PMECC_ECC3, PMECC_ECC4, PMECC_ECC5, PMECC_ECC6, PMECC_ECC7, PMECC_ECC8, PMECC_ECC9, PMECC_ECC10

**Table 21.2.** Number of Relevant ECC Bytes per Sector, Copied from LSbyte to MSbyte

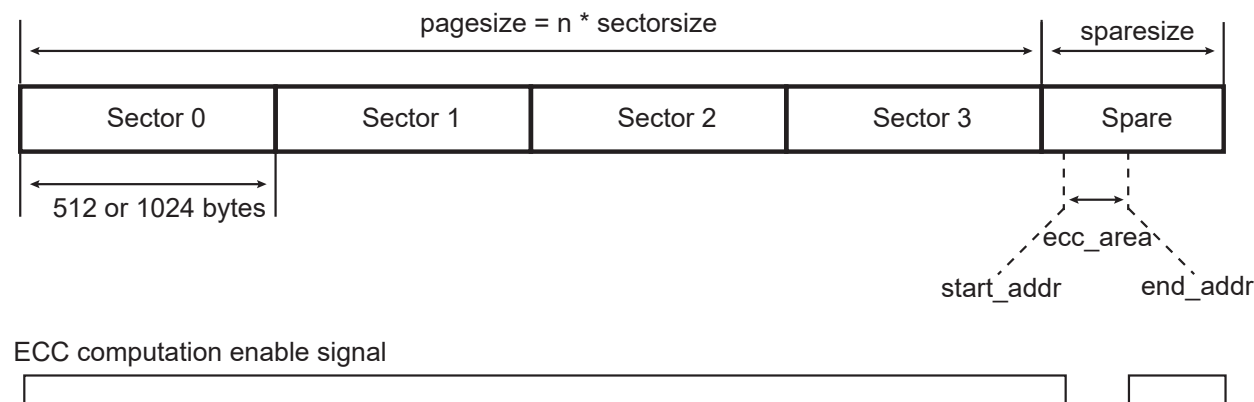

BCH_ERR Field	Sector Size Set to 512 Bytes	Sector Size Set to 1024 Bytes
0	4 bytes	4 bytes
1	7 bytes	7 bytes
2	13 bytes	14 bytes
3	20 bytes	21 bytes
4	39 bytes	42 bytes

#### 21.4.1.1.SLC/MLC Write Operation with Spare Enable Bit Set

When PMECC\_CFG.SPAREEN is set to '1', the spare area of the page is encoded with the stream of data of the last sector of the page. This mode is entered by writing one in the DATA bit in the Control register (PMECC\_CTRL). When the encoding process is over, the redundancy is written to the spare area in user mode, PMECC\_CTRL.USER must be set to '1'.

**Figure 21.3.** NAND Write Operation with Spare Encoding

Write NAND operation with SPAREEN set to one

#### 21.4.1.2.MLC/SLC Write Operation with Spare Area Disabled

When PMECC\_CFG.SPAREEN is set to '0', the spare area is not encoded with the stream of data. This mode is entered by writing '1' to PMECC\_CTRL.DATA.

**Figure 21.4.** NAND Write Operation

Write NAND operation with SPAREEN set to zero

## 21.4.2. MLC/SLC Read Page Operation using PMECC

**Table 21.3.** Relevant Remainders Registers

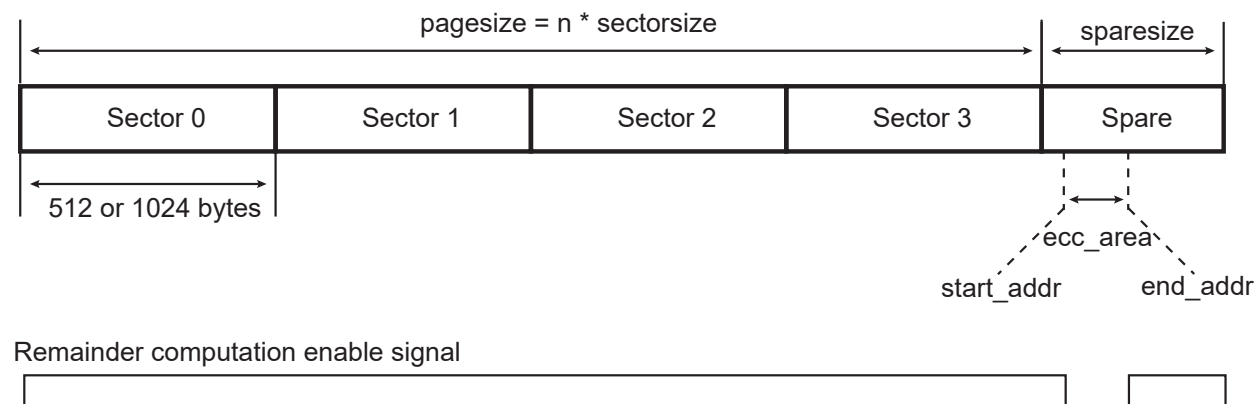

BCH_ERR Field	Sector Size Set to 512 Bytes	Sector Size Set to 1024 Bytes
0	PMECC_REM0	PMECC_REM0
1	PMECC_REM0, PMECC_REM1	PMECC_REM0, PMECC_REM1
2	PMECC_REM0, PMECC_REM1, PMECC_REM2, PMECC_REM3,	PMECC_REM0, PMECC_REM1, PMECC_REM2, PMECC_REM3
3	PMECC_REM0, PMECC_REM1, PMECC_REM2, PMECC_REM3, PMECC_REM4, PMECC_REM5, PMECC_REM6, PMECC_REM7	PMECC_REM0, PMECC_REM1, PMECC_REM2, PMECC_REM3, PMECC_REM4, PMECC_REM5, PMECC_REM6, PMECC_REM7
4	PMECC_REM0, PMECC_REM1, PMECC_REM2, PMECC_REM3, PMECC_REM4, PMECC_REM5, PMECC_REM6, PMECC_REM7, PMECC_REM8, PMECC_REM9, PMECC_REM10, PMECC_REM11	PMECC_REM0, PMECC_REM1, PMECC_REM2, PMECC_REM3, PMECC_REM4, PMECC_REM5, PMECC_REM6, PMECC_REM7, PMECC_REM8, PMECC_REM9, PMECC_REM10, PMECC_REM11

### 21.4.2.1. MLC/SLC Read Operation with Spare Decoding

When the spare area is protected, the spare area contains valid data. As the redundancy may be included in the middle of the information stream, the user programs the start address and the end address of the ECC area. This mode is entered by writing a '1' to PMECC\_CTRL.DATA. When the page has been fully retrieved from NAND, the ECC area is read using the user mode by writing a '1' to PMECC\_CTRL.USER.

**Figure 21.5.** Read Operation with Spare Decoding

Read NAND operation with SPAREEN set to One and AUTO set to Zero

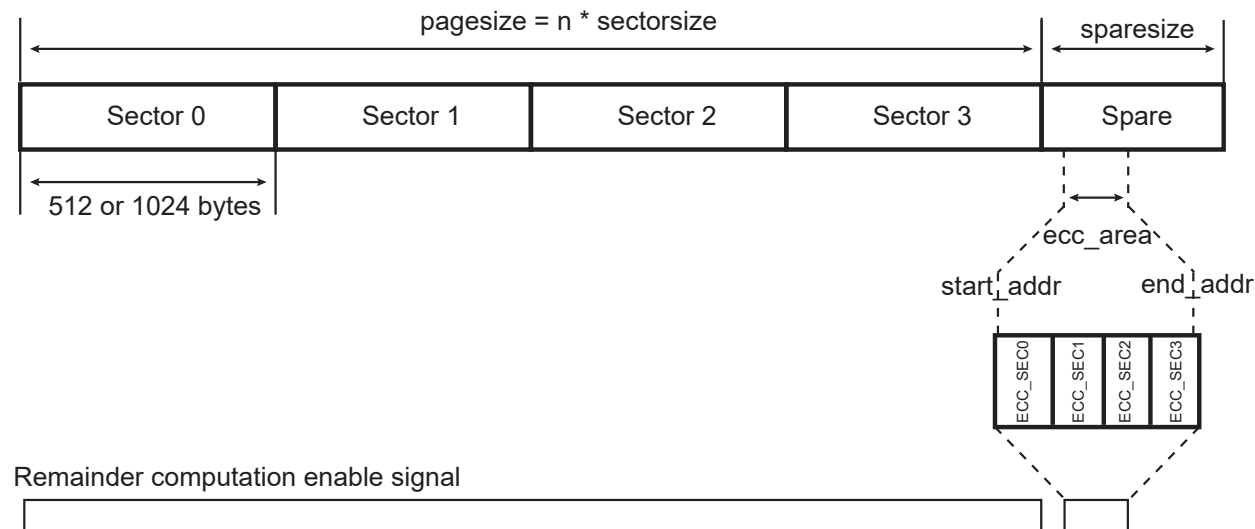

### 21.4.2.2.MLC/SLC Read Operation

If the spare area is not protected with the error correcting code, the redundancy area is retrieved directly. This mode is entered by writing a '1' to PMECC\_CTRL.DATA. When PMECC\_CFG.AUTO is set to '1', the ECC is retrieved automatically, otherwise the ECC must be read using user mode.

**Figure 21.6.** Read Operation

Read NAND operation with SPAREEN set to Zero and AUTO set to One

### 21.4.2.3.MLC/SLC User Read ECC Area

This mode allows a manual retrieve of the ECC.

This mode is entered by writing a '1' to PMECC\_CTRL.USER.

**Figure 21.7.** User Read Mode

## 21.5. Software Implementation

### 21.5.1. Remainder Substitution Procedure

The substitute function evaluates the polynomial remainder, with different values of the field primitive elements. The finite field arithmetic addition operation is performed with the Exclusive or. The finite field arithmetic multiplication operation is performed through the  $\text{gf\_log}$ ,  $\text{gf\_antilog}$  lookup tables.

The REM2NP1 and REM2NP3 fields of the PMECC Remainder x registers (PMECC\_REMx) contain only odd remainders. Each bit indicates whether the coefficient of the polynomial remainder is set to zero or not.

NB\_ERROR\_MAX defines the maximum value of the error correcting capability.

NB\_ERROR defines the error correcting capability selected at encoding/decoding time.

NB\_FIELD\_ELEMENTS defines the number of elements in the field.

si[] is a table that holds the current syndrome value, an element of that table belongs to the field. This is also a shared variable for the next step of the decoding operation.

oo[] is a table that contains the degree of the remainders.

```
int substitute()
{
    int i;
    int j;
    for (i = 1; i < 2 * NB_ERROR_MAX;
        i++)
    {
        si[i] = 0;
    }
    for (i = 1; i < 2*NB_ERROR;
        i++)
    {
        for (j = 0; j < oo[i];
            j++)
        {
            if (REM2NPX[i][j])
            {
                si[i] = gf_antilog[(i *
                    j)%NB_FIELD_ELEMENTS] ^ si[i];
            }
        }
    }
    return 0;
}
```

### 21.5.2. Find the Error Location Polynomial Sigma(x)

The sample code below gives a Berlekamp iterative procedure for finding the value of the error location polynomial.

The input of the procedure is the si[] table defined in the remainder substitution procedure.

The output of the procedure is the error location polynomial named smu (sigma mu). The polynomial coefficients belong to the field. The smu[NB\_ERROR+1][] is a table that contains all these coefficients.

NB\_ERROR\_MAX defines the maximum value of the error correcting capability.

NB\_ERROR defines the error correcting capability selected at encoding/decoding time.

NB\_FIELD\_ELEMENTS defines the number of elements in the field.

```
int get_sigma()
{
    int i;
    int j;
    int k;
    /* mu */
    int
        mu[NB_ERROR_MAX+2];
    /* sigma ro */
    int
        sro[2*NB_ERROR_MAX+1];
    /* discrepancy */
    int
        dmu[NB_ERROR_MAX+2];
    /* delta_order */
    int
```

```

    delta[NB_ERROR_MAX+2];
/* index of largest delta
*/
int ro;
int largest;
int diff;
/*
*/
/*      First Row
*/
/*
*/
/* Mu */
mu[0] = -1; /* Actually -1/2
*/
/* Sigma(x) set to 1
*/
for (i = 0; i <
      (2*NB_ERROR_MAX+1); i++)
    smu[0][i] = 0;
smu[0][0] = 1;
/* discrepancy set to 1
*/
dmu[0] = 1;
/* polynom order set to 0
*/
lmu[0] = 0;
/* delta set to -1 */
delta[0] = (mu[0] * 2 - lmu[0])
    >> 1;
/*
*/
/*      Second Row
*/
/*
*/
/* Mu */
mu[1] = 0;
/* Sigma(x) set to 1
*/
for (i = 0; i <
      (2*NB_ERROR_MAX+1); i++)
    smu[1][i] = 0;
smu[1][0] = 1;
/* discrepancy set to Syndrome 1
*/
dmu[1] = si[1];
/* polynom order set to 0
*/
lmu[1] = 0;
/* delta set to 0 */
delta[1] = (mu[1] * 2 - lmu[1])
    >> 1;
for (i=1; i <= NB_ERROR;
      i++)
{
    mu[i+1] = i << 1;

    /* *****/
/*
*/
/*
*/
/*      Compute Sigma (Mu+1)
*/
/*      And L(mu)
*/
/* check if discrepancy is set
to 0 */
if (dmu[i] == 0)
{
    /* copy polynom */
    for (j=0; j<2*NB_ERROR_MAX+1;
          j++)
    {
        smu[i+1][j] =
            smu[i][j];
    }
}
}

```

```

/* copy previous polynom order
   to the next */
lmu[i+1] = lmu[i];
}
else

        dmu[i+1] =
            gf_antilog[(gf_log[smu[i+1][k]] + gf_log[si[2*(i-1)+3-k]])%nn] ^ dmu[i+1];
}
}
return 0;
}

```

### 21.5.3. Find the Error Position

The output of the `get_sigma()` procedure is a polynomial stored in the `smu[NB_ERROR+1][]` table. The error position is the roots of that polynomial. The degree of this polynomial is very important information, as it gives the number of errors. The PMERRLOC module provides a hardware accelerator for this step.

## 21.6. Register Summary

**Notes:** The blocks of registers listed below are instantiated 8 times in the user interface:

- PMECC\_ECCx[x=0..10]
- PMECC\_REMx[x=0..11]

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

### 21.6.1. PMECC Configuration Register

**Name:** PMECC\_CFG  
**Offset:** 0x000  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access				AUTO				SPAREEN
Reset				R/W				R/W
				0				0
Bit	15	14	13	12	11	10	9	8
Access				NANDWR			PAGESIZE[1:0]	
Reset				R/W			R/W	R/W
				0			0	0
Bit	7	6	5	4	3	2	1	0
Access				SECTORSZ			BCH_ERR[2:0]	
Reset				R/W		R/W	R/W	R/W
				0		0	0	0

#### Bit 20 – AUTO Automatic Mode Enable

This bit is only relevant in NAND Read Mode, when spare enable is activated.

Value	Description
0	Indicates that the spare area is not protected. In that case the ECC computation takes into account the ECC area located in the spare area. (within the start address and the end address).
1	Indicates that the spare is error protected. In this case, the ECC computation takes into account the whole spare area minus the ECC area in the ECC computation operation.

#### Bit 16 – SPAREEN Spare Enable

- For NAND write access:
  - 0: The spare area is skipped
  - 1: The spare area is protected with the last sector of data.
- For NAND read access:
  - 0: The spare area is skipped.
  - 1: The spare area contains protected data or only redundancy information.

#### Bit 12 – NANDWR NAND Write Access

Value	Description
0	NAND read access
1	NAND write access

#### Bits 9:8 – PAGESIZE[1:0] Number of Sectors in the Page

Value	Name	Description
0	PAGESIZE_1SEC	1 sector for main area (512 or 1024 bytes)

Value	Name	Description
1	PAGESIZE_2SEC	2 sectors for main area (1024 or 2048 bytes)
2	PAGESIZE_4SEC	4 sectors for main area (2048 or 4096 bytes)
3	PAGESIZE_8SEC	8 errors for main area (4096 or 8192 bytes)

**Bit 4 – SECTORSZ** Sector Size

Value	Description
0	The ECC computation is based on a sector of 512 bytes.
1	The ECC computation is based on a sector of 1024 bytes.

**Bits 2:0 – BCH\_ERR[2:0]** Error Correct Capability

Value	Name	Description
0	BCH_ERR2	2 errors
1	BCH_ERR4	4 errors
2	BCH_ERR8	8 errors
3	BCH_ERR12	12 errors
4	BCH_ERR24	24 errors

## 21.6.2. PMECC Spare Area Size Register

**Name:** PMECC\_SAREA  
**Offset:** 0x004  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								SPARESIZE[8]
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
	SPARESIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 8:0 – SPARESIZE[8:0] Spare Area Size

The spare area size is equal to (SPARESIZE+1) bytes.

### 21.6.3. PMECC Start Address Register

**Name:** PMECC\_SADDR  
**Offset:** 0x008  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								STARTADDR[8]
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
	STARTADDR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 8:0 – STARTADDR[8:0] ECC Area Start Address (byte oriented address)

This field indicates the first byte address of the ECC area. Location 0 matches the first byte of the spare area.

## 21.6.4. PMECC End Address Register

**Name:** PMECC\_EADDR  
**Offset:** 0x00C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								ENDADDR[8]
Access								R/W
Reset								0
Bit	7	6	5	4	3	2	1	0
	ENDADDR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 8:0 – ENDADDR[8:0]** ECC Area End Address (byte oriented address)  
This field indicates the last byte address of the ECC area.

## 21.6.5. PMECC Clock Control Register

**Name:** PMECC\_CLK  
**Offset:** 0x010  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						CLKCTRL[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

### Bits 2:0 - CLKCTRL[2:0] Clock Control Register

The PMECC datapath setup time is set to CLKCTRL+1.

This field indicates the database setup times in number of clock cycles. At 133 MHz, this field must be programmed with 2, indicating that the setup time is 3 clock cycles.

## 21.6.6. PMECC Control Register

**Name:** PMECC\_CTRL  
**Offset:** 0x014  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			DISABLE	ENABLE		USER	DATA	RST
Access			W	W		W	W	W
Reset			–	–		–	–	–

### Bit 5 – DISABLE PMECC Module Disable

The PMECC module must always be configured after being deactivated.

### Bit 4 – ENABLE PMECC Module Enable

The PMECC module must always be configured before being activated.

### Bit 2 – USER Start a User Mode Phase

### Bit 1 – DATA Start a Data Phase

### Bit 0 – RST Reset the PMECC Module

When set to one, this bit resets the PMECC Controller; configuration registers remain unaffected.

## 21.6.7. PMECC Status Register

**Name:** PMECC\_SR  
**Offset:** 0x018  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
				ENABLE				BUSY
Access				R				R
Reset				0				0

### Bit 4 – ENABLE PMECC Module Status

Value	Description
0	The PMECC module is disabled and can be configured.
1	The PMECC module is enabled and the configuration registers cannot be written.

### Bit 0 – BUSY Kernel of the PMECC is Busy

## 21.6.8. PMECC Interrupt Enable Register

**Name:** PMECC\_IER  
**Offset:** 0x01C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								ERRIE
Access								W
Reset								–

**Bit 0 – ERRIE** Error Interrupt Enable

## 21.6.9. PMECC Interrupt Disable Register

**Name:** PMECC\_IDR  
**Offset:** 0x020  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								ERRID
Access								W
Reset								–

**Bit 0 – ERRID** Error Interrupt Disable

## 21.6.10. PMECC Interrupt Mask Register

**Name:** PMECC\_IMR  
**Offset:** 0x024  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								ERRIM
Access								R
Reset								0

**Bit 0 – ERRIM** Error Interrupt Mask

## 21.6.11. PMECC Interrupt Status Register

**Name:** PMECC\_ISR  
**Offset:** 0x028  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	ERRIS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 7:0 – ERRIS[7:0] Error Interrupt Status

When set to one, bit i of the PMECC\_ISR indicates that sector i is corrupted.

## 21.6.12. PMECC ECC x Register

**Name:** PMECC\_ECCx  
**Offset:** 0x40 + x\*0x04 [x=0..10]  
**Reset:** 0xFFFFFFFF  
**Property:** Read-only

**Note:** The block of registers PMECC\_ECCx[x=0..10] is instanced 8 times in the user interface.

Bit	31	30	29	28	27	26	25	24
	ECC[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	1	1	1	1	1	1	1	1
Bit	23	22	21	20	19	18	17	16
	ECC[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	1	1	1	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8
	ECC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	1	1	1	1	1	1	1	1
Bit	7	6	5	4	3	2	1	0
	ECC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	1	1	1	1	1	1	1	1

### Bits 31:0 – ECC[31:0] BCH Redundancy

This register contains the remainder of the division of the codeword by the generator polynomial.

### 21.6.13. PMECC Remainder x Register

**Name:** PMECC\_REMx  
**Offset:** 0x0240 + x\*0x04 [x=0..11]  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The block of registers PMECC\_REMx[x=0..11] is instanced 8 times in the user interface.

Bit	31	30	29	28	27	26	25	24
	REM2NP3[13:8]							
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	REM2NP3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	REM2NP1[13:8]							
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	REM2NP1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 29:16 – REM2NP3[13:0] BCH Remainder $2 * N + 3$

When sector size is set to 512 bytes, bit REM2NP3[29] is not used and read as zero.

If bit  $i$  of the REM2NP3 field is set to one then the coefficient of the  $X^i$  is set to one, otherwise the coefficient is zero.

#### Bits 13:0 – REM2NP1[13:0] BCH Remainder $2 * N + 1$

When sector size is set to 512 bytes, bit REM2NP1[13] is not used and read as zero.

If bit  $i$  of the REM2NP1 field is set to one then the coefficient of the  $X^i$  is set to one, otherwise the coefficient is zero.

## 22. Programmable Multibit ECC Error Location Controller (PMERRLOC)

### 22.1. Description

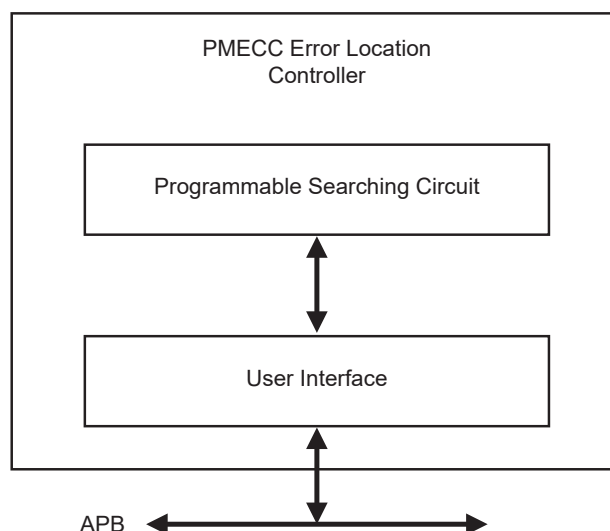

The PMECC Error Location Controller provides hardware acceleration for determining roots of polynomials over two finite fields:  $GF(2^{13})$  and  $GF(2^{14})$ . It integrates 24 fully programmable coefficients. These coefficients belong to  $GF(2^{13})$  or  $GF(2^{14})$ . The coefficient programmed in the PMERRLOC\_SIGMAx register is the coefficient of degree x in the polynomial.

### 22.2. Embedded Characteristics

- Provides Hardware Acceleration to Determine Roots of Polynomials Defined over a Finite Field
- Programmable Finite Field  $GF(2^{13})$  or  $GF(2^{14})$
- Finds Roots of Error Locator Polynomial
- Programmable Number of Roots

### 22.3. Block Diagram

Figure 22.1. Block Diagram

### 22.4. Functional Description

The PMERRLOC search operation is started as soon as a write access is detected in the PMERRLOC\_ELEN register and can be disabled by writing to the PMERRLOC\_ELDIS register. PMERRLOC\_ELEN.ENINIT shall be initialized with the number of Galois field elements to test. The set of the roots can be limited to a valid range.

Table 22.1. ENINIT Field Value for a Sector Size of 512 Bytes

Error Correcting Capability	ENINIT Value
2	4122
4	4148
8	4200
12	4252
24	4408

**Table 22.2.** ENINIT Field Value for a Sector Size of 1024 Bytes

Error Correcting Capability	ENINIT Value
2	8220
4	8248
8	8304
12	8360
24	8528

When the PMERRLOC is searching for roots, PMERRLOC\_ELSR.BUSY remains asserted. An interrupt is asserted at the end of the computation, and PMERRLOC\_ELISR.DONE is set. PMERRLOC\_ELISR.ERR\_CNT indicates the number of errors. The error position can be read in the PMERRLOC\_ELx registers.

## 22.5. Register Summary

Bit	7	6	5	4	3	2	1	0
	SIGMA0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	1

### Bits 13:0 – SIGMA0[13:0] Coefficient of Degree 0 in the SIGMA Polynomial

SIGMA0 belongs to the finite field  $GF(2^{13})$  when the sector size is set to 512 bytes.

SIGMA0 belongs to the finite field  $GF(2^{14})$  when the sector size is set to 1024 bytes.

## 22.5.11. PMERRLOC SIGMAx Register

**Name:** PMERRLOC\_SIGMAx  
**Offset:** 0x2C + (x-1)\*0x04 [x=1..24]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	SIGMA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 13:0 – SIGMA[13:0] Coefficient of Degree x in the SIGMA Polynomial

SIGMAx belongs to the finite field  $GF(2^{13})$  when the sector size is set to 512 bytes.

SIGMAx belongs to the finite field  $GF(2^{14})$  when the sector size is set to 1024 bytes.

**22.5.12. PMERRLOC Error Location x Register**

**Name:** PMERRLOC\_ELx  
**Offset:** 0x8C + x\*0x04 [x=0..23]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			ERRLOCN[13:8]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ERRLOCN[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 13:0 – ERRLOCN[13:0] Error Position within the Set {sector area, spare area}.**

ERRLOCN points to 0 when the first bit of the main area is corrupted.

If the sector size is set to 512 bytes, ERRLOCN points to 4096 when the last bit of the sector area is corrupted.

If the sector size is set to 1024 bytes, ERRLOCN points to 8192 when the last bit of the sector area is corrupted.

If the sector size is set to 512 bytes, ERRLOCN points to 4097 when the first bit of the spare area is corrupted.

If the sector size is set to 1024 bytes, ERRLOCN points to 8193 when the first bit of the spare area is corrupted.

## 23. DDR-SDRAM Controller (MPDDRC)

### 23.1. Description

DDR-SDRAM Controller (MPDDRC) maximizes memory bandwidth and minimizes transaction latency due to the DDR-SDRAM protocol.

The MPDDRC extends the memory capabilities of a chip by providing the interface to the external 16-bit DDR-SDRAM device. The page size supports ranges from 2048 to 16384 rows and from 256 to 4096 columns. It supports word (32-bit), half-word (16-bit), and byte (8-bit) accesses.

The MPDDRC supports a read or write burst length of eight locations. This enables the command and address bus to anticipate the next command, thus reducing latency imposed by the DDR-SDRAM protocol and improving the DDR-SDRAM bandwidth. Moreover, MPDDRC keeps track of the active row in each bank, thus maximizing DDR-SDRAM performance, e.g., the application may be placed in one bank and data in other banks. To optimize performance, avoid accessing different rows in the same bank. The MPDDRC supports a CAS latency of 2 or 3 and optimizes the read access depending on the frequency.

Self-Refresh, Power-Down and Deep Power-Down modes minimize the consumption of the DDR-SDRAM device.

OCD (Off-chip Driver) and ODT (On-die Termination) modes are not supported.

### 23.2. Embedded Characteristics

- Supported Memory Devices:
  - Low-power DDR1-SDRAM (LPDDR1)
  - Low-cost LPDDR1 with 2 internal banks
  - DDR2-SDRAM
- Arbitration Policies: Round-Robin, On Request, Bandwidth, Quality of Service
- 4 System Bus Interfaces; Management of all Accesses Maximizes Memory Bandwidth and Minimizes Transaction Latency
- Bus Transfer: Word, Half Word, Byte Access
- Supported Configurations:
  - 2K, 4K, 8K, 16K row address memory parts
  - DDR-SDRAM with two or four internal banks (low-power DDR1-SDRAM)
  - DDR-SDRAM with four or eight internal banks (DDR2-SDRAM)
  - DDR-SDRAM with 16-bit data path for system-oriented word access
  - One chip select for SDRAM device (256-Mbyte address space)
- Programming Facilities
  - Multibank ping-pong access (up to four or eight banks opened at the same time = reduced average latency of transactions)
  - Timing parameters specified by software
  - Automatic refresh operation, refresh rate is programmable
  - Automatic update of DS, TCR and PASR parameters (low-power DDR-SDRAM devices)
- Energy-Saving Capabilities
  - Self-Refresh, Power-Down, Active Power-Down and Deep Power-Down modes supported
- DDR-SDRAM Power-Up Initialization by Software
- CAS Latency of 2 or 3 Supported

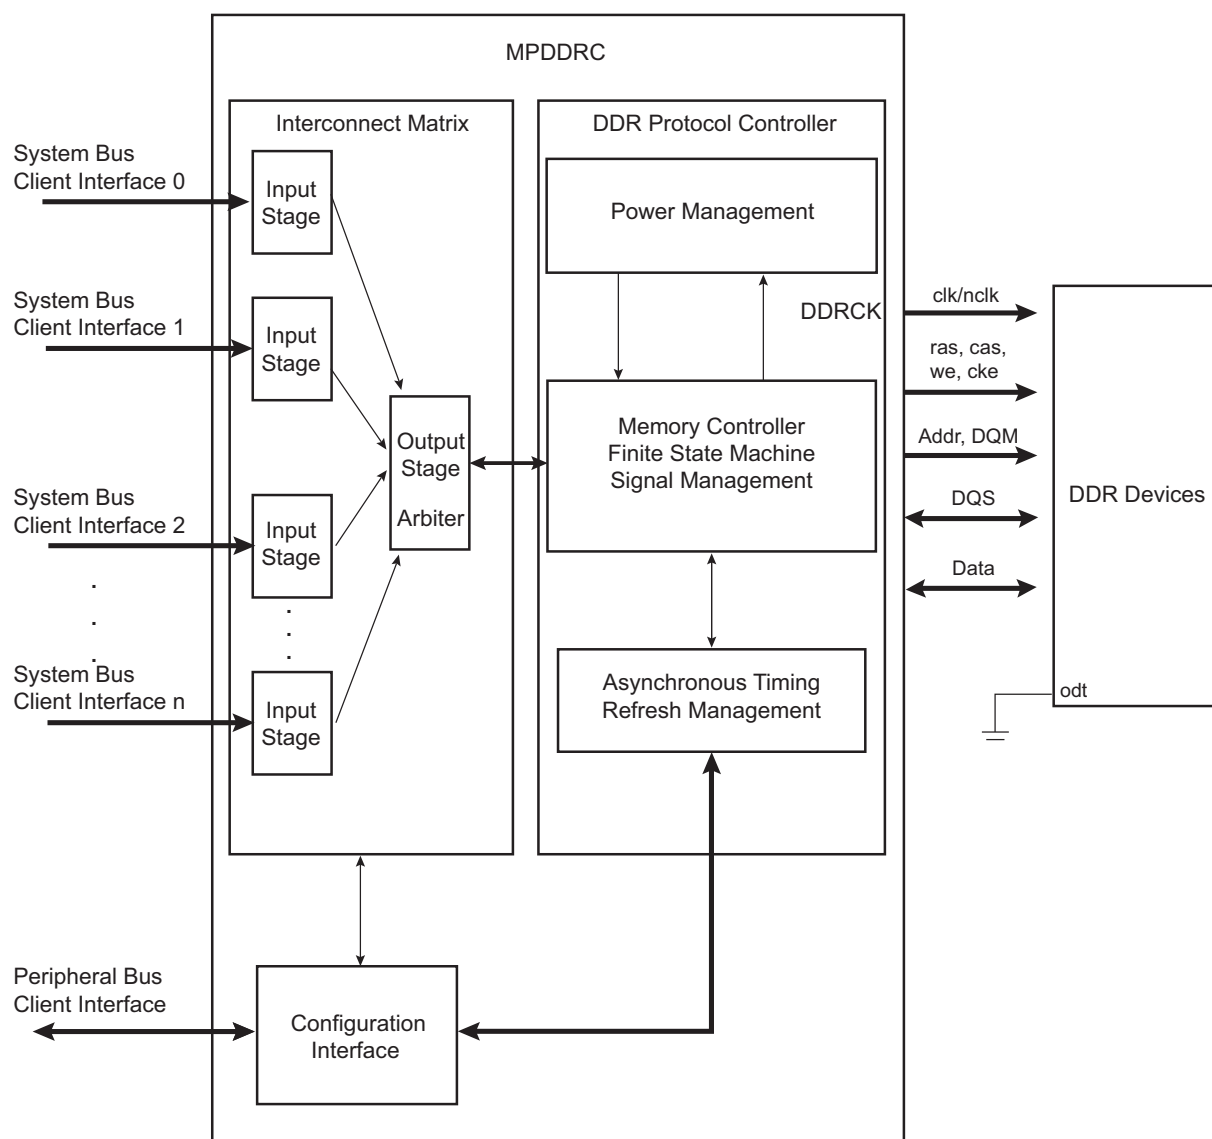

- Reset Function Supported (DDR2-SDRAM)
- Clock Frequency Change in Self-Refresh Mode Supported (Low-Power DDR-SDRAM)
- Auto-precharge Command Not Used
- OCD (Off-chip Driver) Mode, ODT (On-die Termination), are Not Supported
- Abnormal Software Access and Sequencer Integrity Error Reports
- Dynamic Scrambling with User Key (No Impact on Bandwidth)
- Bus Monitor

### 23.3. Block Diagram

The MPDDRC is partitioned in two blocks (see figure below):

- An Interconnect Matrix block that manages concurrent accesses on the system bus between 4 system bus hosts and integrates an arbiter
- A DDR Controller that translates system bus requests (read/write) in the DDR-SDRAM protocol

**Figure 23.1.** Block Diagram

## 23.4. Product Dependencies, Initialization Sequence

### 23.4.1. Interrupt Sources

The MPDDRC interrupt line is connected on one of the internal sources of the interrupt controller. Using the MPDDRC interrupt requires the interrupt controller to be programmed first.

### 23.4.2. Low-power DDR1-SDRAM Initialization

The initialization sequence is generated by software.

The low-power DDR1-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC\_MD).
2. To comply with the LPDDR1 standard, DQS must be used in Single-ended mode. NDQS must be disabled in the MPDDRC Configuration register (MPDDRC\_CR).
3. Program the shift sampling value in the Read Data Path register (MPDDRC\_RD\_DATA\_PATH).
4. Program [MPDDRC\\_IO\\_CALIBR](#).
5. Program the features of the low-power DDR1-SDRAM device in the MPDDRC Configuration register (MPDDRC\_CR) (number of columns, rows, banks, CAS latency and output drive strength) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC\_TPR0/1) (asynchronous timing (TRC, TRAS, etc.)).
6. Program Temperature Compensated Self-refresh (TCR), Partial Array Self-Refresh (PASR) and Drive Strength (DS) parameters in the Low-power register (MPDDRC\_LPR).
7. A NOP command is issued to the low-power DDR1-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM address to acknowledge this command. The clocks which drive the low-power DDR1-SDRAM device are now enabled.
8. A pause of at least 200  $\mu$ s must be observed before a signal toggle.
9. A NOP command is issued to the low-power DDR1-SDRAM. Program the NOP command in the MPDDRC\_MR. The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM address to acknowledge this command. A calibration request is now made to the I/O pad.
10. An All Banks Precharge command is issued to the low-power DDR1-SDRAM. Program All Banks Precharge command in the MPDDRC\_MR. The application must configure the MODE field to 2 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM address to acknowledge this command.
11. Two auto-refresh (CBR) cycles are provided. Program the Auto-refresh command (CBR) in the MPDDRC\_MR. The application must configure the MODE field to 4 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any low-power DDR1-SDRAM location twice to acknowledge these commands.
12. An Extended Mode Register Set (EMRS) cycle is issued to program the low-power DDR1-SDRAM parameters (TCSR, PASR, DS). The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and BA[0] is set to 0. For example: with a 16-bit, 128-Mbit, low-power DDR1-SDRAM (12 rows, 9 columns, 4 banks), the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00800000`. In the case of low-cost and low-density low-power DDR1-SDRAM (2 internal banks), the write address must be chosen so that signal BA[0] is set to 1. BA[1] is not used.

**Note:** This address is given as an example only. The real address depends on implementation in the product.

13. A Mode Register Set (MRS) cycle is issued to program parameters of the low-power DDR1-SDRAM devices, in particular CAS latency. The application must configure the MODE field to 3 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the low-power DDR1-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[1:0] are set to 0. For example, the SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR.
14. The application must enter Normal mode, write a zero to the MODE field in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access at any location in the low-power DDR1-SDRAM to acknowledge this command.
15. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC\_RTR). To compute the value, see [MPDDRC Refresh Timer Register](#).

After initialization, the low-power DDR1-SDRAM device is fully functional.

### 23.4.3. DDR2-SDRAM Initialization

The initialization sequence is generated by software. The DDR2-SDRAM devices are initialized by the following sequence:

1. Program the memory device type in the Memory Device register (MPDDRC\_MD).
2. Program the shift sampling value in the Read Data Path register (MPDDRC\_RD\_DATA\_PATH).
3. Program [MPDDRC\\_IO\\_CALIBR](#).
4. Program features of the DDR2-SDRAM device in the Configuration register (MPDDRC\_CR) (number of columns, rows, banks, CAS latency and output driver impedance control) and in the Timing Parameter 0 register/Timing Parameter 1 register (MPDDRC\_TPR0/1) (asynchronous timing: TRC, TRAS, etc.).
5. A NOP command is issued to the DDR2-SDRAM. Program the NOP command in the Mode register (MPDDRC\_MR). The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command. The clocks which drive the DDR2-SDRAM device are now enabled.
6. A pause of at least 200  $\mu$ s must be observed before a signal toggle.
7. A NOP command is issued to the DDR2-SDRAM. Program the NOP command in the MPDDRC\_MR. The application must configure the MODE field to 1 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command. CKE is now driven high.
8. An All Banks Precharge command is issued to the DDR2-SDRAM. Program All Banks Precharge command in the MPDDRC\_MR. The application must configure the MODE field to 2 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
9. An Extended Mode Register Set (EMRS2) cycle is issued to choose between commercial or high temperature operations. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and signal BA[0] is set to 0. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: BASE\_ADDRESS\_DDR + 0x00800000.

**Note:** This address is given as an example only. The real address depends on implementation in the product.

10. An Extended Mode Register Set (EMRS3) cycle is issued to set the Extended Mode register to 0. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 1 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00C00000`
11. An Extended Mode Register Set (EMRS1) cycle is issued to enable DLL and to program D.I.C. (Output Driver Impedance Control). The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00400000`.
12. An additional 200 cycles of clock are required for locking DLL.
13. Write a '1' to the DLL bit (enable DLL reset) in the Configuration register (MPDDRC\_CR).
14. A Mode Register Set (MRS) cycle is issued to reset DLL. The application must configure the MODE field to 3 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[1:0] are set to 0. For example, the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR`.
15. An All Banks Precharge command is issued to the DDR2-SDRAM. Program the All Banks Precharge command in the MPDDRC\_MR. The application must configure the MODE field to 2 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
16. Two auto-refresh (CBR) cycles are provided. Program the Auto-refresh command (CBR) in the MPDDRC\_MR. The application must configure the MODE field to 4 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM location twice to acknowledge these commands. TRFC must be checked between two auto-refreshes (see [MPDDRC\\_TPR1](#)).
17. Write a '0' to the DLL bit (disable DLL reset) in the MPDDRC\_CR.
18. A Mode Register Set (MRS) cycle is issued to program parameters of the DDR2-SDRAM device, in particular CAS latency and to disable DLL reset. The application must configure the MODE field to 3 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signals BA[1:0] are set to 0. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be done at the address: `BASE_ADDRESS_DDR`.
19. Configure the OCD field (default OCD calibration) to 7 in the MPDDRC\_CR.
20. An Extended Mode Register Set (EMRS1) cycle is issued to the default OCD value. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks), the DDR2-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00400000`.
21. Configure the OCD field (exit OCD calibration mode) to 0 in the MPDDRC\_CR.
22. An Extended Mode Register Set (EMRS1) cycle is issued to enable OCD exit. The application must configure the MODE field to 5 in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to the DDR2-SDRAM

to acknowledge this command. The write address must be chosen so that signal BA[1] is set to 0 and signal BA[0] is set to 1. For example: with a 16-bit, 128-Mbit, DDR2-SDRAM (12 rows, 9 columns, 4 banks) bank address, the DDR2-SDRAM write access should be done at the address: `BASE_ADDRESS_DDR + 0x00400000`.

23. A Normal Mode command is provided. Program the Normal mode in the MPDDRC\_MR. Read the MPDDRC\_MR and add a memory barrier assembler instruction just after the read. Perform a write access to any DDR2-SDRAM address to acknowledge this command.
24. Write the refresh rate into the COUNT field in the Refresh Timer register (MPDDRC\_RTR). To compute the value, see [MPDDRC Refresh Timer Register](#).

After initialization, the DDR2-SDRAM devices are fully functional.

## 23.5. Functional Description

### 23.5.1. DDR-SDRAM Controller Write Cycle

The MPDDRC provides burst access or single access in Normal mode (MPDDRC\_MR.MODE = 0). Whatever the access type, the MPDDRC keeps track of the active row in each bank, thus maximizing performance.

The DDR-SDRAM device is programmed with a burst length (bl) equal to 8. This determines the length of a sequential data input by the write command that is set to 8. The latency from write command to data input depends on the memory type, as shown in the following table.

**Table 23.1.** CAS Write Latency

Memory Devices	CAS Write Latency (CWL)
Low-power DDR1-SDRAM	1
DDR2-SDRAM	2

To initiate a single access, the MPDDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a write command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a write command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/write ( $t_{RCD}$ ) commands. As the burst length is set to 8, in case of single access, it has to stop the burst, otherwise seven invalid values may be written. In case of the DDR-SDRAM device, the Burst Stop command is not supported for the burst write operation. So, in order to interrupt the write operation, the DM (data mask) input signal must be set to 1 to mask invalid data (see the following figures), and DQS must continue to toggle.

To initiate a burst access, the MPDDRC uses the transfer type signal provided by the host requesting the access. If the next access is a sequential write access, writing to the DDR-SDRAM device is carried out. If the next access is a write non-sequential access, then an automatic access break is inserted, the MPDDRC generates a precharge command, activates the new row and initiates a write command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/write ( $t_{RCD}$ ) commands.

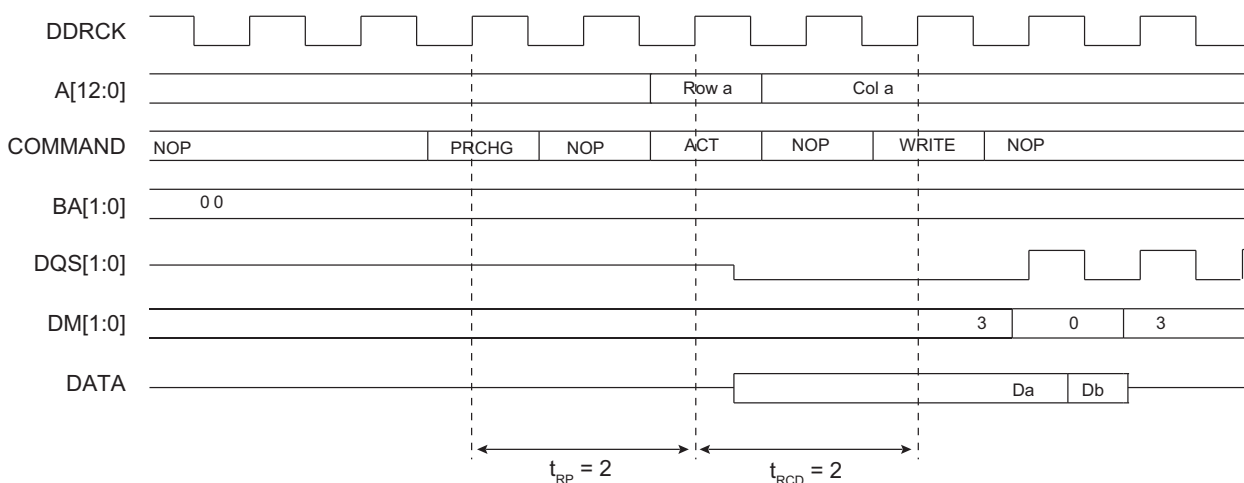

For the definition of timing parameters, see [MPDDRC Timing Parameter 0 Register](#).

Write accesses to the DDR-SDRAM device are burst oriented and the burst length is programmed to 8. It determines the maximum number of column locations that can be accessed for a given write command. When the write command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, thus the burst wraps within these eight columns if a boundary is reached. These eight columns are selected by `addr[13:3]`. `addr[2:0]` is used to select the starting location within the block.

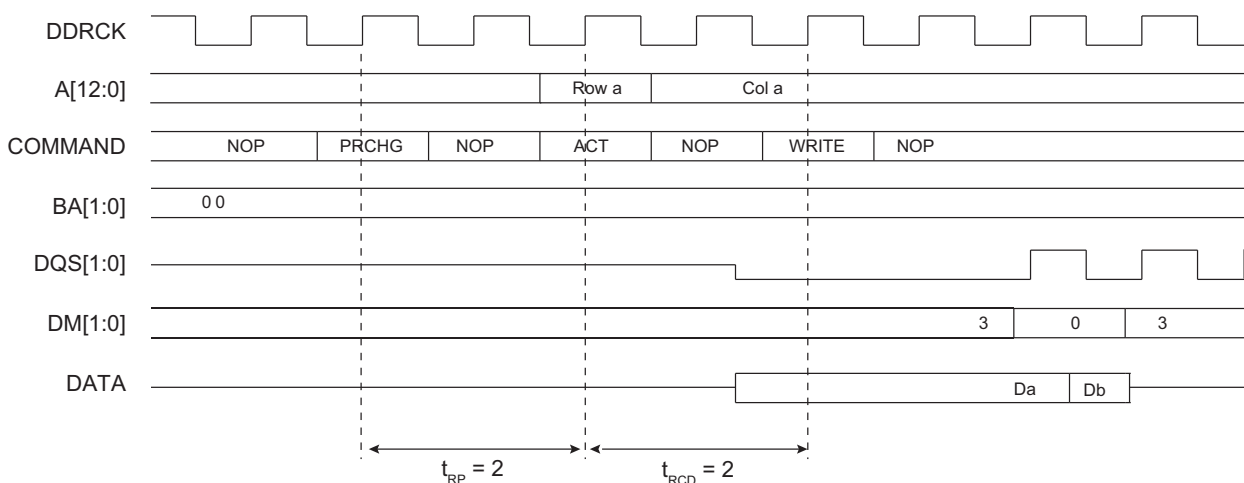

In case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the DDR-SDRAM device. For example, when a transfer (INCR4) starts at address 0x0C,

the next access is 0x10, but since the burst length is programmed to 8, the next access is at 0x00. Since the boundary is reached, the burst is wrapped. The MPDDRC takes this feature of the DDR-SDRAM device into account. In case of a transfer starting at address 0x04/0x08/0x0C or starting at address 0x10/0x14/0x18/0x1C, two write commands are issued to avoid wrapping when the boundary is reached. The last write command is subject to DM input logic level. If DM is registered high, the corresponding data input is ignored and the write access is not done. This avoids additional writing.

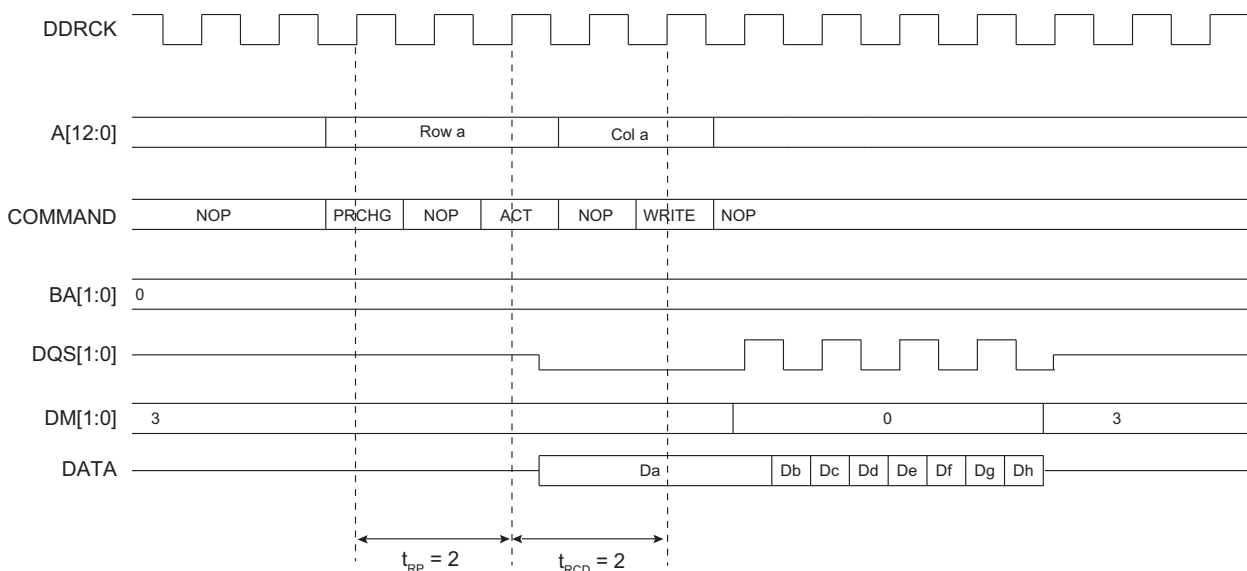

**Figure 23.2.** Single Write Access, Row Closed, DDR-SDRAM Devices

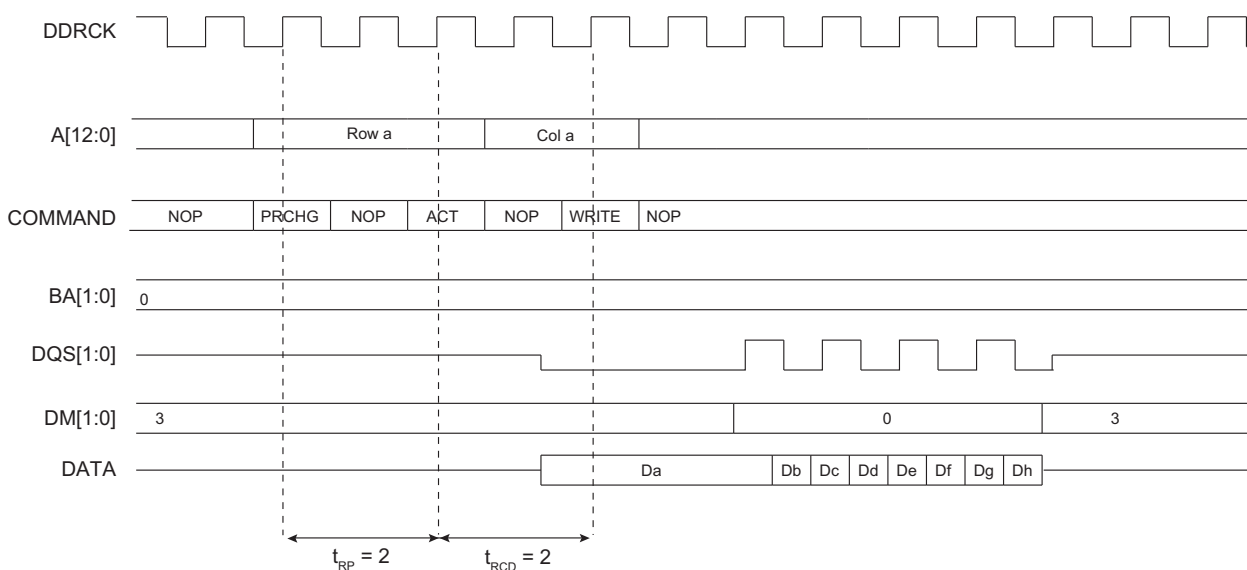

**Figure 23.3.** Single Write Access, Row Closed, DDR2-SDRAM Devices

**Figure 23.4.** Burst Write Access, Row Closed, DDR-SDRAM Devices

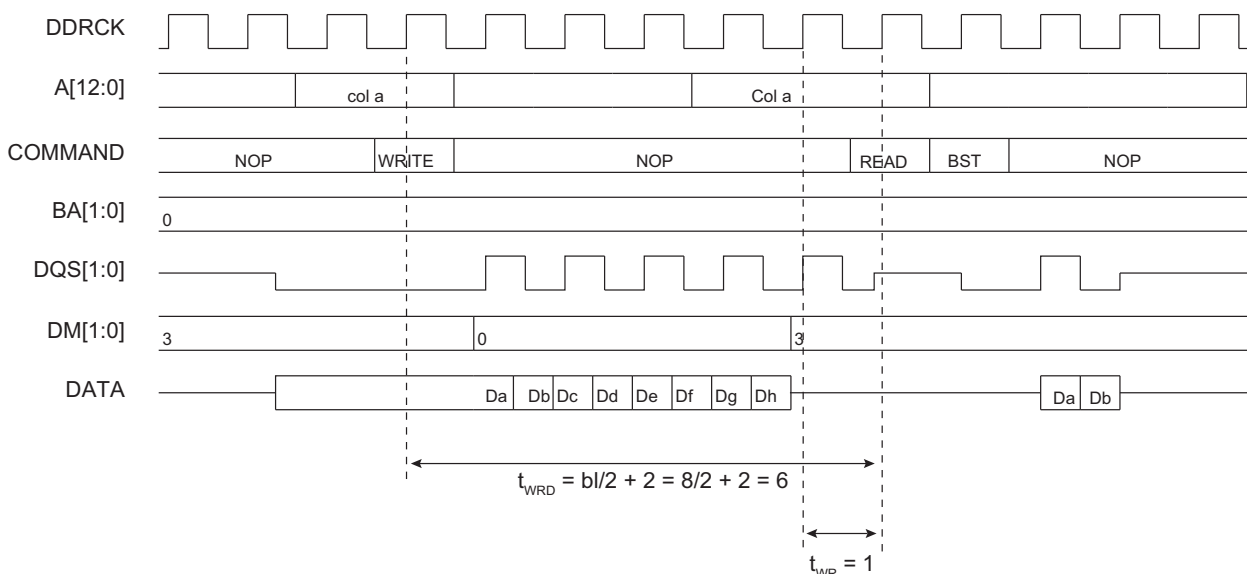

**Figure 23.5.** Burst Write Access, Row Closed, DDR2-SDRAM Devices

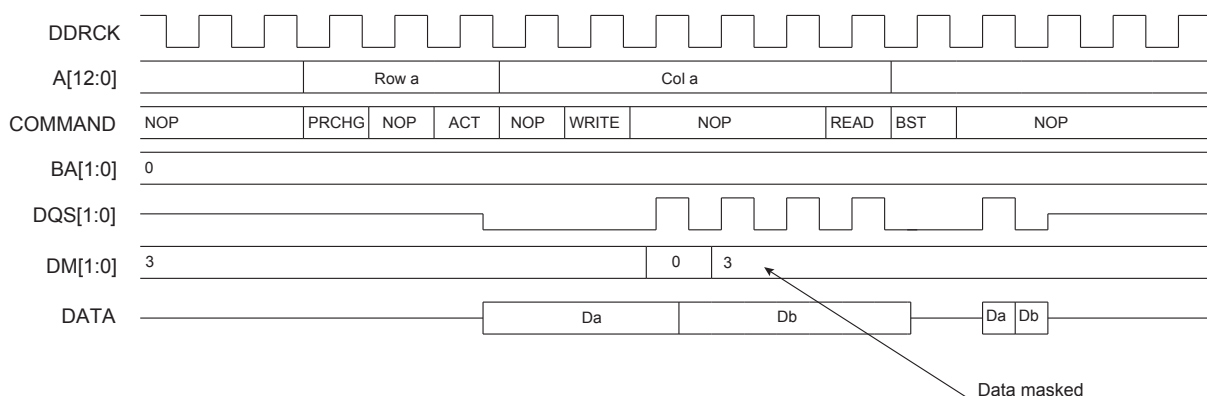

A write command can be followed by a read command. To avoid breaking the current write burst,  $t_{WTR}/t_{WRD}$  ( $bl/2 + 2 = 6$  cycles) should be met. See the figure below.

**Figure 23.6.** Write Command Followed by a Read Command without Burst Write Interrupt, DDR-SDRAM Devices

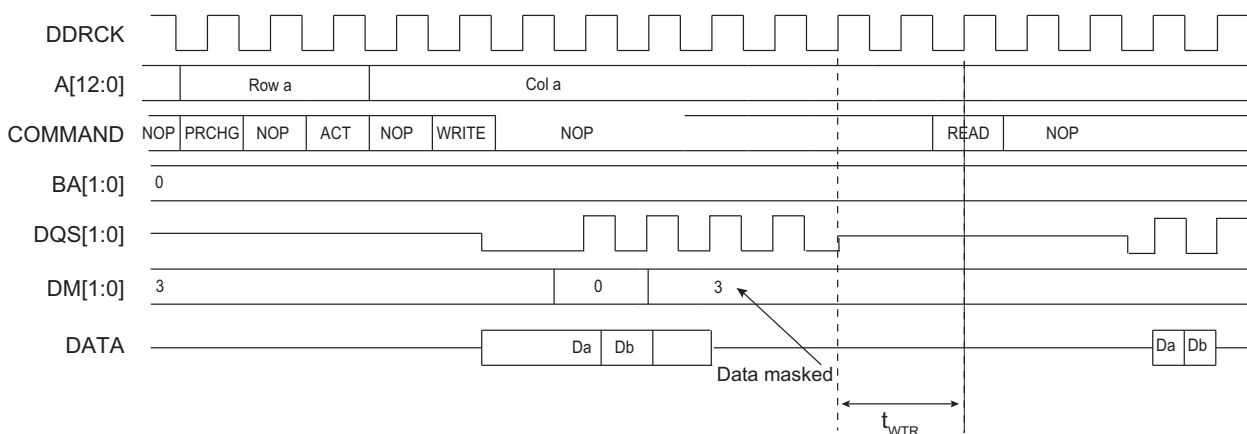

In case of a single write access, write operation should be interrupted by a read access but DM must be input 1 cycle prior to the read command to avoid writing invalid data. See the figure below.

**Figure 23.7.** Single Write Access Followed by a Read Access, DDR-SDRAM Devices

**Figure 23.8.** Single Write Access Followed by a Read Access, DDR2-SDRAM Devices

### 23.5.2. DDR-SDRAM Controller Read Cycle

The MPDDRC provides burst access or single access in Normal mode (MPDDRC\_MR.MODE = 0). Whatever the access type, the MPDDRC keeps track of the active row in each bank, thus maximizing performance of the MPDDRC.

The DDR-SDRAM devices are programmed with a burst length equal to 8 which determines the length of a sequential data output by the read command that is set to 8. The latency from read command to data output depends on the memory type, as shown in the following table. This value is programmed during the initialization phase (see [Product Dependencies, Initialization Sequence](#)).

**Table 23.2.** CAS Read Latency

Memory Devices	CAS Read Latency
Low-power DDR1-SDRAM	2/3
DDR2-SDRAM	3

To initiate a single access, the MPDDRC checks if the page access is already open. If row/bank addresses match with the previous row/bank addresses, the controller generates a read command. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/read ( $t_{RCD}$ ) commands. After a read command, additional wait states are generated to comply with CAS latency. The MPDDRC supports a CAS latency delay of 2 or 3 clock cycles. As the burst length is set to 8, in case of a single access or a burst access lower than 8 data requests, it has to stop the burst, otherwise an additional seven or X values could be read. The Burst Stop command (BST) is used to stop output during a burst read. If the DDR2-SDRAM Burst Stop command is not supported by the JEDEC standard, in a single read access, an additional seven unwanted data will be read.

To initiate a burst access, the MPDDRC checks the transfer type signal. If the next accesses are sequential read accesses, reading to the SDRAM device is carried out. If the next access is a read non-sequential access, then an automatic page break can be inserted. If the bank addresses are not identical or if bank addresses are identical but the row addresses are not identical, the controller generates a precharge command, activates the new row and initiates a read command. If page access is already open, a read command is generated.

To comply with DDR-SDRAM timing parameters, additional clock cycles are inserted between precharge/active ( $t_{RP}$ ) commands and active/read ( $t_{RCD}$ ) commands. The MPDDRC supports a CAS latency delay of 2 or 3 clock cycles. During this delay, the controller uses internal signals to anticipate the next access and improve the performance of the controller. Depending on the latency, the MPDDRC anticipates 2 or 3 read accesses. In case of burst of specified length, accesses are not anticipated, but if the burst is broken (border, Busy mode, etc.), the next access is treated as an incrementing burst of unspecified length, and depending on the latency, the MPDDRC anticipates 2 or 3 read accesses.

For the definition of timing parameters, see [MPDDRC Configuration Register](#).

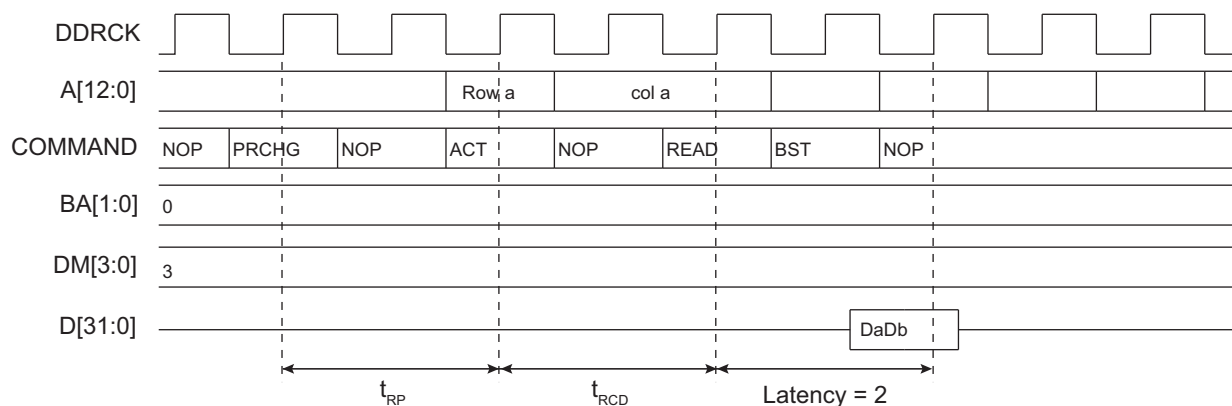

Read accesses to the DDR-SDRAM are burst oriented and the burst length is programmed to 8. The burst length determines the maximum number of column locations that can be accessed for a given read command. When the read command is issued, eight columns are selected. All accesses for that burst take place within these eight columns, meaning that the burst wraps within these eight columns if the boundary is reached. These eight columns are selected by `addr[13:3]; addr[2:0]` is used to select the starting location within the block.

In case of incrementing burst (INCR/INCR4/INCR8/INCR16), the addresses can cross the 16-byte boundary of the DDR-SDRAM device. For example, when a transfer (INCR4) starts at address 0x0C, the next access is 0x10, but since the burst length is programmed to 8, the next access is 0x00. Since the boundary is reached, the burst wraps. The MPDDRC takes into account this feature of

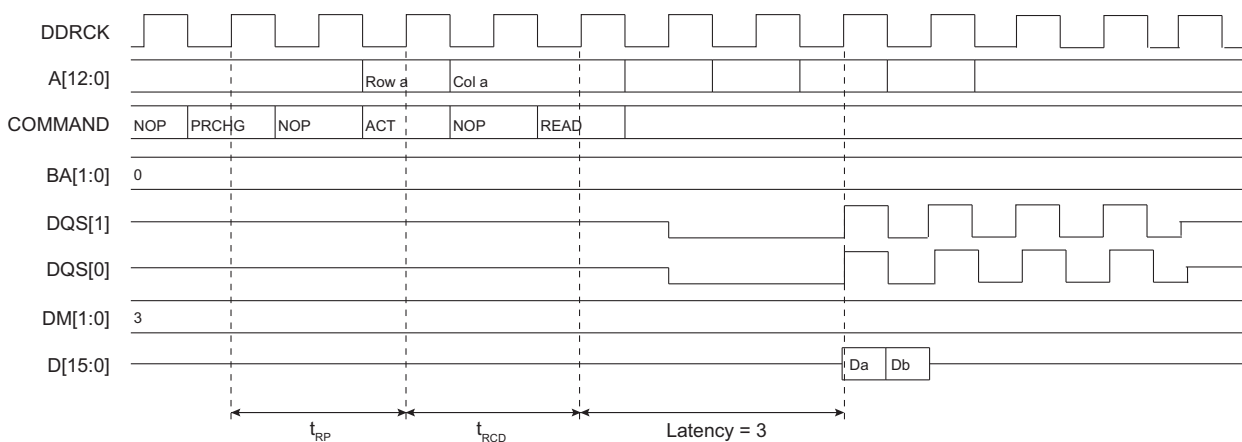

the SDRAM device. In case of the DDR-SDRAM device, transfers start at address 0x04/0x08/0x0C. Two read commands are issued to avoid wrapping when the boundary is reached. The last read command may generate additional reading (1 read cmd = 4 DDR words).

To avoid additional reading, it is possible to use the Burst Stop command to truncate the read burst and to decrease power consumption. The DDR2-SDRAM devices do not support the Burst Stop command.

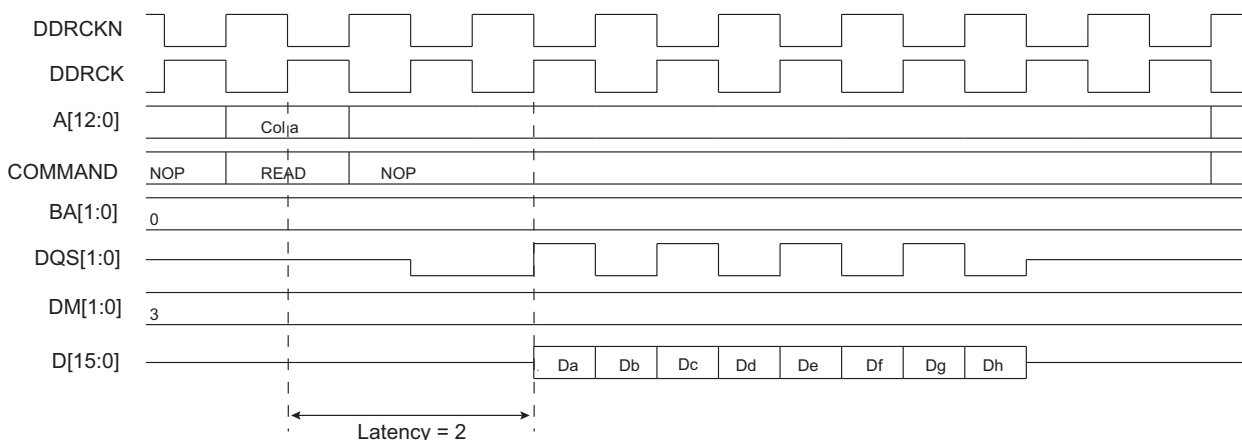

**Figure 23.9.** Single Read Access, Row Closed, Latency = 2, DDR-SDRAM Devices

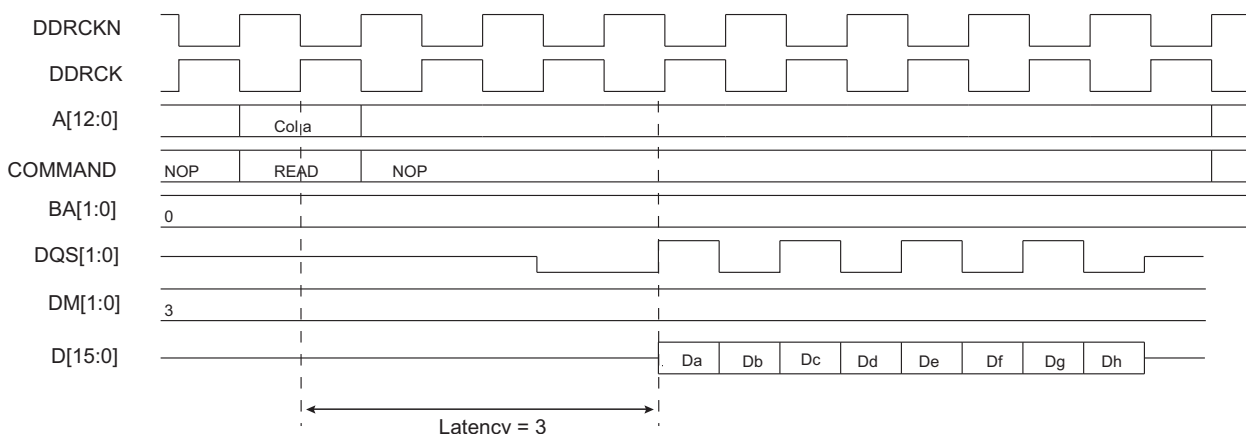

**Figure 23.10.** Single Read Access, Row Closed, Latency = 3, DDR2-SDRAM Devices

**Figure 23.11.** Burst Read Access, Latency = 2, DDR-SDRAM Devices

**Figure 23.12.** Burst Read Access, Latency = 3, DDR2-SDRAM Devices

### 23.5.3. Refresh (Auto-Refresh Command)

An Auto-refresh command is used to refresh the external SDRAM devices. Refresh addresses are generated internally by the DDR-SDRAM device and incremented automatically after each auto-refresh. The MPDDRC generates these auto-refresh commands periodically. A timer is loaded in the MPDDRC\_RTR with the value which indicates the number of clock cycles between refresh cycles (see [MPDDRC Refresh Timer Register](#)). When the MPDDRC initiates a refresh of the DDR-SDRAM device, internal memory accesses are not delayed. However, if the CPU tries to access the DDR-SDRAM device, the client indicates that the device is busy. A refresh request does not interrupt a burst transfer in progress.

### 23.5.4. Power Management

#### 23.5.4.1. Self-Refresh Mode

This mode is activated by configuring the Low-power Command bit (LPCB) to 1 in the [MPDDRC Low-Power Register](#) (MPDDRC\_LPR).

Self-refresh mode is used in Power-down mode, that is, when no access to the DDR-SDRAM device is possible. In this case, power consumption is very low. In Self-refresh mode, the DDR-SDRAM device retains data without external clocking and provides its own internal clocking, thus performing its own auto-refresh cycles. During the self-refresh period, CKE is driven low. As soon as the DDR-SDRAM device is selected, the MPDDRC provides a sequence of commands and exits Self-refresh mode.

The MPDDRC re-enables Self-refresh mode as soon as the DDR-SDRAM device is not selected. It is possible to define when Self-refresh mode is to be enabled by configuring the TIMEOUT field in the MPDDRC\_LPR:

- 0: Self-refresh mode is enabled as soon as the DDR-SDRAM device is not selected.
- 1: Self-refresh mode is enabled 64 clock cycles after completion of the last access.
- 2: Self-refresh mode is enabled 128 clock cycles after completion of the last access.

This controller also interfaces the low-power DDR-SDRAM. To optimize power consumption, the Low-Power DDR SDRAM provides programmable self-refresh options comprised of Partial Array Self-refresh (full, half, quarter and 1/8 and 1/16 array).

Disabled banks are not refreshed in Self-refresh mode. This feature permits to reduce the self-refresh current. In case of low-power DDR1-SDRAM, the Extended Mode register controls this feature. It includes Temperature Compensated Self-refresh (TSCR) and Partial Array Self-refresh (PASR) parameters and the drive strength (DS) (see [MPDDRC Low-Power Register](#)). These parameters are set during the initialization phase. After initialization, as soon as the PASR/DS/TCSR

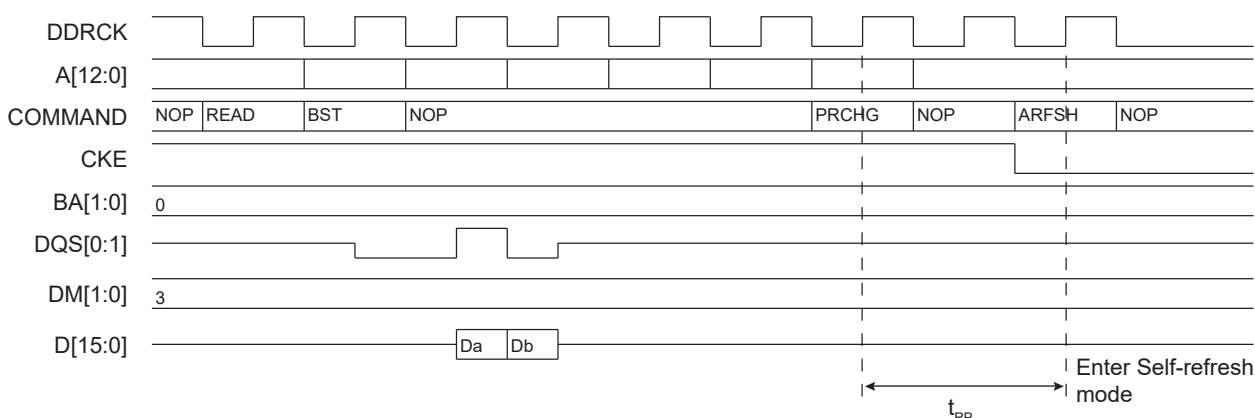

fields are modified, the memory device Extended Mode register are automatically accessed. Thus if MPDDRC does not share an external bus with another controller, PASR/DS/TCSR bits are updated before entering Self-refresh mode or during a refresh command. If MPDDRC does share an external bus with another controller, PASR/DS/TCSR bits are also updated during a pending read or write access. This type of update depends on the UPD\_MR bit (see [MPDDRC Low-Power Register](#)).

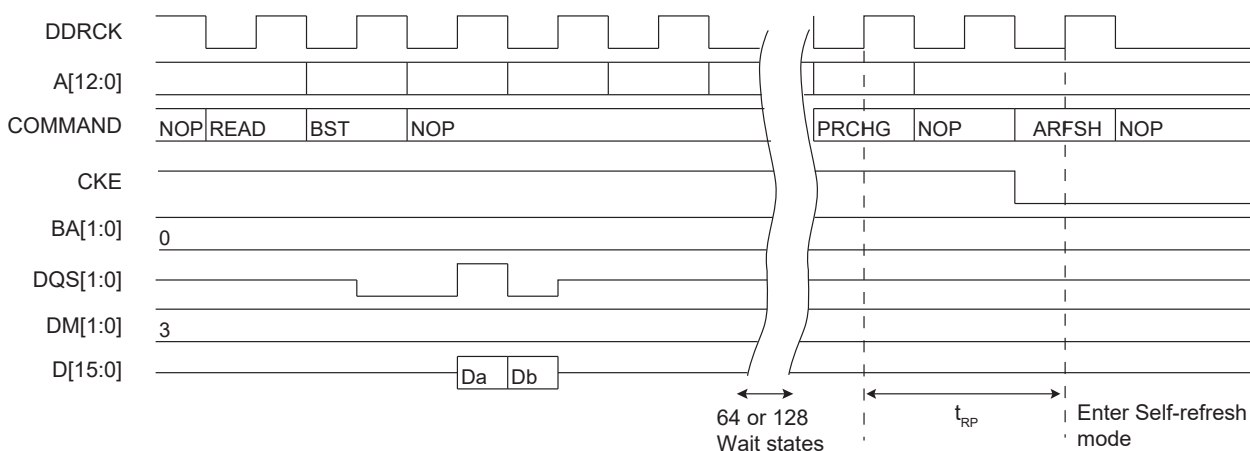

The low-power DDR1-SDRAM must remain in Self-refresh mode during the minimum of TRFC periods (see [MPDDRC Timing Parameter 1 Register](#)), and may remain in Self-refresh mode for an indefinite period.

The DDR2-SDRAM must remain in Self-refresh mode during the minimum of  $t_{CKE}$  periods (refer to the memory device data sheet), and may remain in Self-refresh mode for an indefinite period.

**Figure 23.13.** Self-Refresh Mode Entry, TIMEOUT = 0

**Figure 23.14.** Self-Refresh Mode Entry, TIMEOUT = 1 or 2

**Figure 23.15.** Self-Refresh Mode Exit

#### 23.5.4.2. Power-Down Mode

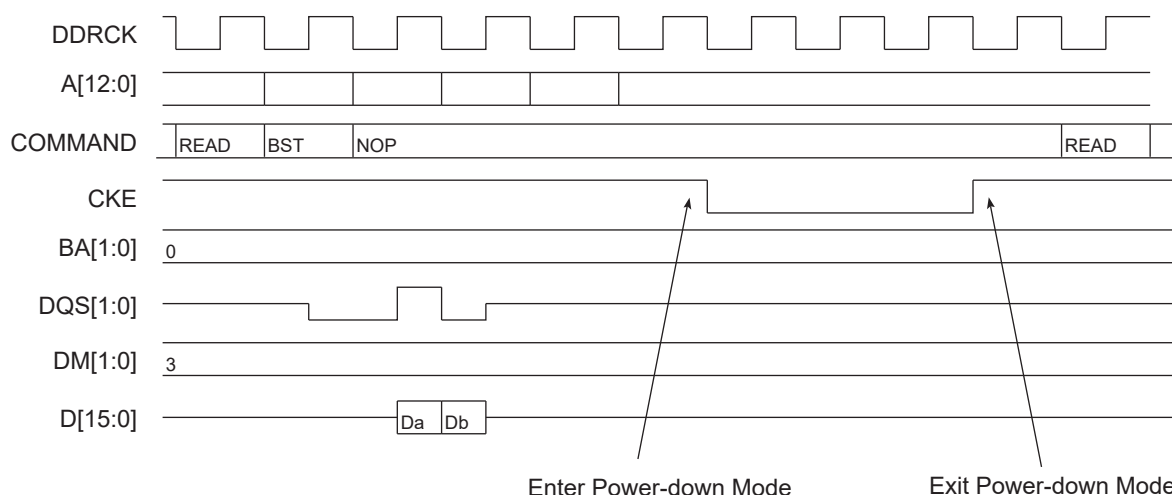

This mode is activated by configuring the Low-power Command bit (LPCB) to 2 in the [MPDDRC Low-Power Register](#) (MPDDRC\_LPR).

Power-down mode is used when no access to the DDR-SDRAM device is possible. In this mode, power consumption is greater than in Self-refresh mode. This state is similar to Normal mode (no Low-power mode/no Self-refresh mode), but the CKE pin is low and the input and output buffers are deactivated as soon the DDR-SDRAM device is no longer accessible. In contrast to Self-refresh mode, the DDR-SDRAM device cannot remain in Low-power mode longer than one refresh period (64 ms/32 ms). As no auto-refresh operations are performed in this mode, the MPDDRC carries out the refresh operation. For the low-power DDR-SDRAM devices, a NOP command must be generated for a minimum period defined in the TXP field of the Timing Parameter 1 register (MPDDRC\_TPR1). For DDR-SDRAM devices, a NOP command must be generated for a minimum period defined in the TXP field of MPDDRC\_TPR1 (see [MPDDRC Timing Parameter 1 Register](#)) and in the TXARD and TXARDS fields of MPDDRC\_TPR2 (see [MPDDRC Timing Parameter 2 Register](#)) for DDR2\_SDRAM devices. In addition, low-power DDR-SDRAM and DDR-SDRAM must remain in Power-down mode for a minimum period corresponding to  $t_{CKE}$ ,  $t_{PD}$ , etc. (refer to the memory device data sheet).

The exit procedure is faster than in Self-refresh mode. See the following figure. The MPDDRC returns to Power-down mode as soon as the DDR-SDRAM device is not selected. It is possible to define when Power-down mode is enabled by configuring the TIMEOUT field in the MPDDRC\_LPR:

- 0: Power-down mode is enabled as soon as the DDR-SDRAM device is not selected.
- 1: Power-down mode is enabled 64 clock cycles after completion of the last access.
- 2: Power-down mode is enabled 128 clock cycles after completion of the last access.

**Figure 23.16.** Power-Down Entry/Exit, TIMEOUT = 0

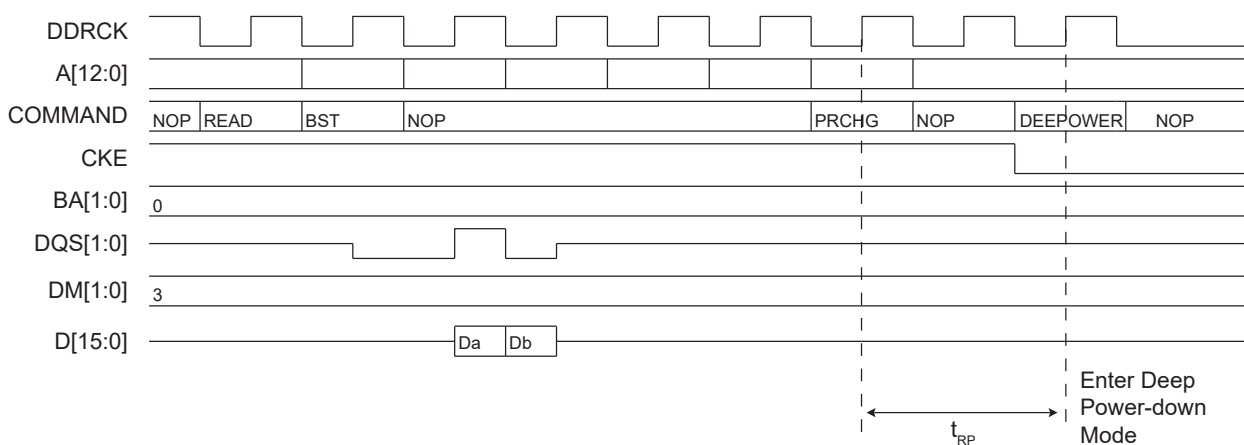

### 23.5.4.3. Deep Power-Down Mode

The Deep Power-down mode is a feature of low-power DDR-SDRAM. When this mode is activated, all internal voltage generators inside the device are stopped and all data is lost.

Deep Power-down mode is activated by configuring the Low-power Command bit (LPCB) to 3 in the [MPDDRC Low-Power Register](#) (MPDDRC\_LPR). When this mode is enabled, the MPDDRC leaves Normal mode (MPDDRC\_MR.MODE = 0) and the controller is frozen. The clock can be stopped during Deep Power-down mode by setting the CLK\_FR field to 1.

Before enabling this mode, the user must make sure there is no access in progress. To exit Deep Power-down mode, the Low-power Command bit (LPCB) and Clock Frozen bit (CLK\_FR) must be 0 and the initialization sequence must be generated by software. See [Low-power DDR1-SDRAM Initialization](#).

**Figure 23.17.** Deep Power-Down Mode Entry

### 23.5.4.4. Change Frequency During Self-Refresh Mode with Low-power DDR-SDRAM Devices

To change frequency, Self-refresh mode must be activated. This is done by configuring the Low-power Command bit (LPCB) to 1 and writing a '1' to the Change Frequency Command bit (CHG\_FR) in the Low-power register (MPDDRC\_LPR).

Once the DDR-SDRAM device is in Self-refresh mode, the user must make sure there is no access in progress. Then, the user can change the clock frequency. The device input clock frequency changes only within minimum and maximum operating frequencies as specified by the low-power

DDR-SDRAM providers. The [MPDDRC\\_RTR](#) (COUNT), [MPDDRC\\_CR](#) (CAS, etc.), [MPDDRC\\_TPR0](#) (TRC, TRP, TRAS, etc.), [MPDDRC\\_TPR1](#) (TRFC, TXSNR, TXSRD, TXP) and [MPDDRC\\_TPR2](#) (TRTP, TFAW, etc.) registers can be updated according to the new clock frequency. Once the input clock frequency is changed, new stable clocks must be provided to the device before exiting from Self-refresh mode.

To exit from Self-refresh mode, the DDR-SDRAM device must be selected. The MPDDRC provides a sequence of commands and exits Self-refresh mode.

During a change frequency procedure, MPDDRC\_LPR.CHG\_FR is set to 0 automatically.

It is not possible to change the frequency with DDR2-SDRAM devices.

Before changing frequency, make sure the processor clock (PCK) value is twice the system bus clock (MCK) value.

#### 23.5.4.5. Reset Mode

The Reset mode is a feature of DDR2-SDRAM. This mode is activated by configuring the Low-power Command bit (LPCB) to 3 and writing a '1' to the Clock Frozen Command bit (CLK\_FR) in the Low-power register (MPDDRC\_LPR).

When this mode is enabled, the MPDDRC leaves Normal mode (MPDDRC\_MR.MODE = 0) and the controller is frozen. Before enabling this mode, the user must make sure there is no access in progress.

To exit Reset mode, the Low-power Command bit (LPCB) must be configured to 0, the Clock Frozen Command bit (CLK\_FR) must be written to '0' and the initialization sequence must be generated by software (see [DDR2-SDRAM Initialization](#)).

#### 23.5.5. Optimized Access Functionality

The DDR-SDRAM protocol imposes a check of timings prior to performing a read or a write access, thus decreasing system performance. An access to DDR-SDRAM is performed if banks and rows are open (or active). To activate a row in a particular bank, the last open row must be deactivated and a new row must be open. Two DDR-SDRAM commands must be performed to open a bank: Precharge command and Activate command with respect to  $T_{RP}$  timing. Before performing a read or write command,  $T_{RCD}$  timing must be checked.

This operation generates a significant bandwidth loss (see the following figure).

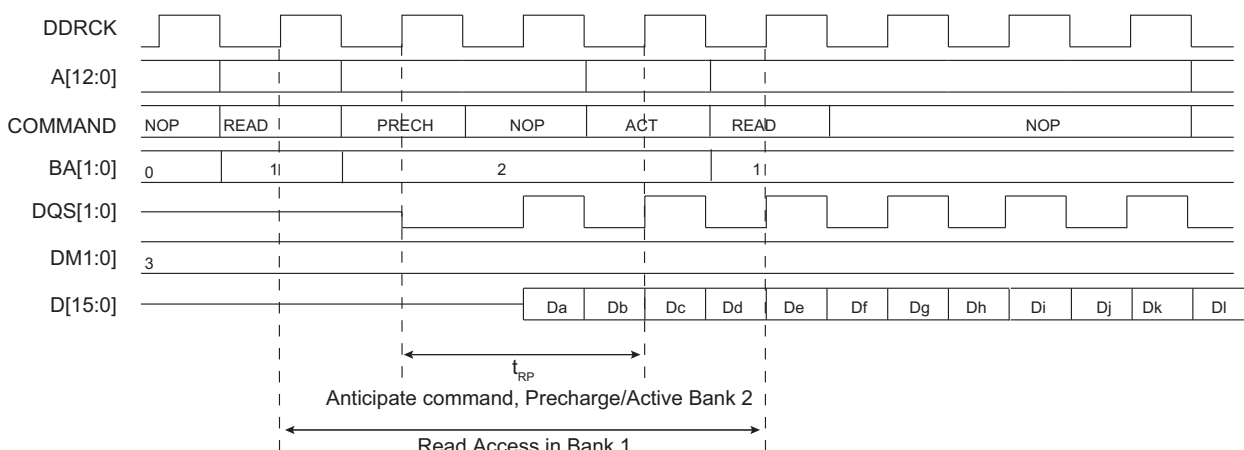

**Figure 23.18.**  $T_{RP}$  and  $T_{RCD}$  Timings

The controller is designed to mask these timings and thus improve the system bandwidth.

The MPDDRC is a controller whereby 4 hosts can simultaneously reach the controller. This feature improves the bandwidth of the system because it can detect 4 requests on the system bus client inputs and thus anticipate the commands that follow, Precharge command and Activate command in bank X during the current access in bank Y. This masks  $t_{RP}$  and  $t_{RCD}$  timings (see the following figure). In the best case, all accesses are done as if the banks and rows were already open. The best condition is met when the 4 hosts work in different banks. In the case of 4 simultaneous read accesses, when the four or eight banks and associated rows are open, the controller reads with a continuous flow and masks the CAS latency for each access. To allow a continuous flow, the read command must be set at 2 or 3 cycles (CAS latency) before the end of the current access. The arbitration scheme must be changed since the round-robin arbitration cannot be respected. If the controller anticipates a read access, and thus a host with a high priority arises before the end of the current access, then this host will not be serviced.

**Figure 23.19.** Anticipate Precharge/Activate Command in Bank 2 during Read Access in Bank 1

MPDDRC embeds three arbitration mechanisms based on round-robin arbitration which allows to share the external device between different hosts when two or more hosts try to access the DDR-SDRAM device at the same time.

The three arbitration types are round-robin arbitration and two weighted round-robin arbitrations. For weighted round-robin arbitrations, the priority can be given either depending on the number of requests or words per port, or depending on the required bandwidth per port. The type of arbitration can be chosen by setting the ARB field in the Configuration Arbiter register (MPDDRC\_CONF\_ARBITER) (see [MPDDRC Configuration Arbiter Register](#)).

### 23.5.5.1.Round-robin Arbitration

Round-robin arbitration is used when the ARB field is set to 0 (see [MPDDRC Configuration Arbiter Register](#)). This algorithm dispatches the requests from different hosts to the DDR-SDRAM device in a round-robin manner. If two or more host requests arise at the same time, the host with the lowest number is serviced first, then the others are serviced in a round-robin manner.

To avoid burst breaking and to provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Idle cycles: when no host is connected to the DDR-SDRAM device.
2. Single cycles: when a client is currently doing a single access.
3. End of Burst cycles: when the current cycle is the last cycle of a burst transfer:
  - For bursts of defined length, predicted end of burst matches the size of the transfer.
  - For bursts of undefined length, predicted end of burst is generated at the end of each four-beat boundary inside the INCR transfer.

4. Anticipated Access: when an anticipated read access is done while the current access is not complete, the arbitration scheme can be changed if the anticipated access is not the next access serviced by the arbitration scheme.

#### 23.5.5.2. Request-word Weighted Round-robin Arbitration

In request-word weighted round-robin arbitration, the weight is the number of requests or the number of words per port.

This arbitration scheme is enabled by configuring the ARB field to 1 (see [MPDDRC Configuration Arbiter Register](#)). This algorithm grants a port for  $X^{(1)}$  consecutive first transfer (htrans = NON SEQUENTIAL) of a burst or  $X$  single transfer, or for  $X$  word transfers. It is possible to choose between an arbitration scheme by request or by word per port by setting the RQ\_WD\_Px field (see [MPDDRC Configuration Arbiter Register](#)).

Note: 1.  $X$  is an integer value provided by some host modules to the arbiter.

It is also possible for the user to provide the number of requests or words (by overwriting the information provided by a host) on host basis by configuring the MA\_PR\_Px field. Depending on the application, the number of these requests or words can be reduced or increased using the NRD\_NWD\_BDW\_Px fields (see [MPDDRC Configuration Arbiter Register](#)).

The TIMEOUT\_Px field defines the delay between two accesses on the same port in number of cycles before re-arbitrating the access to another port. This field avoids a timeout on the system, as some hosts add idle cycles between two consecutive accesses (see [MPDDRC Configuration Arbiter Register](#)).

This algorithm dispatches the requests from different hosts to the DDR-SDRAM device in a round-robin manner. If two or more host requests arise at the same time, the host with the lowest number is serviced first, then the others are serviced in a round-robin manner when the number of requests or words is reached or when the timeout value is reached.

To avoid burst breaking and to provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Timeout is reached: the delay between two accesses is equal to TIMEOUT\_Px.
2. The number of requests or words is reached: when the current cycle is the last cycle of a transfer.

#### 23.5.5.3. Bandwidth Weighted Round-robin Arbitration

In bandwidth weighted round-robin arbitration, a minimum bandwidth is guaranteed per port.

This arbitration scheme is enabled when the ARB field is set to 2 (see [MPDDRC Configuration Arbiter Register](#)).

This algorithm grants to each port a percentage of the bandwidth. The NRD\_NWD\_BDW\_Px field defines the percentage allocated to each port.

The percentage of the bandwidth is programmed with the NRD\_NWD\_BDW\_Px fields (see [MPDDRC Configuration Arbiter Register](#)).

The TIMEOUT\_Px field defines the delay between two accesses on the same port in number of cycles re-arbitrating the access to another port. This field avoids a timeout on the system, as some hosts add idle cycles between two consecutive accesses (see [MPDDRC Configuration Arbiter Register](#)).

This algorithm dispatches the requests from different hosts to the DDR-SDRAM device in a round-robin manner. If two or more host requests arise at the same time, the host with the lowest number is serviced first, then the others are serviced in a round-robin manner when the allocated bandwidth is reached or when the timeout value is reached.

The BDW\_BURST field allows to arbitrate either when the current host reaches exactly the programmed bandwidth, or when the current host reaches exactly the programmed bandwidth and the current access is ended (see [MPDDRC Configuration Arbiter Register](#)).

To provide the maximum throughput for the DDR-SDRAM device, arbitration must only take place during the following cycles:

1. Timeout is reached: the delay between two accesses is equal to TIMEOUT\_Px.
2. The allocated bandwidth is reached although the current cycle is not ended.
3. The allocated bandwidth is reached and the current cycle is the last cycle of a transfer.

#### 23.5.5.4. Quality Of Service Arbitration

This arbitration scheme is enabled when the ARB field is set to 3 (see [MPDDRC Configuration Arbiter Register](#)).

The arbitration scheme is organized in priority pools corresponding each to an access criticality class as shown in the corresponding Latency Quality of Service column in the following table. When the Latency Quality of Service is enabled for a host-client pair through the system bus matrix (refer to the section "Bus Matrix (MATRIX)"), the priority pool number to use for arbitration at the client port is determined from the host. When the Latency Quality of Service is disabled, it is determined through the system bus matrix user interface. Refer to "MATRIX Priority Register A For Clients" in the section "Bus Matrix (MATRIX)".

**Table 23.3.** Arbitration Priority Pools

Priority pool	Latency Quality of Service
3	Latency Critical
2	Latency Sensitive
1	Bandwidth Sensitive
0	Background Transfers

Round-robin priority is used in the highest and lowest priority pools 3 and 0, whereas fixed level priority is used between priority pools and in the intermediate priority pools 2 and 1.

For each client, each host is assigned to one of the client priority pools based on the Latency Quality of Service inputs or to the priority registers for clients (MxPR fields of MATRIX\_PRAS and MATRIX\_PRBS, refer to the section "Bus Matrix (MATRIX)"). When evaluating host requests, this priority pool level always takes precedence.

After reset, most of the hosts belong to the lowest priority pool (MxPR = 0, Background Transfer) and are therefore granted bus access in a true round-robin order.

The highest priority pool must be specifically reserved for hosts requiring very low access latency. If more than one host belong to this pool, those hosts are granted bus access in a biased round-robin manner which enables tight and deterministic maximum access latency from system bus requests. In the worst case, any currently occurring high-priority host request is granted after the current bus host access has ended and any other high priority pool host requests have been granted once each.

The lowest priority pool shares the remaining bus bandwidth between system bus hosts.

Intermediate priority pools enable fine priority tuning. Typically, a latency-sensitive host or a bandwidth-sensitive host uses such a priority level. The higher the priority level (MxPR value, refer to the section "Bus Matrix (MATRIX)"), the higher the host priority.

All combinations of MxPR values are allowed for all hosts and clients. For example, some hosts might be assigned the highest priority pool (round-robin), and remaining hosts the lowest priority pool (round-robin), with no host for intermediate fixed priority levels.

Some hosts, such as LCD or DMA, drive a signal named HNBREQ on the system bus to indicate the number of transfers to be performed. When the field MPDDRC\_CONF\_ARBITER.KEEP\_LAYER is set to 1, the host with the highest LQOS value and a HNBREQ value different from 0 continues to be granted, even during a last data phase with IDLE cycles.

### 23.5.6. Scrambling/Unscrambling Function

The external data bus can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the memory device.

The scrambling and unscrambling are performed on-the-fly without additional wait states.

The scrambling method depends on two user-configurable key registers, KEY1 in the “[MPDDRC OCMS KEY1 Register](#)” and KEY2 in the “[MPDDRC OCMS KEY2 Register](#)”. These key registers are only accessible in Write mode.

The key must be securely stored in a reliable non-volatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

The scrambling/unscrambling function can be enabled or disabled by programming the “[MPDDRC OCMS Register](#)”.

### 23.5.7. Clearing Scrambling Keys on Tamper Event

On tamper detection event on WKUP pins, it is possible to perform an immediate clear of the scrambling keys (MPDDRC\_OCMS\_KEY1 and MPDDRC\_OCMS\_KEY2) if bit MPDDRC\_OCMS.TAMPCLR = 1.

### 23.5.8. Register Write Protection

To prevent any single software error from corrupting MPDDRC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [MPDDRC Write Protection Mode Register](#) (MPDDRC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the MPDDRC Write Protection Status Register (MPDDRC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading MPDDRC\_WPSR.

The following registers are write-protected when the bit WPEN is set:

- [MPDDRC Mode Register](#)
- [MPDDRC Refresh Timer Register](#)
- [MPDDRC Configuration Register](#)
- [MPDDRC Timing Parameter 0 Register](#)
- [MPDDRC Timing Parameter 1 Register](#)
- [MPDDRC Memory Device Register](#)
- [MPDDRC OCMS Register](#)
- [MPDDRC OCMS KEY1 Register](#)
- [MPDDRC OCMS KEY2 Register](#)

The following registers are write-protected when the bit WPITEN is set:

- [MPDDRC Interrupt Enable Register](#)
- [MPDDRC Interrupt Disable Register](#)

### 23.5.9. Bus Monitor, Performance Monitor

The MPDDRC embeds a bus monitor which collects bus transaction information from 4 MPDDRC ports. This information, such as accumulated latency ([MPDDRC\\_MINFOx \(TOTAL\\_LATENCY\)](#)) or number of transfers ([MPDDRC\\_MINFOx \(NB\\_TRANSFERS\)](#)), can be used to calculate the latency and bandwidth for each port by using a metric counter.

The following metrics are computed for each port within a configurable address range:

- Total number of write transfers
- Total number of read transfers
- Total number of read/write transfers
- Total read latencies
- Total write latencies
- Total write/read latencies
- Maximum latencies per port
- Total latency vs QoS value

The Monitor Configuration (MPDDRC\_MCFGR) and Monitor Address High/Low Port x (MPDDRC\_MADDRx) registers define the type of transaction collected (read, write or read/write) and the address range to monitor.

MPDDRC address mapping is from 0x2000\_0000 to 0x2FFF\_FFFF. To define the address range analyzed by the monitor, the address bits [27:13] are used to configure the lower and upper bounds. The lower bound can be modified by writing the field MPDDRC\_MADDRx.ADDR\_LOW\_PORTx. The upper bound can be modified by writing the field MPDDRC\_MADDRx.ADDR\_HIGH\_PORTx. The minimum range that can be analyzed is 8 Kbytes.

By default, the monitor is enabled and the address range is 0x2000\_0000 to 0x2FFF\_FFFF.

Monitor use example:

1. Clear the configuration register: write 0x00000000 in [MPDDRRRC\\_MCFGR](#).
2. Enable the monitor: write 0x00000001 in [MPDDRRRC\\_MCFGR](#).
3. Reset the monitor: write 0x00000003 in [MPDDRRRC\\_MCFGR](#).
4. Enable the monitor: write 0x00000001 in [MPDDRRRC\\_MCFGR](#).
5. Define the address range in [MPDDRC\\_MADDRx](#) or use the default value.
6. Start monitoring: write 0x00000011 in [MPDDRRRC\\_MCFGR](#).
7. Monitoring is launched. An event can be used to stop monitoring.
8. Stop profiling: write 0x00000001 in [MPDDRRRC\\_MCFGR](#).
9. To know the number of tranfers per port, write 0x00000801 in [MPDDRRRC\\_MCFGR](#) and read [MPDDRC\\_MINFOx \(NB\\_TRANSFERS\)](#).

Use the following formulas to compute the latency and bandwidth for each port (in percent):

- Latency:  
 $(Px\_TOTAL\_LATENCY/TOTAL\_CYCLE\_COUNT) * 100$
- Bandwidth:  
 $(Px\_TOTAL\_Px\_NB\_TRANSFERS/TOTAL\_CYCLE\_COUNT) * 100$

### 23.5.10. Security and Safety Analysis and Reports

Several types of checks are performed when the MPDDRC is accessing the memory device.

The registers listed below are monitored with a single error checker and, in case of a single error event, the error is reported in MPDDRC\_WPSR.SEQE:

- Mode register (MPDDRC\_MR)
- Memory Device register (MPDDRC\_MD)
- Refresh Timer register (MPDDRC\_RTR)
- Timing Parameter 0/1/2 registers (MPDDRC\_TPR0/1/2)
- Low-Power register (MPDDRC\_LPR)

- Configuration register (MPDDRC\_CR)
- OCMS KEY1 register (MPDDRC\_OCMS\_KEY1)
- OCMS KEY2 register (MPDDRC\_OCMS\_KEY2)

The peripheral clock of the MPDDRC is monitored by specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the MPDDRC. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag MPDDRC\_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the MPDDRC is also monitored and if an abnormal state is detected, the flag MPDDRC\_WPSR.SEQE is set. This flag is not set under normal operating conditions.

If the flag MPDDRC\_WPSR.CGD = 1, a clock glitch has been detected. This flag is not set under normal operating conditions.

The software accesses to the MPDDRC are monitored and if an incorrect access is performed, the flag MPDDRC\_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the MPDDRC\_WPSR.SWETYP field (see MPDDRC Write Protection Status Register (MPDDRC\_WPSR) for details), e.g., writing a new configuration (MPDDRC\_CR, MPDDRC\_TPR0/1/2, MPDDRC\_MD, MPDDRC\_OCMS, MPDDRC\_OCMS\_KEY1/2) after the initialization of the MPDDRC (i.e., if MPDDRC\_TR.COUNT > 0) is an error. MPDDRC\_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when MPDDRC\_WPSR is read.

If one of these flags is set, the flag MPDDRC\_ISR.SECE is set and can trigger an interrupt if the MPDDRC\_IMR.SECE bit is '1'. SECE is cleared by reading MPDDRC\_ISR.

The MPDDRC embeds an automatic periodic check of an address of the memory device. This function can be enabled by writing a 1 to the MPDDRC\_SAFETY.EN bit. The address to be checked can be configured by writing the field MPDDRC\_SAFETY.ADDRESS. When MPDDRC\_SAFETY.EN = 1, the MPDDRC performs read and write accesses with specific, predetermined, data patterns to the configured address, with no impact for the application software.

MPDDRC\_SAFETY.EN must be set immediately after the initialization sequence.

## 23.6. Software Interface/SDRAM Organization, Address Mapping

The DDR-SDRAM address space is organized into banks, rows and columns. The MPDDRC maps different memory types depending on values set in the Configuration register (MPDDRC\_CR) (see [MPDDRC Configuration Register](#)). The tables that follow illustrate the relation between CPU addresses and columns, rows and banks addresses for 16-bit memory data bus widths.

The MPDDRC supports address mapping in Linear mode.

Sequential mode is a method for address mapping where banks alternate at each last DDR-SDRAM page of the current bank.

Interleaved mode is a method for address mapping where banks alternate at each DDR-SDRAM end of page of the current bank.

The MPDDRC makes the DDR-SDRAM device access protocol transparent to the user. The tables that follow illustrate the DDR-SDRAM device memory mapping seen by the user in correlation with the device structure. Various configurations are illustrated.

### 23.6.1. DDR-SDRAM Address Mapping for 16-bit Memory Data Bus Width

## 23.6.2. DDR-SDRAM Address Mapping for Low-cost Memories

**Table 23.16.** Sequential Mapping for DDR-SDRAM Configuration, 2K Rows, 512 Columns, 2 Banks, 16 Bits

						Row[10:0]											Bk	Column[8:0]								M0	

## 23.7. Register Summary

The User Interface is connected to the APB bus. The MPDDRC is programmed using the registers listed in the following table.

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0	
0x00	MPDDRC_MR	31:24									
		23:16									
		15:8									
		7:0						MODE[2:0]			
0x04	MPDDRC_RTR	31:24									
		23:16									
		15:8						COUNT[11:8]			
		7:0	COUNT[7:0]								
0x08	MPDDRC_CR	31:24									
		23:16	UNAL	DECOD	NDQS	NB	LC_LPDDR1			DQMS	
		15:8		OCD[2:0]					DIS_DLL	DIC_DS	
		7:0	DLL	CAS[2:0]				NR[1:0]	NC[1:0]		
0x0C	MPDDRC_TPR0	31:24	TMRD[3:0]					TWTR[2:0]			
		23:16	TRRD[3:0]					TRP[3:0]			
		15:8	TRC[3:0]					TWR[3:0]			
		7:0	TRCD[3:0]					TRAS[3:0]			
0x10	MPDDRC_TPR1	31:24						TXP[3:0]			
		23:16					TXSRD[7:0]				
		15:8					TXSNR[7:0]				
		7:0		TRFC[6:0]							
0x14	MPDDRC_TPR2	31:24									
		23:16						TFAW[3:0]			
		15:8		TRTP[2:0]				TRPA[3:0]			
		7:0	TXARDS[3:0]				TXARD[3:0]				
0x18 ... 0x1B	Reserved										
0x1C	MPDDRC_LPR	31:24							SELF_DONE	CHG_FRQ	
		23:16			UPD_MR[1:0]					APDE	
		15:8		SELFAUTO	TIMEOUT[1:0]			DS[2:0]

### 23.7.1. MPDDRC Mode Register

**Name:** MPDDRC\_MR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access						MODE[2:0]		
Reset						R/W	R/W	R/W
						0	0	0

#### Bits 2:0 – MODE[2:0] MPDDRC Command Mode

This field defines the command issued by the MPDDRC when the SDRAM device is accessed. This register is used to initialize the SDRAM device and to activate Deep Power-down mode.

Value	Name	Description
0	NORMAL_CMD	Normal Mode. Any access to the MPDDRC is decoded normally. To activate this mode, the command must be followed by a write to the DDR-SDRAM.
1	NOP_CMD	The MPDDRC issues a NOP command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM.
2	PRCGALL_CMD	The MPDDRC issues the All Banks Pre-charge command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.
3	LMR_CMD	The MPDDRC issues a Load Mode Register command when the DDR-SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM.
4	RFSH_CMD	The MPDDRC issues an Auto-refresh command when the DDR-SDRAM device is accessed regardless of the cycle. Previously, an All Banks Pre-charge command must be issued. To activate this mode, the command must be followed by a write to the DDR-SDRAM.
5	EXT_LMR_CMD	The MPDDRC issues an Extended Load Mode Register command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the DDR-SDRAM. The write in the DDR-SDRAM must be done in the appropriate bank.
6	DEEP_CMD	Deep Power mode: Access to Deep Power-down mode

### 23.7.2. MPDDRC Refresh Timer Register

**Name:** MPDDRC\_RTR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					COUNT[11:8]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	COUNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 11:0 – COUNT[11:0] MPDDRC Refresh Timer Count

This 12-bit field is loaded into a timer which generates the refresh pulse. Each time the refresh pulse is generated, a refresh sequence is initiated.

The SDRAM requires auto-refresh cycles at an average periodic interval of  $T_{refi}$ . The value to be loaded depends on the MPDDRC clock frequency MCK (main system bus clock) and average periodic interval of  $T_{refi}$ .

For example, for an SDRAM with  $T_{refi} = 7.8 \mu s$  and a 133 MHz (7.5 ns) main system bus clock, the value of the COUNT field is configured:  $((7.8 \times 10^{-6}) / (7.5 \times 10^{-9})) = 1040$  or 0x0410.

### 23.7.3. MPDDRC Configuration Register

**Name:** MPDDRC\_CR

**Offset:** 0x08

**Reset:** 0x00207024

**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	UNAL	DECOD	NDQS	NB	LC_LPDDR1			DQMS
Access	R/W	R/W	R/W	R/W	R/W			R/W
Reset	0	0	1	0	0			0
Bit	15	14	13	12	11	10	9	8
		OCD[2:0]					DIS_DLL	DIC_DS
Access		R/W	R/W	R/W			R/W	R/W
Reset		1	1	1			0	0
Bit	7	6	5	4	3	2	1	0
	DLL	CAS[2:0]			NR[1:0]		NC[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	1	0	0

**Bit 23 – UNAL** This bit must always be written to 1.

**Bit 22 – DECOD** Type of Decoding

Value	Name	Description
0	SEQUENTIAL	Method for address mapping where banks alternate at each last DDR-SDRAM page of the current bank.
1	INTERLEAVED	Method for address mapping where banks alternate at each DDR-SDRAM end of page of the current bank.

**Bit 21 – NDQS** Not DQS.

This bit is found in DDR2-SDRAM devices, in Extended Mode register 1. DQS may be used in Single-ended mode or paired with optional complementary signal NDQS. To comply with the LPDDR1 standard, DQS must be used in Single-ended mode. NDQS must be disabled.

Value	Name	Description
0	ENABLED	'Not DQS' is enabled.
1	DISABLED	'Not DQS' is disabled.

**Bit 20 – NB** Number of Banks

If LC\_LPDDR1 is set to 1, NB is not relevant.

Value	Name	Description
0	4_BANKS	4-bank memory devices
1	8_BANKS	8 banks. Only possible when using DDR2-SDRAM, devices.

**Bit 19 – LC\_LPDDR1** Low-cost Low-power DDR1

Value	Name	Description
0	NOT_2_BANKS	Any type of memory devices except low-cost, low-density low-power DDR1.
1	2_BANKS_LPDDR1	Low-cost and low-density low-power DDR1. These devices have a density of 32 Mbits and are organized as two internal banks. To use this feature, the user has to define the type of memory and the data bus width (see <a href="#">MPDDRC_MD</a> ). The 16-bit memory device is organized as 2 banks, 9 columns and 11 rows.

**Bit 16 – DQMS** Mask Data is Shared

Value	Name	Description
0	NOT_SHARED	DQM is not shared with another controller
1	SHARED	DQM is shared with another controller

**Bits 14:12 – OCD[2:0]** Off-chip Driver

SDRAM Controller supports only two values for OCD (default calibration and exit from calibration). These values MUST always be programmed during the initialization sequence. The default calibration must be programmed first, after which the exit calibration and maintain settings must be programmed.

This field is found only in the DDR2-SDRAM devices.

Value	Name	Description
0	DDR2_EXITCALIB	Exit from OCD Calibration mode and maintain settings
7	DDR2_DEFAULT_CALIB	OCD calibration default

**Bit 9 – DIS\_DLL** Disable DLL

This value is used during the power-up sequence. It is only found in DDR2-SDRAM devices.

Value	Description
0	Enable DLL.
1	Disable DLL.

**Bit 8 – DIC\_DS** Output Driver Impedance Control (Drive Strength)

This bit name is described as “DS” in some memory data sheets. It defines the output drive strength. This value is used during the power-up sequence.

This bit is found only in DDR2-SDRAM devices.

Value	Name	Description
0	DDR2_NORMALSTRENGTH	Normal drive strength (DDR2)
1	DDR2_WEAKSTRENGTH	Weak drive strength (DDR2)

**Bit 7 – DLL** Reset DLL

This bit defines the value of Reset DLL. It is found only in DDR2-SDRAM devices.

This value is used during the power-up sequence.

Value	Name	Description
0	RESET_DISABLED	Disable DLL reset
1	RESET_ENABLED	Enable DLL reset

**Bits 6:4 – CAS[2:0]** CAS Latency

Value	Name	Description
2	DDR_CAS2	LPDDR1 CAS Latency 2
3	DDR_CAS3	DDR2/LPDDR1 CAS Latency 3

**Bits 3:2 – NR[1:0]** Number of Row Bits

Value	Name	Description
0	11_ROW_BITS	11 bits to define the row number, up to 2048 rows
1	12_ROW_BITS	12 bits to define the row number, up to 4096 rows
2	13_ROW_BITS	13 bits to define the row number, up to 8192 rows
3	14_ROW_BITS	14 bits to define the row number, up to 16384 rows

**Bits 1:0 – NC[1:0] Number of Column Bits**

Value	Name	Description
0	DDR9_MDDR8_COL_BITS	9 bits to define the column number, up to 512 columns, for DDR2-SDRAM 8 bits to define the column number, up to 256 columns, for LPDDR1-SDRAM
1	DDR10_MDDR9_COL_BITS	10 bits to define the column number, up to 512 columns, for DDR2-SDRAM 9 bits to define the column number, up to 256 columns, for LPDDR1-SDRAM
2	DDR11_MDDR10_COL_BITS	11 bits to define the column number, up to 512 columns, for DDR2-SDRAM 10 bits to define the column number, up to 256 columns, for LPDDR1-SDRAM
3	DDR12_MDDR11_COL_BITS	12 bits to define the column number, up to 512 columns, for DDR2-SDRAM 11 bits to define the column number, up to 256 columns, for LPDDR1-SDRAM

### 23.7.4. MPDDRC Timing Parameter 0 Register

**Name:** MPDDRC\_TPR0

**Offset:** 0x0C

**Reset:** 0x20227225

**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TMRD[3:0]					TWTR[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W

Reset	0	0	1	0	0	1	0	1

#### Bits 31:28 – TMRD[3:0] Load Mode Register Command to Activate or Refresh Command

This field defines the delay between a Load mode register command and an Activate or Refresh command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

#### Bits 26:24 – TWTR[2:0] Internal Write to Read Delay

This field defines the internal Write to Read command time in number of DDRCK clock cycles. The number of cycles is between 1 and 7.

#### Bits 23:20 – TRRD[3:0] Active BankA to Active BankB

This field defines the delay between an Activate command in BankA and an Activate command in BankB in number of DDRCK clock cycles. The number of cycles is between 1 and 15.

#### Bits 19:16 – TRP[3:0] Row Precharge Delay

This field defines the delay between a Precharge command and another command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

#### Bits 15:12 – TRC[3:0] Row Cycle Delay

This field defines the delay between an Activate command and a Refresh command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

#### Bits 11:8 – TWR[3:0] Write Recovery Delay

This field defines the Write Recovery Time in number of DDRCK clock cycles. The number of cycles is between 1 and 15.

**Bits 7:4 – TRCD[3:0]** Row to Column Delay

This field defines the delay between an Activate command and a Read/Write command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

**Bits 3:0 – TRAS[3:0]** Active to Precharge Delay

This field defines the delay between an Activate command and a Precharge command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

### 23.7.5. MPDDRC Timing Parameter 1 Register

**Name:** MPDDRC\_TPR1

**Offset:** 0x10

**Reset:** 0x03C80808

**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
					TXP[3:0]			
Access					R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0
					TRFC[6:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	1	0	0	0

#### Bits 27:24 – TXP[3:0] Exit Power-down Delay to First Command

This field defines the delay between CKE set high and a valid command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

#### Bits 23:16 – TXSRD[7:0] Exit Self-refresh Delay to Read Command

This field defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 255.

This field is found only in DDR2-SDRAM devices.

#### Bits 15:8 – TXSNR[7:0] Exit Self-refresh Delay to Non-Read Command

This field defines the delay between CKE set high and a Non Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 255. This field is used by the DDR-SDRAM devices. In case of low-power DDR-SDRAM, this field is equivalent to  $t_{XSR}$ .

#### Bits 6:0 – TRFC[6:0] Row Refresh Cycle

This field defines the delay between a Refresh command or a Refresh and Activate command in number of DDRCK clock cycles. The number of cycles is between 0 and 127.

**23.7.6. MPDDRC Timing Parameter 2 Register****Name:** MPDDRC\_TPR2**Offset:** 0x14**Reset:** 0x00042062**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	0	1	1	0	0	0	1	0

**Bits 19:16 – TFAW[3:0]** Four Active Windows

DDR2 devices with eight banks (1 Gbit or larger) have an additional requirement concerning  $t_{FAW}$  timing. This requires that no more than four Activate commands may be issued in any given  $t_{FAW}$  (MIN) period.

The number of cycles is between 0 and 15.

**Bits 14:12 – TRTP[2:0]** Read to Precharge

Defines the delay between a Read command and a Precharge command in number of DDRCK clock cycles.

The number of cycles is between 0 and 7.

**Bits 11:8 – TRPA[3:0]** Row Precharge All Delay

Defines the delay between a Precharge All Banks command and another command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

**Bits 7:4 – TXARDS[3:0]** Exit Active Power Down Delay to Read Command in Mode “Slow Exit”

Defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

**Bits 3:0 – TXARD[3:0]** Exit Active Power Down Delay to Read Command in Mode “Fast Exit”

Defines the delay between CKE set high and a Read command in number of DDRCK clock cycles. The number of cycles is between 0 and 15.

This field is found only in the DDR2-SDRAM devices.

### 23.7.7. MPDDRC Low-Power Register

**Name:** MPDDRC\_LPR  
**Offset:** 0x1C  
**Reset:** 0x00010000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							SELF_DONE	CHG_FRQ
Access							R	R/W
Reset							0	0

Bit	23	22	21	20	19	18	17	16
			UPD_MR[1:0]					APDE
Access			R/W	R/W				R/W
Reset			0	0				1

Bit	15	14	13	12	11	10	9	8
		SELFAUTO	TIMEOUT[1:0]				DS[2:0]	
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

Bit	7	6	5	4	3	2	1	0
		PASR[2:0]				CLK_FR	LPCB[1:0]	
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

**Bit 25 – SELF\_DONE** Self-Refresh is Done  
Indicates that external device is in Self-refresh mode.

**Bit 24 – CHG\_FRQ** Change Clock Frequency During Self-Refresh Mode  
This mode is used to change the low-power DDR-DRAM input clock frequency. This mode is unique to the low-power DDR-DRAM devices.

**Bits 21:20 – UPD\_MR[1:0]** Update Load Mode Register and Extended Mode Register  
Used to enable or disable automatic update of the Load Mode register and Extended Mode register. This update depends on the MPDDRC integration in a system. The MPDDRC can either share or not an external bus with another controller.

Value	Name	Description
0	NO_UPDATE	Update of Load Mode and Extended Mode registers is disabled.
1	UPDATE_SHARED BUS	The MPDDRC shares an external bus. Automatic update is done during a refresh command and a pending read or write access in the SDRAM device.
2	UPDATE_NOSHARED BUS	The MPDDRC does not share an external bus. Automatic update is done before entering Self-refresh mode.
3	–	Reserved

**Bit 16 – APDE** Active Power Down Exit Time  
This mode is unique to the DDR2-SDRAM devices.  
This mode manages the active Power-down mode which determines performance versus power saving.  
After the initialization sequence, as soon as the APDE field is modified, the Extended Mode register (located in the memory of the external device) is accessed automatically and APDE bits are updated.

Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access

Value	Name	Description
0	DDR2_FAST_EXIT	Fast exit from power-down. DDR2-SDRAM devices only.
1	DDR2_SLOW_EXIT	Slow exit from power-down. DDR2-SDRAM devices only.

#### Bit 14 – SELFAUTO Self-Refresh Exit Auto-Refresh

Value	Description
1	Upon exiting Self-refresh mode, auto-refresh command is immediately performed after $t_{XSNR}$ .
0	Upon exiting Self-refresh mode, active command is immediately performed after $t_{XSNR}$ . The auto-refresh command is issued every 15.6 $\mu$ s or less.

#### Bits 13:12 – TIMEOUT[1:0] Time Between Last Transfer and Low-Power Mode

Defines when Low-power mode is activated.

Value	Name	Description
0	NONE	SDRAM Low-power mode is activated immediately after the end of the last transfer.
1	DELAY_64_CLK	SDRAM Low-power mode is activated 64 clock cycles after the end of the last transfer.
2	DELAY_128_CLK	SDRAM Low-power mode is activated 128 clock cycles after the end of the last transfer.
3	–	Reserved

#### Bits 10:8 – DS[2:0] Drive Strength

Unique to low-power DDR1-SDRAM. Selects the output drive strength.

After the initialization sequence, as soon as the DS field is modified, the Extended Mode Register is accessed automatically and DS bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

Value	Name	Description
0	DS_FULL	Full drive strength
1	DS_HALF	Half drive strength
2	DS_QUARTER	Quarter drive strength
3	DS_OCTANT	Octant drive strength
4–7	–	Reserved

#### Bits 6:4 – PASR[2:0] Partial Array Self-Refresh

Is unique to low-power DDR1-SDRAM. Used to specify whether only one-quarter, one-half or all banks of the DDR-SDRAM array are enabled. Disabled banks are not refreshed in Self-refresh mode. The values of this field are dependent on the low-power DDR-SDRAM devices.

After the initialization sequence, as soon as the PASR field is modified, the Extended Mode Register in the external device memory is accessed automatically and PASR bits are updated. Depending on the UPD\_MR bit, update is done before entering Self-refresh mode or during a refresh command and a pending read or write access.

#### Bit 2 – CLK\_FR Clock Frozen Command Bit

Sets the clock low during Power-down mode. Some DDR-SDRAM devices do not support freezing the clock during Power-down mode. Refer to the relevant DDR-SDRAM device data sheet for details.

Value	Name	Description
0	DISABLED	Clock(s) is/are not frozen.
1	ENABLED	Clock(s) is/are frozen.

#### Bits 1:0 – LPCB[1:0] Low-power Command Bit

Value	Name	Description
0	NOLOWPOWER	Low-power feature is inhibited. No Power-down, Self-refresh and Deep power modes are issued to the DDR-SDRAM device.

Value	Name	Description
1	SELFREFRESH	The MPDDRC issues a self-refresh command to the DDR-SDRAM device, the clock(s) is/are deactivated and the CKE signal is set low. The DDR-SDRAM device leaves the Self-refresh mode when accessed and reenters it after the access.
2	POWERDOWN	The MPDDRC issues a Power-down command to the DDR-SDRAM device after each access, the CKE signal is set low. The DDR-SDRAM device leaves the Power-down mode when accessed and reenters it after the access.
3	DEEPPOWERDOWN	The MPDDRC issues a Deep Power-down command to the low-power DDR-SDRAM device.

### 23.7.8. MPDDRC Memory Device Register

**Name:** MPDDRC\_MD  
**Offset:** 0x20  
**Reset:** 0x00000013  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

#### Bit 4 – DBW Data Bus Width

Value	Name	Description
0	–	Reserved
1	DBW_16_BITS	Data bus width is 16 bits.

#### Bits 2:0 – MD[2:0] Memory Device

Value	Name	Description
3	LPDDR_SDRAM	Low-power DDR1-SDRAM
6	DDR2_SDRAM	DDR2-SDRAM

**23.7.9. MPDDRC I/O Calibration Register****Name:** MPDDRC\_IO\_CALIBR**Offset:** 0x34**Reset:** 0x00870000**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access		CALCODEN[3:0]				CALCODEP[3:0]		
Reset	R	R	R	R	R	R	R	R
Reset	1	0	0	0	0	1	1	1
Bit	15	14	13	12	11	10	9	8
Access		TZQIO[6:0]						
Reset		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access						CK_F_RANGE[2:0]		
Reset						R/W	R/W	R/W
Reset						0	0	0

**Bits 23:20 – CALCODEN[3:0]** Number of N-type Transistors  
 Gives the number of N-type transistors to perform the calibration.

**Bits 19:16 – CALCODEP[3:0]** Number of P-type Transistors  
 Gives the number of P-type transistors to perform the calibration.

**Bits 14:8 – TZQIO[6:0]** IO Calibration

Defines the delay between the start up of the amplifier and the beginning of the calibration, in number of DDRCK clock cycles. The value of this field must be set to 600 ns. The number of cycles is between 0 and 127.

The TZQIO configuration code must be set correctly depending on the clock frequency using the following formula:

$$\bullet \text{ TZQIO} = (\text{DDRCK} \times (600 \times 10^{-9})) + 1$$

where the DDRCK frequency is in Hz.

For example, for a frequency of 176 MHz, the value of the TZQIO field is configured  $(176 \times 10^6) \times (600 \times 10^{-9}) + 1$ .

**Bits 2:0 – CK\_F\_RANGE[2:0]** DDRCK Maximum Clock Frequency Range

This field is written only once at the initialization sequence and is always written to 7 whatever the frequency configured on DDRCK.

### 23.7.10. MPDDRC OCMS Register

**Name:** MPDDRC\_OCMS  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
				TAMPCLR				SCR_EN
Access				R/W				R/W
Reset				0				0

#### Bit 4 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on MPDDRC scrambling keys.
1	A tamper detection event immediately clears MPDDRC scrambling keys.

#### Bit 0 – SCR\_EN Scrambling Enable

Value	Description
0	Disables “Off-chip” scrambling for SDRAM access.
1	Enables “Off-chip” scrambling for SDRAM access.

### 23.7.11. MPDDRC OCMS KEY1 Register

**Name:** MPDDRC\_OCMS\_KEY1  
**Offset:** 0x3C  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

This register can only be written once.

Bit	31	30	29	28	27	26	25	24
	KEY1[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – KEY1[31:0] Off-chip Memory Scrambling (OCMS) Key Part 1

When Off-chip Memory Scrambling is enabled, the data scrambling depends on KEY1 and KEY2 values.

## 23.7.12. MPDDRC OCMS KEY2 Register

**Name:** MPDDRC\_OCMS\_KEY2  
**Offset:** 0x40  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

This register can only be written once.

Bit	31	30	29	28	27	26	25	24
	KEY2[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY2[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Reset	–	–	–	–	–	–	–	–

### Bits 31:0 – KEY2[31:0] Off-chip Memory Scrambling (OCMS) Key Part 2

When Off-chip Memory Scrambling is enabled, the data scrambling depends on KEY1 and KEY2 values.

### 23.7.13. MPDDRC Configuration Arbiter Register

**Name:** MPDDRC\_CONF\_ARBITER

**Offset:** 0x44

**Reset:** 0x00000000

**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
					BDW_BURST_P3	BDW_BURST_P2	BDW_BURST_P1	BDW_BURST_P0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	23	22	21	20	19	18	17	16
					MA_PR_P3	MA_PR_P2	MA_PR_P1	MA_PR_P0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
					RQ_WD_P3	RQ_WD_P2	RQ_WD_P1	RQ_WD_P0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
					BDW_MAX_CUR		ARB[1:0]	
Access					R/W		R/W	R/W
Reset					0		0	0

#### Bits 24, 25, 26, 27 – BDW\_BURST\_Px Bandwidth Arbitration Mode on Port X

Value	Description
0	The arbitration is done when the bandwidth limit defined in MPDDRC_BDW_PORT_0123.BDW_Px is reached. If the bandwidth limit is reached during a burst access, the burst is completed.
1	The arbitration is done when the bandwidth limit defined in MPDDRC_BDW_PORT_0123.BDW_Px is reached. If the bandwidth limit is reached during a burst access, the burst is broken.

#### Bits 16, 17, 18, 19 – MA\_PR\_Px Host or Software Provide Information

Value	Description
0	Number of requests or words is provided by the host, if the host supports this feature.
1	Number of requests or words is provided by software, see <a href="#">“NRQ_NWD_BDW_Px: Number of Requests, Number of Words or Bandwidth Allocation from Port 0-1-2-3”</a> .

#### Bits 8, 9, 10, 11 – RQ\_WD\_Px Request or Word from Port X

Value	Description
0	Number of requests is selected.
1	Number of words is selected.

#### Bit 3 – BDW\_MAX\_CUR Bandwidth Max or Current

Displays the maximum bandwidth or the current bandwidth for each port.

The maximum bandwidth is computed when at least two ports of MPDDRC are used.

This information is provided in [MPDDRC Current/Maximum Bandwidth Port 0-1-2-3 Register](#).

Value	Description
0	Current bandwidth is displayed.
1	Maximum bandwidth is displayed.

**Bits 1:0 – ARB[1:0] Type of Arbitration**

Selects the type of arbitration: round-robin, number of requests per port or bandwidth per port.

Value	Name	Description
0	ROUND	Round-robin policy
1	NB_REQUEST	Request policy
2	BANDWIDTH	Bandwidth policy
3	LQOS	Quality of Service policy

## 23.7.14. MPDDRC Timeout Register

**Name:** MPDDRC\_TIMEOUT  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	TIMEOUT_P3[3:0]				TIMEOUT_P2[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TIMEOUT_P1[3:0]				TIMEOUT_P0[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 0:3, 4:7, 8:11, 12:15 – TIMEOUT\_Px Timeout for Ports 0, 1, 2, 3

Some hosts insert an idle state between two accesses. This field defines the delay between two accesses on the same port in number of DDRCK clock cycles before arbitration and handing the access over to another port.

This field is not used with round-robin and bandwidth arbitrations.

The number of cycles is between 1 and 15.

**23.7.15. MPDDRC Request Port 0-1-2-3 Register****Name:** MPDDRC\_REQ\_PORT\_0123**Offset:** 0x4C**Reset:** 0x00000000**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	NRQ_NWD_BDW_P3[7:0]

Reset	0	0	0	0	0	0	0	0

**Bits 0:7, 8:15, 16:23, 24:31 – NRQ\_NWD\_BDW\_Px** Number of Requests, Number of Words or Bandwidth

Allocation from Port 0-1-2-3

The number of requests corresponds to the number of start transfers. For example, setting this field to 2 performs two burst accesses regardless of the burst type (INCR4, INCR8, etc.). The number of words corresponds exactly to the number of accesses; setting this field to 2 performs two accesses. In this example, burst accesses will be broken.

These values depend on scheme arbitration (see [MPDDRC Configuration Arbiter Register](#)).

In case of round-robin arbitration, this field is not used. In case of “bandwidth arbitration”, this field corresponds to percentage allocated for each port. In case of “request” arbitration, this field corresponds to number of start transfers or to number of accesses allocated for each port.

**23.7.16. MPDDRC Current/Maximum Bandwidth Port 0-1-2-3 Register****Name:** MPDDRC\_BDW\_PORT\_0123**Offset:** 0x54**Reset:** 0x00000000**Property:** Read-only

**Bits 0:6, 8:14, 16:22, 24:30 – BDW\_Px** Current/Maximum Bandwidth from Port 0-1-2-3

Displays the current bandwidth or the maximum bandwidth for each port. This information is provided in the [“BDW\\_MAX\\_CUR: Bandwidth Max or Current”](#) field description.

### 23.7.17. MPDDRC Read Data Path Register

**Name:** MPDDRC\_RD\_DATA\_PATH  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							SHIFT_SAMPLING[1:0]	
Access							R/W	R/W
Reset							0	0

#### Bits 1:0 – SHIFT\_SAMPLING[1:0] Shift Sampling Point of Data

Shifts the sampling point of data coming from the memory device. The higher the memory device clock frequency, the higher the SHIFT\_SAMPLING value. Refer to the section "Electrical Characteristics".

Value	Name	Description
0	NO_SHIFT	Initial sampling point.
1	SHIFT_ONE_CYCLE	Sampling point is shifted by one cycle.
2	SHIFT_TWO_CYCLES	Sampling point is shifted by two cycles.
3	SHIFT_THREE_CYCLES	Sampling point is shifted by three cycles. Not applicable for DDR2 and LPDDR1 devices.

### 23.7.18. MPDDRC Monitor Configuration Register

**Name:** MPDDRC\_MCFGR

**Offset:** 0x60

**Reset:** 0x00000011

**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
				INFO[2:0]		REFR_CALIB	READ_WRITE[1:0]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				RUN			SOFT_RESET	EN_MONI
Access				R/W			R/W	R/W
Reset				1			0	1

#### Bits 13:11 – INFO[2:0] Information Type

Reports information such as latency and the number of transfers monitored on port x [x = 0..3].

Value	Name	Description
0	MAX_WAIT	Information concerning the transfer with the longest waiting time
1	NB_TRANSFERS	Number of transfers on the port
2	TOTAL_LATENCY	Total latency on the port
3	–	Reserved
4	MAX_WAIT_QOS01	Information concerning the transfer with the longest waiting time, depending on QOS values (0 and 1)
5	MAX_WAIT_QOS23	Information concerning the transfer with the longest waiting time, depending on QOS values (2 and 3)

#### Bit 10 – REFR\_CALIB Refresh Calibration

Value	Description
0	Monitoring does not depend on Auto-refresh mode, Self-refresh mode, Power-down mode, DLL nor calibration impact.
1	Monitoring depends on Auto-refresh mode, Self-refresh mode, Power-down mode, DLL and calibration impact.

#### Bits 9:8 – READ\_WRITE[1:0] Read/Write Access

Used to monitor different types of access.

Value	Name	Description
0	TRIG_RD_WR	Read and Write accesses are triggered.
1	TRIG_WR	Only Write accesses are triggered.
2	TRIG_RD	Only Read accesses are triggered.
3	–	Reserved

#### Bit 4 – RUN Control Monitor

Value	Description
0	Monitoring is halted. All counters are stopped.
1	Monitoring is launched.

#### Bit 1 – SOFT\_RESET Soft Reset

Value	Description
0	Soft reset is not performed.
1	Soft reset is performed.

#### Bit 0 – EN\_MONI Enable Monitor

Value	Description
0	Monitor is disabled.
1	Monitor is enabled.

**23.7.19. MPDDRC Monitor Address High/Low Port x Register**

**Name:** MPDDRC\_MADDRx  
**Offset:** 0x64 + x\*0x04 [x=0..3]  
**Reset:** 0xFFFF0000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ADDR_HIGH_PORTx[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – ADDR\_HIGH\_PORTx[15:0] Address High on Port x**

Address high which defines the interval to be monitored on port x. This address must be programmed according to the memory mapping of the product.

**Bits 15:0 – ADDR\_LOW\_PORTx[15:0] Address Low on Port x**

Address low which defines the interval to be monitored on port x. This address must be programmed according to the memory mapping of the product.

**23.7.20. MPDDRC Monitor Information Port x Register (MAX\_WAIT)****Name:** MPDDRC\_MINFOx (MAX\_WAIT)**Offset:** 0x84 + x\*0x04 [x=0..3]**Reset:** 0x00000000**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MAX_PORTx_WAITING[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 26:25 – LQOS[1:0]** Value of Quality Of Service on Port x

Can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 0.  
 This field reports the Quality of Service value for the maximum waiting time.

Value	Name	Description
0	BACKGROUND	Background transfers
1	BANDWIDTH	Bandwidth sensitive
2	SENSITIVE_LAT	Latency sensitive
3	CRITICAL_LAT	Latency critical

**Bit 24 – READ\_WRITE** Read or Write Access on Port x

Can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 0.  
 Reports the transfer direction for the maximum waiting time.

Value	Description
0	Read transfer
1	Write transfer

**Bits 22:20 – SIZE[2:0]** Transfer Size on Port x

Can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 0.  
 Reports the size of the transfer for the maximum waiting time.

Value	Name	Description
0	8BITS	Byte transfer
1	16BITS	Halfword transfer
2	32BITS	Word transfer
3	64BITS	Dword transfer
4–7	–	Reserved

**Bits 18:16 – BURST[2:0]** Type of Burst on Port x

Can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 0.

Reports the type of burst for the maximum waiting time.

Value	Name	Description
0	SINGLE	Single transfer
1	INCR	Incrementing burst of unspecified length
2	WRAP4	4-beat wrapping burst
3	INCR4	4-beat incrementing burst
4	WRAP8	8-beat wrapping burst
5	INCR8	8-beat incrementing burst
6	WRAP16	16-beat wrapping burst
7	INCR16	16-beat incrementing burst

**Bits 15:0 – MAX\_PORTx\_WAITING[15:0]** Address High on Port x

Can be read if the INFO field in the MPDDRC Monitor Configuration register is set to 0.

Reports the maximum waiting time and the associated type of transfer (burst, size, read or write).

**23.7.21. MPDDRC Monitor Information Port x Register (NB\_TRANSFERS)****Name:** MPDDRC\_MINFOx (NB\_TRANSFERS)**Offset:** 0x84 + x\*0x04 [x=0..3]**Reset:** 0x00000000**Property:** Read-only

**Bits 31:16 – Px\_TOTAL\_LATENCY\_QOS3[15:0]** Total Latency on Port x when value of qos is 3

Can be read if the INFO field is set to 5.

Reports the total latency within an interval (ADDR\_HIGH\_PORT and ADDR\_LOW\_PORT) when the port is used with qos = 3.

**Bits 15:0 – Px\_TOTAL\_LATENCY\_QOS2[15:0]** Total Latency on Port x when value of qos is 2

Can be read if the INFO field is set to 5.

Reports the total latency within an interval (ADDR\_HIGH\_PORT and ADDR\_LOW\_PORT) when the port is used with qos = 2.

### 23.7.25. MPDDRC Interrupt Enable Register

**Name:** MPDDRC\_IER  
**Offset:** 0xC0  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset								
Bit	7	6	5	4	3	2	1	0
							RD_ERR	SEC
Access							W	W
Reset							–	–

**Bit 1 – RD\_ERR** Read Error Interrupt Enable

**Bit 0 – SEC** Security and /or Safety Interrupt Enable

## 23.7.26. MPDDRC Interrupt Disable Register

**Name:** MPDDRC\_IDR  
**Offset:** 0xC4  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [MPDDRC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset							–	–

**Bit 1 – RD\_ERR** Read Error Interrupt Disable

**Bit 0 – SEC** Security and /or Safety Interrupt Disable

## 23.7.27. MPDDRC Interrupt Mask Register

**Name:** MPDDRC\_IMR  
**Offset:** 0xC8  
**Reset:** –  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset								
Bit	7	6	5	4	3	2	1	0
							RD_ERR	SEC
Access							R	R
Reset							–	–

**Bit 1 – RD\_ERR** Read Error Interrupt Mask

**Bit 0 – SEC** Security and /or Safety Interrupt Mask

## 23.7.28. MPDDRC Interrupt Status Register

**Name:** MPDDRC\_ISR  
**Offset:** 0xCC  
**Reset:** –  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							RD_ERR	SEC
Access							R	R
Reset							–	–

### Bit 1 – RD\_ERR Read Error

Value	Description
0	There is no error during memory check.
1	There is one error during memory check.

### Bit 0 – SEC Security and /or Safety Event

Value	Description
0	There is no security report in MPDDRC_WPSR.
1	One security flag is set in MPDDRC_WPSR.

## 23.7.29. MPDDRC Safety Register

**Name:** MPDDRC\_SAFETY  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
				EN	ADDRESS[27:24]			
Access				R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

### Bit 28 – EN Enable Periodic Check of Memory Device

Value	Description
0	Memory check is disabled.
1	Memory check is enabled.

### Bits 27:0 – ADDRESS[27:0] Memory Device Address

Memory device address to be checked.

### 23.7.30. MPDDRC Write Protection Mode Register

**Name:** MPDDRC\_WPMR

**Offset:** 0xE4

**Reset:** 0x00000000

**Property:** Read/Write

See [Register Write Protection](#) for the list of registers that can be protected.

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
				FIRSTE			WPITEN	WPEN
Access				R/W			R/W	R/W
Reset				0			0	0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x444452	PASSWD	Writing any other value in this field aborts the write operation of the WPEN and WPITEN bits. Always reads as 0.

#### Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in MPDDRC_WPSR.WPVSRC and the last software control error type is reported in MPDDRC_WPSR.SWETYP. The MPDDRC_ISR.SEC flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in MPDDRC_WPSR.WPVSRC and only the first software control error type is reported in MPDDRC_WPSR.SWETYP. The MPDDRC_ISR.SEC flag is set at the first error occurrence within a series.

#### Bit 1 – WPITEN Write Protection Interruption Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x444452 ("DDR" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x444452 ("DDR" in ASCII).

#### Bit 0 – WPEN Write Protection Enable

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x444452 ("DDR" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x444452 ("DDR" in ASCII).

**23.7.31. MPDDRC Write Protection Status Register****Name:** MPDDRC\_WPSR**Offset:** 0xE8**Reset:** 0x00000000**Property:** Read-only

**Bit 31 – ECLASS** Software Error Class (cleared on read)

0 (WARNING): An abnormal access that does not affect system functionality is performed.

1 (ERROR): An access is performed into some registers after memory device initialization sequence.

**Bits 25:24 – SWETYP[1:0]** Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (warning).
1	WRITE_RO	MPDDRC is enabled and a write access has been performed on a read-only register (warning).
2	UNDEF_RW	Access to an undefined address (warning).
3	W_AFTER_INIT	Abnormal use of MPDDRC user interface when memory device is already configured and initialized, i.e., if MPDDRC_RTR.COUNT > 0 (error).

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 3 – SWE** Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of MPDDRC_WPSR.
1	A software error has occurred since the last read of MPDDRC_WPSR. The field SWE details the type of software error. The associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error or Non-Correctable Error on Configuration Registers (cleared on read)

Value	Description
0	<p>In the registers listed below, no peripheral internal sequencer error has occurred or no single error has occurred since the last read of MPDDRC_WPSR:</p> <ul style="list-style-type: none"> <li>• Mode register (MPDDRC_MR)</li> <li>• Memory Device register (MPDDRC_MD)</li> <li>• Refresh Timer register (MPDDRC_RTR)</li> <li>• Timing Parameter 0/1/2 registers (MPDDRC_TPR0/1/2)</li> <li>• Low-Power register (MPDDRC_LPR)</li> <li>• Configuration register (MPDDRC_CR)</li> <li>• OCMS KEY1 register (MPDDRC_OCMS_KEY1)</li> <li>• OCMS KEY2 register (MPDDRC_OCMS_KEY2)</li> </ul>
1	<p>A peripheral internal sequencer error has occurred since the last read of MPDDRC_WPSR. In the registers listed below, this flag can only be set under abnormal operating conditions or if a non-correctable error has occurred since the last read of MPDDRC_WPSR:</p> <ul style="list-style-type: none"> <li>• Mode register (MPDDRC_MR)</li> <li>• Memory Device register (MPDDRC_MD)</li> <li>• Refresh Timer register (MPDDRC_RTR)</li> <li>• Timing Parameter 0/1/2 registers (MPDDRC_TPR0/1/2)</li> <li>• Low-Power register (MPDDRC_LPR)</li> <li>• Configuration register (MPDDRC_CR)</li> <li>• OCMS KEY1 register (MPDDRC_OCMS_KEY1)</li> <li>• OCMS KEY2 register (MPDDRC_OCMS_KEY2)</li> </ul> <p><b>Note:</b> The error is not corrected and the software must reconfigure all registers.</p>

#### Bit 1 – CGD Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of MPDDRC_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of MPDDRC_WPSR. This flag can only be set in case of an abnormal clock signal waveform (glitch).

#### Bit 0 – WPVS Write Protection Enable

Value	Description
0	No write protection violation occurred since the last read of this register (MPDDRC_WPSR).
1	A write protection violation occurred since the last read of this register (MPDDRC_WPSR). If this violation is an unauthorized attempt to write a control register, the associated violation is reported into the WPVSRC field.

## 24. SDRAM Controller (SDRAMC)

### 24.1. Description

The SDRAM Controller (SDRAMC) extends the memory capabilities of a chip by providing the interface to external 16-bit and 32-bit DRAM devices. The page size supports ranges from 2048 to 8192 and the number of columns from 256 to 2048. It supports byte (8-bit), half-word (16-bit) and word (32-bit) accesses.

The SDRAMC supports a read or write burst length of one location. It keeps track of the active row in each bank, thus maximizing SDRAM performance, for example, the application may be placed in one bank and data in the other banks. For optimized performance, it is advisable to avoid accessing different rows in the same bank.

The SDRAMC supports a CAS latency of 2 or 3 and optimizes the read access depending on the frequency.

The different modes available – Self-refresh, Powerdown and Deep Powerdown modes – minimize power consumption on the SDRAM device.

### 24.2. Embedded Characteristics

- Numerous Configurations Supported
  - 2K, 4K, 8K row address memory parts
  - SDRAM with two or four internal banks
  - SDRAM with 16-bit and 32-bit data path
- Programming Facilities
  - Word, half-word, byte access
  - Automatic Page break when memory boundary has been reached
  - Multibank ping-pong access
  - Timing parameters specified by software
  - Automatic refresh operation, refresh rate is programmable
  - Automatic update of DS, TCR and PASR parameters (mobile SDRAM devices)
- Energy-Saving Capabilities
  - Self-refresh, Powerdown and Deep Power modes Supported
  - Supports mobile SDRAM devices
- Error Detection
  - Refresh error interrupt
- SDRAM Power-up Initialization by Software
- CAS Latency of 2, 3 Supported
- Auto Precharge Command Not Used
- 256-Mbyte address space with 32-bit data path, 128-Mbyte address space with 16-bit data path
- Zero Wait State Scrambling/Unscrambling Function with User Key
- Multiplexed Address/Data Lines or Address/Data/Command Lines for Reduced Pin Count
- Abnormal Software Access and Internal Sequencer Integrity Check Reports

## 24.3. Signal Description

**Table 24.1.** Signal Description

Name	Description	Type	Active Level
SDCK	SDRAM Clock	Output	–
SDCKE	SDRAM Clock Enable	Output	High
SDCS	SDRAMC Chip Select	Output	Low
BA[1:0]	Bank Select Signals	Output	–
RAS	Row Signal	Output	Low
CAS	Column Signal	Output	Low
SDWE	SDRAM Write Enable	Output	Low
NBS[3:0]	Data Mask Enable Signals	Output	Low
SDRAMC_A[12:0]	Address Bus	Output	–
D[31:0]	Data Bus	I/O	–

## 24.4. Software Interface/SDRAM Organization, Address Mapping

The SDRAM address space is organized into banks, rows, and columns. The SDRAMC allows mapping different memory types according to the values set in the Configuration register (SDRAMC\_CR).

The SDRAMC makes the SDRAM device access protocol transparent to the user. The following tables illustrate the SDRAM device memory mapping seen by the user in correlation with the device structure. Various configurations are illustrated.

### 24.4.1. SDRAM Address Mapping for 32-bit Memory Data Bus Width

**Table 24.2.** SDRAM Configuration Mapping: 2K Rows, 256/512/1024/2048 Columns

CPU Address Line

		Bk[1:0]		Row[11:0]											Column[10:0]						M0						

**Note:** M0 is the byte address inside a 16-bit half-word and Bk[1] = BA1, Bk[0] = BA0.

**Table 24.7.** SDRAM Configuration Mapping: 8K Rows, 256/512/1024/2048 Columns

CPU Address Line																											
27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
				Bk[1:0]		Row[12:0]												Column[7:0]				M0					
				Bk[1:0]		Row[12:0]												Column[8:0]				M0					
		Bk[1:0]		Row[12:0]												Column[9:0]				M0							
	Bk[1:0]		Row[12:0]												Column[10:0]				M0								

**Note:** M0 is the byte address inside a 16-bit half-word and Bk[1] = BA1, Bk[0] = BA0.

## 24.5. Product Dependencies

### 24.5.1. SDRAM Device Initialization

The initialization sequence is generated by software. The sequence to initialize SDRAM devices is the following:

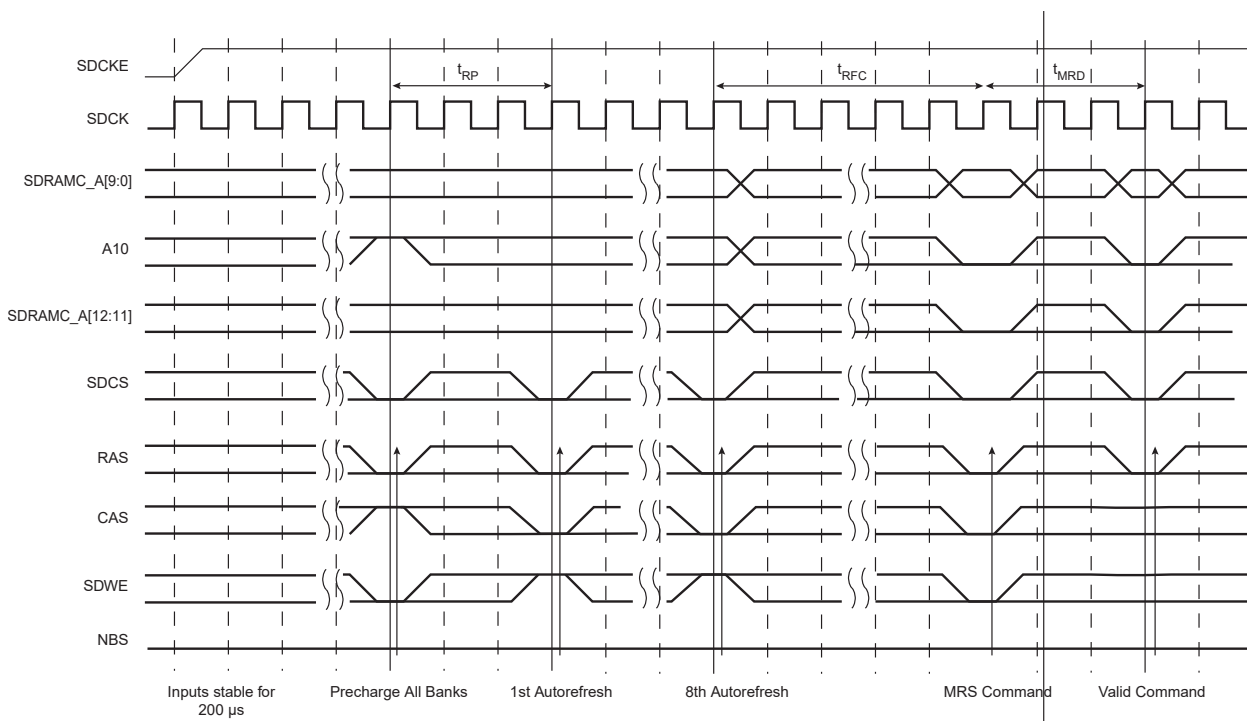

1. Set the SDRAM features in SDRAMC\_CR: asynchronous timings (TRC, TRAS, etc.), number of columns, number of rows, CAS latency and data bus width. Set UNAL bit in SDRAMC\_CFR1.
2. For mobile SDRAM, configure temperature-compensated self-refresh (TCSR), drive strength (DS) and partial array self-refresh (PASR) in the Low Power register (SDRAMC\_LPR).
3. Select the SDRAM memory device type and the shift sampling value in the Memory Device register (SDRAMC\_MDR).

4. A pause of at least 200  $\mu$ s must be observed before a signal toggle.
5. A NOP command is issued to the SDRAM devices. The application must write a 1 to the MODE field in the Mode register (SDRAMC\_MR) (see [Note](#)). Perform a write access to any SDRAM address. A calibration request is now made to the I/O pad.
6. An All Banks Precharge command is issued to the SDRAM. The application must write a 2 to the MODE field in SDRAMC\_MR. Perform a write access to any SDRAM address.
7. Eight autorefresh (CBR) cycles are provided. The application must set the MODE field to 4 in SDRAMC\_MR. Perform a write access to any SDRAM location eight times.
8. A Mode Register set (MRS) cycle is issued to program the parameters of the SDRAM, in particular CAS latency and burst length. The application must write a 3 to the MODE field in SDRAMC\_MR. Perform a write access to the SDRAM. The write address must be chosen so that BA[1:0] are set to 0. For example, with a 16-bit 128 MB SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be done at the address 0x20000000.
9. For mobile SDRAM initialization, an Extended Mode Register set (EMRS) cycle is issued to program the SDRAM parameters (TCSR, PASR, DS). The application must set the MODE field to 5 in SDRAMC\_MR. Perform a write access to the SDRAM. The write address must be chosen so that BA[1] or BA[0] are set to 1. For example, with a 16-bit 128 MB SDRAM (12 rows, 9 columns, 4 banks) bank address, the SDRAM write access should be done at address 0x20800000 or 0x20400000.
10. The application must go into Normal mode. Configure MODE to 0 in SDRAMC\_MR. Perform a write access at any location in the SDRAM.
11. Write the refresh rate into the COUNT field in the Refresh Timer register (SDRAMC\_TR). (Refresh rate = delay between refresh cycles). The SDRAM device requires a refresh every 15.625  $\mu$ s or 7.81  $\mu$ s. With a 100 MHz frequency, the Refresh Timer register must be set with the value 1562 (15.625  $\mu$ s x 100 MHz) or 781 (7.81  $\mu$ s x 100 MHz).

After initialization, the SDRAM devices are fully functional.

**Note:** The instructions stated in [Step 5](#) of the initialization process must be respected to make sure the subsequent commands issued by the SDRAMC are taken into account.

**Figure 24.1.** SDRAM Device Initialization Sequence

## 24.5.2. I/O Lines

The pins used for interfacing the SDRAMC may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the SDRAMC pins to their peripheral function. If I/O lines of the SDRAMC are not used by the application, they can be used for other purposes by the PIO Controller.

## 24.5.3. Power Management

The SDRAMC may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the SDRAMC clock.

The SDRAM clock on pin SDCK is output as soon as the first access to the SDRAM is made during the initialization phase. To stop the SDRAM clock signal, the SDRAMC\_LPR must be programmed with the self-refresh command.

## 24.5.4. Interrupt Sources

Using the SDRAMC interrupt requires the interrupt controller to be programmed first.

The SDRAMC interrupt line (Refresh Error notification) is connected to the interrupt controller through the memory controller (external bus interface) interrupt line.

SDRAMC refresh error notification interrupt line is ORed with other system peripheral interrupt lines and is finally provided as the system interrupt source to the interrupt controller.

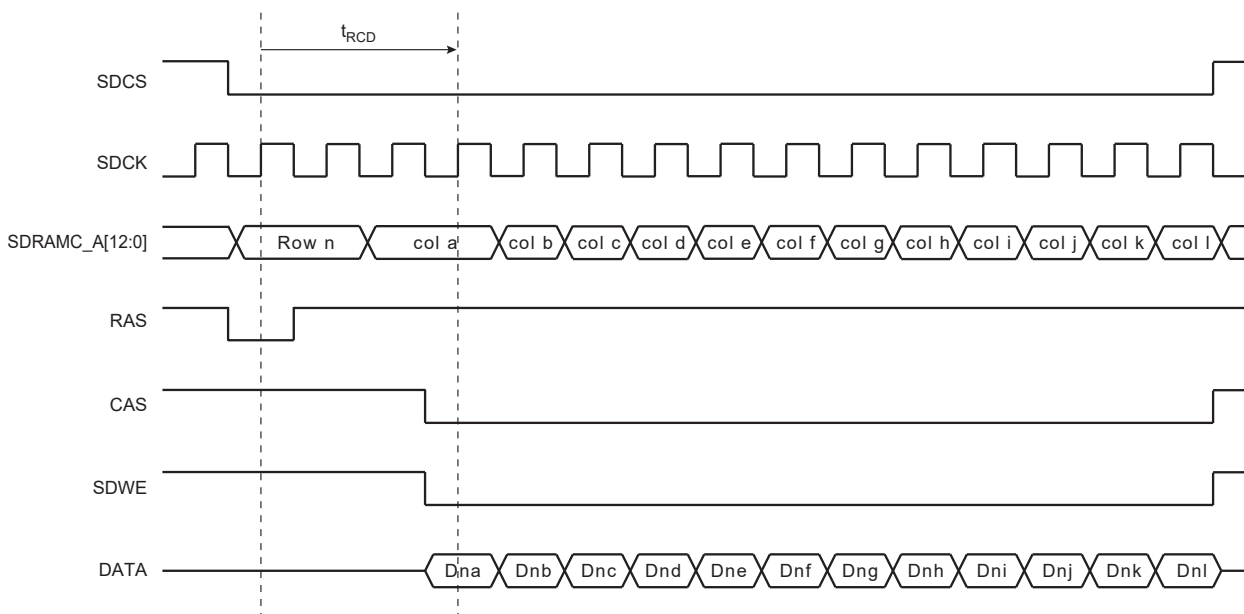

## 24.6. Functional Description

### 24.6.1. SDRAM Controller Write Cycle

The SDRAMC allows burst access or single access. In both cases, the SDRAMC keeps track of the active row in each bank, thus maximizing performance. To initiate a burst access, the SDRAMC uses the transfer type signal provided by the system bus host requesting the access. If the next access is a sequential write access, writing to the SDRAM device is carried out. If the next access is a write-sequential access, but the current access is to a boundary page, or if the next access

is in another row, then the SDRAMC generates a precharge command, activates the new row and initiates a write command. To comply with SDRAM timing parameters, additional clock cycles are inserted between precharge and active commands ( $t_{RP}$ ), and between active and write commands ( $t_{RCD}$ ). For definition of these timing parameters, see [SDRAMC\\_CR](#). See the following figure.

**Figure 24.2.** Write Burst SDRAM Access

### 24.6.2. SDRAM Controller Read Cycle

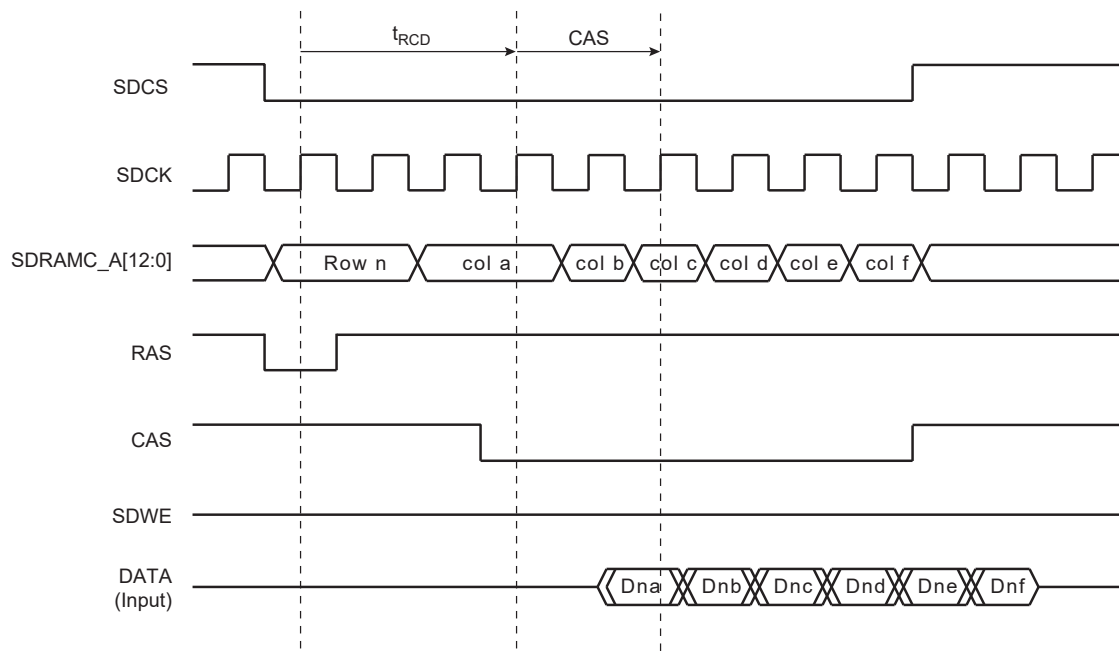

The SDRAMC allows burst access, incremental burst of unspecified length or single access. In all cases, the SDRAMC keeps track of the active row in each bank, thus maximizing performance of the SDRAM. If row and bank addresses do not match the previous row/bank address, then the SDRAMC automatically generates a precharge command, activates the new row and starts the read command. To comply with the SDRAM timing parameters, additional clock cycles on SDCK are inserted between precharge and active commands ( $t_{RP}$ ), and between active and read commands ( $t_{RCD}$ ). These two parameters are set in the SDRAMC\_CR. After a read command, additional wait states are generated to comply with the CAS latency (2 or 3 clock delays specified in the SDRAMC\_CR).

For a single access or an incremented burst of unspecified length, the SDRAMC anticipates the next access. While the last value of the column is returned by the SDRAMC on the bus, the SDRAMC anticipates the read to the next column and thus anticipates the CAS latency. This reduces the effect of the CAS latency on the internal bus.

For burst access of specified length (4, 8, 16 words), access is not anticipated. This case leads to the best performance. If the burst is broken (border, Busy mode, etc.), the next access is handled as an incrementing burst of unspecified length.

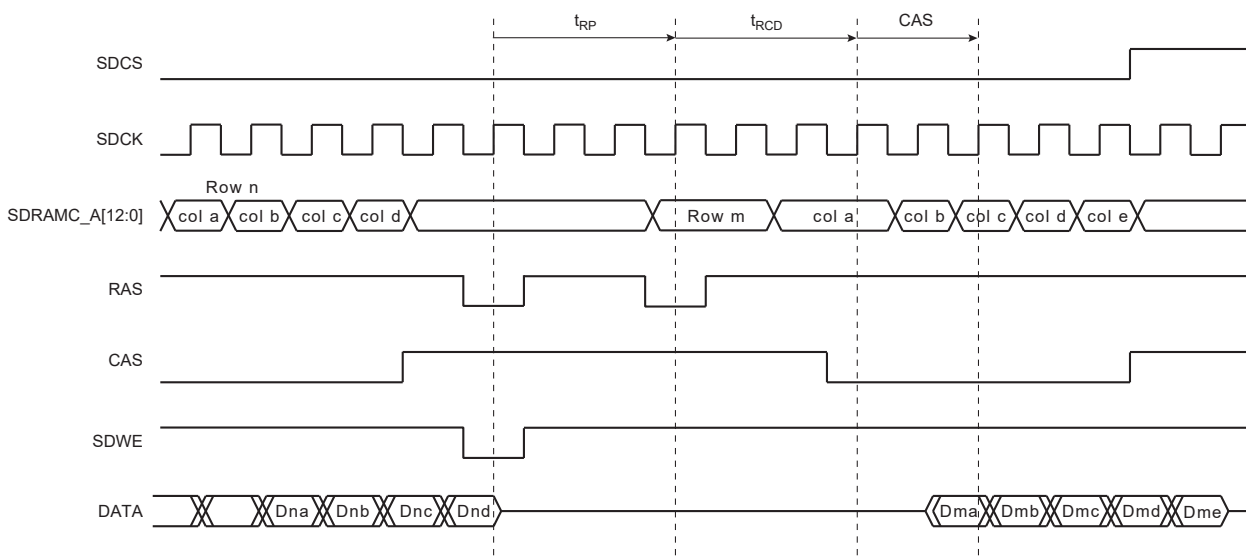

**Figure 24.3.** Read Burst SDRAM Access

### 24.6.3. Border Management

When the memory row boundary has been reached, an automatic page break is inserted. In this case, the SDRAMC generates a precharge command, activates the new row and initiates a read or write command. To comply with SDRAM timing parameters, an additional clock cycle is inserted between the precharge and the active command ( $t_{RP}$ ) and between the active and the read command ( $t_{RCD}$ ). See the following figure.

**Figure 24.4.** Read Burst with Boundary Row Access

### 24.6.4. SDRAM Controller Refresh Cycles

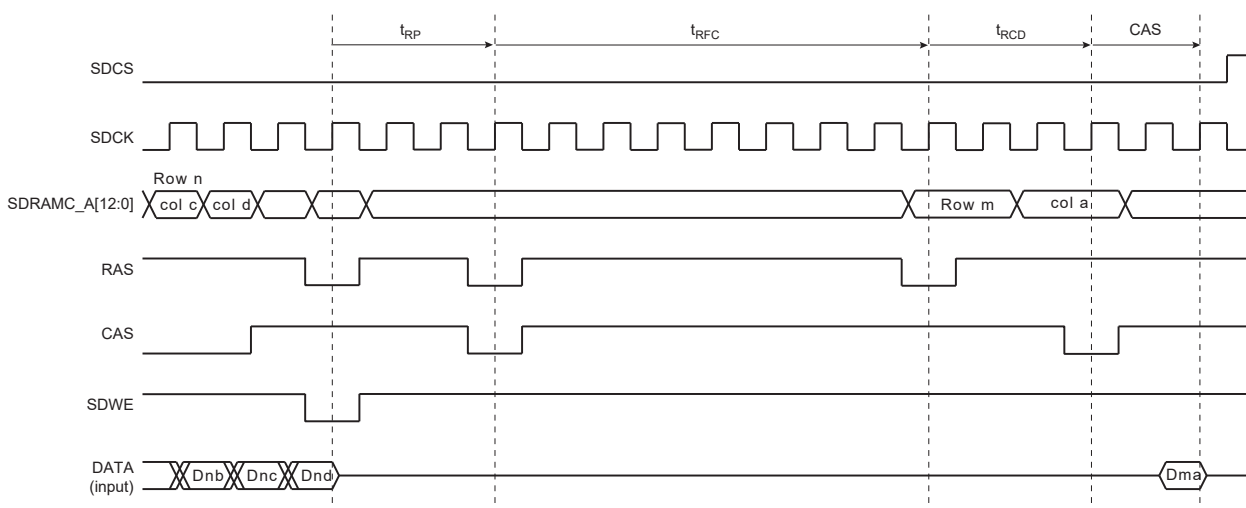

An autorefresh command is used to refresh the SDRAM device. Refresh addresses are generated internally by the SDRAM device and incremented after each autorefresh automatically. The SDRAMC

generates these autorefresh commands periodically. An internal timer is loaded with the value in SDRAMC\_TR that indicates the number of clock cycles between refresh cycles.

A refresh error interrupt is generated when the previous autorefresh command did not perform. It is acknowledged by reading the Interrupt Status register (SDRAMC\_ISR).

When the SDRAMC initiates a refresh of the SDRAM device, internal memory accesses are not delayed. However, if the processor tries to access the SDRAM, the SDRAMC system bus client interface indicates that the device is busy and the system bus host transfer is held by a wait signal. See the following figure.

**Figure 24.5.** Refresh Cycle Followed by a Read Access

## 24.6.5. Power Management

Three low-power modes are available:

- Self-refresh mode: The SDRAM executes its own Autorefresh cycle without control of the SDRAMC. Current drained by the SDRAM is very low.
- Powerdown mode: Autorefresh cycles are controlled by the SDRAMC. Between autorefresh cycles, the SDRAM is in powerdown. Current drained in Powerdown mode is higher than in Self-refresh Mode.
- Deep Powerdown mode (only available with Mobile SDRAM): The SDRAM contents are lost, but the SDRAM does not drain any current.

The SDRAMC activates one low-power mode as soon as the SDRAM device is not selected. It is possible to delay the entry in Self-refresh and Powerdown modes after the last access by programming a timeout value in the SDRAMC\_LPR.

### 24.6.5.1. Self-Refresh Mode

This mode is selected by configuring SDRAMC\_LPR.LPCB to 1. In Self-refresh mode, the SDRAM device retains data without external clocking and provides its own internal clocking, thus performing its own autorefresh cycles. All the inputs to the SDRAM device become “don’t care” except SDCKE, which remains low. As soon as the SDRAM device is selected, the SDRAMC provides a sequence of commands and exits Self-refresh mode.

Some low-power SDRAMs (e.g., mobile SDRAM) can refresh only one-quarter or a half quarter or all banks of the SDRAM array. This feature reduces the self-refresh current. To configure this feature, Temperature Compensated Self-Refresh (TCSR), Partial Array Self-Refresh (PASR) and Drive Strength (DS) must be set in the SDRAMC\_LPR and transmitted to the low-power SDRAM during initialization.

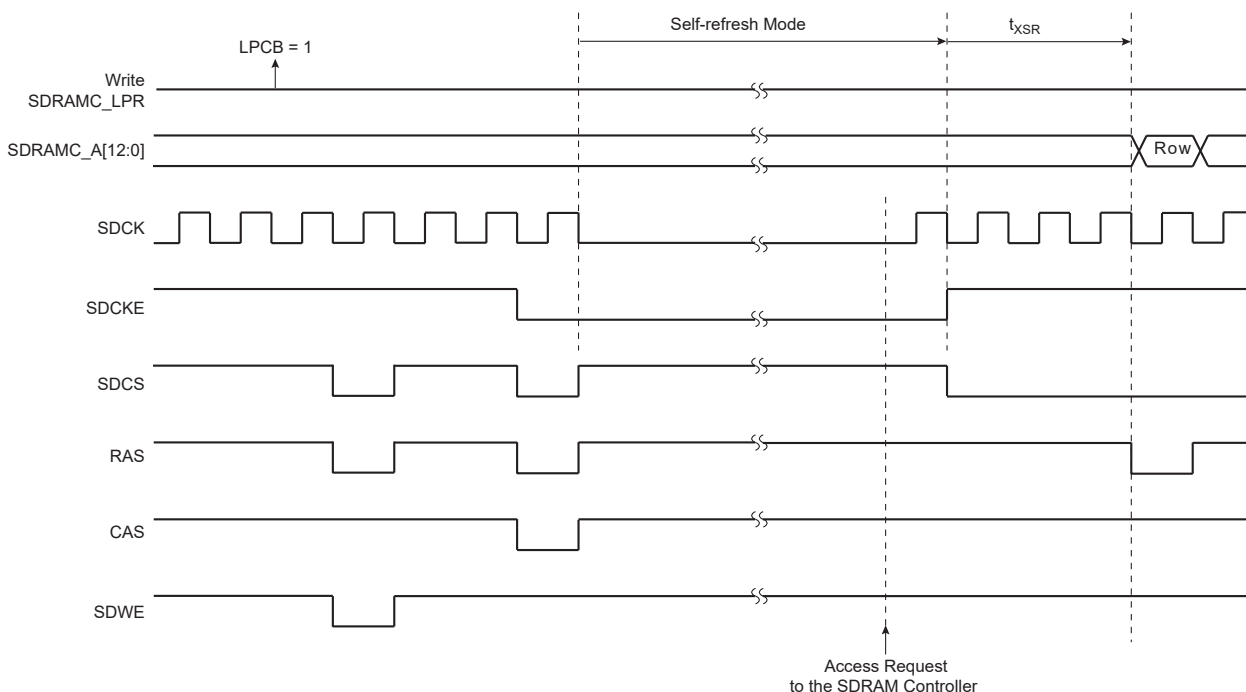

After initialization, as soon as the PASR/DS/TCSR fields are modified and Self-refresh mode is activated, the Extended Mode register is accessed automatically and the PASR/DS/TCSR bits are updated before entry into Self-refresh mode. This feature is not supported when SDRAMC shares an external bus with another controller.

The SDRAM device must remain in Self-refresh mode for a minimum period of  $t_{RAS}$  and may remain in Self-refresh mode for an indefinite period. See the following figure.

Upon exiting Self-refresh mode, an autorefresh command can be issued immediately after  $t_{XSR}$  by setting the bit SELFAUTO to 1 (see [SDRAMC\\_LPR](#)). Otherwise, an active command is issued immediately after  $t_{XSR}$  and an autorefresh command is issued every 7.81  $\mu$ s or 15.6  $\mu$ s.

**Note:** Some SDRAM providers impose some cycles of burst autorefresh immediately before self-refresh entry and immediately after self-refresh exit. For example, a SDRAM with 4096 rows will impose 4096 cycles of burst autorefresh. This constraint is not supported.

**Figure 24.6.** Self-Refresh Mode Behavior

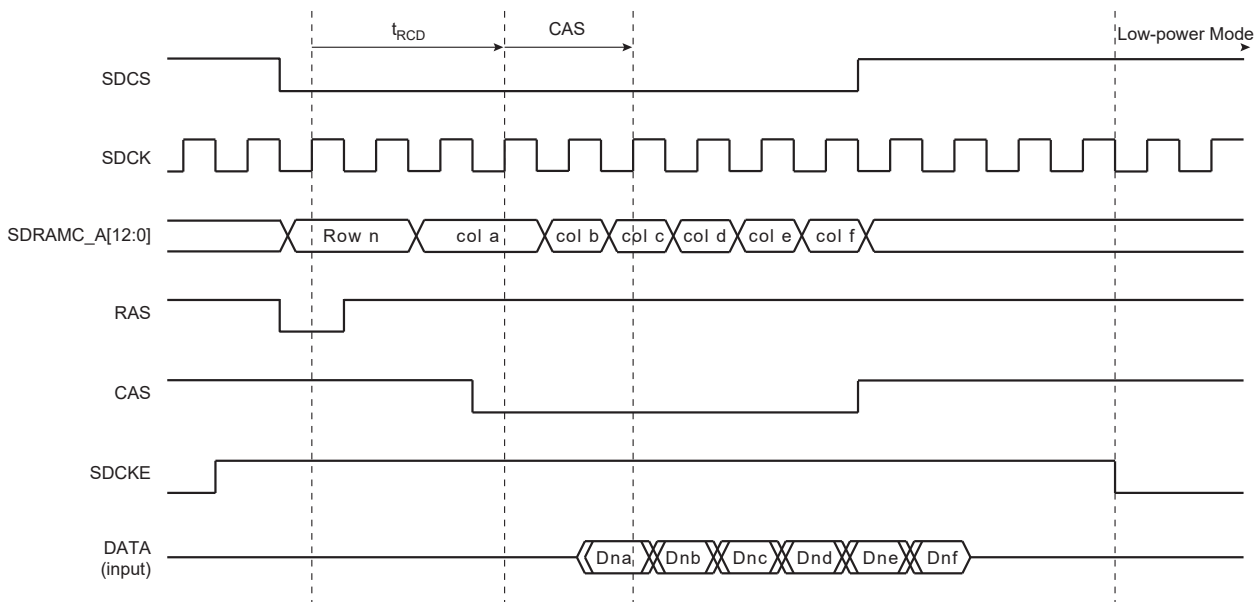

#### 24.6.5.2. Low-Power Mode

This mode is selected by configuring SDRAMC\_LPR.LPCB to 2. Power consumption is greater than in Self-refresh mode. All the input and output buffers of the SDRAM device are deactivated except SDCKE, which remains low. In contrast to Self-refresh mode, the SDRAM device cannot remain in Low-power mode longer than the refresh period (64 ms for a whole device refresh operation). As no autorefresh operations are performed by the SDRAM itself, the SDRAMC carries out the refresh operation. The exit procedure is faster than in Self-refresh mode.

See the following figure.

**Figure 24.7.** Low-Power Mode Behavior

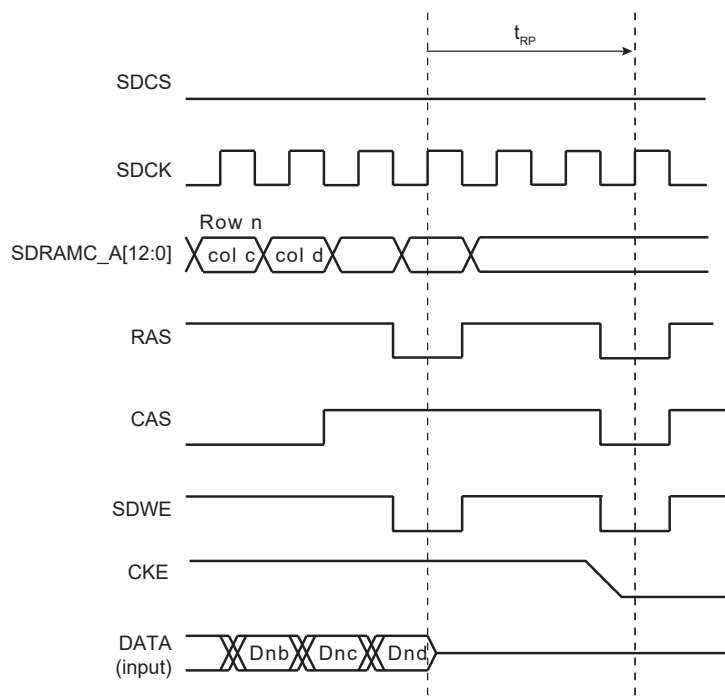

### 24.6.5.3. Deep Powerdown Mode

This mode is selected by configuring SDRAMC\_LPR.LPCB to 3. When this mode is activated, all internal voltage generators inside the SDRAM are stopped and all data is lost.

When this mode is enabled, the application must not access the SDRAM until a new initialization sequence is done (see [“SDRAM Device Initialization”](#)).

See the following figure.

**Figure 24.8.** Deep Powerdown Mode Behavior

#### 24.6.6. Scrambling/Unscrambling Function

The external data bus can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either microcontroller or memory device.

The scrambling and unscrambling are performed on-the-fly without additional wait states.

The scrambling/unscrambling function can be enabled or disabled by configuring the SDR\_SE bit in the OCMS register (SDRAMC\_OCMS). This bit cannot be reconfigured as long as the external memory device is powered.

The scrambling method depends on two user-configurable key registers, SDRAMC\_OCMS\_KEY1 and SDRAMC\_OCMS\_KEY2 plus a random value depending on device processing characteristics. These key registers are only accessible in Write mode.

The scrambling user key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

When multiple chip selects are handled, it is possible to configure the scrambling function per chip select using the OCMS field in the SDRAMC\_OCMS registers.

#### 24.6.7. Clearing Scrambling Keys on Tamper Event

On tamper detection event on WKUP pins, it is possible to perform an immediate clear of the scrambling keys (SDRAMC\_OCMS\_KEY1 and SDRAMC\_OCMS\_KEY2) if bit SDRAMC\_OCMS.TAMPCLR = 1.

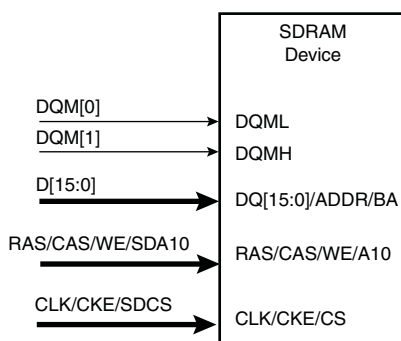

#### 24.6.8. Interface with Multiplexed Data/Address Lines and Data/Address/Command Lines

This feature takes advantage of the SDRAM protocol to reduce the pin count by multiplexing address and data lines or address, data and command lines. Up to 16 lines can be reduced depending on the configuration of the SDRAM.

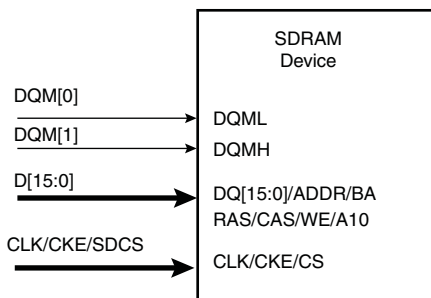

Using this feature reduces the efficiency of the SDRAM by adding one clock cycle during write access.

When address, data and command lines are multiplexed, as SDA10 is multiplexed, refresh operations increase the latency. It is not possible to perform an access to another device during auto-refresh process.

**Figure 24.9.** Multiplexed Address/Data, Connection to 1x16 SDRAM Interface

**Figure 24.10.** Multiplexed Address/Data/Command, Connection to 1x16 SDRAM Interface

**Table 24.8.** 16-Mbit SDR-SDRAM, 512 Kbits\*16 bits\*2 Banks: Multiplexed Address/Data

## 24.6.9. Register Write Protection

To prevent any single software error from corrupting SDRAMC behavior, some registers in the address space can be write-protected by setting the WPEN and WPITEN bits in the [SDRAMC Write Protection Mode Register](#) (SDRAMC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [SDRAMC Write Protection Status Register](#) (SDRAMC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the SDRAMC\_WPSR.

The following registers can be write-protected:

- [SDRAMC Mode Register](#)
- [SDRAMC Refresh Timer Register](#)
- [SDRAMC Configuration Register](#)

- [SDRAMC Memory Device Register](#)
- [SDRAMC Configuration Register 1](#)
- [SDRAMC OCMS Register](#)
- [SDRAMC OCMS KEY1 Register](#)
- [SDRAMC OCMS KEY2 Register](#)

The following registers can be write-protected when WPITEN is enabled:

- [SDRAMC Interrupt Enable Register](#)
- [SDRAMC Interrupt Disable Register](#)

#### 24.6.10. Security and Safety Analysis and Reports

Several types of checks are performed when the SDRAMC is accessing the memory device.

The peripheral clock of the SDRAMC is monitored by specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the SDRAMC. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag SDRAMC\_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the SDRAMC is also monitored and if an abnormal state is detected, the flag SDRAMC\_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the SDRAMC are monitored and if an incorrect access is performed, the flag SDRAMC\_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the SDRAMC\_WPSR.SWETYP field (see [SDRAMC\\_WPSR](#) for details), e.g., writing a new configuration (SDRAMC\_CR, SDRAMC\_CFR1, SDRAMC\_HSR, SDRAMC\_OCMS, SDRAMC\_KEY1/2) after the initialization of the SDRAMC (i.e., if SDRAMC\_TR.COUNT > 0) is an error. SDRAMC\_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when SDRAMC\_WPSR is read.

If one of these flags is set, the flag SDRAMC\_ISR.SECE is set and can trigger an interrupt if the SDRAMC\_IMR.SECE bit is '1'. SECE is cleared by reading SDRAMC\_ISR.

## 24.7. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0	
0x00	SDRAMC_MR	31:24

### 24.7.1. SDRAMC Mode Register

**Name:** SDRAMC\_MR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

#### Bits 2:0 – MODE[2:0] SDRAMC Command Mode

This field defines the command issued by the SDRAMC when the SDRAM device is accessed.

Value	Name	Description
0	NORMAL	Normal mode. Any access to the SDRAM is decoded normally. To activate this mode, the command must be followed by a write to the SDRAM.
1	NOP	The SDRAMC issues a NOP command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.
2	ALLBANKS_PRECHARGE	The SDRAMC issues an “All Banks Precharge” command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.
3	LOAD_MODEREG	The SDRAMC issues a “Load Mode Register” command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the command must be followed by a write to the SDRAM.
4	AUTO_REFRESH	The SDRAMC issues an “Autorefresh” Command when the SDRAM device is accessed regardless of the cycle. Previously, an “All Banks Precharge” command must be issued. To activate this mode, the command must be followed by a write to the SDRAM.
5	EXT_LOAD_MODEREG	The SDRAMC issues an “Extended Load Mode Register” command when the SDRAM device is accessed regardless of the cycle. To activate this mode, the “Extended Load Mode Register” command must be followed by a write to the SDRAM. The write in the SDRAM must be done in the appropriate bank; most low-power SDRAM devices use the bank 1.
6	DEEP_POWERDOWN	Deep Powerdown mode. Enters Deep Powerdown mode.

## 24.7.2. SDRAMC Refresh Timer Register

**Name:** SDRAMC\_TR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					COUNT[11:8]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	COUNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 11:0 – COUNT[11:0] SDRAMC Refresh Timer Count

This 12-bit field is loaded into a timer that generates the refresh pulse. Each time the refresh pulse is generated, a refresh burst is initiated. The SDRAM device requires a refresh every 15.625  $\mu$ s or 7.81  $\mu$ s. With a 100 MHz frequency, the Refresh Timer Counter Register must be set with the value 1562 (15.625  $\mu$ s x 100 MHz) or 781 (7.81  $\mu$ s x 100 MHz).

To refresh the SDRAM device, this 12-bit field must be written. If this condition is not satisfied, no refresh command is issued and no refresh of the SDRAM device is carried out.

### 24.7.3. SDRAMC Configuration Register

**Name:** SDRAMC\_CR  
**Offset:** 0x08  
**Reset:** 0x852372C0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TXSR[3:0]				TRAS[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	0	0	0	0	1	0	1
Bit	23	22	21	20	19	18	17	16
	TRCD[3:0]				TRP[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	1	1
Bit	15	14	13	12	11	10	9	8
	TRC_TRFC[3:0]				TWR[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	0	1	0
Bit	7	6	5	4	3	2	1	0
	DBW	CAS[1:0]		NB	NR[1:0]		NC[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	0	0	0	0	0	0

#### Bits 31:28 – TXSR[3:0] Exit Self-Refresh to Active Delay

Reset value is eight cycles.

This field defines the delay between SCKE set high and an Activate Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 27:24 – TRAS[3:0] Active to Precharge Delay

Reset value is five cycles.

This field defines the delay between an Activate Command and a Precharge Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 23:20 – TRCD[3:0] Row to Column Delay

Reset value is two cycles.

This field defines the delay between an Activate Command and a Read/Write Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 19:16 – TRP[3:0] Row Precharge Delay

Reset value is three cycles.

This field defines the delay between a Precharge Command and another Command in number of cycles. Number of cycles is between 0 and 15.

#### Bits 15:12 – TRC\_TRFC[3:0] Row Cycle Delay and Row Refresh Cycle

Reset value is seven cycles.

This field defines two timings:

- the delay ( $t_{RFC}$ ) between two Refresh commands and between a Refresh command and an Activate command
- the delay ( $t_{RC}$ ) between two Active commands in number of cycles.

The number of cycles is between 0 and 15. The end user must program  $\max\{t_{RC}, t_{RFC}\}$ .

#### Bits 11:8 – TWR[3:0] Write Recovery Delay

Reset value is two cycles.

This field defines the Write Recovery Time in number of cycles. Number of cycles is between 0 and 15.

#### Bit 7 – DBW Data Bus Width

Reset value is 16 bits.

Value	Description
0	Data bus width is 32 bits.
1	Data bus width is 16 bits.

#### Bits 6:5 – CAS[1:0] CAS Latency

Reset value is two cycles. In the SDRAMC, only a CAS latency of one, two and three cycles is managed.

Value	Name	Description
0	Reserved	–
1	LATENCY1	1 cycle latency
2	LATENCY2	2 cycle latency
3	LATENCY3	3 cycle latency

#### Bit 4 – NB Number of Banks

Reset value is two banks.

Value	Name	Description
0	BANK2	2 banks
1	BANK4	4 banks

#### Bits 3:2 – NR[1:0] Number of Row Bits

Reset value is 11 row bits.

Value	Name	Description
0	ROW11	11 bits to define the row number, up to 2048 rows
1	ROW12	12 bits to define the row number, up to 4096 rows
2	ROW13	13 bits to define the row number, up to 8192 rows
3		Reserved

#### Bits 1:0 – NC[1:0] Number of Column Bits

Reset value is 8 column bits.

Value	Name	Description
0	COL8	8 bits to define the column number, up to 256 columns.
1	COL9	9 bits to define the column number, up to 512 columns.
2	COL10	10 bits to define the column number, up to 1024 columns.
3	COL11	11 bits to define the column number, up to 2048 columns.

**24.7.4. SDRAMC Low-Power Register****Name:** SDRAMC\_LPR**Offset:** 0x10**Reset:** 0x00000000**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								SELFDONE
Reset								R/W 0
Bit	15	14	13	12	11	10	9	8
Access		SELFAUTO	TIMEOUT[1:0]		DS[1:0]		TCSR[1:0]	
Reset		R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0
Bit	7	6	5	4	3	2	1	0
Access		PASR[2:0]					LPCB[1:0]	
Reset		R/W 0	R/W 0	R/W 0			R/W 0	R/W 0

**Bit 16 – SELFDONE** Self-refresh Done (read-only)

This bit indicates that the external device is in Self-refresh mode.

**Bit 14 – SELFAUTO** Self-refresh Exit Autorefresh

Value	Description
1	Upon exiting Self-refresh mode, autorefresh command is immediately performed after $t_{XSR}$ .
0	Upon exiting Self-refresh mode, active command is immediately performed after $t_{XSR}$ . The autorefresh command is issued every 15.6 $\mu$ s or less.

**Bits 13:12 – TIMEOUT[1:0]** Time to Define When Low-power Mode Is Enabled

Value	Name	Description
0	LP_LAST_XFER	The SDRAMC activates the SDRAM Low-power mode immediately after the end of the last transfer.
1	LP_LAST_XFER_64	The SDRAMC activates the SDRAM Low-power mode 64 clock cycles after the end of the last transfer.
2	LP_LAST_XFER_128	The SDRAMC activates the SDRAM Low-power mode 128 clock cycles after the end of the last transfer.
3	Reserved	

**Bits 11:10 – DS[1:0]** Drive Strength (only for low-power SDRAM)

DS is transmitted to the SDRAM during initialization to select the SDRAM strength of data output. This parameter must be set according to the SDRAM device specification.

After initialization, as soon as the DS field is modified and Self-refresh mode is activated, the Extended Mode Register is accessed automatically and DS bits are updated before entry in Self-refresh mode. This feature is not supported when SDRAMC shares an external bus with another controller.

**Bits 9:8 – TCSR[1:0]** Temperature Compensated Self-Refresh (only for low-power SDRAM)

TCSR is transmitted to the SDRAM during initialization to set the refresh interval during Self-refresh mode depending on the temperature of the low-power SDRAM. This parameter must be set according to the SDRAM device specification.

After initialization, as soon as the TCSR field is modified and Self-refresh mode is activated, the Extended Mode Register is accessed automatically and TCSR bits are updated before entry in Self-refresh mode. This feature is not supported when SDRAMC shares an external bus with another controller.

**Bits 6:4 – PASR[2:0]** Partial Array Self-refresh (only for low-power SDRAM)

PASR is transmitted to the SDRAM during initialization to specify whether only one quarter, one half or all banks of the SDRAM array are enabled. Disabled banks are not refreshed in Self-refresh mode. This parameter must be set according to the SDRAM device specification.

After initialization, as soon as the PASR field is modified and Self-refresh mode is activated, the Extended Mode Register is accessed automatically and PASR bits are updated before entry in Self-refresh mode. This feature is not supported when SDRAMC shares an external bus with another controller.

**Bits 1:0 – LPCB[1:0]** Low-power Configuration Bits

Value	Name	Description
0	DISABLED	The low-power feature is inhibited: no Powerdown, Self-refresh or Deep Powerdown command is issued to the SDRAM device.
1	SELF_REFRESH	The SDRAMC issues a Self-refresh command to the SDRAM device, the SDCK clock is deactivated and the SDCKE signal is set low. The SDRAM device leaves the Self-refresh mode when accessed and enters it after the access.
2	POWER_DOWN	The SDRAMC issues a Powerdown Command to the SDRAM device after each access, the SDCKE signal is set to low. The SDRAM device leaves the Powerdown mode when accessed and enters it after the access.
3	DEEP_POWER_DOWN	The SDRAMC issues a Deep Powerdown command to the SDRAM device. This mode is unique to low-power SDRAM.

## 24.7.5. SDRAMC Interrupt Enable Register

**Name:** SDRAMC\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the SDRAMC Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
							SECE	RES
Access							W	W
Reset							–	–

**Bit 1 – SECE** Security and/or Safety Event Interrupt Enable

**Bit 0 – RES** Refresh Error Interrupt Enable

## 24.7.6. SDRAMC Interrupt Disable Register

**Name:** SDRAMC\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the SDRAMC Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
							SECE	RES
Access							W	W
Reset							–	–

**Bit 1 – SECE** Security and/or Safety Event Interrupt Disable

**Bit 0 – RES** Refresh Error Interrupt Disable

## 24.7.7. SDRAMC Interrupt Mask Register

**Name:** SDRAMC\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							SECE	RES
Access							W	R
Reset							0	0

### Bit 1 – SECE Security and/or Safety Event Interrupt Mask

Value	Description
0	The security and/or safety event interrupt is disabled.
1	The security and/or safety event interrupt is enabled.

### Bit 0 – RES Refresh Error Interrupt Mask

Value	Description
0	The refresh error interrupt is disabled.
1	The refresh error interrupt is enabled.

## 24.7.8. SDRAMC Interrupt Status Register

**Name:** SDRAMC\_ISR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							SECE	RES
Access							W	R
Reset							0	0

### Bit 1 – SECE Security and/or Safety Event Event (cleared on read)

Value	Description
0	There is no security report in SDRAMC_WPSR.
1	One security flag is set in SDRAMC_WPSR.

### Bit 0 – RES Refresh Error Status (cleared on read)

Value	Description
0	No refresh error has been detected since the register was last read.
1	A refresh error has been detected since the register was last read.

## 24.7.9. SDRAMC Memory Device Register

**Name:** SDRAMC\_MDR  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			SHIFT_SAMPLING[1:0]				MD[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

### Bits 5:4 – SHIFT\_SAMPLING[1:0] Shift Sampling Point of Data

Shifts the sampling point of data coming from the memory device. The higher the memory device clock frequency, the higher the SHIFT\_SAMPLING value. Refer to the section "Electrical Characteristics".

Value	Name	Description
0	–	Reserved.
1	SHIFT_ONE_CYCLE	Sampling point is shifted by one cycle.
2	SHIFT_TWO_CYCLES	Sampling point is shifted by two cycles.
3	SHIFT_THREE_CYCLES	Sampling point is shifted by three cycles.

### Bits 1:0 – MD[1:0] Memory Device Type

Value	Name	Description
0	SDRAM	SDRAM
1	LPSDRAM	Low-power SDRAM
2	–	Reserved
3	–	Reserved

## 24.7.10. SDRAMC Configuration Register 1

**Name:** SDRAMC\_CFR1  
**Offset:** 0x28  
**Reset:** 0x00000002  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8
					CMD_MUX	ADD_DATA_MUX		UNAL
Access					R/W	R/W		R/W
Reset					0	0		0
Bit	7	6	5	4	3	2	1	0
					TMRD[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	1	0

### Bit 11 – CMD\_MUX Commands are Multiplexed with Address and Data

To use this feature, ADD\_DATA\_MUX must be set to '1'. This feature allows to reduce the number of pins.

Value	Name	Description
0	UNSUPPORTED	Commands are not multiplexed with address and data.
1	SUPPORTED	Commands are multiplexed with address and data.

### Bit 10 – ADD\_DATA\_MUX Multiplexed Address and Data

.This feature allows to reduce the number of pins.

Value	Name	Description
0	UNSUPPORTED	Data and address are not multiplexed
1	SUPPORTED	Data and address are multiplexed

### Bit 8 – UNAL Always written to 1

This bit must be always written to 1.

### Bits 3:0 – TMRD[3:0] Load Mode Register Command to Active or Refresh Command

This field defines the delay between a "Load Mode Register" command and an active or refresh command in number of cycles. Number of cycles is between 0 and 15.

## 24.7.11. SDRAMC OCMS Register

**Name:** SDRAMC\_OCMS  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
				TAMPCLR				SDR_SE
Access				R/W				R/W
Reset				0				0

### Bit 4 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on SDRAMC scrambling keys.
1	A tamper detection event immediately clears SDRAMC scrambling keys.

### Bit 0 – SDR\_SE SDRAM Memory Controller Scrambling Enable

Value	Description
0	Disables off-chip scrambling for SDR-SDRAM access.
1	Enables off-chip scrambling for SDR-SDRAM access.

## 24.7.12. SDRAMC OCMS KEY1 Register

**Name:** SDRAMC\_OCMS\_KEY1  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	KEY1[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY1[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	KEY1[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEY1[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bits 31:0 – KEY1[31:0] Off-chip Memory Scrambling (OCMS) Key Part 1

When off-chip memory scrambling is enabled, the data scrambling depends on KEY1 and KEY2 values.

### 24.7.13. SDRAMC OCMS KEY2 Register

**Name:** SDRAMC\_OCMS\_KEY2  
**Offset:** 0x34  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [SDRAMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	KEY2[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY2[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	KEY2[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEY2[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – KEY2[31:0] Off-chip Memory Scrambling (OCMS) Key Part 2

When off-chip memory scrambling is enabled, the data scrambling depends on KEY1 and KEY2 values.

## 24.7.14. SDRAMC Write Protection Mode Register

**Name:** SDRAMC\_WPMR**Offset:** 0x3C**Reset:** 0x00000000**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
							WPITEN	WPEN
Access							R/W	R/W
Reset							0	0

**Bits 31:8 – WPKEY[23:0]** Write Protection Key

Value	Name	Description
0x534452	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

**Bit 1 – WPITEN** Write Protection Interrupt Enable

Value	Description
0	Disables the write protection of SDRAMC_IER/IDR if WPKEY corresponds to 0x534452 (SDR in ASCII).
1	Enables the write protection of SDRAMC_IER/IDR if WPKEY corresponds to 0x534452 (SDR in ASCII).

**Bit 0 – WPEN** Write Protection Enable

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x534452 ("SDR" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x534452 ("SDR" in ASCII).

## 24.7.15. SDRAMC Write Protection Status Register

**Name:** SDRAMC\_WPSR**Offset:** 0x40**Reset:** 0x00000000**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS						SWETYP[2:0]	
Access	R					R	R	R
Reset	0					0	0	0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPEN
Access					R	R	R	R
Reset					0	0	0	0

**Bit 31 – ECLASS** Software Error Class (cleared on read)

Value	Name	Description
0	WARNING	An abnormal access is performed but it does not affect system functionality.
1	ERROR	An access is performed into some registers after memory device initialization sequence.

**Bits 26:24 – SWETYP[2:0]** Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (Warning).
1	WRITE_RO	A write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address (Warning).
3	W_AFTER_INIT	Write access performed into some configuration registers after memory device initialization, i.e. if SDRAMC_TR.COUNT > 0 (Error).

**Bits 15:8 – WPVSR[7:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

When WPVS=0 and SWE=1, WPVSR reports the address of the incorrect software access. As soon as WPVS=1, WPVSR returns the address of the write-protected violation.

**Bit 3 – SWE** Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of SDRAMC_WPSR.
1	A software error has occurred since the last read of SDRAMC_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of SDRAMC_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of SDRAMC_WPSR. This flag can only be set under abnormal operating conditions.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of SDRAMC_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of SDRAMC_WPSR. This flag can only be set in case of an abnormal clock signal waveform (glitch).

**Bit 0 – WPEN** Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the QSPI_WPSR.
1	A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

## 25. OTP Memory Controller (OTPC)

### 25.1. Description

The One-Time Programmable (OTP) Memory Controller (OTPC) is the secure interface between the system and the OTP memory.

The default value of a memory bit is logic '0' (not programmed). A programmed memory bit is logic '1'.

An OTP matrix is a type of non-volatile memory. Each bit in the matrix can be programmed only once. The bits are used to store data such as:

- calibration bits for analog cells (for example, RC oscillators, etc.),
- hardware configuration settings (for example, JTAG disable, etc.),
- chip identifiers,
- key data invisible by software,
- user data.

### 25.2. Embedded Characteristics

- Programs and Reads the Memory by Software
- Emulation Mode
- Automatic Check of Programmed Bits on Start-up for Safe Operation
- User Area Organized by Packet for Flexibility on Size and Security:
  - Individual packet locking possibility (with checksum check)
  - Individual packet read access through only Private Key bus or System bus
  - Individual packet hiding (for packet with System bus access only)
  - Individual packet size of 32 bits to 8192 bits in 32-bit steps
  - Individual packet invalidation
- Firewall: Software/Hardware Protection Against Unexpected Read/Write

## 25.3. Block Diagram

Figure 25.1. OTPC Block Diagram

## 25.4. Product Dependencies

### 25.4.1. Power Management

The OTPC is clocked through the Power Management Controller (PMC). The user must power on the main RC oscillator and enable the peripheral clock of the OTPC prior to reading or writing the OTP memory.

### 25.4.2. Interrupt Sources

The OTPC interface has an interrupt line connected to the Interrupt Controller.

Handling the OTPC interrupt requires programming the Interrupt Controller before configuring the OTPC.

## 25.5. Functional Description

### 25.5.1. Bus Interfaces

The OTPC features four bus interfaces to access the OTP memory:

- Host system bus
- Client system bus
- Host key bus (private key bus)
- Client key bus (private key bus)

The host system bus is used in Emulation mode to write and read data to/from the Emulation memory instead of the OTP memory. The host system bus can only access the emulation memory.

The client system bus is available to access to the user interface.

The host key bus is available to read keys stored in the User area of the OTP memory and transfer them to the client crypto-engines connected to this bus (e.g. AES). No data accessible to the host key bus are accessible to the System bus.

The client key bus is available to write some data to the User area of the OTP memory. No data coming from the client key bus are accessible to the system bus.

### 25.5.2. OTP Memory Partitioning

The OTP memory is partitioned into different areas:

- Reserved area
- 11-Kbyte User area

The initial value of the OTP memory is '0' but the memory may contain some "defective" bits already set to the value '1'.

The memory is organized into 32-bit words.

### 25.5.3. User Area

#### 25.5.3.1. Area Configuration and Control

The User area is controlled and configured through the OTPC Control (OTPC\_CR), OTPC Mode (OTPC\_MR) and OTPC Data (OTPC\_DR) registers.

#### 25.5.3.2. Area Mapping

The entire User area space is mapped into 32-bit words. Each 32-bit word is part of one packet.

Each packet contains a 32-bit header and 32-bit words of payload (data). The number of payload words is defined in the header.

This mapping system allows three important functions for an OTP memory:

- Gives a flexible size for any type of data
- Improves security by identifying and masking key areas to the System bus,
- Provides an easy way to invalidate a packet and create a replacement packet (key, data) while free space is available in OTP.

The packet organization into the User area is shown in the figure below.

**Figure 25.2.** User Area Memory Mapping

The number of packets depends on the size of the User area and the size of each packet.

### 25.5.3.3. Packet Definition

Each packet contains:

- One 32-bit header field
- One payload field containing at least 32 bits of data and up to 256 x 32 bits of data (8192 bits)

The payload field has no effect on the hardware except for “special” packets.

#### 25.5.3.3.1. Header Field

The following table provides the definition of the header content.

31	30	29	28	27	26	25	24
CHECKSUM							
23	22	21	20	19	18	17	16
CHECKSUM							
15	14	13	12	11	10	9	8
SIZE							
7	6	5	4	3	2	1	0
ONE	–	INVLD		LOCK	PACKET		

- **PACKET:** Indicates the packet type. Six types are available:
  - REGULAR packet (value 1) accessible through the User Interface
  - KEY packet (value 2) accessible only through the Private Key buses
  - BOOT\_CONFIGURATION “special” packet (value 3)
  - SECURE\_BOOT\_CONFIGURATION “special” packet (value 4)
  - HARDWARE\_CONFIGURATION “special” packet (value 5)
  - CUSTOM “special” packet (value 6)
- **LOCK:** Written by the controller when the checksum is generated.
- **INVLD:** Written when an invalidation process is requested.
- **ONE:** Must be written to ‘1’.
- **SIZE:** Indicates the size in 32-bit words of the payload field. SIZE = 0 means payload is 32-bit size, SIZE = 255 means payload is 8192-bit size.  
The entire packet size (in bits) in OTP memory is  $32 \text{ (header)} + (32 * (\text{SIZE} + 1))$ .
- **CHECKSUM:** Represents the checksum of the packet excluding the CHECKSUM field of the header. The real value of the CHECKSUM field is not readable; it is generated by the OTPC.
  - When CHECKSUM is read as 0, the checksum has not been generated. It is possible to modify the packet content.
  - When CHECKSUM is read as 0x33CC, the checksum has not been generated but some bits are already at 1. Locking the packet may fail.
  - When CHECKSUM is read as 0xA5A5, the checksum has been generated and the last check was successful. It is impossible to modify the packet content.
  - When CHECKSUM is read as 0xCC33, the header of the packet is corrupted.
  - When CHECKSUM is read as 0xFFFF, the entire packet is no longer valid. It is possible to modify the packet content and it is up to the software to program the payload to a different value if needed.
  - For all other values of CHECKSUM, the checksum has been generated and the last check failed to match the checksum written in the OTP memory. It is impossible to modify the packet content.

### 25.5.3.3.2. “Special” Packets

The payload of “special” packets is interpreted by the OTPC and some actions can be triggered while the “special” packets are read. The address of the “special” packets inside the area does not matter.

If the checksum has been generated and does not match during the last read, the payload is not interpreted by the OTPC.

The table below provides the list of “special” packets.

**Table 25.1.** “Special” Packets

Name	SIZE	PACKET	Description
Boot Configuration	(see Note 1)	3	Boot configuration
Secure Boot Configuration	(see Note 1)	4	Secure Boot configuration
User Hardware Configuration	1	5	Hardware configuration
Custom	N/A	6	For user custom purposes. The size of this packet is user application dependent.

**Note:**

1. For details, refer to the section “Boot Strategies”.

The address of the Boot Configuration and Secure Boot Configuration special packets can be retrieved in the OTPC Boot Addresses (OTPC\_BAR) register.

The address of the Custom special packets can be retrieved in the OTPC Custom Address (OTPC\_CAR) register.

For each “special” packets, if there is more than one valid packet (of the same type), only the last packet will be considered (previous packets will be ignored). It is recommended to invalidate prior “special” packets to keep only one valid packet for each “special” packet type.

#### 25.5.3.4.Init

After each reset, the OTPC parses the User area to check its content. The header of each packet will be read, depending on the header value some actions can be triggered:

- If the header is corrupted, the init sequence is interrupted and the OTPC\_ISR.COERR bit is set.
- If the INVLD field of the header is 3, the OTPC ignores the packet and jumps to the next header.
- If the LOCK bit of the header is set, the payload is read and the checksum computed during the read is compared to the checksum saved in the header. If the checksums do not match, the OTPC\_ISR.CKERR bit will be set.
- If the PACKET field of the header is BOOT\_CONFIGURATION, the address of the packet will be stored in the OTPC\_BAR.BCADDR field. Any previous value stored in the OTPC\_BAR.BCADDR field is lost.
- If the PACKET field of the header is SECURE\_BOOT\_CONFIGURATION, the address of the packet will be stored in the OTPC\_BAR.SBCADDR field. Any previous value stored in the OTPC\_BAR.SBCADDR field is lost.
- If the PACKET field of the header is HARDWARE\_CONFIGURATION, the payload is read and stored in the OTPC User Hardware Configuration (OTPC\_UHCxR) registers (unless the checksums do not match if the packet is locked, in that case the reset value of the OTPC\_UHCxR registers is stored). Any previous value stored in the OTPC\_UHCxR registers is lost.
- If the PACKET field of the header is CUSTOM, the address of the packet will be stored in the OTPC\_CAR.CADDR field. Any previous value stored in the OTPC\_CAR.CADDR field is lost.

At the end of the init sequence, the value of the last HARDWARE\_CONFIGURATION “special” packet found is applied to the hardware.

#### 25.5.3.5.Read Access

The User area can be read through the User interface at any time after a reset. Each packet is available through the OTPC\_DR register. To trigger a packet read, follow the steps below:

1. The address of the header (or any address of the payload) must be written in OTPC\_MR.ADDR.
2. OTPC\_CR.READ must be set to ‘1’ (the OTPC\_CR.KEY field value does not matter).
3. Wait for OTPC\_ISR.EOR to be set to ‘1’ or for OTPC\_SR.READ to be set to ‘0’, indicating that the whole packet has been transferred into temporary registers.
4. Read the header of the packet in the OTPC\_HR register. To read each payload word, the address of the payload word must be written in OTPC\_AR.DADDR. The payload word is then available in OTPC\_DR.

If OTPC\_AR.INCRT is set to AFTER\_READ, any read in the OTPC\_DR increments the DADDR field.

If INCRT is set to AFTER\_WRITE, any write in the OTPC\_DR increments the DADDR field.

The payload of a packet with PACKET set to KEY is read as ‘0’. The payload of a packet hidden since the last reset is read as ‘0’.

##### 25.5.3.5.1.Transfer a Packet through the Host Key Bus

To transfer a packet from the OTP memory through the host key bus, follow the steps below:

1. The address of the header (or any address of the payload) must be written in OTPC\_MR.ADDR. Only the packets with the packet type set to KEY are transferable on the host key bus.

2. The key bus destination must be written in OTPC\_MR.KBDST.
3. Write 0x7167 in the OTPC\_CR.KEY field and '1' to OTPC\_CR.KBSTART.

The end of the transfer is indicated by OTPC\_ISR.EOKT='1' and/or OTPC\_SR.MKBB='0'.

If the type of the packet is not KEY, OTPC\_ISR.KBERR is set.

To cancel a packet transfer, OTPC\_CR.KEY must be set to 0x7167 and KBSTOP must be set.

#### 25.5.3.5.2.Hiding a Packet

For security reasons, it is possible to hide a packet after having read it through the User Interface. Once hidden, any read to the payload of the packet returns '0'.

To unhide a packet, a reset is necessary.

Hiding a packet does not make it available through the Key Buses.

To hide a packet, follow the steps below:

1. Write the address value of the header of the packet to hide in OTPC\_MR.ADDR.
2. Write 0x7167 in OTPC\_CR.KEY and '1' to HIDE.

#### 25.5.3.6.Write (Program) Considerations

Each word of the User area can be written only once. It is possible to write a packet payload partially and/or update a packet payload already written.

The packet to write (either the header or the payload) may contain some bits already at '1'. In this case, a dummy packet can be used to write the packet in a different location. The OTPC may also be able to fix the '1' already written if this bit also matches the packet to write. Thus before writing any new packet, it is necessary to proceed to a read at the last address.

##### 25.5.3.6.1.'1' in the Header

After the read, the header may contain one or more '1's. If the '1's match the '1's to write in the header, the packet can be written.

If the '1's do not all match the '1's to write in the header, the packet cannot be written. It is mandatory to create (and then invalidate if necessary) a packet with a compatible header.

##### 25.5.3.6.2.'1' in the Payload

If the payload is written and then updated later, the '1's already written must match the '1's to write.

If the payload is written only once (no update later), the '1's already written must all match either the '1' or the '0' to write (it cannot be a mix of '1's and '0's to write).

#### 25.5.3.7.Write (Program) Access

The User area can be programmed at any time after a reset until OTPC\_MR.WRDIS has been set.

##### 25.5.3.7.1.Writing a New Packet from the User Interface

To write a new packet from the User Interface, follow the steps below:

1. Write OTPC\_MR.NPCKT to '0' if it is set at '1'.
2. Write OTPC\_MR.ADDR to its maximum value.
3. Write a '1' to OTPC\_CR.READ and wait for the read completion (OTPC\_ISR.EOR='1' when the read is completed).
4. Check there is no bit already set to '1' in the OTPC\_HR and OTPC\_DR. The check for the data registers can be replaced by reading OTPC\_SR.ONEF (if ONEF is set, at least one bit of the data registers is set to '1').  
If the header or the payload of the packet already contains a 1, the new packet may need to be adapted.
5. Write OTPC\_MR.ADDR to '0' and set NPCKT.

Depending on the contents of the temporary registers, an automatic flush can be triggered. If an automatic flush is started, OTPC\_SR.FLUSH is set and OTPC\_ISR.EOF is raised at the completion of the flush. It is mandatory to wait for the end of the flush.

6. Write the header value in OTPC\_HR. The value of PACKET must not be the same as KEY.
7. Set DADDR to '0'.
8. Write the first data in the OTPC\_DR register. To update the 32-bit data later (using the packet update), the OTPC\_DR register must be set to 0.
9. Increment the DADDR field and write the next data in the OTPC\_DR. Repeat this operation until all the data has been written.  
Skip the increment of DADDR if INCRT is set to AFTER\_WRITE.
10. Write USER\_KEY in the OTPC\_CR.KEY field and '1' to OTPC\_CR.PGM.

Before the write operation in the OTP memory, the OTPC checks the consistency of the packet and that the packet does not overlap on any existing packet. In case of error, OTPC\_ISR.WERR is set and the write operation is cancelled.

The end of the programming operation is indicated by OTPC\_ISR.EOP='1' and/or OTPC\_SR.PGM='0'. At the end of the programming, the address of the header is available in OTPC\_MR.ADDR and the OTPC\_MR.NPKT must be cleared.

The payload can be read back before programming. After read back, it is possible to update PACKET value to KEY before programming.

If the new written packet is the User Hardware Configuration special packet, its payload is ignored until the next reset or the next refresh. The OTPC\_UHCxR registers will be updated after the reset or the refresh following programming.

#### 25.5.3.7.2.Updating an Existing Packet from the User Interface

To update an existing packet from the User Interface, follow the steps below:

1. Write the address of the header of the packet to update in OTPC\_MR.ADDR.
2. Start a read by setting OTPC\_CR.READ and wait for the read completion indicated by OTPC\_ISR.EOR.
3. Update the data using the OTPC\_AR and OTPC\_DR registers. Only the 32-bit data set to 0 can be updated, the non-zero 32-bit data must be left unchanged
4. Write 0x7167 in the OTPC\_CR.KEY field and '1' to OTPC\_CR.PGM.

The end of the programming operation is indicated by OTPC\_ISR.EOP='1' and/or OTPC\_SR.PGM='0'.

If the updated packet is the User Hardware Configuration special packet, its new payload is ignored until the next reset. The OTPC\_UHCxR registers will be updated after the reset or the refresh following programming.

#### 25.5.3.7.3.Writing a Packet from the Client Key Bus

To write a packet from the client key bus interface (payload only), follow the steps below:

1. Write OTPC\_MR.ADDR to '0' and set NPKT.  
Depending on the content of the temporary registers, an automatic flush can be triggered. If an automatic flush is started, OTPC\_SR.FLUSH is set and OTPC\_ISR.EOF is raised at the completion of the flush. It is mandatory to wait for the end of the flush.
2. Write the header value in the OTPC\_HR register. The value of PACKET must be KEY.
3. Initiate a data transfer to the OTP memory through the TRNG host key bus.
4. Wait for the data transfer completion.
5. Check that no error happened during the key transfer (OTPC\_ISR.KBERR must be cleared).
6. Write 0x7167 in the OTPC\_CR.KEY field and '1' to OTPC\_CR.PGM.

- Before the write operation in the OTP memory, the OTPC checks the consistency of the packet and that the packet does not overlap on any existing packet. In case of error, OTPC\_ISR.WERR is set and the write operation is cancelled. The end of the programming operation is indicated by OTPC\_ISR.EOP=1 and/or OTPC\_SR.PGM=0.

If the PACKET field is changed before programming, the payload is erased (and lost).

#### 25.5.3.7.4.Locking a Packet

To lock a packet, follow the steps below:

- Write the address value of the header of the packet to lock in OTPC\_MR.ADDR.
- Start a read by setting OTPC\_CR.READ and waiting for the read completion indicated by OTPC\_ISR.EOR.
- Write 0x7167 in the OTPC\_CR.KEY field and '1' in OTPC\_CR.CKSGEN.

The end of the lock operation is indicated by OTPC\_ISR.EOL='1' and/or OTPC\_SR.LOCK='0'.

Generating the checksum locks the packet and modification is no longer possible.

#### 25.5.3.7.5.Invalidating a Packet

To invalidate a packet, follow the steps below:

- Write the address value of the header of the packet to invalidate in OTPC\_MR.ADDR.
- Write 0x7167 in the OTPC\_CR.KEY field and '1' to OTPC\_CR.INVLD.

The end of the invalidation operation is indicated by OTPC\_ISR.EOI= '1' and/or OTPC\_SR.INVLD='0'.

If the invalidated packet is the User Hardware Configuration special packet, its old payload remains active until the next reset or the next refresh. The OTPC\_UHCxR registers will be updated after the reset or the refresh following the invalidation operation.

#### 25.5.3.8.Fixing Corruption

During a programming sequence, packet header corruption may occur. This corruption can be caused by a partial programming of the header. It is mandatory to fix any corruption prior to any usage of the Engineering Area or User Area.

During the start sequence, the OTPC stops parsing the OTP memory at the first header corruption detected. When OTPC\_ISR.COERR is set, a corruption has been detected. The corrupted header can be read in OTPC\_HR and its location can be read in OTPC\_MR.ADDR.

A header is corrupted if at least one of the following statements matches:

- The ONE bit is cleared (it must be set to fix the corruption).
- The INVLD field is 3 and the PACKET field is 0 (PACKET must be set to a non-0 value to fix the corruption).
- The SIZE and PACKET fields are not consistent (for PACKET set to PRODUCT\_UID, HARDWARE\_CONFIGURATION or SECURITY\_CONFIGURATION, the packet must be invalidated to fix the corruption).

To fix a corruption, start a read procedure at the location of the corrupted header. The OTPC reads the payload according to the size provided in the header and reads one extra word of payload, which should match the next header.

The corrupted header must be fixed by writing any missing '1's or, if not possible, by extending its size if the supposed next header is 0, or by invalidating the packet.

A reset is required after fixing the corruption.

#### 25.5.3.9.“Software” Protections

The User area can be protected against read accesses and/or modifications.

To enable read protection of the User data (OTPC\_DR) and header (OTPC\_HR) registers, OTPC\_MR.RDDIS must be set. Clearing RDDIS allows read access again. When the OTPC\_DR and OTPC\_HR registers are read-protected, any read returns 0.

To enable write protection of the OTPC\_DR registers, the WRDIS bit of OTPC\_MR should be set. Clearing the WRDIS bit allows write access again.

To enable write protection of the User area, the write protection of the User data registers must be enabled.

The OTPC\_MR can be locked until the next reset by setting the LOCK bit of OTPC\_MR. Once locked, the current protection configuration of the OTPC\_DR and OTPC\_HR registers applies, it is then also impossible to update, program, invalidate, hide or read a packet (the OTPC\_MR.ADDR field is then locked too preventing to select a packet).

### 25.5.3.10. “Hardware” Protections

The User area can be protected against read accesses and/or modifications.

To enable the different protections of the User area, the User Configuration special packet must be programmed. The packet is described in the OTPC\_UHCxR registers.

As an example, to disable the JTAG interface for an indefinite period, the JTAGDIS, UHCINVDIS and UHCPGDIS fields of the User Hardware Configuration special packet must all be programmed to a non-zero value. Thus, it will be impossible to update or invalidate the User Hardware Configuration special packet.

**WARNING** “Hardware” protections are in effect for an indefinite period and cannot be cancelled.

### 25.5.4. OTP Emulation Mode

The OTPC features an Emulation mode. This Emulation mode can be used to test all the operations allowed by the controller on a memory instead of the real OTP memory.

When Emulation mode is enabled, the controller has the same behavior. The Emulation mode is enabled only when the OTP memory has not been previously programmed.

To enable/disable Emulation mode on the User area, follow the steps below:

1. Set OTPC\_MR.EMUL to '1' (to enable) or to '0' (to disable).
2. Refresh the User area by writing a '1' to OTPC\_CR.REFRESH and 0x7167 in OTPC\_CR.KEY.
3. Wait for the refresh completion by polling OTPC\_ISR.EORF.

The current running mode of the User area can be observed by reading OTPC\_SR.EMUL. If EMUL is set to '1', Emulation mode is enabled; if it is set to '0', Emulation mode is disabled.

After a reset, Emulation mode is disabled.

### 25.5.5. Interrupts

An OTPC interrupt request can be triggered when one or several of the following bits are set in the OTPC Interrupt Status register (OTPC\_ISR): End Of Programming (EOP), End Of Locking (EOL), End Of Invalidation (EOI), End Of Key Transfer (EOKT), Programming Error (PGERR), Locking Error (LKERR), Invalidation Error (IVERR), Write Error (WERR), End Of Read (EOR), End Of Flush (EOF), End Of Hide (EOH), End Of Refresh (EORF), Checksum Check Error (CKERR) or Key Invalid Error (KBERR).

The interrupt request is generated if the corresponding bit in the OTPC Interrupt Mask register (OTPC\_IMR) is set. Bits in OTPC\_IMR are set by writing a '1' to the corresponding bit in the OTPC Interrupt Enable register (OTPC\_IER) and cleared by writing a '1' to the corresponding bit in the OTPC

Interrupt Disable register (OTPC\_IDR). The interrupt request remains active until the corresponding bit in OTPC\_ISR is cleared.

Reading the OTPC\_ISR clears all bits of the register.

#### 25.5.6. Register Write Protection

To prevent any single software error from corrupting the OTPC behavior, certain registers in the address space can be write-protected by setting the Write Protection Configuration Enable (WPCFEN), Write Protection Interrupt Enable (WPITEN) and/or Write Protection Control Enable (WPCTEN) bit(s) in the Write Protection Mode Register (OTPC\_WPMR).

If a write access to the protected registers is detected, the Write Protection Violation Status (WPVS) flag in the Write Protection Status Register (OTPC\_WPSR) is set and the field Write Protection Violation Source (WPVSR) indicates the register in which the write access has been attempted. An interrupt can be raised if the Security and/or Safety Event (SECE) interrupt is set in OTPC\_IMR.

The WPVS flag is automatically reset by reading the OTPC\_WPSR.

The following registers can be write-protected with the OTPC\_WPMR.WPCFEN bit:

- [OTPC Mode Register](#)

The following registers can be write-protected with the OTPC\_WPMR.WPITEN bit:

- [OTPC Interrupt Enable Register](#)
- [OTPC Interrupt Disable Register](#)

The following registers can be write-protected with the OTPC\_WPMR.WPCTEN bit:

- [OTPC Control Register](#)

## 25.6. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

## 25.6.1. OTPC Control Register

**Name:** OTPC\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCTEN bit is cleared in the [OTPC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	KEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	REFRESH						KBSTOP	KBSTART
Access	W						W	W
Reset	–						–	–
Bit	7	6	5	4	3	2	1	0
	FLUSH	READ		HIDE		INVLD	CKSGEN	PGM
Access	W	W		W		W	W	W
Reset	–	–		–		–	–	–

### Bits 31:16 – KEY[15:0] Programming Key

This field must be written with the correct key code (0x7167) to allow programming, checksum generation, packet invalidation or packet hiding.

### Bit 15 – REFRESH Refresh the Area

Value	Description
0	No effect.
1	Starts a refresh of the area.

### Bit 9 – KBSTOP Key Bus Transfer Stop

Value	Description
0	No effect.
1	Stops an on-going transfer on the host key bus.

### Bit 8 – KBSTART Key Bus Transfer Start

Value	Description
0	No effect.
1	Starts a transfer through the host key bus.

### Bit 7 – FLUSH Flush Temporary Registers

Value	Description
0	No effect.

Value	Description
1	Starts a flush of the temporary registers used to store the packet payload.

#### Bit 6 – READ Read Packet

Value	Description
0	No effect.
1	Starts a read sequence of the selected packet.

#### Bit 4 – HIDE Hide Packet

Value	Description
0	No effect.
1	The selected packet is not readable anymore until the next reset.

#### Bit 2 – INVLD Invalidate Packet

Value	Description
0	No effect.
1	Invalidates the selected packet.

#### Bit 1 – CKSGEN Generate Checksum

Value	Description
0	No effect.
1	Generates and programs the selected packet checksum. This action also locks the packet.

#### Bit 0 – PGM Program Packet

Value	Description
0	No effect.
1	The selected packet is written.

## 25.6.2. OTPC Mode Register

**Name:** OTPC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPCFEN bit is cleared in the [OTPC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	ADDR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ADDR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	LOCK			KBDST			WRDIS	RDDIS
Access	R/W			R/W			R/W	R/W
Reset	0			0			0	0
Bit	7	6	5	4	3	2	1	0
	EMUL			NPCKT				UHCRRDIS
Access	R/W			R/W				R/W
Reset	0			0				0

### Bits 31:16 – ADDR[15:0] Address

This field represents the address of the packet's header.

### Bit 15 – LOCK Lock Register

The LOCK bit is set-only. Only a reset can disable lock.

Value	Description
0	The OTPC_MR register is unlocked; write access changes its value.
1	The OTPC_MR register is locked; write access does not change its value.

### Bit 12 – KBDST Key Bus Destination

Value	Name	Description
0	TDES	The TDES is the destination of the key transfer.
1	AES	The AES is the destination of the key transfer.

### Bit 9 – WRDIS Write Disable

Value	Description
0	The write capability of the OTPC_DR register is enabled.
1	The write capability of the OTPC_DR register is disabled.

### Bit 8 – RDDIS Read Disable

Value	Description
0	The read capability of the OTPC_HR and OTPC_DR registers are enabled.

Value	Description
1	The read capability of the OTPC_HR and OTPC_DR registers are disabled. In case of read, the returned value is 0.

**Bit 7 – EMUL** Emulation Enable

Value	Description
0	The Emulation mode of the User area is disabled, all accesses are computed in the OTP memory.
1	The Emulation mode of the User area is enabled, all accesses are computed in the Emulation memory.

**Bit 4 – NPCKT** New Packet

Value	Description
0	Updates the packet defined at the ADDR address.
1	Creates a new packet.

**Bit 0 – UHCRRDIS** User Hardware Configuration Register Read Disable

Value	Description
0	The User Hardware Configuration register can be read through the User Interface.
1	The User Hardware Configuration register cannot be read through the User Interface.

### 25.6.3. OTPC Address Register

**Name:** OTPC\_AR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

#### Bit 16 – INCRT Increment Type

Value	Name	Description
0	AFTER_READ	Increment DADDR after a read of OTPC_DR.
1	AFTER_WRITE	Increment DADDR after a write of OTPC_DR.

#### Bits 7:0 – DADDR[7:0] Data Address

This field represents the word address of the payload to access through the OTPC\_DR register.

## 25.6.4. OTPC Status Register

**Name:** OTPC\_SR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
							ONEF	HIDE
Access							R	R
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	FLUSH	READ	SKBB	MKBB	EMUL	INVLD	LOCK	PGM
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bit 9 – ONEF One Found

Value	Description
0	No bit at '1' found during the last packet read.
1	At least one '1' has been found during the last packet read.

### Bit 8 – HIDE Hiding On-Going

Value	Description
0	No packet hiding is on-going.
1	A packet hiding is on-going.

### Bit 7 – FLUSH Flush On-Going

Value	Description
0	The temporary registers are not flushed.
1	The temporary registers are being flushed.

### Bit 6 – READ Read On-Going

Value	Description
0	No packet read is on-going.
1	A packet read is on-going.

### Bit 5 – SKBB Client Key Bus Busy

Value	Description
0	The client key bus is not busy.
1	The client key bus is busy.

#### Bit 4 – MKBB Host Key Bus Busy

Value	Description
0	The host key bus is not busy.
1	The host key bus is busy.

#### Bit 3 – EMUL Emulation Enabled

Value	Description
0	The User area Emulation mode is disabled.
1	The User area Emulation mode is enabled.

#### Bit 2 – INVLD Invalidation On-Going

Value	Description
0	No packet invalidation is on-going.
1	A packet invalidation is on-going.

#### Bit 1 – LOCK Lock On-Going

Value	Description
0	No packet locking is on-going.
1	A packet locking is on-going.

#### Bit 0 – PGM Programming On-Going

Value	Description
0	No packet programming is on-going.
1	A packet programming is on-going.

## 25.6.5. OTPC Interrupt Enable Register

**Name:** OTPC\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [OTPC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
				SECE				
Access				W				
Reset				–				

Bit	23	22	21	20	19	18	17	16
								KBERR
Access								W
Reset								–

Bit	15	14	13	12	11	10	9	8
		HDERR	COERR	CKERR	EORF	EOH	EOF	EOR
Access		W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	WERR	IVERR	LKERR	PGERR	EOKT	EOI	EOL	EOP
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 28 – SECE** Security and/or Safety Event Interrupt Enable

**Bit 16 – KBERR** Key Bus Error Interrupt Enable

**Bit 14 – HDERR** Hide Error Interrupt Enable

**Bit 13 – COERR** Corruption Error Interrupt Enable

**Bit 12 – CKERR** Checksum Check Error Interrupt Enable

**Bit 11 – EORF** End Of Refresh Interrupt Enable

**Bit 10 – EOH** End Of Hide Interrupt Enable

**Bit 9 – EOF** End Of Flush Interrupt Enable

**Bit 8 – EOR** End Of Read Interrupt Enable

**Bit 7 – WERR** Write Error Interrupt Enable

**Bit 6 – IVERR** Invalidation Error Interrupt Enable

**Bit 5 – LKERR** Locking Error Interrupt Enable

**Bit 4 – PGERR** Programming Error Interrupt Enable

**Bit 3 – EOKT** End Of Key Transfer Interrupt Enable

**Bit 2 – EOI** End Of Invalidation Interrupt Enable

**Bit 1 – EOL** End Of Locking Interrupt Enable

**Bit 0 – EOP** End Of Programming Interrupt Enable

## 25.6.6. OTPC Interrupt Disable Register

**Name:** OTPC\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [OTPC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
				SECE				
Access				W				
Reset				–				

Bit	23	22	21	20	19	18	17	16
								KBERR
Access								W
Reset								–

Bit	15	14	13	12	11	10	9	8
		HDERR	COERR	CKERR	EORF	EOH	EOF	EOR
Access		W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	WERR	IVERR	LKERR	PGERR	EOKT	EOI	EOL	EOP
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 28 – SECE** Security and/or Safety Event Interrupt Disable

**Bit 16 – KBERR** Key Bus Error Interrupt Disable

**Bit 14 – HDERR** Hide Error Interrupt Disable

**Bit 13 – COERR** Corruption Error Interrupt Disable

**Bit 12 – CKERR** Checksum Check Error Interrupt Disable

**Bit 11 – EORF** End Of Refresh Interrupt Disable

**Bit 10 – EOH** End Of Hide Interrupt Disable

**Bit 9 – EOF** End Of Flush Interrupt Disable

**Bit 8 – EOR** End Of Read Interrupt Disable

**Bit 7 – WERR** Write Error Interrupt Disable

**Bit 6 – IVERR** Invalidation Error Interrupt Disable

**Bit 5 – LKERR** Locking Error Interrupt Disable

**Bit 4 – PGERR** Programming Error Interrupt Disable

**Bit 3 – EOKT** End Of Key Transfer Interrupt Disable

**Bit 2 – EOI** End Of Invalidation Interrupt Disable

**Bit 1 – EOL** End Of Locking Interrupt Disable

**Bit 0 – EOP** End Of Programming Interrupt Disable

## 25.6.7. OTPC Interrupt Mask Register

**Name:** OTPC\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: Corresponding interrupt is not enabled.

1: Corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
				SECE				
Access				R				
Reset				0				

Bit	23	22	21	20	19	18	17	16
								KBERR
Access								R
Reset								0

Bit	15	14	13	12	11	10	9	8
		HDERR	COERR	CKERR	EORF	EOH	EOF	EOR
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	WERR	IVERR	LKERR	PGERR	EOKT	EOI	EOL	EOP
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 28 – SECE** Security and/or Safety Event Interrupt Mask

**Bit 16 – KBERR** Key Bus Error Interrupt Mask

**Bit 14 – HDERR** Hide Error Interrupt Mask

**Bit 13 – COERR** Corruption Error Interrupt Mask

**Bit 12 – CKERR** Checksum Check Error Interrupt Mask

**Bit 11 – EORF** End Of Refresh Interrupt Mask

**Bit 10 – EOH** End Of Hide Interrupt Mask

**Bit 9 – EOF** End Of Flush Interrupt Mask

**Bit 8 – EOR** End Of Read Interrupt Mask

**Bit 7 – WERR** Write Error Interrupt Mask

**Bit 6 – IVERR** Invalidation Error Interrupt Mask

**Bit 5 – LKERR** Locking Error Interrupt Mask

**Bit 4 – PGERR** Programming Error Interrupt Mask

**Bit 3 – EOKT** End Of Key Transfer Interrupt Mask

**Bit 2 – EOI** End Of Invalidation Interrupt Mask

**Bit 1 – EOL** End Of Locking Interrupt Mask

**Bit 0 – EOP** End Of Programming Interrupt Mask

## 25.6.8. OTPC Interrupt Status Register

**Name:** OTPC\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
				SECE				
Access				R

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bit 28 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	No security or safety event occurred since the last read of OTPC_ISR.
1	One or more safety or security event occurred since the last read of OTPC_ISR. For details on the event, see OTPC_WPSR.

### Bit 16 – KBERR Key Bus Error (cleared on read)

Value	Description
0	No error happened on the key bus since the last read of OTPC_ISR.
1	An error happened on the key bus since the last read of OTPC_ISR.

### Bit 14 – HDERR Hide Error (cleared on read)

Value	Description
0	No hiding error occurred since the last read of OTPC_ISR.
1	A hiding error occurred since the last read of OTPC_ISR.

### Bit 13 – COERR Corruption Error (cleared on read)

Value	Description
0	No corruption occurred during the last start-up since the last read of OTPC_ISR.
1	A corruption occurred since the last read of OTPC_ISR.

### Bit 12 – CKERR Checksum Check Error (cleared on read)

Value	Description
0	No checksum check failure occurred during last reading sequence since the last read of OTPC_ISR.

Value	Description
1	A checksum check failure occurred since the last read of OTPC_ISR.

**Bit 11 – EORF** End Of Refresh (cleared on read)

Value	Description
0	No refresh sequence completion since the last read of OTPC_ISR.
1	At least one refresh sequence completion since the last read of OTPC_ISR.

**Bit 10 – EOH** End Of Hide (cleared on read)

Value	Description
0	No hiding sequence completion since the last read of OTPC_ISR.
1	At least one hiding sequence completion since the last read of OTPC_ISR.

**Bit 9 – EOF** End Of Flush (cleared on read)

Value	Description
0	No flush of the temporary registers since the last read of OTPC_ISR.
1	At least one flush of the temporary registers has been completed since the last read of OTPC_ISR.

**Bit 8 – EOR** End Of Read (cleared on read)

Value	Description
0	No reading sequence completion since the last read of OTPC_ISR.
1	At least one reading sequence completion since the last read of OTPC_ISR.

**Bit 7 – WERR** Write Error (cleared on read)

Value	Description
0	No write error occurred since the last read of OTPC_ISR.
1	A write error occurred since the last read of OTPC_ISR.

**Bit 6 – IVERR** Invalidation Error (cleared on read)

Value	Description
0	No invalidation failure occurred during last invalidation sequence since the last read of OTPC_ISR.
1	An invalidation failure occurred since the last read of OTPC_ISR.

**Bit 5 – LKERR** Locking Error (cleared on read)

Value	Description
0	No locking failure occurred during last locking sequence since the last read of OTPC_ISR.
1	A locking failure occurred since the last read of OTPC_ISR.

**Bit 4 – PGERR** Programming Error (cleared on read)

Value	Description
0	No programming failure occurred during last programming sequence since the last read of OTPC_ISR.
1	A programming failure occurred since the last read of OTPC_ISR.

**Bit 3 – EOKT** End Of Key Transfer (cleared on read)

Value	Description
0	No key transfer completion since the last read of OTPC_ISR.
1	At least one key transfer has been completed on the host key bus since the last read of OTPC_ISR.

**Bit 2 – EOI** End Of Invalidation (cleared on read)

Value	Description
0	No invalidation sequence completion since the last read of OTPC_ISR.
1	At least one invalidation sequence completion since the last read of OTPC_ISR.

**Bit 1 – EOL** End Of Locking (cleared on read)

Value	Description
0	No locking sequence completion since the last read of OTPC_ISR.
1	At least one locking sequence completion since the last read of OTPC_ISR.

**Bit 0 – EOP** End Of Programming (cleared on read)

Value	Description
0	No programming sequence completion since the last read of OTPC_ISR.
1	At least one programming sequence completion since the last read of OTPC_ISR.

## 25.6.9. OTPC Header Register

**Name:** OTPC\_HR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	CHECKSUM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CHECKSUM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	SIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ONE		INVLD[1:0]		LOCK	PACKET[2:0]		
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

### Bits 31:16 – CHECKSUM[15:0] Packet Checksum

When CHECKSUM is read as 0, the checksum has not been generated. It is still possible to modify the packet content.

When CHECKSUM is read as 0x33CC, the checksum has not been generated but has already some bit at 1. Locking the packet may fail.

When CHECKSUM is read as 0xA5A5, the checksum has been generated and the last check was successful. It is impossible to modify the packet content.

When CHECKSUM is read as 0xCC33, the packet header is corrupted.

When CHECKSUM is read as 0xFFFF, the entire packet is no longer valid. It is possible to modify the packet content and it is up to the software to program the payload to a different value if needed.

For all other values of CHECKSUM, the checksum has been generated and the last check failed to match the checksum written in the OTP. It is impossible to modify the packet content.

This field is not writeable and is set by the OTPC during a lock request.

### Bits 15:8 – SIZE[7:0] Packet Size

This field represents the size of the packet payload.

This field is writeable only for new packets.

### Bit 7 – ONE One

This field is set to 1 by hardware and is not writeable.

### Bits 5:4 – INVLD[1:0] Invalid Status

If set to value 3, this field indicates that the packet is not valid.

This field is not writeable and is set by the OTPC during an invalidation request.

**Bit 3 – LOCK** Lock Status

This field is not writeable and is set by the OTPC during a lock request.

Value	Description
0	The packet is not locked.
1	The packet is locked.

**Bits 2:0 – PACKET[2:0]** Packet Type

This field is writeable only for new packets.

Value	Name	Description
1	REGULAR	Regular packet accessible through the user interface
2	KEY	Key packet accessible only through the Key Buses
3	BOOT_CONFIGURATION	Boot Configuration packet
4	SECURE_BOOT_CONFIGURATION	Secure Boot Configuration packet
5	HARDWARE_CONFIGURATION	Hardware Configuration packet
6	CUSTOM	Custom packet

## 25.6.10. OTPC Data Register

**Name:** OTPC\_DR  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	DATA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	DATA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – DATA[31:0]** Packet Data

This field represents the data of one of the packets. The data read or written is located at the address specified by OTPC\_AR.DADDR.

## 25.6.11. OTPC Boot Addresses Register

**Name:** OTPC\_BAR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	SBCADDR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	SBCADDR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	BCADDR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	BCADDR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:16 – SBCADDR[15:0] Secure Boot Configuration Address

This field represents the address of the “Secure Boot Configuration” special packet.

### Bits 15:0 – BCADDR[15:0] Boot Configuration Address

This field represents the address of the “Boot Configuration” special packet.

## 25.6.12. OTPC Custom Address Register

**Name:** OTPC\_CAR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	CADDR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CADDR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 15:0 – CADDR[15:0] Custom Address

This field represents the address of the “Custom” special packet.

## 25.6.13. OTPC User Hardware Configuration 0 Register

**Name:** OTPC\_UHC0R  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The reset value depends on the hardware configuration.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access

Bit	7	6	5	4	3	2	1	0
	JTAGDIS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 7:0 – JTAGDIS[7:0] JTAG Disable

Value	Description
0	The JTAG is enabled.
Non-zero	The JTAG is disabled.

## 25.6.14. OTPC User Hardware Configuration 1 Register

**Name:** OTPC\_UHC1R  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The reset value depends on the hardware configuration.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
							URFDIS	CPGDIS
Access							R	R
Reset							0	0

Bit	15	14	13	12	11	10	9	8
	CLKDIS	CINVDIS				SBCPGDIS	SBCLKDIS	SBCINVDIS
Access	R	R				R	R	R
Reset	0	0				0	0	0

Bit	7	6	5	4	3	2	1	0
	BCPGDIS	BCLKDIS	BCINVDIS	UHCPGDIS	UHCLKDIS	UHCINVDIS	UPGDIS	URDDIS
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bit 17 – URFDIS User Refresh Disable

Value	Description
0	The OTPC_CR.REFRESH bit is fully functional.
1	The OTPC_CR.REFRESH bit is only functional in Emulation mode.

### Bit 16 – CPGDIS Custom Packet Program Disable

Value	Description
0	The programming of Custom Special Packet is allowed.
1	The programming of Custom Special Packet is forbidden.

### Bit 15 – CLKDIS Custom Packet Lock Disable

Value	Description
0	The generation of the checksum (lock) of the Custom Special Packet is allowed.
1	The generation of the checksum (lock) of the Custom Special Packet is forbidden.

### Bit 14 – CINVDIS Custom Packet Invalidation Disable

Value	Description
0	The invalidation of the Custom Special Packet is allowed.
1	The invalidation of the Custom Special Packet is forbidden.

### Bit 10 – SBCPGDIS Secure Boot Configuration Packet Program Disable

Value	Description
0	The programming of Secure Boot Configuration Special Packet is allowed.

Value	Description
1	The programming of Secure Boot Configuration Special Packet is forbidden.

**Bit 9 – SBCLKDIS** Secure Boot Configuration Packet Lock Disable

Value	Description
0	The generation of the checksum (lock) of the Secure Boot Configuration Special Packet is allowed.
1	The generation of the checksum (lock) of the Secure Boot Configuration Special Packet is forbidden.

**Bit 8 – SBCINVDIS** Secure Boot Configuration Packet Invalidation Disable

Value	Description
0	The invalidation of the Secure Boot Configuration Special Packet is allowed.
1	The invalidation of the Secure Boot Configuration Special Packet is forbidden.

**Bit 7 – BCPGDIS** Boot Configuration Packet Program Disable

Value	Description
0	The programming of Boot Configuration Special Packet is allowed.
1	The programming of Boot Configuration Special Packet is forbidden.

**Bit 6 – BCLKDIS** Boot Configuration Packet Lock Disable

Value	Description
0	The generation of the checksum (lock) of the Boot Configuration Special Packet is allowed.
1	The generation of the checksum (lock) of the Boot Configuration Special Packet is forbidden.

**Bit 5 – BCINVDIS** Boot Configuration Packet Invalidation Disable

Value	Description
0	The invalidation of the Boot Configuration Special Packet is allowed.
1	The invalidation of the Boot Configuration Special Packet is forbidden.

**Bit 4 – UHCPGDIS** User Hardware Configuration Packet Program Disable

Value	Description
0	The programming of User Hardware Configuration Special Packet is allowed.
1	The programming of User Hardware Configuration Special Packet is forbidden.

**Bit 3 – UHCLKDIS** User Hardware Configuration Packet Lock Disable

Value	Description
0	The generation of the checksum (lock) of the User Hardware Configuration Special Packet is allowed.
1	The generation of the checksum (lock) of the User Hardware Configuration Special Packet is forbidden.

**Bit 2 – UHCINVDIS** User Hardware Configuration Packet Invalidation Disable

Value	Description
0	The invalidation of the User Hardware Configuration Special Packet is allowed.
1	The invalidation of the User Hardware Configuration Special Packet is forbidden.

**Bit 1 – UPGDIS** User programming Disable

Value	Description
0	The OTPC_CR.PGM bit is fully functional.
1	The OTPC_CR.PGM bit is not functional.

**Bit 0 – URDDIS** User Read Disable

Value	Description
0	The OTPC_CR.READ bit is fully functional.
1	The OTPC_CR.READ bit is not functional.

## 25.6.15. OTPC Product UID x Register

**Name:** OTPC\_UIDxR  
**Offset:** 0x60 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The reset value depends on the hardware configuration.

Bit	31	30	29	28	27	26	25	24
	UID[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	UID[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	UID[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	UID[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – UID[31:0]** Unique Product ID  
This field represents the unique product ID.

## 25.6.16. OTPC Write Protection Mode Register

**Name:** OTPC\_WPMR

**Offset:** 0xE4

**Reset:** 0x00000000

**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				FIRSTE		WPCTEN	WPITEN	WPCFEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x4F5450	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

### Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in OTPC_WPSR.WPVSRC and the last software control error type is reported in OTPC_WPSR.SWETYP; The OTPC_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in OTPC_WPSR.WPVSRC and only the first software control error type is reported in OTPC_WPSR.SWETYP. The OTPC_ISR.SECE flag is set at the first error occurrence within a series.

### Bit 2 – WPCTEN Write Protection Control Enable

Value	Description
0	Disables the write protection of the control if WPKEY matches to 0x4F5450 (OTP in ASCII).
1	Enables the write protection of the control if WPKEY matches to 0x4F5450 (OTP in ASCII).

### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection of the interruption configuration if WPKEY matches to 0x4F5450 (OTP in ASCII).
1	Enables the write protection of the interruption configuration if WPKEY matches to 0x4F5450 (OTP in ASCII).

### Bit 0 – WPCFEN Write Protection Configuration Enable

Value	Description
0	Disables the write protection of the configuration if WPKEY matches to 0x4F5450 (OTP in ASCII).
1	Enables the write protection of the configuration if WPKEY matches to 0x4F5450 (OTP in ASCII).

## 25.6.17. OTPC Write Protection Status Register

**Name:** OTPC\_WPSR**Offset:** 0xE8**Reset:** 0x00000000**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

**Bit 31 – ECLASS** Software Error Class

Value	Name	Description
0	WARNING	An abnormal access that does not have any impact.
1	ERROR	An abnormal access that may have an impact.

**Bits 27:24 – SWETYP[3:0]** Software Error Type

Value	Name	Description
0	READ_WO	A write-only register has been read (warning).
1	WRITE_RO	A write access has been performed on a read-only register (warning).
2	CONF_CHG	A change has been made into the configuration (error).
3	KEY_ERROR	A write has been computed in OTPC_CR or OTPC_WPMR register with a wrong value in the related KEY field (error).
4	DATA_ACC	The non-secure world application tried to read a packet from the secure world (error).

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 3 – SWE** Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of OTPC_WPSR.
1	A software error has occurred since the last read of OTPC_WPSR. The field SWETYP details the type of software error encountered.

**Bit 2 – SEQE** Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of OTPC_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of OTPC_WPSR. This flag can be set under abnormal operating conditions.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	No clock glitch has occurred since the last read of OTPC_WPSR.
1	A clock glitch has occurred since the last read of OTPC_WPSR. This flag can be set under abnormal operating conditions.

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

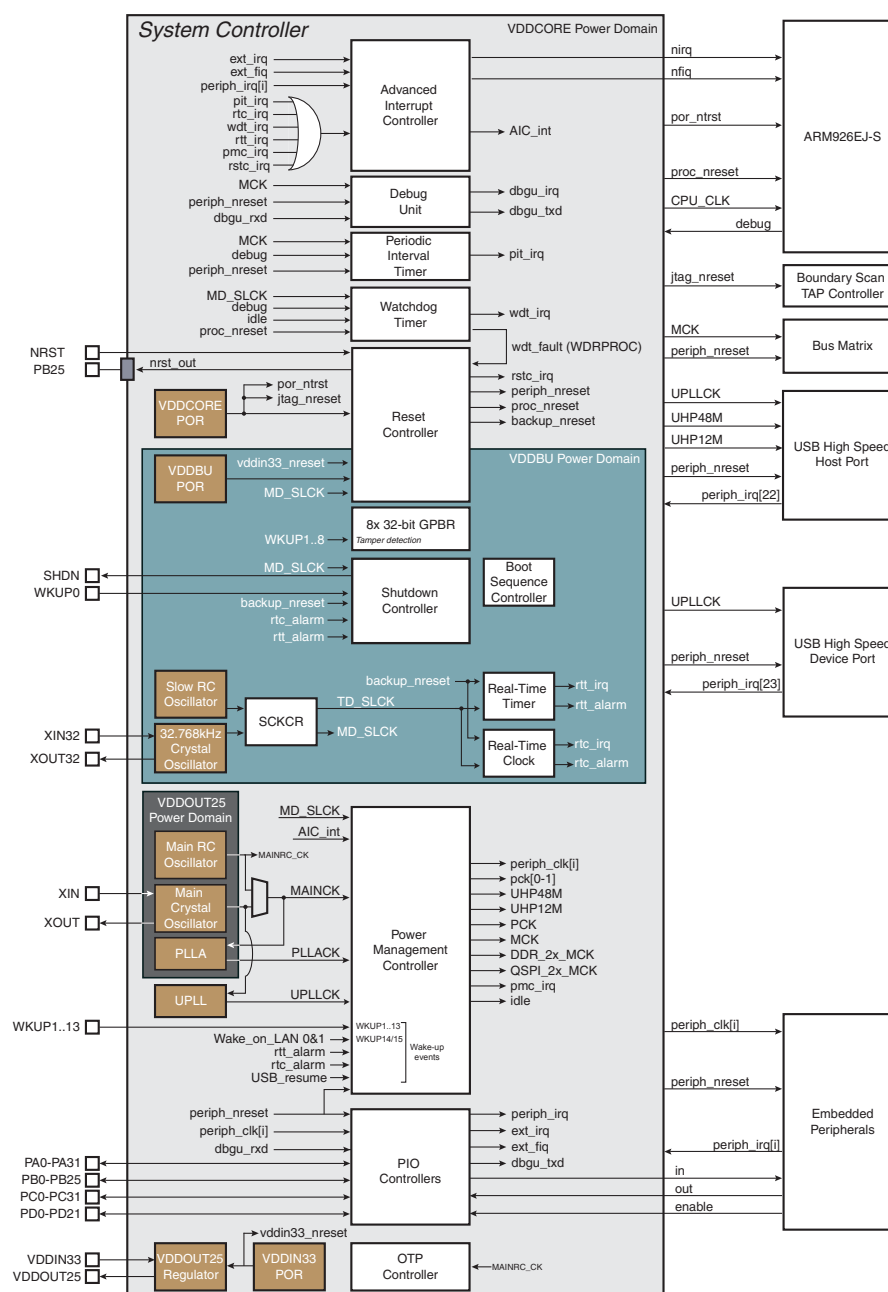

Value	Description
0	No write protection violation has occurred since the last read of OTPC_WPSR.
1	A write protection violation has occurred since the last read of OTPC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into WPVSR.

# System Controller

## 26. Overview

### 26.1. Block Diagram

Figure 26.1. System Controller Block Diagram

## 26.2. Components

- Peripherals powered by VDDDBU:
  - System Controller Write Protection (SYSCWP)
  - General Purpose Backup Registers (GPBR)
  - Reset Controller (RSTC)
  - Real-time Timer (RTT)
  - Real-time Clock (RTC)
  - Shutdown Controller (SHDWC)
  - Slow Clock Controller (SCKC)
- Peripherals powered by VDDCORE:
  - Watchdog Timer (WDT)
  - Debug Unit (DBGU)
  - OTP Memory Controller (OTPC)
  - Special Function Registers (SFR)
  - Clock Generator and Power Management Controller (PMC)
  - Parallel Input/Output Controllers (PIOA, PIOB, PIOC, PIOD)
  - Periodic Interval Timer (PIT)

## 26.3. Product Dependencies

### 26.3.1. Clocks

The system controller peripherals are always on, except:

- Parallel Input/Output Controllers (PIOs) that have one clock control (PIOA) for all PIO controllers
- Special Function Registers (SFR)
- Periodic Interval Timer (PIT)

### 26.3.2. Changing System Frequencies

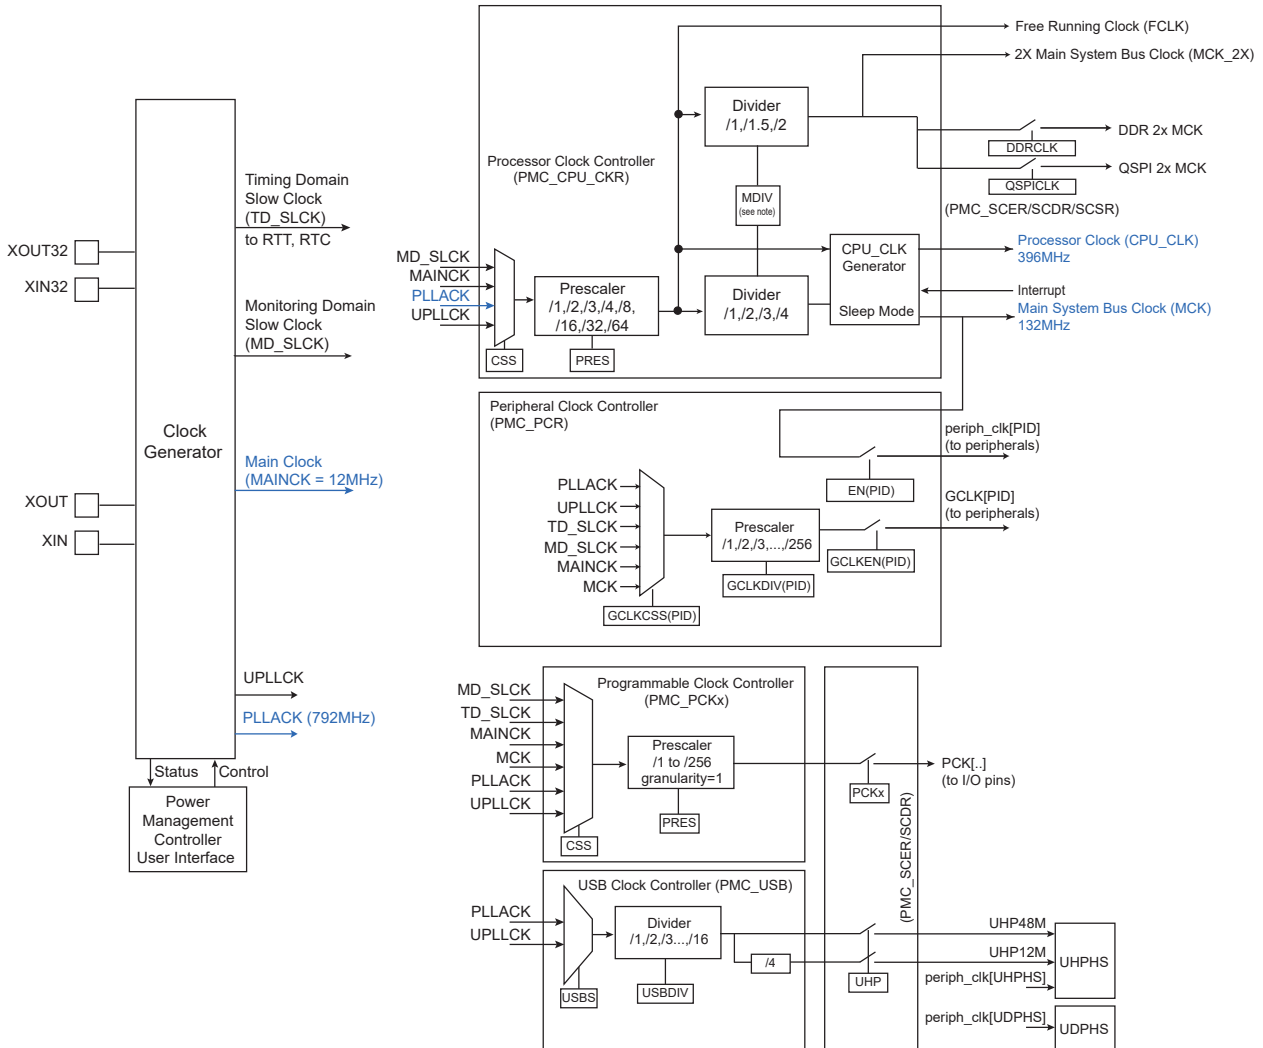

After ROM code execution, the system clock is set as follows:

- MAINCK is fed by the main RC oscillator i.e., 12 MHz.
- PLLA is set to 792 MHz.
- CPU\_CLK is set to 396 MHz.
- MCK is set to 132 MHz.

This is illustrated in the following figure.

**Figure 26.2. PMC Rom Code Configuration**

Note: MDIV should always be different from 0 when using DDR memories. If MDIV must be set to 0, first switch the DDR memories to Self-refresh mode and disable DDRCLK.

To avoid any overclocking during system clock modification, it is recommended to change system frequencies in two steps.

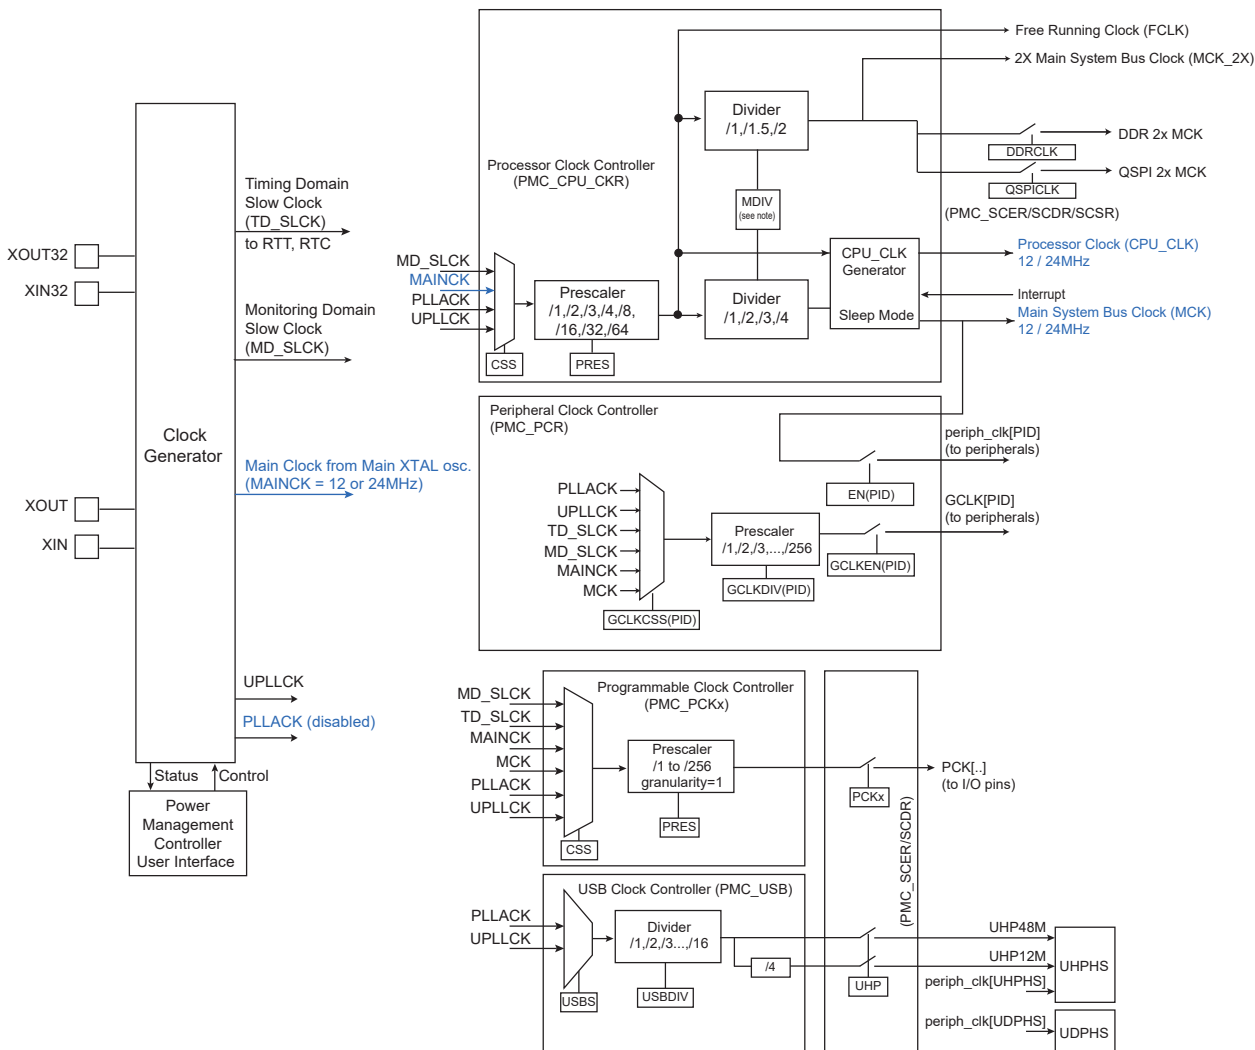

The first step leads to a known and basic intermediate state where all clocks are in a low-frequency range.

For example, the following sequence can be performed:

1. Set MCK to MAINCK, i.e., 12 MHz.
2. Set MAINCK to Crystal Oscillator, typically 24 MHz. MCK then runs at 24 MHz.

This intermediate state is illustrated in the following figure.

**Figure 26.3. PMC Intermediate Configuration**

Note: MDIV should always be different from 0 when using DDR memories. If MDIV must be set to 0, first switch the DDR memories to Self-refresh mode and disable DDRCLK.

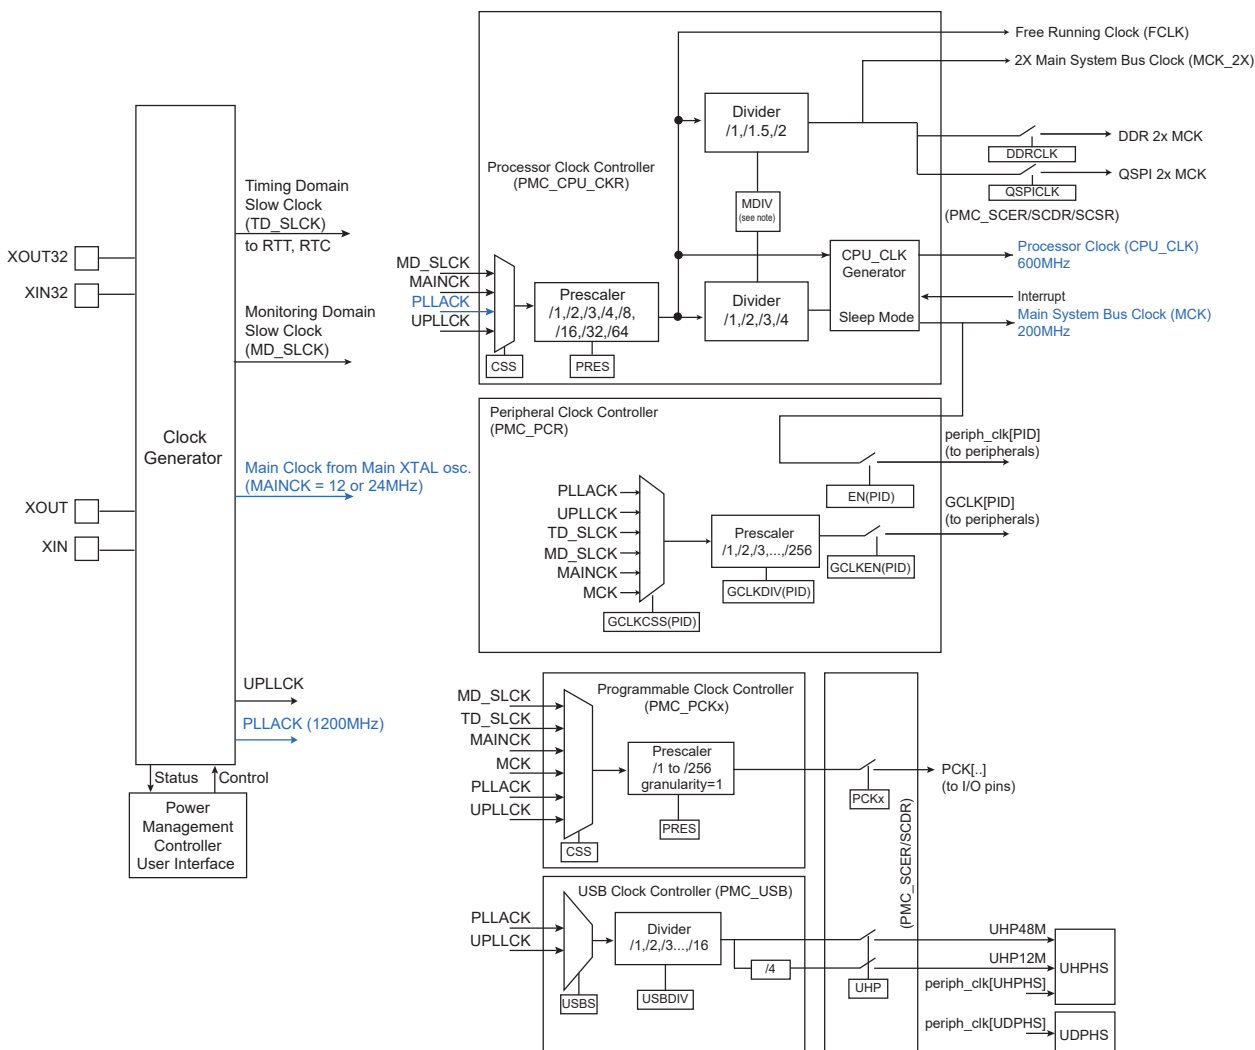

The second step leads to the final expected state.

Perform the following sequence:

1. Set PLL to 1.2 GHz, and set the PLLACK to 600 MHz.
2. Set CPU\_CLK to 600 MHz.
3. Set MCK to CPU\_CLK/3, i.e., 200 MHz.

The final state is illustrated in the following figure.

**Figure 26.4. PMC Final Configuration**

Note: MDIV should always be different from 0 when using DDR memories. If MDIV must be set to 0, first switch the DDR memories to Self-refresh mode and disable DDRCLK.

### 26.3.3. Interrupts

Refer to the table [Peripheral Identifiers](#).

### 26.3.4. Reset

System controller peripherals are connected to the processor and peripherals reset line.

### 26.3.5. I/Os

For the applicable I/O type and power supply, refer to the [Pin Description](#) table.

### 26.3.6. Power Supplies

The 32.768 kHz crystal oscillator and the slow RC oscillator are powered by VDDBU.

The main crystal oscillator, the main RC oscillator and PLLA are powered by VDDANA.

UPLL is powered by VDDIN33.

## 26.4. Special Functions in SFR

None.

## 27. System Controller Write Protection (SYSCWP)

### 27.1. Functional Description

#### 27.1.1. System Controller Peripheral Mapping

**Table 27.1.** System Controller Peripheral Mapping

Offset	System Controller Peripheral	Name
0x000-0x00C	Reset Controller	RSTC
0x010-0x01C	Shutdown Controller	SHDWC
0x020-0x03C	Real Time Timer	RTT
0x040-0x04C	Period Interval Timer	PIT
0x050-0x05C	Slow Clock Controller	SCKC
0x060-0x0A4	General Purpose Backup Registers	GPBR
0x0A8-0xD8	Real Time Clock	RTC
0x0DC	Write Protection Mode Register	SYSC_WPMR
0x0E0	Write Protection Status Register	SYSC_WPSR

#### 27.1.2. Register Write Protection

To prevent any single software error from modifying the configuration of the Reset Controller (RSTC), Shutdown Controller (SHDWC), Real-time Timer (RTT), Periodic Interval Timer (PIT), Slow Clock Controller (SCKC), General Purpose Backup Register (GPBR), Real-time Clock (RTC) and Watchdog Timer (WDT), some registers of these peripherals can be write-protected by setting the WPEN and/or WPITEN bits in the System Controller Write Protection Mode register (SYSC\_WPMR).

**Note:** The WDT embeds additional write protection mechanisms.

When write protection is enabled, any attempt to write these registers is reported in the System Controller Write Protection Status register (SYSC\_WPSR).

The following registers can be write-protected when SYSC\_WPMR.WPEN=1:

- WDT Control Register
- WDT Mode Register
- RSTC Mode Register
- SHDWC Mode Register
- SHDWC Wakeup Inputs Register
- PIT Mode Register
- SCKC Configuration Register
- RTC Control Register
- RTC Mode Register
- RTC Time Alarm Register
- RTC Calendar Alarm Register
- RTT Mode Register
- RTT Alarm Register
- RTT Modulo Selection Register
- GPBR Full Clear Register
- GPBR Registers

The following registers can be write-protected when SYSC\_WPMR.WPITEN=1:

- RTC Interrupt Enable Register
- RTC Interrupt Disable Register

## 27.2. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	SYSC_WPMR	31:24	WPKEY[23:16]							
		23:16	WPKEY[15:8]							
		15:8	WPKEY[7:0]							
		7:0							WPITEN	WPEN
0x04	SYSC_WPSR	31:24								
		23:16								
		15:8	WVSR[7:0]							
		7:0								WPVS

## 27.2.1. SYSC Write Protection Mode Register

**Name:** SYSC\_WPMR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
							WPITEN	WPEN
Access							R/W	R/W
Reset							0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535943	PASSWD	Writing any other value in this field aborts the write operation of the WPEN and WPITEN bits. Always reads as 0.

### Bit 1 – WPITEN Write Protection RTC Interrupt Enable

Value	Description
0	Disables the write protection of the RTC_IER/RTC_IDR configuration registers if WPKEY corresponds to 0x535943 ("SYC" in ASCII).
1	Enables the write protection of the RTC_IER/RTC_IDR configuration registers if WPKEY corresponds to 0x535943 ("SYC" in ASCII).

### Bit 0 – WPEN Write Protection Enable

Value	Description
0	Disables the write protection of the configuration registers if WPKEY corresponds to 0x535943 ("SYC" in ASCII).
1	Enables the write protection of the configuration registers if WPKEY corresponds to 0x535943 ("SYC" in ASCII).

## 27.2.2. SYSC Write Protection Status Register

**Name:** SYSC\_WPSR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	WVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 15:8 – WVSRC[7:0] Write Violation Source

When bit WPVS is equal to 1, the field WVSRC indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protection Register Violation Status

WDT\_CR, WDT\_MR, RTT\_MODR, RTC\_IDR and RTC\_IER can be write-protected but WPVS does not report any violation for these registers.

Value	Description
0	No write protection violation has occurred since the last read of SYSC_WPSR.
1	A write protection violation has occurred since the last read of SYSC_WPSR. The associated violation is reported into field WVSRC.

## 28. Advanced Interrupt Controller (AIC)

### 28.1. Description

The Advanced Interrupt Controller (AIC) is an 8-level priority, individually maskable, vectored interrupt controller providing handling of up to one hundred and twenty-eight interrupt sources. It is designed to substantially reduce the software and real-time overhead in handling internal and external interrupts.

The AIC drives the nFIQ (fast interrupt request) and the nIRQ (standard interrupt request) inputs of an Arm processor. Inputs of the AIC are either internal peripheral interrupts or external interrupts coming from the product's pins.

The 8-level Priority Controller allows the user to define the priority for each interrupt source, thus permitting higher priority interrupts to be serviced even if a lower priority interrupt is being processed.

Internal interrupt sources can be programmed to be level-sensitive or edge-triggered. External interrupt sources can be programmed to be rising-edge or falling-edge triggered or high-level or low-level sensitive.

The fast-forcing feature redirects any internal or external interrupt source to provide a fast interrupt rather than a normal interrupt.

### 28.2. Embedded Characteristics

- Controls the Interrupt Lines (nIRQ and nFIQ) of an Arm Processor
- 50 Individually Maskable and Vectored Interrupt Sources
  - Source 0 is reserved for the fast interrupt input (FIQ)
  - Source 1 is reserved for system peripheral interrupts
  - Source 2 to Source 49 control up to 126 embedded peripheral interrupts or external interrupts
  - Programmable edge-triggered or level-sensitive internal sources
  - Programmable rising/falling edge-triggered or high/low level-sensitive external sources
- 8-level Priority Controller
  - Drives the normal interrupt of the processor
  - Handles priority of the interrupt sources 1 to 49
  - Higher priority interrupts can be served during service of lower priority interrupt
- Vectoring
  - Optimizes interrupt service routine branch and execution
  - One 32-bit vector register for all interrupt sources
  - Interrupt vector register reads the corresponding current interrupt vector or the current interrupt number
- Protect Mode
  - Easy debugging by preventing automatic operations when protect models are enabled
- Fast Forcing
  - Permits redirecting any normal interrupt source to the fast interrupt of the processor
- General Interrupt Mask
  - Provides processor synchronization on events without triggering an interrupt
- Register Write Protection

## 28.6. I/O Line Description

Table 28.1. I/O Line Description

Pin Name	Pin Description	Type
FIQ	Fast Interrupt	Input
IRQ0-IRQn	Interrupt 0-Interrupt n	Input

## 28.7. Product Dependencies

### 28.7.1. I/O Lines

The interrupt signals FIQ and IRQ0 to IRQn are normally multiplexed through the PIO controllers. Depending on the features of the PIO controller used in the product, the pins must be programmed in accordance with their assigned interrupt functions. This is not applicable when the PIO controller used in the product is transparent on the input path.

### 28.7.2. Power Management

The AIC is continuously clocked. The Power Management Controller has no effect on the AIC behavior.

The assertion of the AIC outputs, either nIRQ or nFIQ, wakes up the Arm processor while it is in Idle mode. The General Interrupt Mask feature enables the AIC to wake up the processor without asserting the interrupt line of the processor, thus providing synchronization of the processor on an event.

### 28.7.3. Interrupt Sources

FIQ always drives Interrupt Source 0.

The System Controller interrupt drives Interrupt Source 1.

The System Controller interrupt is the result of the OR-wiring of the System Controller interrupt lines. When a System Controller interrupt occurs, the service routine must first distinguish the cause of the interrupt. This is performed by reading successively the status registers of the System Controller peripherals.

Interrupt sources 2 to 49 can either be connected to the interrupt outputs of an embedded user peripheral, or to external interrupt lines. The external interrupt lines can be connected either directly or through the PIO Controller.

PIO controllers are considered as user peripherals in the scope of interrupt handling. Accordingly, the PIO controller interrupt lines are connected to interrupt sources 2 to 49.

The peripheral identification defined at the product level corresponds to the interrupt source number (as well as the bit number controlling the clock of the peripheral). Consequently, to simplify the description of the functional operations and the user interface, the interrupt sources are named FIQ, SYS, and PID2 to PID49.

## 28.8. Functional Description

### 28.8.1. Interrupt Source Control

#### 28.8.1.1. Interrupt Source Mode

The AIC independently programs each interrupt source. The SRCTYPE field of the Source Mode register (AIC\_SMR) selects the interrupt condition of the interrupt source selected by the INTSEL field of the Source Select register (AIC\_SSR).

**Note:** Configuration registers such as AIC\_SMR and AIC\_SSR return the values corresponding to the interrupt source selected by INTSEL.

The internal interrupt sources wired on the interrupt outputs of the embedded peripherals can be programmed either in Level-Sensitive mode or in Edge-Triggered mode. The active level of the internal interrupts is not important for the user.

The external interrupt sources can be programmed either in High Level-Sensitive or Low Level-Sensitive modes, or in Rising Edge-Triggered or Negative Edge-Triggered modes.

#### 28.8.1.2. Interrupt Source Enabling

Each interrupt source, including the FIQ in source 0, can be enabled or disabled by using the command registers Interrupt Enable Command register (AIC\_IECR) and Interrupt Disable Command register (AIC\_IDCR). The interrupt mask of the selected interrupt source can be read in the Interrupt Mask register (AIC\_IMR). A disabled interrupt does not affect servicing of other interrupts.

#### 28.8.1.3. Interrupt Clearing and Setting

All interrupt sources programmed to be edge-triggered (including the FIQ in source 0) can be individually set or cleared by writing respectively the Interrupt Set Command register (AIC\_ISCR) and Interrupt Clear Command register (AIC\_ICCR). Clearing or setting interrupt sources programmed in Level-Sensitive mode has no effect.

The clear operation is perfunctory, as the software must perform an action to reset the “memorization” circuitry activated when the source is programmed in Edge-Triggered mode. However, the set operation is available for auto-test or software debug purposes. It can also be used to execute an AIC-implementation of a software interrupt.

The AIC features an automatic clear of the current interrupt when AIC\_IVR (Interrupt Vector register) is read. Only the interrupt source being detected by the AIC as the current interrupt is affected by this operation. (See the section [Priority Controller](#).) The automatic clear reduces the operations required by the interrupt service routine entry code to read AIC\_IVR. Note that the automatic interrupt clear is disabled if the interrupt source has the Fast Forcing feature enabled, as it is considered uniquely as an FIQ source. (For further details, see the section “Fast Forcing”).

The automatic clear of interrupt source 0 is performed when the FIQ Vector register (AIC\_FVR) is read.

#### 28.8.1.4. Interrupt Status

Interrupt Pending registers (AIC\_IPR) represent the state of the interrupt lines, whether they are masked or not. AIC\_IMR can be used to define the mask of the interrupt lines.

The Interrupt Status register (AIC\_ISR) reads the number of the current interrupt (see the section [Priority Controller](#)) and the Core Interrupt Status register (AIC\_CISR) gives an image of the nIRQ and nFIQ signals driven on the processor.

Each status referred to above can be used to optimize the interrupt handling of the systems.

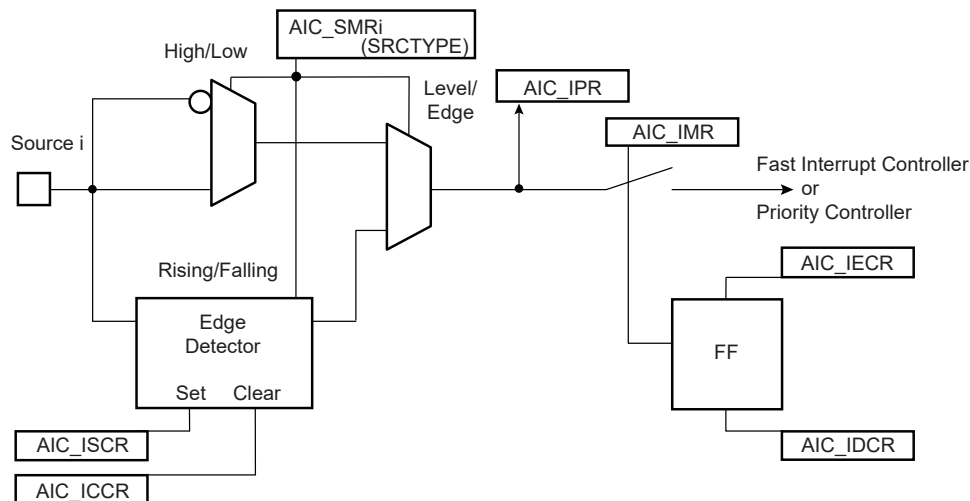

### 28.8.1.5. Internal Interrupt Source Input Stage

Figure 28.4. Internal Interrupt Source Input Stage

### 28.8.1.6. External Interrupt Source Input Stage

Figure 28.5. External Interrupt Source Input Stage

## 28.8.2. Interrupt Latencies

Global interrupt latencies depend on several parameters, including:

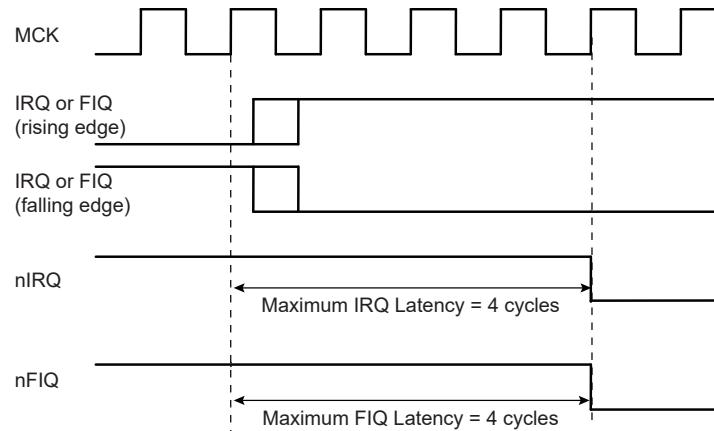

- The time the software masks the interrupts
- Occurrence, either at the processor level or at the AIC level
- The execution time of the instruction in progress when the interrupt occurs
- The treatment of higher priority interrupts and the resynchronization of the hardware signals

This section addresses hardware resynchronizations only. It gives details about the latency times between the events on an external interrupt leading to a valid interrupt (edge or level) or the assertion of an internal interrupt source and the assertion of the nIRQ or nFIQ line on the processor. The resynchronization time depends on the programming of the interrupt source and on its type (internal or external). For the standard interrupt, resynchronization times are given assuming there is no higher priority in progress.

The PIO Controller multiplexing has no effect on the interrupt latencies of the external interrupt sources.

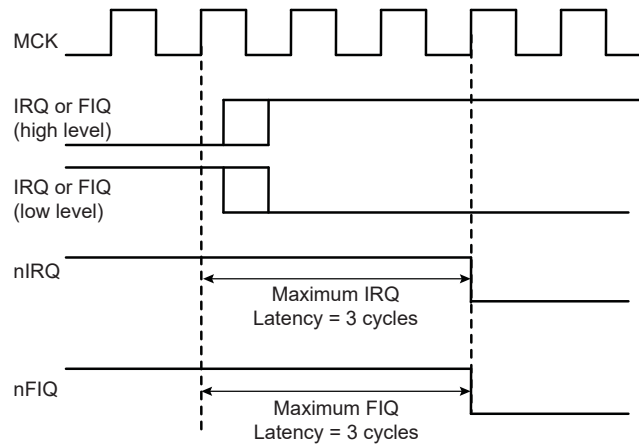

### 28.8.2.1.External Interrupt Edge Triggered Source

**Figure 28.6.** External Interrupt Edge Triggered Source

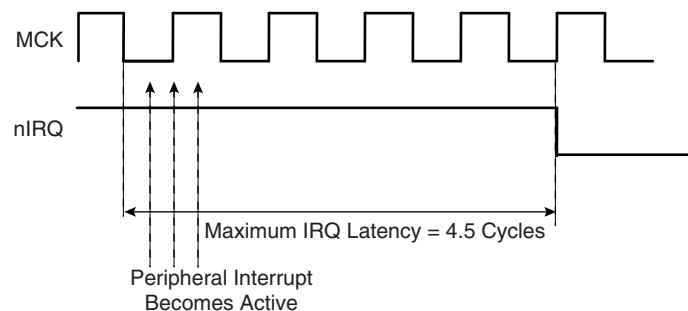

### 28.8.2.2.External Interrupt Level Sensitive Source

**Figure 28.7.** External Interrupt Level Sensitive Source

### 28.8.2.3.Internal Interrupt Edge Triggered Source

**Figure 28.8.** Internal Interrupt Edge Triggered Source

#### 28.8.2.4. Internal Interrupt Level Sensitive Source

**Figure 28.9.** Internal Interrupt Level Sensitive Source

### 28.8.3. Normal Interrupt

#### 28.8.3.1. Priority Controller

An 8-level priority controller drives the nIRQ line of the processor, depending on the interrupt conditions occurring on the interrupt sources 1 to 49 (except for those programmed in Fast Forcing).

Each interrupt source has a programmable priority level of 7 to 0, which is user-definable by writing AIC\_SMR.PRIOR. Level 7 is the highest priority and level 0 the lowest.

As soon as an interrupt condition occurs, as defined by AIC\_SMR.SRCTYPE, the nIRQ line is asserted. As a new interrupt condition might have happened on other interrupt sources since the nIRQ has been asserted, the priority controller determines the current interrupt at the time AIC\_IVR is read. The read of AIC\_IVR is the entry point of the interrupt handling which allows the AIC to consider that the interrupt has been taken into account by the software.

The current priority level is defined as the priority level of the current interrupt.

If several interrupt sources of equal priority are pending and enabled when AIC\_IVR is read, the interrupt with the lowest interrupt source number is serviced first.

The nIRQ line can be asserted only if an interrupt condition occurs on an interrupt source with a higher priority. If an interrupt condition happens (or is pending) during the interrupt treatment in progress, it is delayed until the software indicates to the AIC the end of the current service by writing AIC\_EOICR (End of Interrupt Command register). The write of AIC\_EOICR is the exit point of the interrupt handling.

#### 28.8.3.2. Interrupt Nesting

The priority controller utilizes interrupt nesting in order for the high priority interrupt to be handled during the service of lower priority interrupts. This requires the interrupt service routines of the lower interrupts to re-enable the interrupt at the processor level.

When an interrupt of a higher priority happens during an already occurring interrupt service routine, the nIRQ line is re-asserted. If the interrupt is enabled at the core level, the current execution is interrupted and the new interrupt service routine should read AIC\_IVR. At this time, the current interrupt number and its priority level are pushed into an embedded hardware stack, so that they are saved and restored when the higher priority interrupt servicing is finished and AIC\_EOICR is written.

The AIC is equipped with an 8-level wide hardware stack in order to support up to eight interrupt nestings to match the eight priority levels.

#### 28.8.3.3. Interrupt Vectoring

The interrupt handler address corresponding to the interrupt source selected by the INTSEL field can be stored in AIC\_SVR (Source Vector register). When the processor reads AIC\_IVR, the value written into AIC\_SVR corresponding to the current interrupt is returned. Optionally, the AIC\_IVR

register can return the current interrupt number instead. This can be defined separately for each interrupt source using the AIC SVR Return Enable Register (AIC\_SVRRER) and AIC SVR Return Disable Register (AIC\_SVRRDR).

This feature offers a way to branch in one single instruction to the handler corresponding to the current interrupt, as AIC\_IVR is mapped at the absolute address 0xFFFFF100 and thus accessible from the Arm interrupt vector at address 0x00000018 through the following instruction:

```
LDR PC, [PC, # -&F20]
```

When the processor executes this instruction, it loads the read value in AIC\_IVR in its program counter, thus branching the execution on the correct interrupt handler.

#### 28.8.3.4. Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the Arm processor, and especially the Processor Interrupt modes and the associated status bits.

It is assumed that:

1. The AIC has been programmed, AIC\_SVR registers are loaded with corresponding interrupt service routine addresses and interrupts are enabled.
2. The instruction at the Arm interrupt exception vector address is required to work with the vectoring

```
LDR PC, [PC, # -&F20]
```

When nIRQ is asserted, if the bit "I" of CPSR is 0, the sequence is as follows:

1. The CPSR is stored in SPSR\_irq, the current value of the Program Counter is loaded in the Interrupt link register (R14\_irq) and the Program Counter (R15) is loaded with 0x18. In the following cycle during fetch at address 0x1C, the Arm core adjusts R14\_irq, decrementing it by four.
2. The Arm core enters Interrupt mode, if it has not already done so.
3. When the instruction loaded at address 0x18 is executed, the program counter is loaded with the value read in AIC\_IVR. Reading AIC\_IVR has the following effects:
  - Sets the current interrupt to be the pending and enabled interrupt with the highest priority. The current level is the priority level of the current interrupt.
  - De-asserts the nIRQ line on the processor. Even if vectoring is not used, AIC\_IVR must be read in order to de-assert nIRQ.
  - Automatically clears the interrupt, if it has been programmed to be edge-triggered.
  - Pushes the current level and the current interrupt number on to the stack.
  - Returns the value written in AIC\_SVR corresponding to the current interrupt.
4. The previous step has the effect of branching to the corresponding interrupt service routine. This should start by saving the link register (R14\_irq) and SPSR\_IRQ. The link register must be decremented by four when it is saved if it is to be restored directly into the program counter at the end of the interrupt. For example, the instruction `SUB PC, LR, #4` may be used.
5. Further interrupts can then be unmasked by clearing the "I" bit in CPSR, allowing re-assertion of the nIRQ to be taken into account by the core. This can happen if an interrupt with a higher priority than the current interrupt occurs.
6. The interrupt handler can then proceed as required, saving the registers that will be used and restoring them at the end. During this phase, an interrupt of higher priority than the current level will restart the sequence from step 1.

**Note:** If the interrupt is programmed to be level-sensitive, the source of the interrupt must be cleared during this phase.

7. The “I” bit in CPSR must be set in order to mask interrupts before exiting to ensure that the interrupt is completed in an orderly manner.
8. AIC\_EOICR must be written in order to indicate to the AIC that the current interrupt is finished. This causes the current level to be popped from the stack, restoring the previous current level if one exists on the stack. If another interrupt is pending, with lower or equal priority than the old current level but with higher priority than the new current level, the nIRQ line is re-asserted, but the interrupt sequence does not immediately start because the “I” bit is set in the core. SPSR\_irq is restored. Finally, the saved value of the link register is restored directly into the PC. This has the effect of returning from the interrupt to whatever was being executed before, and of loading the CPSR with the stored SPSR, masking or unmasking the interrupts depending on the state saved in SPSR\_irq.

**Note:** The “I” bit in SPSR is significant. If it is set, it indicates that the Arm core was on the verge of masking an interrupt when the mask instruction was interrupted. Hence, when SPSR is restored, the mask instruction is completed (interrupt is masked).

## 28.8.4. Fast Interrupt

### 28.8.4.1. Fast Interrupt Source

Interrupt source 0 is the only source which can raise a fast interrupt request to the processor except if fast forcing is used. Interrupt source 0 is generally connected to a FIQ pin of the product, either directly or through a PIO Controller.

### 28.8.4.2. Fast Interrupt Control

The fast interrupt logic of the AIC has no priority controller. The mode of interrupt source 0 is programmed with AIC\_SMR and INTSEL = 0; the PRIOR field of this register is not used even if it reads what has been written. AIC\_SMR.SRCTYPE enables programming the fast interrupt source to be rising-edge triggered or falling-edge triggered or high-level sensitive or low-level sensitive.

Writing 0x1 in AIC\_IECR and AIC\_IDCR respectively enables and disables the fast interrupt when INTSEL = 0. Bit 0 of AIC\_IMR indicates whether the fast interrupt is enabled or disabled.

### 28.8.4.3. Fast Interrupt Vectoring

The fast interrupt handler address can be stored through AIC\_SVR. The value written into this register when INTSEL = 0 is returned when the processor reads AIC\_FVR (FIQ Vector register). This offers a way to branch in one single instruction to the interrupt handler, as AIC\_FVR is mapped at the absolute address 0xFFFF F104 and thus accessible from the Arm fast interrupt vector at address 0x0000 001C through the following instruction:

```
LDR PC, [PC, # -&F20]
```

When the processor executes this instruction, it loads the value read in AIC\_FVR in its program counter, thus branching the execution on the fast interrupt handler. It also automatically performs the clear of the fast interrupt source if it is programmed in Edge-Triggered mode.

### 28.8.4.4. Fast Interrupt Handlers

This section gives an overview of the fast interrupt handling sequence when using the AIC. It is assumed that the programmer understands the architecture of the Arm processor, and especially the Processor Interrupt modes and associated status bits.

Assuming that:

1. The AIC has been programmed, AIC\_SVR is loaded with the fast interrupt service routine address, and interrupt source 0 is enabled.
2. The Instruction at address 0x1C (FIQ exception vector address) is required to vector the fast interrupt:

```
LDR PC, [PC, # -&F20]
```

3. The user does not need nested fast interrupts.

When nFIQ is asserted, if bit “F” of CPSR is 0, the sequence is:

1. The CPSR is stored in SPSR\_fiq, the current value of the program counter is loaded in the FIQ link register (R14\_FIQ) and the program counter (R15) is loaded with 0x1C. In the following cycle, during fetch at address 0x20, the Arm core adjusts R14\_fiq, decrementing it by four.
2. The Arm core enters FIQ mode.
3. When the instruction loaded at address 0x1C is executed, the program counter is loaded with the value read in AIC\_FVR. Reading AIC\_FVR has the effect of automatically clearing the fast interrupt, if it has been programmed to be edge-triggered. In this case only, it de-asserts the nFIQ line on the processor.

```
FIQ_Handler_Branch
    mov r14, _pc
    bx r0
```

4. The previous step enables branching to the corresponding interrupt service routine. It is not necessary to save the link register R14\_fiq and SPSR\_fiq if nested fast interrupts are not needed.
5. The Interrupt Handler can then proceed as required. It is not necessary to save registers R8 to R13 because the FIQ mode has its own dedicated registers and registers R8 to R13 are banked. The other registers, R0 to R7, must be saved before being used, and restored at the end (before the next step).  
**Note:** If the fast interrupt is programmed to be level-sensitive, the source of the interrupt must be cleared during this phase in order to de-assert interrupt source 0.
6. Finally, Link register R14\_fiq is restored into the PC after decrementing it by four (with instruction `SUB PC, LR, #4` for example). This has the effect of returning from the interrupt to whatever was being executed before, loading the CPSR with the SPSR and masking or unmasking the fast interrupt depending on the state saved in the SPSR.  
**Note:** The “F” bit in SPSR is significant. If it is set, it indicates that the Arm core was just about to mask FIQ interrupts when the mask instruction was interrupted. Hence, when the SPSR is restored, the interrupted instruction is completed (FIQ is masked).

Another way to handle the fast interrupt is to map the interrupt service routine at the address of the Arm vector 0x1C. This method does not use vectoring, so that reading AIC\_FVR must be performed at the very beginning of the handler operation. However, this method saves the execution of a branch instruction.

#### 28.8.4.5.Fast Forcing

The Fast Forcing feature of the advanced interrupt controller provides redirection of any normal Interrupt source on the fast interrupt controller.

Fast Forcing is enabled or disabled by writing to the Fast Forcing Enable register (AIC\_FFER) and the Fast Forcing Disable register (AIC\_FFDR). Writing to these registers results in an update of the Fast Forcing Status register (AIC\_FFSR) that controls the feature for each internal or external interrupt source.

When Fast Forcing is disabled, the interrupt sources are handled as described in the previous sections.

When Fast Forcing is enabled, the edge/level programming and, in certain cases, edge detection of the interrupt source is still active but the source cannot trigger a normal interrupt to the processor and is not seen by the priority handler.

If the interrupt source is programmed in Level-Sensitive mode and an active level is sampled, Fast Forcing results in the assertion of the nFIQ line to the core.

If the interrupt source is programmed in Edge-Triggered mode and an active edge is detected, Fast Forcing results in the assertion of the nFIQ line to the core.

The Fast Forcing feature does not affect the Source 0 pending bit in AIC\_IPR.

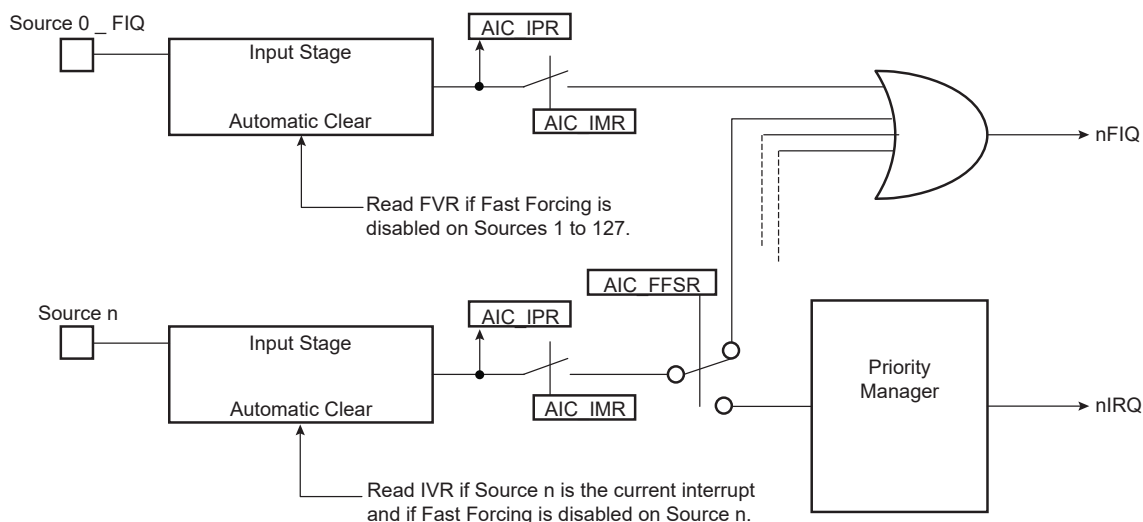

The FIQ Vector register (AIC\_FVR) reads the contents of the Source Vector register (AIC\_SVR), whatever the source of the fast interrupt may be. The read of the FVR does not clear Source 0 when the fast forcing feature is used and the interrupt source should be cleared by writing to AIC\_ICCR.

All enabled and pending interrupt sources that have the fast forcing feature enabled and that are programmed in Edge-Triggered mode must be cleared by writing to the Interrupt Clear Command register. In doing so, they are cleared independently and thus lost interrupts are prevented.

The read of AIC\_IVR does not clear the source that has the fast forcing feature enabled.

Source 0, reserved to the fast interrupt, continues operating normally and becomes one of the Fast Interrupt sources.

**Figure 28.10.** Fast Forcing

### 28.8.5. Protect Mode

The Protect mode is used to read the Interrupt Vector register without performing the associated automatic operations. This is necessary when working with a debug system. When a debugger, working either with a Debug Monitor or the Arm processor's ICE, stops the applications and updates the opened windows, it might read the AIC User Interface and thus the IVR. This has adverse consequences:

- If an enabled interrupt with a higher priority than the current one is pending, it is stacked.
- If there is no enabled pending interrupt, the spurious vector is returned.

In either case, an End of Interrupt command is necessary to acknowledge and restore the context of the AIC. This operation is generally not performed by the debug system, as the debug system would become strongly intrusive and cause the application to enter an undesired state.

This is avoided by using the Protect mode. Writing PROT in the Debug Control register (AIC\_DCR) at 0x1 enables the Protect mode.

When the Protect mode is enabled, the AIC performs interrupt stacking only when a write access is performed on AIC\_IVR. Therefore, the Interrupt Service Routines must write (arbitrary data) to AIC\_IVR just after reading it. The new context of the AIC, including the value of AIC\_ISR, is updated with the current interrupt only when AIC\_IVR is written.

An AIC\_IVR read on its own (e.g., by a debugger) modifies neither the AIC context nor AIC\_ISR. Extra AIC\_IVR reads perform the same operations. However, it is recommended to not stop the processor between the read and the write of AIC\_IVR of the interrupt service routine to make sure the debugger does not modify the AIC context.

To summarize, in normal operating mode, the read of AIC\_IVR performs the following operations within the AIC:

1. Calculates active interrupt (higher than current or spurious).
2. Determines and returns the vector of the active interrupt.
3. Memorizes the interrupt.
4. Pushes the current priority level onto the internal stack.
5. Acknowledges the interrupt.

However, while the Protect mode is activated, only operations 1 to 3 are performed when AIC\_IVR is read. Operations 4 and 5 are only performed by the AIC when AIC\_IVR is written.

Software that has been written and debugged using the Protect mode runs correctly in normal mode without modification. However, in normal mode, the AIC\_IVR write has no effect and can be removed to optimize the code.

#### 28.8.6. Spurious Interrupt

The AIC features a protection against spurious interrupts. A spurious interrupt is defined as being the assertion of an interrupt source long enough for the AIC to assert the nIRQ, but no longer present when AIC\_IVR is read. This is most prone to occur when:

- An external interrupt source is programmed in Level-Sensitive mode and an active level occurs for only a short time.
- An internal interrupt source is programmed in level-sensitive and the output signal of the corresponding embedded peripheral is activated for a short time (as is the case for the watchdog).
- An interrupt occurs just a few cycles before the software begins to mask it, thus resulting in a pulse on the interrupt source.

The AIC detects a spurious interrupt at the time AIC\_IVR is read while no enabled interrupt source is pending. When this happens, the AIC returns the value stored by the programmer in the Spurious Vector register (AIC\_SPU). The programmer must store the address of a spurious interrupt handler in AIC\_SPU as part of the application, to enable an as fast as possible return to the normal execution flow. This handler writes in AIC\_EOICR and performs a return from interrupt.

#### 28.8.7. General Interrupt Mask

The AIC features a General Interrupt Mask bit (AIC\_DCR.GMSK) to prevent interrupts from reaching the processor. Both the nIRQ and the nFIQ lines are driven to their inactive state if AIC\_DCR.GMSK is set. However, this mask does not prevent waking up the processor if it has entered Idle mode. This function facilitates synchronizing the processor on a next event and, as soon as the event occurs, performs subsequent operations without having to handle an interrupt. It is strongly recommended to use this mask with caution.

#### 28.8.8. Register Write Protection

To prevent any single software error from corrupting AIC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the AIC Write Protection Mode Register (AIC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the AIC Write Protection Status Register (AIC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading AIC\_WPSR.

The following registers can be write-protected:

- AIC Source Mode Register
- AIC Source Vector Register
- AIC Spurious Interrupt Vector Register
- AIC Debug Control Register

## 28.9. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	AIC_SSR	31:24								
		23:16								
		15:8								
		7:0		INTSEL[6:0]

## 28.9.1. AIC Source Select Register

**Name:** AIC\_SSR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		INTSEL[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

**Bits 6:0 – INTSEL[6:0]** Interrupt Line Selection  
0–49 = Selects the interrupt line to handle.  
See the section [Interrupt Source Mode](#).

## 28.9.2. AIC Source Mode Register

**Name:** AIC\_SMR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

### Bits 6:5 – SRCTYPE[1:0] Interrupt Source Type

The active level or edge is not programmable for the internal interrupt source selected by INTSEL.

Value	Name	Description
0	INT_LEVEL_SENSITIVE	High-level sensitive for internal source. Low-level sensitive for external source.
1	EXT_NEGATIVE_EDGE	Negative-edge triggered for external source.
2	EXT_HIGH_LEVEL	High-level sensitive for internal source. High-level sensitive for external source.
3	EXT_POSITIVE_EDGE	Positive-edge triggered for external source.

### Bits 2:0 – PRIOR[2:0] Priority Level

Programs the priority level of the source selected by INTSEL except FIQ source (source 0).

The priority level can be between 0 (lowest) and 7 (highest).

The priority level is not used for the FIQ.

### 28.9.3. AIC Source Vector Register

**Name:** AIC\_SVR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	VECTOR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	VECTOR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	VECTOR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	VECTOR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – VECTOR[31:0] Source Vector**

The user may store in this register the address of the corresponding handler for the interrupt source selected by INTSEL.

**28.9.4. AIC Interrupt Vector Register**

**Name:** AIC\_IVR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	IRQV[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IRQV[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IRQV[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IRQV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – IRQV[31:0] Interrupt Vector Register**

Contains the vector programmed by the user in AIC\_SVR or the interrupt index corresponding to the current interrupt. (See the sections [AIC\\_SVRRER](#), [AIC\\_SVRRDR](#) and [AIX\\_SVRRSR](#).)

AIC\_SVR is indexed using the current interrupt number when AIC\_IVR is read.

When there is no current interrupt, AIC\_IVR reads the value stored in AIC\_SPU.

## 28.9.5. AIC FIQ Vector Register

**Name:** AIC\_FVR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	FIQV[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	FIQV[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	FIQV[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FIQV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – FIQV[31:0] FIQ Vector Register

Contains the vector programmed by the user in AIC\_SVR when INTSEL = 0. When there is no fast interrupt, AIC\_FVR reads the value stored in AIC\_SPU.

## 28.9.6. AIC Interrupt Status Register

**Name:** AIC\_ISR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset								
Bit	7	6	5	4	3	2	1	0
		IRQID[6:0]						
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

**Bits 6:0 – IRQID[6:0]** Current Interrupt Identifier  
Returns the current interrupt source number.

**28.9.7. AIC Interrupt Pending Register 0**

**Name:** AIC\_IPR0  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.

Bit	31	30	29	28	27	26	25	24
	PID31	PID30	PID29	PID28	PID27	PID26	PID25	PID24
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	PID15	PID14	PID13	PID12	PID11	PID10	PID9	PID8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PID7	PID6	PID5	PID4	PID3	PID2	SYS	FIQ
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx Interrupt Pending**

PID2...PID31 refer to the identifiers as defined in the Peripheral Identifiers section.

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

**Bit 1 – SYS Interrupt Pending**

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

**Bit 0 – FIQ Interrupt Pending**

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

## 28.9.8. AIC Interrupt Pending Register 1

**Name:** AIC\_IPR1  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.  
PID32...PID63 refer to the identifiers as defined in the Peripheral Identifiers section.

Bit	31	30	29	28	27	26	25	24
	PID63	PID62	PID61	PID60	PID59	PID58	PID57	PID56
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx Interrupt Pending**

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

## 28.9.9. AIC Interrupt Pending Register 2

**Name:** AIC\_IPR2  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	PID95	PID94	PID93	PID92	PID91	PID90	PID89	PID88
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	PID87	PID86	PID85	PID84	PID83	PID82	PID81	PID80
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

	PID79	PID78	PID77	PID76	PID75	PID74	PID73	PID72
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PID71	PID70	PID69	PID68	PID67	PID66	PID65	PID64
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx Interrupt Pending

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

### Bit 10 – PIDx Interrupt Pending

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 – PIDx Interrupt Pending

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

**28.9.10. AIC Interrupt Pending Register 3**

**Name:** AIC\_IPR3  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read-only

The reset value of this register depends on the level of the external interrupt source. All other sources are cleared at reset, thus not pending.

PID96...PID127 bit fields refer to the identifiers as defined in the Peripheral Identifiers section.

Bit	31	30	29	28	27	26	25	24
	PID127	PID126	PID125	PID124	PID123	PID122	PID121	PID120

Bit	7	6	5	4	3	2	1	0
	PID103	PID102	PID101	PID100	PID99	PID98	PID97	PID96
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – PIDx Interrupt Pending**

Value	Description
0	The corresponding interrupt is not pending.
1	The corresponding interrupt is pending.

## 28.9.11. AIC Interrupt Mask Register

**Name:** AIC\_IMR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								INTM
Access								R
Reset								0

### Bit 0 – INTM Interrupt Mask

Value	Description
0	The interrupt source selected by AIC_SSR.INTSEL is disabled.
1	The interrupt source selected by AIC_SSR.INTSEL is enabled.

## 28.9.12. AIC Core Interrupt Status Register

**Name:** AIC\_CISR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	7	6	5	4	3	2	1	0
								ENDIT
Access								W
Reset								–

#### Bit 0 – ENDIT Interrupt Processing Complete Command

Used by the interrupt routine to indicate that the interrupt treatment is complete. Any value can be written because it is only necessary to make a write to this register location to signal the end of interrupt treatment.

**28.9.14. AIC Spurious Interrupt Vector Register**

**Name:** AIC\_SPU  
**Offset:** 0x3C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	SIVR[31:24]

								SVRRDIS
Access								W
Reset								–

### Bit 0 – SVRRDIS SVR Return Disable

Value	Description
0	No effect.
1	IVR register returns the corresponding vector programmed in AIC_SVR for the interrupt source selected by INTSEL.

## 28.9.24. AIC SVR Return Status Register

**Name:** AIC\_SVRRSR  
**Offset:** 0x68  
**Reset:** 0x00000000  
**Property:** Read-only

### Bit 0 – SVRRS SVR Return Status

Value	Description
0	IVR register returns the corresponding vector programmed in AIC_SVR for the interrupt source selected by INTSEL.
1	IVR register returns the interrupt index for the interrupt source selected by INTSEL.

**28.9.25. AIC Debug Control Register**

**Name:** AIC\_DCR  
**Offset:** 0x6C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the AIC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access

Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of AIC_WPSR.
1	A write protection violation has occurred since the last read of AIC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 29. General Purpose Backup Registers (GPBR)

### 29.1. Description

The System Controller embeds 256 bits of General Purpose Backup registers organized as 8 32-bit registers.

It is possible to generate an immediate clear of the content of General Purpose Backup registers 0 to 3 if a tamper event is detected on WKUP1 to WKUP8 pins. These pins are internally routed through the VDDCORE area, thus tamper events can be generated only when the VDDCORE is powered. These pins are also used for fast wake-up in Power Management Controller (PMC). Thus, if some WKUP pins are not enabled for fast wake-up in PMC, they can be enabled for tamper event detection. The immediate clear of the GPBR is enabled if `RSTC_MR.ENGCLR=1`.

The immediate clear on tamper detection can be extended to all General Purpose Backup registers by writing to '1' `GPBR_FCLR.FCLR`.

If an event has been detected on WKUP pins enabled for event detection in RTC, it is not possible to write to the General Purpose Backup registers (`SYS_GPBRx`) while the event has not been cleared.

`SYS_GPBR0` to `SYS_GPBR7` can be individually (each 32-bit part-select) read- and write-protected by configuring `GPBR_MR`. This register is write-once, which means that once it has been configured, the read or write protection is available until the loss of `VDDBU`.

### 29.2. Embedded Characteristics

- 256 bits of General Purpose Backup Registers
- Immediate Clear on WKUP Event
- Read and Write Protection for `SYS_GPBR0` to `SYS_GPBR7`

## 29.3. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

### 29.3.1. GPBR Mode Register

**Name:** GPBR\_MR  
**Offset:** 0x0  
**Reset:** 0x00000000  
**Property:** Read/Write-Once

This register is write-once. All bits are cleared at first power-up and on each loss of VDDBU.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	GPBRRP7	GPBRRP6	GPBRRP5	GPBRRP4	GPBRRP3	GPBRRP2	GPBRRP1	GPBRRP0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	GPBRWP7	GPBRWP6	GPBRWP5	GPBRWP4	GPBRWP3	GPBRWP2	GPBRWP1	GPBRWP0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 16, 17, 18, 19, 20, 21, 22, 23 – GPBRRPx GPBRx Read Protection

Value	Description
0	The content of the corresponding GPBR register (32-bit part-select) can be read.
1	The corresponding GPBR register (32-bit part-select) always returns zero when read.

#### Bits 0, 1, 2, 3, 4, 5, 6, 7 – GPBRWPx GPBRx Write Protection

Value	Description
0	The corresponding GPBR register (32-bit part-select) can be written.
1	The corresponding GPBR register (32-bit part-select) is write-protected.

### 29.3.2. GPBR Full Clear Register

**Name:** GPBR\_FCLR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

#### Bit 0 – FCLR Full Clear Enable

GPBR full clear is only possible if the system is not in Backup mode. In Backup mode, FCLR has no effect.

Value	Description
0	SYS_GPBR0 to SYS_GPBR3 are immediately cleared in case of fast wake-up pin tamper event.
1	All SYS_GPBRx are immediately cleared in case of fast wake-up pin tamper event.

### 29.3.3. General Purpose Backup Register x [x=0..7]

**Name:** SYS\_GPBRx  
**Offset:** 0x08 + x\*0x04 [x=0..7]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

These registers are reset at first power-up and on each loss of VDDBU.

If an event has been detected on WKUP pins enabled for tamper event detection in the RTC, it is not possible to write to SYS\_GPBRx as long as the event has not been cleared.

## 30. Watchdog Timer (WDT)

### 30.1. Description

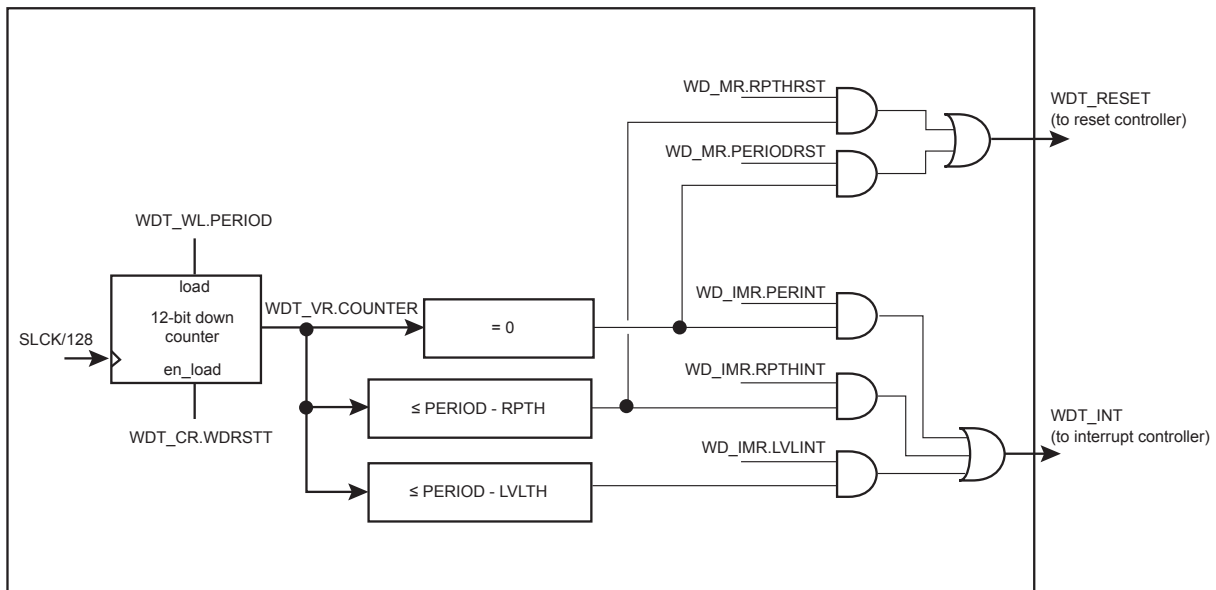

The Watchdog Timer (WDT) is used to prevent system lockup if the software becomes trapped in a deadlock. It features one 12-bit down counter that allows a watchdog period of up to 16 seconds (slow clock around 32 kHz). The WDT can generate a general reset or a processor reset only. In addition, it can be stopped while the processor is in Debug mode or Sleep mode (Idle mode).

### 30.2. Embedded Characteristics

- 12-bit Key-protected Programmable Counter
- Watchdog Clock is Independent from Processor Clock
- Provides Reset or Interrupt Signals to the System
- Counter May Be Stopped while the Processor is in Debug State or in Idle Mode

### 30.3. Block Diagram

Figure 30.1. WDT Block Diagram

### 30.4. Functional Description

The WDT is used to prevent system lockup if the software becomes trapped in a deadlock. It is supplied with VDDCORE. It restarts with initial values on processor reset.

The WDT is built around a 12-bit down counter loaded with the value defined in field PERIOD of the Window Level Register (WDT\_WLR). WDT uses slow clock divided by 128 to establish the maximum watchdog period to 16 seconds (with a typical slow clock of 32.768 kHz).

The following parameters can be configured:

- Watchdog event period: a watchdog event occurs when the 12-bit down counter reaches 0, and leads to either an interrupt (if bit PERINT in the Interrupt Mask register (WDT\_IMR) is high) or a reset (if bit PERIODRST in the Mode register (WDT\_MR) is high).

- Minimum restart period: if the restart command is performed before this period, WDT creates a repeat violation. A repeat violation leads to either an interrupt (if WDT\_IMR.RPTHINT = 1) or a reset (if WDT\_MR.RPTHRST = 1).
- Maximum period before single interrupt event: if WDT\_IMR.LVLINT = 1, a single interrupt is generated (no reset). The WDT\_ILR.LVLTH value must be lower than WDT\_WLR.PERIOD.

After a processor reset, the value of PERIOD is 0xFFFF, corresponding to the maximum value of the counter with the external reset generation enabled (bit PERIODRST at 1 after a backup reset). This means that the WDT is running at reset, i.e., at powerup. The user can either disable the WDT by setting bit WDT\_MR.WDDIS to '1' or reprogram the WDT to meet the maximum WDT period the application requires.

If the WDT is restarted by writing into the corresponding Control register (WDT\_CR), the corresponding WDT\_MR must not be programmed during a period of time of three slow clock periods following the WDT\_CR write access. In any case, programming a new value in WDT\_MR automatically initiates a restart instruction.

WDT\_MR, WDT\_WLR and WDT\_ILR (Interrupt Level register) can be written until a WDT\_CR.LOCKMR command is issued in the corresponding WDT\_CR. Only a peripheral reset can configure the bit LOCKMR to 0.

When the bit WDT\_CR.LOCKMR = 0, writing WDT\_WLR reloads the corresponding WDT with the newly programmed mode parameters.

In normal operation, the user reloads the WDT at regular intervals before the timer underflow occurs, by setting bit WDT\_CR.WDRSTT. The WDT counter is then immediately reloaded from PERIOD and restarted, and the slow clock 128 divider is reset and restarted.

Writing WDR\_CR without the correct hard-coded key has no effect (see [Watchdog Timer Control Register](#)).

A repeat threshold can be defined for each watchdog in order to protect against dead-locks that would repeatedly restart the watchdog. WDT\_WLR.RPTH defines the minimum number of cycles to wait after a watchdog restart before the WDT can be started again. If a watchdog restart occurs before this limit is reached, a repeat threshold failure is asserted and the RPTHINT bit in the Interrupt Status register (WDT\_ISR) is set to one.

If WDT\_IMR.RPTHINT is high and a repeat threshold violation occurs in the WDT, an interrupt is generated.

If WDT\_MR.RPTHRST is high and a repeat threshold violation occurs in the WDT, a watchdog reset is generated.

WDT reload must occur while the WDT counter is within a window between 0 and (PERIOD-RPTH). PERIOD and RPTH are defined in WDT\_WLR.

Note that this feature can be disabled by programming a null RPTH value. In such configuration, restarting the WDT is permitted in the whole range [0 up to PERIOD] and does not generate an error. This is the default configuration on reset (RPTH is null).

If a reset is generated or if WDT\_SR is read, the status bits are reset and the interrupt is cleared.

Writing WDT\_MR reloads and restarts the down counter.

While the processor is in debug state or in Sleep mode, the counter may be stopped depending on the value programmed for the bits WDIDLEHLT and WDDBGHLT in WDT\_MR.

**Figure 30.2.** Watchdog Timing Diagram

## 30.5. Register Summary

### 30.5.1. Watchdog Timer Control Register

**Name:** WDT\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

The WDT\_CR register values must not be modified within three slow clock periods following a restart of the WDT performed by a write access in WDT\_CR. Any modification will cause the WDT to trigger an end of period earlier than expected.

Bit	31	30	29	28	27	26	25	24
	KEY[7:0]							
Access	W	W	W	W	W	W	W	W

				LOCKMR				WDRSTT
Access				W				W
Reset				–				–

#### Bits 31:24 – KEY[7:0] Password

Value	Name	Description
0xA5	PASSWD	Writing any other value in this field aborts the write operation.

#### Bit 4 – LOCKMR Lock Mode Register Write Access

Value	Description
0	No effect.
1	Locks the configuration registers if KEY is written to 0xA5. Write accesses to WDT_MR, WDT_WLR and WDT_ILR have no effect.

#### Bit 0 – WDRSTT Watchdog Restart

Value	Description
0	No effect.
1	Restarts the WDT if KEY is written to 0xA5.

### 30.5.2. Watchdog Timer Mode Register

**Name:** WDT\_MR  
**Offset:** 0x04  
**Reset:** 0x00000030  
**Property:** Read/Write

Write access to this register has no effect if the LOCKMR command is issued in WDT\_CR (unlocked on hardware reset).

The WDT\_MR register values must not be modified within three slow clock periods following a restart of the WDT performed by a write access in WDT\_CR. Any modification will cause the WDT to trigger an end of period earlier than expected.

Bit	31	30	29	28	27	26	25	24
			WDBGHLT	WDIDLEHLT				
Access			R/W	R/W				
Reset			0	0				

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
				WDDIS				
Access				R/W				
Reset				0				

Bit	7	6	5	4	3	2	1	0
			RPTRST	PERIODRST				
Access			R/W	R/W				
Reset			1	1				

#### Bit 29 – WDBGHLT Watchdog Debug Halt

Value	Description
0	The WDT runs when the processor is in Debug state.
1	The WDT stops when the processor is in Debug state.

#### Bit 28 – WDIDLEHLT Watchdog Idle Halt

Value	Description
0	The WDT runs when the system is in Idle state.
1	The WDT stops when the system is in Idle state.

#### Bit 12 – WDDIS Watchdog Disable

Value	Description
0	Enables the WDT.
1	Disables the WDT.

#### Bit 5 – RPTRST Minimum Restart Period

Value	Description
0	No reset is generated if the WDT is restarted before the RPTH threshold.
1	A reset is generated if the WDT is restarted before the RPTH threshold.

**Bit 4 – PERIODRST** Period Reset

Value	Description
0	No reset is generated if the WDT down counter reaches 0.
1	A reset is generated once the WDT down counter reaches 0.

### 30.5.3. Watchdog Timer Value Register

**Name:** WDT\_VR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					COUNTER[11:8]			
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	COUNTER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 11:0 – COUNTER[11:0] Watchdog Down Counter Value

Shows the current value of the WDT down counter for debug operation.

Due to the asynchronous operation of the WDT with respect to the rest of the chip, to be certain that the value read in this register is valid and stable, it is necessary to read the register twice. If the data is the same both times, then it is valid. Therefore, a minimum of two and a maximum of three accesses are required.

### 30.5.4. Watchdog Timer Window Level Register

**Name:** WDT\_WLR  
**Offset:** 0x0C  
**Reset:** 0x00000FFF  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	RPTH[11:8]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RPTH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	PERIOD[11:8]							
Access					R/W	R/W	R/W	R/W
Reset					1	1	1	1
Bit	7	6	5	4	3	2	1	0
	PERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

#### Bits 27:16 – RPTH[11:0] Repeat Threshold

Defines the period before which a WDT restart generates an interrupt.

#### Bits 11:0 – PERIOD[11:0] Watchdog Period

Defines the period after which the WDT generates a reset.

### 30.5.5. Watchdog Timer Interrupt Level Register

**Name:** WDT\_ILR  
**Offset:** 0x10  
**Reset:** 0x00000FFF  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					LVLTH[11:8]			
Access					R/W	R/W	R/W	R/W
Reset					1	1	1	1
Bit	7	6	5	4	3	2	1	0
	LVLTH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

#### Bits 11:0 – LVLTH[11:0] Level Threshold

Defines the period after which the WDT generates an interrupt.

### 30.5.6. Watchdog Interrupt Enable Register

**Name:** WDT\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						LVLINT	RPTHINT	PERINT
Access						W	W	W
Reset						–	–	–

**Bit 2 – LVLINT** Interrupt Level Threshold Interrupt Enable

**Bit 1 – RPTHINT** Repeat Threshold Interrupt Enable

**Bit 0 – PERINT** Period Interrupt Enable

### 30.5.7. Watchdog Interrupt Disable Register

**Name:** WDT\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						LVLINT	RPTHINT	PERINT
Access						W	W	W
Reset						–	–	–

**Bit 2 – LVLINT** Interrupt Level Threshold Interrupt Disable

**Bit 1 – RPTHINT** Repeat Threshold Interrupt Disable

**Bit 0 – PERINT** Period Interrupt Disable

### 30.5.8. Watchdog Interrupt Status Register

**Name:** WDT\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						LVLINT	RPTHINT	PERINT
Access						R	R	R
Reset						0	0	0

#### Bit 2 – LVLINT Interrupt Level Threshold Interrupt Status (cleared on read)

Value	Description
0	No level threshold failure has occurred in the WDT since the last read of WDT_ISR.
1	At least one level threshold failure has occurred in the WDT since the last read of WDT_ISR.

#### Bit 1 – RPTHINT Repeat Threshold Interrupt Status (cleared on read)

Value	Description
0	No repeat threshold failure has occurred in the WDT since the last read of WDT_ISR.
1	At least one repeat threshold failure has occurred in the WDT since the last read of WDT_ISR.

#### Bit 0 – PERINT Period Interrupt Status (cleared on read)

Value	Description
0	No period failure has occurred in the WDT since the last read of WDT_ISR.
1	At least one period failure has occurred in the WDT since the last read of WDT_ISR.

### 30.5.9. Watchdog Interrupt Mask Register

**Name:** WDT\_IMR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						LVLINT	RPTHINT	PERINT
Access						R	R	R
Reset						0	0	0

**Bit 2 – LVLINT** Interrupt Level Threshold Interrupt Mask

**Bit 1 – RPTHINT** Repeat Threshold Interrupt Mask

**Bit 0 – PERINT** Period Interrupt Mask

## 31. Reset Controller (RSTC)

### 31.1. Description

The Reset Controller (RSTC) handles all the resets of the system without any external components. It reports which reset occurred last.

The RSTC is driven by Power-on Reset (POR) cells, software, an external reset pin, and peripheral events.

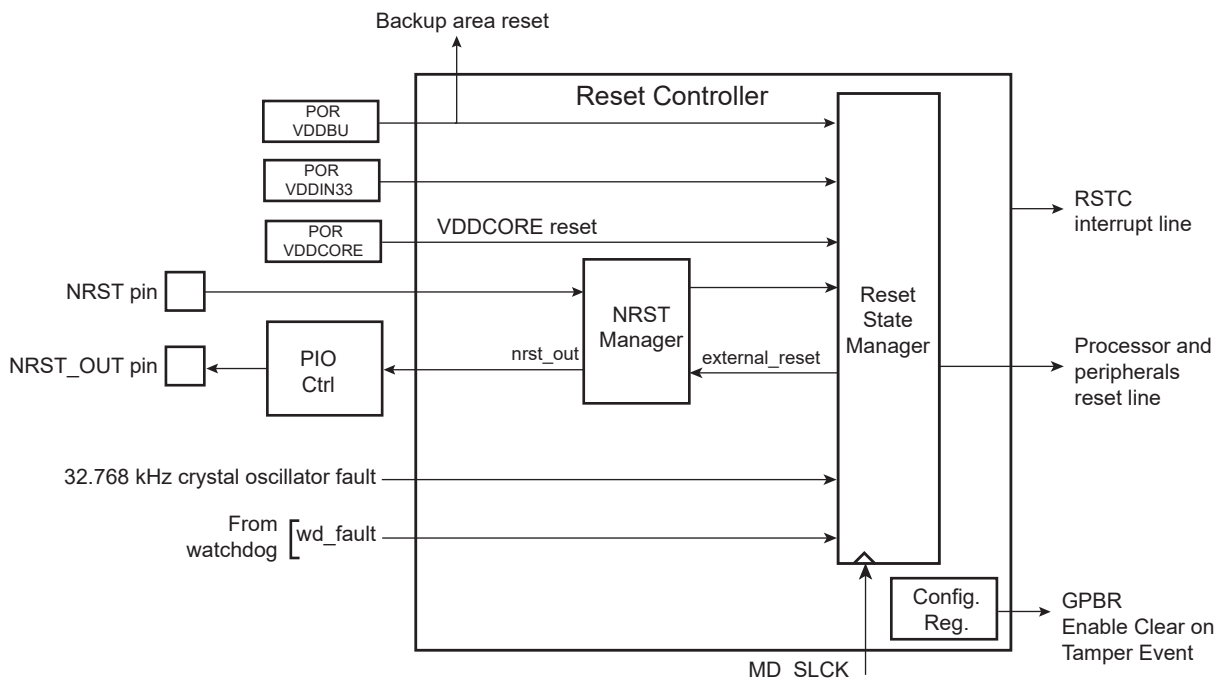

The RSTC drives simultaneously the External reset and the Peripheral and Processor resets.

### 31.2. Embedded Characteristics

- Driven by Embedded Power-on Reset, Software, External Reset Pin and Peripheral Events
- Management of All System Resets, Including
  - External devices through an I/O multiplexed output reset pin
  - Processor
  - Peripheral set
- Reset Source Status
  - Status of the last reset
  - Either VDDCORE, VDDIN33 and VDDBU POR reset, Software reset, User reset, Watchdog reset, 32.768 kHz Crystal Oscillator Failure Detection reset

### 31.3. Block Diagram

Figure 31.1. RSTC Block Diagram

### 31.4. Functional Description

The RSTC is made up of an NRST manager and a reset state manager. The RSTC clock is MD\_SLCK (monitoring domain slow clock). The RSTC generates the following reset signals:

- Processor reset line (also resets the Watchdog Timer)
- Entire set of embedded peripherals reset line
- NRST\_OUT pin

**Note:** Processor and peripheral reset lines are driven in the same way.

These internal reset signals are asserted by the RSTC, either on events generated by peripherals, events on NRST pin, or on software action. The reset state manager controls the generation of reset signals and drives the NRST\_OUT pin when required.

The NRST manager asserts the NRST\_OUT pin during a programmable time, thus controlling external device resets.

The Mode register (RSTC\_MR), used to configure the RSTC, is powered by VDDBU.

#### 31.4.1. NRST Manager

The NRST manager samples the NRST pin and drives the NRST\_OUT pin low when required by the reset state manager. See the following figure.

**Figure 31.2.** NRST Pin Management

##### 31.4.1.1. NRST Signal or Interrupt

The NRST manager handles the NRST input line asynchronously if **RSTC\_MR.URSTASYNC = 1**. When the NRST input is low, a user reset is immediately reported to the Reset State manager and the internal reset signals are asserted even if there is a clock failure on MD\_SLCK (safe reset).

The NRST manager handles the NRST input line synchronously if **RSTC\_MR.URSTASYNC = 0**. When the line is low, it is first resynchronized on slow clock before it is reported to the Reset State manager. In both cases, when the NRST goes from low to high, the internal reset is synchronized with the monitoring slow clock to provide a safe internal de-assertion of reset (if enabled).

If **RSTC\_MR.URSTEN = 0**, the assertion of the NRST input pin does not trigger a VDDCORE domain reset.

The level of the pin NRST is reported in **NRSTL** of the Status register (**RSTC\_SR**).

As soon as the pin NRST is asserted (low level), **RSTC\_SR.URSTS = 1**. This bit is cleared on read.

If RSTC\_MR.URSTIEN=1, the assertion of NRST pin triggers an interrupt rather than a VDDCORE reset.

### 31.4.1.2. NRST\_OUT External Reset Control

The RSTC can be configured to assert the external reset line (NRST\_OUT). The NRST\_OUT pin is driven low for a time programmed by RSTC\_MR.ERSTL. This assertion duration lasts  $2^{(ERSTL+1)}$  MD\_SLCK cycles. This assertion duration time is in the range of 60  $\mu$ s to 2 seconds. If ERSTL=0, a two slow clock period duration is generated on the NRST\_OUT pin.

This feature allows the NRST\_OUT line to be compliant with any external devices connected on the system reset (i.e., when external devices require a longer start-up time than the processor system).

### 31.4.2. Reset States

The reset state manager handles the different reset sources and generates the internal reset signals. It reports the reset status in RSTC\_SR.RSTTYP. RSTC\_SR.RSTTYP is updated when the Processor reset is released.

If more than one reset event occurred since the last read of RST\_SR, the field RSTTYP reports the first reset that occurred.

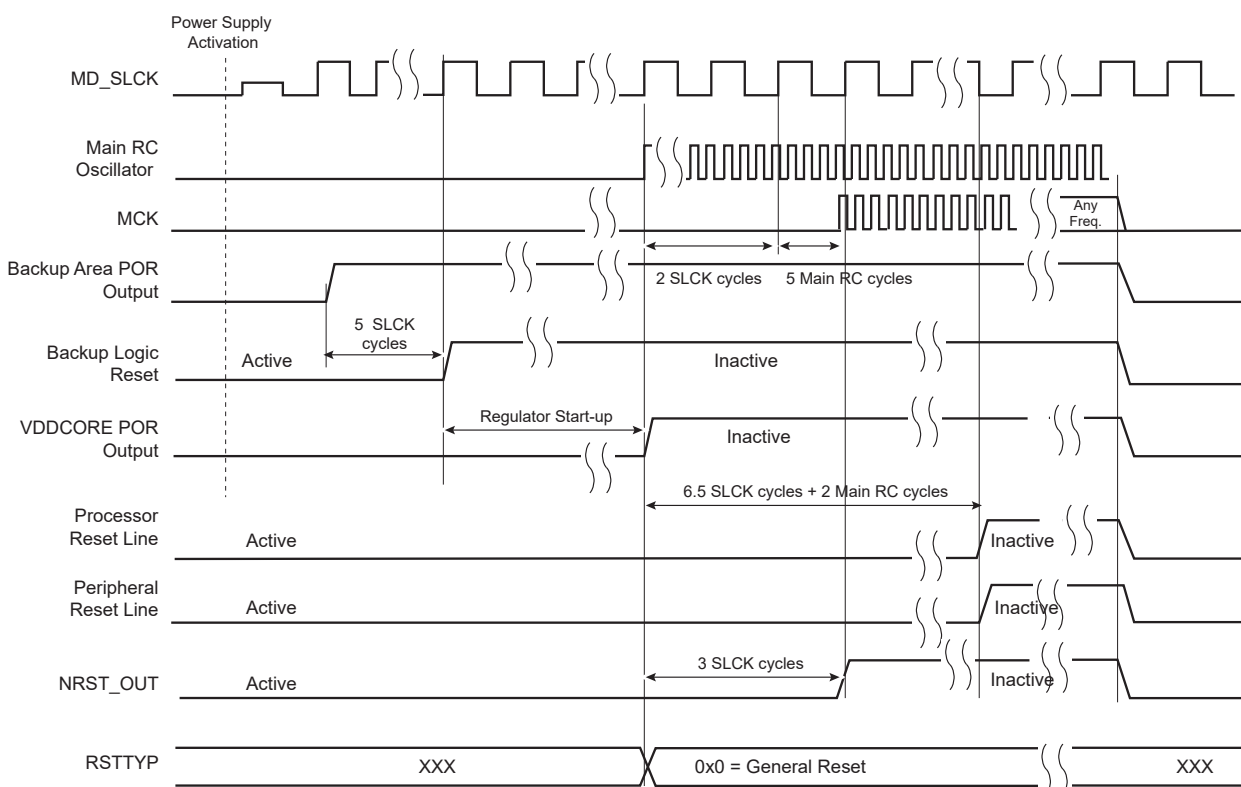

#### 31.4.2.1. General Reset

A general reset occurs when a VDDBU Power-on reset is detected. The internal VDDCORE reset signal is asserted when a general reset occurs. All the reset signals are released and RSTC\_SR.RSTTYP reports a general reset.

The NRST\_OUT line rises two cycles after the VDDCORE reset line, as ERSTL defaults at value 0x0.

The following figure shows how the general reset affects the reset signals.

**Figure 31.3.** General Reset Timing Diagram

### 31.4.2.2.Backup Exit Reset

A Backup reset occurs when the chip exits from Backup mode. While exiting Backup mode, the VDDCORE reset signal is de-asserted.

RSTC\_SR.RSTTYP is updated to report a Backup reset.

### 31.4.2.3.32.768 kHz Crystal Oscillator Failure Detection Reset

The 32.768 kHz Crystal Oscillator Failure Detection reset is done when the 32.768 kHz crystal oscillator frequency monitoring circuitry in the PMC detects a failure and RSTC\_MR.SCKSW is written to '1'. This reset lasts three slow clock cycles.

When RSTC\_MR.SCKSW is written to '0', the 32.768 kHz crystal oscillator fault has no impact on the RSTC.

During the 32.768 kHz Crystal Oscillator Failure Detection reset, the Processor reset and the Peripheral reset are asserted. The NRST\_OUT line is also asserted, depending on the value of RSTC\_MR.ERSTL.

When the 32.768 kHz crystal oscillator failure generates a VDDCORE reset, PMC\_SR.XT32KERR is automatically cleared by the Peripheral and Processor resets.

**Figure 31.4.** 32.768 kHz Crystal Oscillator Failure Detection Reset Timing Diagram

### 31.4.2.4.Watchdog Reset

The Watchdog reset is entered when a watchdog fault occurs. This reset lasts three MD\_SLCK cycles.

When in Watchdog reset, the Processor reset and the Peripheral reset are asserted. The NRST\_OUT line is also asserted, depending on the value of RSTC\_MR.ERSTL. However, the resulting low level on NRST\_OUT does not result in a User reset state.

The WDT is reset by the Processor reset signal. As the watchdog fault always causes a Processor reset if WDT\_MR.WDRSTEN is written to '1', the WDT is always reset after a Watchdog reset, and the Watchdog is enabled by default and with a period set to a maximum.

When WDT\_MR.WDRSTEN is written to '0', the watchdog fault has no impact on the RSTC.

After a watchdog overflow occurs, the report on the RSTC\_SR.RSTTYP may differ (either WDT\_RST or USER\_RST) depending on the external components driving the NRST pin. For example, if the

NRST line is driven through a resistor and a capacitor (NRST pin debouncer), the reported value is USER\_RST if the low-to-high transition is greater than one MD\_SLCK cycle.

**Figure 31.5.** Watchdog Reset Timing Diagram

### 31.4.2.5. Software Reset

The RSTC offers commands to assert the different reset signals. These commands are performed by writing the Control register (RSTC\_CR) with the following bits at '1':

- RSTC\_CR.PROCRST: Writing a '1' to PROCRST resets the processor and all the embedded peripherals, including the memory system and, in particular, the Remap Command.
- RSTC\_CR.EXTRST: Writing a '1' to EXTRST asserts low the NRST\_OUT pin during a time defined by the field RSTC\_MR.ERSTL.

The Software reset is entered if at least one of these bits is written to '1' by the software. All these commands can be performed independently or simultaneously. The Software reset lasts three MD\_SLCK cycles.

The internal reset signals are asserted as soon as the register write is performed. They are released when the Software reset has ended, i.e., synchronously to MD\_SLCK.

If EXTRST is written to '1', the NRST\_OUT pin is asserted depending on the configuration of RSTC\_MR.ERSTL. However, the resulting falling edge on NRST\_OUT does not lead to a User reset.

If and only if the RSTC\_CR.PROCRST is written to '1', the RSTC reports the software status in field RSTC\_SR.RSTTYP. Other software resets are not reported in RSTTYP.

As soon as a software operation is detected, RSTC\_SR.SRCMP is written to '1'. SRCMP is cleared at the end of the Software reset. No other Software reset can be performed while SRCMP='1', and writing any value in the RSTC\_CR has no effect.

**Figure 31.6.** Software Reset Timing Diagram (PROCRST)

### 31.4.2.6. User Reset

The User reset is entered when a low level is detected on the NRST pin and `RSTC_MR.URSTEN = 1`. If `URSTASYNC = 1`, a falling edge of the NRST input signal immediately asserts internal reset lines. If `URSTASYNC = 0`, the NRST input signal is resynchronized and internal reset lines are asserted once a falling edge has been detected on the resynchronized NRST input signal.

The Processor reset and the Peripheral reset are asserted.

The User reset is released when NRST rises, after a two-cycle resynchronization time and a 2-cycle processor start-up. The processor clock is re-enabled as soon as NRST is confirmed high.

When the Processor reset signal is released, `RSTC_SR.RSTTYP` is loaded with the value `0x4`, indicating a User reset.

The NRST manager ensures that the NRST\_OUT line is asserted as programmed in the field `ERSTL`. However, if NRST is driven low externally, the internal reset lines remain asserted until NRST rises.

**Figure 31.7.** User Reset State (URSTASYNC = '0')

**Figure 31.8.** User Reset State (URSTASYNC = '1')

### 31.4.3. Reset State Priorities

The reset state manager manages the priorities among the different reset sources. The resets are listed in order of priority as follows:

1. General reset
2. Backup reset
3. 32.768 kHz Crystal Failure Detection reset

4. Watchdog reset
5. Software reset
6. User reset

Specific cases are listed below:

- When in User reset:
  - A watchdog event is impossible because the WDT is being reset by the Processor reset signal.
  - A Software reset is impossible, since the Processor reset is being activated.
- When in Software reset:
  - A watchdog event has priority over the current state.
  - The NRST has no effect.
- When in Watchdog reset:
  - The Processor reset is active and so a Software reset cannot be programmed.
  - A User reset cannot be entered.

## 31.5. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	RSTC_CR	31:24	KEY[7:0]

Bit	23	22	21	20	19	18	17	16
							SRCMP	NRSTL
Access							R	R
Reset							0	0
Bit	15	14	13	12	11	10	9	8
							RSTTYP[2:0]	
Access						R	R	R
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0
								URSTS
Access								R
Reset								1

#### Bit 17 – SRCMP Software Reset Command in Progress

When set, indicates that a software reset command is in progress and that no further software reset should be performed until the end of the current one. This bit is automatically cleared at the end of the current software reset.

Value	Description
0	No software command is being performed by the RSTC. The RSTC is ready for a software command.
1	A software reset command is being performed by the RSTC. The RSTC is busy.

#### Bit 16 – NRSTL NRST Pin Level

Registers the NRST pin level sampled on each MCK rising edge.

#### Bits 10:8 – RSTTYP[2:0] Reset Type

Reports the cause of the last processor reset. Reading RSTC\_SR does not reset this field.

Value	Name	Description
0	GENERAL_RST	First power-up reset
1	BACKUP_RST	Return from Backup mode
2	WDT_RST	Watchdog fault occurred
3	SOFT_RST	Processor reset required by the software
4	USER_RST	NRST pin detected low
5	–	Reserved
6	–	Reserved
7	SLCK_XTAL_RST	32.768 kHz crystal failure detection fault occurred

**Bit 0 – URSTS** User Reset Status

A high-to-low transition of the NRST pin sets URSTS. This transition is also detected on the MCK rising edge. If the user reset is disabled (RSTC\_MR.URSTEN = 0) and if the interrupt is enabled by RSTC\_MR.URSTIEN, URSTS triggers an interrupt. Reading RSTC\_SR resets URSTS and clears the interrupt.

Value	Description
0	No high-to-low edge on NRST happened since the last read of RSTC_SR.
1	At least one high-to-low transition of NRST has been detected since the last read of RSTC_SR.

### 31.5.3. RSTC Mode Register

**Name:** RSTC\_MR  
**Offset:** 0x08  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
	KEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–
Bit	23	22	21	20	19	18	17	16
				ENGCLR				
Access				R/W				
Reset				0				
Bit	15	14	13	12	11	10	9	8
					ERSTL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
				URSTIEN		URSTASYNC	SCKSW	URSTEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	1

#### Bits 31:24 – KEY[7:0] Write Access Password

Value	Name	Description
0xA5	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

#### Bit 20 – ENGCLR Enable GPBR Clear on Tamper Event

Value	Description
0	Disables the GPBR immediate clear on tamper detection event.
1	Enables the GPBR immediate clear on tamper detection event

#### Bits 11:8 – ERSTL[3:0] External Reset Length

This field defines the external reset length. The external reset pin RST\_OUT is asserted during a time of  $2^{(ERSTL+1)}$  MD\_SLCK cycles. This allows assertion duration to be programmed between 60  $\mu$ s and 2 seconds. Note that synchronization cycles must also be considered when calculating the actual reset length as previously described.

#### Bit 4 – URSTIEN User Reset Interrupt Enable

Value	Description
0	RSTC_SR.USRTS at '1' has no effect on the RSTC interrupt line.
1	RSTC_SR.USRTS at '1' asserts the RSTC interrupt line if URSTEN = 0.

#### Bit 2 – URSTASYNC User Reset Asynchronous Control

See [NRST Signal or Interrupt](#) for important information on the use of URSTASYNC.

Value	Description
0	The NRST input signal is managed synchronously.
1	The NRST input signal is managed asynchronously. <b>Note:</b> This mode cannot be selected if the external bus interface drives an SDR/DDR memory device and another memory on the same bus.

**Bit 1 – SCKSW** Slow Clock Switching

Value	Description
0	The detection of a 32.768 kHz crystal failure has no effect.
1	The detection of a 32.768 kHz crystal failure resets the logic supplied by VDDCORE.

**Bit 0 – URSTEN** User Reset Enable

Value	Description
0	The detection of a low level on the NRST pin does not generate a user reset.
1	The detection of a low level on the NRST pin triggers a user reset.

## 32. Real-Time Timer (RTT)

### 32.1. Description

The Real-Time Timer (RTT) is built around a 32-bit counter used to count roll-over events of the programmable 16-bit prescaler driven from the 32-kHz slow clock source. It generates a periodic interrupt and/or triggers an alarm on a programmed value.

The RTT can also be configured to be driven by the 1Hz RTC signal, thus taking advantage of a calibrated 1Hz clock.

The slow clock source can be fully disabled to reduce power consumption when only an elapsed seconds count is required.

## 32.2. Embedded Characteristics

- 32-bit Free-running Counter on Prescaled Slow Clock or RTC Calibrated 1Hz Clock
- 16-bit Configurable Prescaler
- Interrupt on Alarm or Counter Increment
- Programmable Event

### 32.3. Block Diagram

### Figure 32.1. RTT Block Diagram

### 32.4. Functional Description

The programmable 16-bit prescaler value can be configured through the RTPRES field in the RTT Mode register (RTT\_MR).

Configuring RTPRES to 0x8000 (default value) corresponds to feeding the real-time counter with a 1Hz signal (if the slow clock is 32.768 kHz). The 32-bit counter can count up to  $2^{32}$  seconds, corresponding to more than 136 years, then roll over to 0. Bit RTTINC in the RTT Status register (RTT\_SR) is set each time there is a prescaler roll-over (see the figure below).

The real-time 32-bit counter can also be supplied by the 1Hz RTC clock. This mode is applicable when the RTC 1Hz is calibrated (RTC\_MR.CORRECTION  $\neq$  0) in order to ensure the synchronism between RTC and RTT counters.

Setting RTT\_MR.RTC1HZ drives the 32-bit RTT counter from the 1Hz RTC clock. In this mode, RTPRES has no effect on the 32-bit counter.

The prescaler roll-over generates an increment of the RTT counter if RTC1HZ = 0. Otherwise, if RTC1HZ = 1, the RTT counter is incremented every second. RTTINC is set independently from the 32-bit counter increment.

The RTT can also be used as a free-running timer with a lower time-base. The best accuracy is achieved by writing RTT\_MR.RTPRES to 3.

Programming RTPRES to 1 or 2 is forbidden.

The CRTV field can be read at any time in the RTT Value register (RTT\_VR). As this value can be updated asynchronously with the peripheral bus clock, CRTV must be read twice at the same value to read a correct value.

The current value of the counter is compared with the value written in the RTT Alarm register (RTT\_AR). If the counter value matches the alarm, the ALMS bit in the RTT\_SR is set. The RTT\_AR is set to its maximum value (0xFFFFFFFF) after a reset.

ALMS is always a source of the RTT alarm signal that may be used to exit the system from low power modes (see the [RTT Block Diagram](#) above).

The alarm interrupt must be disabled (RTT\_MR.ALMIEEN must be cleared) when writing a new value to RTT\_AR.ALMV.

RTT\_SR.RTTINC can be used to start a periodic interrupt. The period is one second when RTT\_MR.RTPRES = 0x8000 and the slow clock = 32.768 kHz.

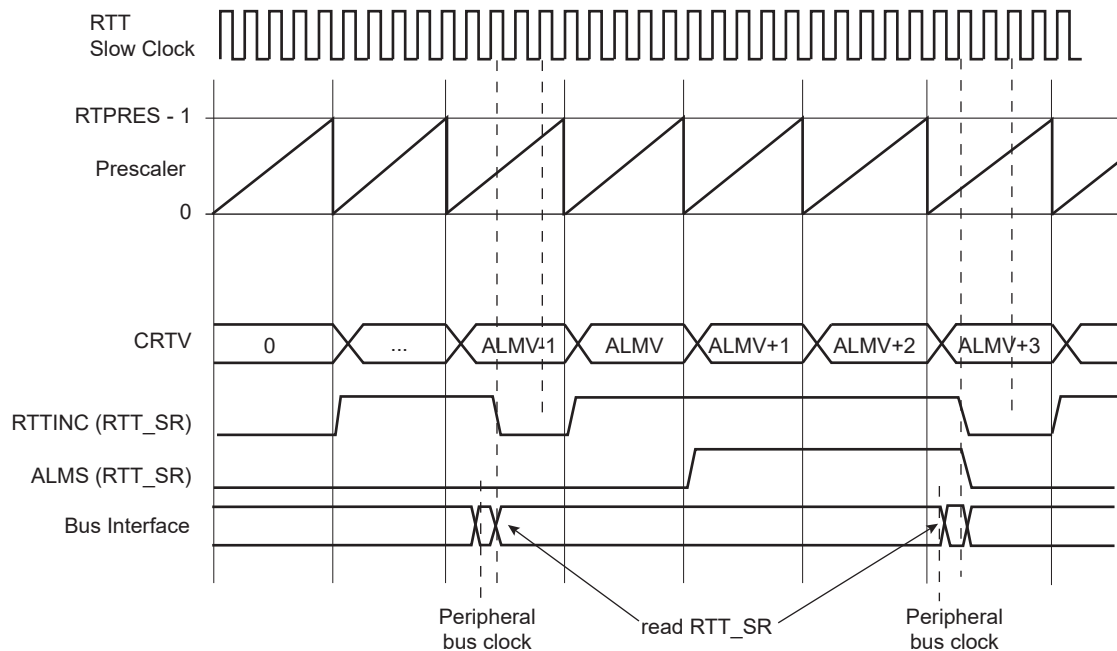

RTT\_MR.RTTINCIEN must be cleared prior to writing a new value in RTT\_MR. RTPRES.

Reading RTT\_SR automatically clears RTT\_SR.RTTINC and RTT\_SR.ALMS.

Writing RTT\_MR.RTTRST immediately reloads and restarts the clock divider with the new programmed value. This also resets the 32-bit counter.

When not used, the RTT can be disabled in order to suppress dynamic power consumption in this module. This can be achieved by setting RTT\_MR.RTTDIS.

**Figure 32.2.** RTT Counting

The RTTINC2 flag is set when the number of prescaler roll-overs programmed through the SELINC2 field in the RTT Modulo Selection register (RTT\_MODR) has been reached since the last read of RTT\_SR.

For example, it is possible to generate two sources of interrupt of different periods with flags RTTINC and RTTINC2. If the RTT slow clock frequency is 32.768 kHz and RTPRES=32, the RTTINC flag rises 1024 times per second (less than 1 ms period). If the field SELINC2=5, the RTTINC2 flag rises once per second.

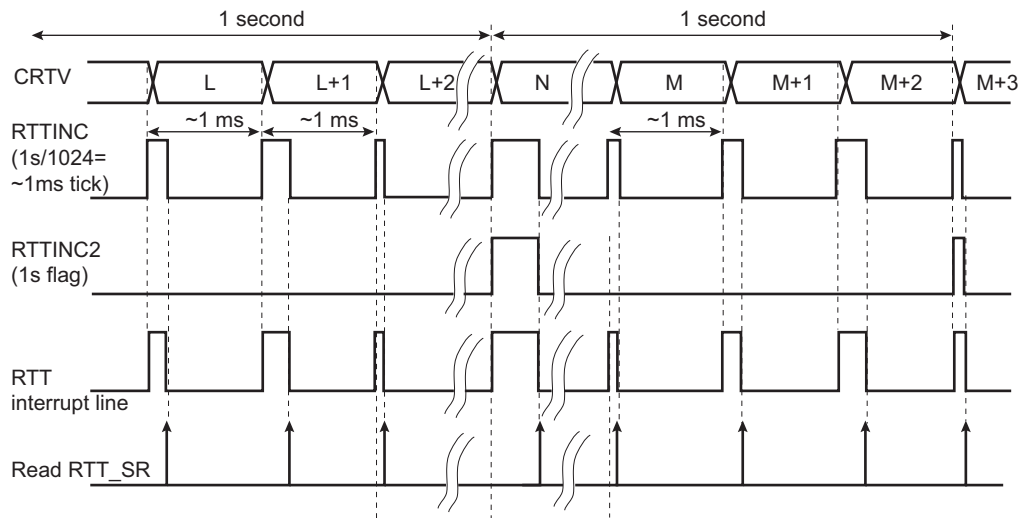

If RTTINC is defined as the unique source of interrupt (RTTINCEN=1, ALMIEN=0 and INC2AEN=0 in RTT\_MR), the value read in RTT\_SR by the interrupt handler determines if the current interrupt event corresponds to a 1-second event (RTT\_SR[2:1]=3) or to a 1-millisecond event (RTT\_SR[2:1]=1). See the figure below.

If the bit INC2AEN=1, RTTINC2 flag is also a source for the RTT alarm signal. See [RTT Block Diagram](#).

**Figure 32.3. RTTINC2 Behavior**

RTT slow clock=32.768KHz, RTPRES=32, SELINC2=5

## 32.5. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

**32.5.1. Real-Time Timer Mode Register**

**Name:** RTT\_MR  
**Offset:** 0x00  
**Reset:** 0x00008000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
								RTC1HZ
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16
			INC2AEN	RTTDIS		RTTRST	RTTINCIEN	ALMIEN
Access			R/W	R/W		R/W	R/W	R/W
Reset			0	0		0	0	0

Bit	15	14	13	12	11	10	9	8
	RTPRES[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RTPRES[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 24 – RTC1HZ** Real-Time Clock 1Hz Clock Selection

Value	Description
0	The RTT 32-bit counter is driven by the 16-bit prescaler roll-over events.
1	The RTT 32-bit counter is driven by the 1Hz RTC clock.

**Bit 21 – INC2AEN** RTTINC2 Alarm and Interrupt Enable

Value	Description
0	The RTTINC2 flag is not a source of the RTT alarm signal nor a source of interrupt.
1	The RTTINC2 flag is a source of the RTT alarm signal and a source of interrupt.

**Bit 20 – RTTDIS** Real-Time Timer Disable

Value	Description
0	The RTT is enabled.
1	The RTT is disabled (no dynamic power consumption).

**Bit 18 – RTTRST** Real-Time Timer Restart

Value	Description
0	No effect.
1	Reloads and restarts the clock divider with the new programmed value. This also resets the 32-bit counter.

**Bit 17 – RTTINCIEN** Real-Time Timer Increment Interrupt Enable

Value	Description
0	The RTT_SR.RTTINC bit has no effect on interrupt.
1	The RTT_SR.RTTINC bit asserts interrupt.

**Bit 16 – ALMIEN** Alarm Interrupt Enable

Value	Description
0	The RTT_SR.ALMS bit has no effect on interrupt.
1	The RTT_SR.ALMS bit asserts interrupt.

**Bits 15:0 – RTPRES[15:0]** Real-Time Timer Prescaler Value

Defines the number of RTT slow clock periods required to increment the Real-Time Timer. The RTTINCIEN bit must be cleared prior to writing a new RTPRES value.

RTPRES is defined as follows:

- RTPRES = 0: The prescaler period is equal to  $2^{16}$  \* slow clock periods.
- RTPRES = 1 or 2: forbidden.
- RTPRES  $\neq$  0, 1 or 2: The prescaler period is equal to RTPRES \* slow clock periods.

**32.5.2. Real-Time Timer Alarm Register**

**Name:** RTT\_AR  
**Offset:** 0x04  
**Reset:** 0xFFFFFFFF  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
	ALMV[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	23	22	21	20	19	18	17	16
	ALMV[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8
	ALMV[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1
Bit	7	6	5	4	3	2	1	0
	ALMV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

**Bits 31:0 – ALMV[31:0] Alarm Value**

When the CRTV value in RTT\_VR equals the ALMV field, the ALMS flag is set in RTT\_SR.

The alarm interrupt must be disabled (ALMIEN must be cleared in RTT\_MR) when writing a new ALMV value.

### 32.5.3. Real-Time Timer Value Register

**Name:** RTT\_VR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	CRTV[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CRTV[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CRTV[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CRTV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – CRTV[31:0] Current Real-Time Value

Returns the current value of the RTT.

As CRTV can be updated asynchronously, it must be read twice at the same value.

### 32.5.4. Real-Time Timer Status Register

**Name:** RTT\_SR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						RTTINC2	RTTINC	ALMS
Access						R	R	R
Reset						0	0	0

#### Bit 2 – RTTINC2 Predefined Number of Prescaler Roll-Over Status (cleared on read)

Value	Description
0	SELINC2 = 0 or the number of prescaler roll-overs programmed through the SELINC2 field in RTT_MODR has not been reached since the last read of RTT_SR.
1	The number of prescaler roll-overs programmed through the SELINC2 field has been reached since the last read of RTT_SR.

#### Bit 1 – RTTINC Prescaler Roll-Over Status (cleared on read)

Value	Description
0	No prescaler roll-over occurred since the last read of RTT_SR.
1	Prescaler roll-over occurred since the last read of RTT_SR.

#### Bit 0 – ALMS Real-Time Alarm Status (cleared on read)

Value	Description
0	The real-time alarm has not occurred since the last read of RTT_SR.
1	The real-time alarm occurred since the last read of RTT_SR.

### 32.5.5. Real-Time Timer Modulo Selection Register

**Name:** RTT\_MODR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						SELINC2[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 2:0 – SELINC2[2:0] Selection of the 32-bit Counter Modulo to generate RTTINC2 Flag

Value	Name	Description
0	NO_RTTINC2	The RTTINC2 flag never rises.
1	MOD64	The RTTINC2 flag is set when CRTC modulo 64 equals 0.
2	MOD128	The RTTINC2 flag is set when CRTC modulo 128 equals 0.
3	MOD256	The RTTINC2 flag is set when CRTC modulo 256 equals 0.
4	MOD512	The RTTINC2 flag is set when CRTC modulo 512 equals 0.
5	MOD1024	The RTTINC2 flag is set when CRTC modulo 1024 equals 0. Example: If RTPRES=32 then RTTINC2 flag rises once per second if the slow clock is 32.768 kHz.
6	MOD2048	The RTTINC2 flag is set when CRTC modulo 2048 equals 0.
7	MOD4096	The RTTINC2 flag is set when CRTC modulo 4096 equals 0.

**32.5.6. Real-Time Timer Timestamp Register**

**Name:** RTT\_TSR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	TS_OVF	TSTAMP[30:24]						
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TSTAMP[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TSTAMP[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TSTAMP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 31 – TS\_OVF** Timestamp Overflow

Value	Description
0	RTT_ST.RTTINC2 was set but no new event occurred since the last read of RTT_SR.
1	RTT_ST.RTTINC2 was set and a second event occurred. To avoid any overflow, clear RTTINC2 by reading RTT_SR.

**Bits 30:0 – TSTAMP[30:0]** Real-Time Timer Value Timestamp

Each time an event triggers the flag RTT\_SR.RTTINC2, RTT\_VR.CRTV is copied into RTT\_TSR.TSTAMP. The field TSTAMP remains stable until the next RTTINC2 event and can be used for event timestamping.

## 33. Real-Time Clock (RTC)

### 33.1. Description

The Real-Time Clock (RTC) peripheral is designed for very low power consumption. For optimal functionality, the RTC requires an accurate external 32.768 kHz clock, which can be provided by a crystal oscillator.

It combines a complete time-of-day clock with alarm and a Gregorian calendar, complemented by a programmable periodic interrupt. The alarm and calendar registers are accessed by a 32-bit data bus.

The RTC can also be configured for the UTC time format.

The time and calendar values are coded in binary-coded decimal (BCD) format. The time format can be 24-hour mode or 12-hour mode with an AM/PM indicator.

Updating time and calendar fields and configuring the alarm fields are performed by a parallel capture on the 32-bit data bus. An entry control is performed to avoid loading registers with incompatible BCD format data or with an incompatible date according to the current month/year/century.

A clock divider calibration circuitry can be used to compensate for crystal oscillator frequency variations.

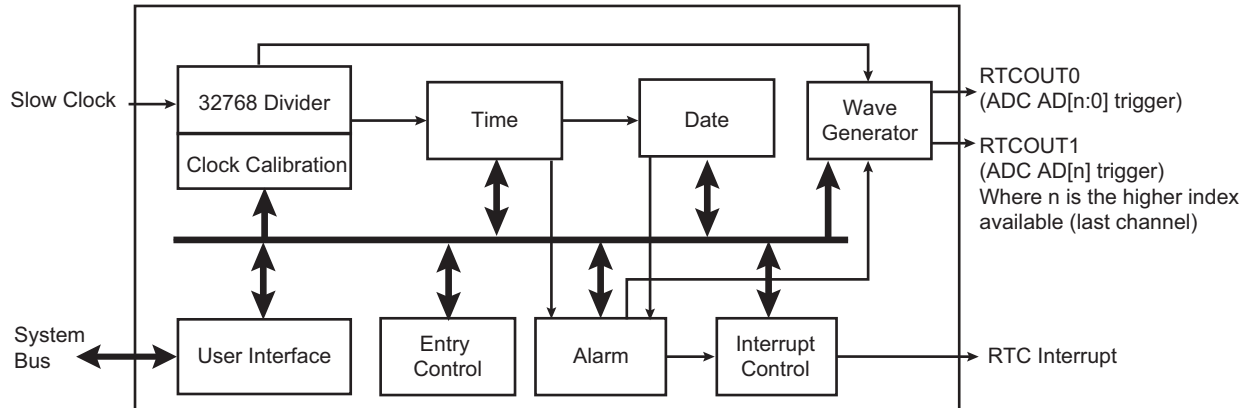

Timestamping capability reports the first and last occurrences of tamper events.

### 33.2. Embedded Characteristics

- Full Asynchronous Design for Ultra Low-Power Consumption
- Gregorian and UTC Modes Supported
- Programmable Periodic Interrupt
- Safety/Security Features:
  - Valid time and date programming check
  - On-the-fly time and date validity check
- Counters Calibration Circuitry to Compensate for Crystal Oscillator Variations
- Waveform Generation for Trigger Event
- Tamper Control Registers and Detection Logic
- Tamper Timestamping Registers
- Register Write Protection

### 33.3. Block Diagram

Figure 33.1. RTC Block Diagram

### 33.4. Product Dependencies

#### 33.4.1. Power Management

The Real-Time Clock is continuously clocked at 32.768 kHz. The Power Management Controller (PMC) has no effect on RTC behavior.

#### 33.4.2. Interrupt

Within the System Controller, the RTC interrupt is OR-wired with all the other module interrupts.

Only one System Controller interrupt line is connected on one of the internal sources of the interrupt controller.

RTC interrupt requires the interrupt controller to be programmed first.

When a System Controller interrupt occurs, the service routine must first determine the cause of the interrupt. This is done by reading each status register of the System Controller peripherals successively.

### 33.5. Functional Description

The RTC provides a full binary-coded decimal (BCD) clock that includes century (19/20), year (with leap years), month, date, day, hours, minutes and seconds reported in [RTC Time Register \(RTC\\_TIMR\)](#) and [RTC Calendar Register \(RTC\\_CALR\)](#).

The RTC can operate in UTC mode, giving the number of seconds elapsed since a reference time defined by the user (the UTC standard—ISO 8601—reference time is the 30th of June 1972). In this mode, the timefield is 32 bits wide and coded in hexadecimal format.

The valid year range is up to 2099 in Gregorian mode.

The RTC can operate in 24-hour mode or in 12-hour mode with an AM/PM indicator.

Corrections for leap years are included (all years divisible by 4 being leap years except 1900). This is correct up to the year 2099.

The RTC can generate events to trigger ADC measurements.

#### 33.5.1. Reference Clock

The reference clock is the slow clock. It can be driven externally by a 32.768 kHz crystal, or internally.

### 33.5.2. Timing

In Gregorian mode, the RTC is updated in real time at one-second intervals in Normal mode for the counters of seconds, at one-minute intervals for the counter of minutes and so on.

In UTC mode, the RTC is updated in real-time at one-second intervals (32-bit UTC counter default configuration).

Due to the asynchronous operation of the RTC with respect to the rest of the chip, to ensure that the value read in the RTC registers (century, year, month, date, day, hours, minutes, seconds) are valid and stable, it is necessary to read these registers twice. If the data is the same both times, then it is valid. Therefore, a minimum of two and a maximum of three accesses are required.

### 33.5.3. Alarm

In Gregorian mode, the RTC has five programmable fields: month, date, hours, minutes and seconds.

Each of these fields can be enabled or disabled to match the alarm condition:

- If all the fields are enabled, an alarm flag is generated (the corresponding flag is asserted and an interrupt generated if enabled) at a given month, date, hour/minute/second.
- If only the “seconds” field is enabled, then an alarm is generated every minute.

Depending on the fields that are enabled in the RTC Calendar Alarm register (RTC\_CALALR) and the RTC Time Alarm register(RTC\_TIMALR), a large number of possibilities are available to the user ranging from minutes to 365/366 days.

**Note:** To change one of the RTC\_TIMALR.SEC, MIN, HOUR and/or RTC\_CALALR.DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to the RTC\_TIMALR or RTC\_CALALR. The first access clears the enable corresponding to the field to change (RTC\_TIMALR.SECEN, MINEN, HOUREN and/or RTC\_CALALR.DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (RTC\_TIMALR.SEC, MIN, HOUR and/or RTC\_CALALR.DATE, MONTH). The third access is required to re-enable the field by writing 1 in RTC\_TIMALR.SECEN, MINEN, HOUREN and/or RTC\_CALALR.DATEEN, MTHEN.

In UTC mode, RTC\_TIMALR must be configured to set the UTC alarm value and bit 0 in RTC\_CALALR must be used to enable or disable the UTC alarm. If the UTC alarm is enabled, the alarm is generated once the UTC time matches the programmed UTC\_TIME alarm field.

To change the UTC\_TIME alarm field, proceed as follows:

1. Disable the UTC alarm by clearing RTC\_CALALR.UTCEN if it is not already cleared.
2. Change the RTC\_TIMALR.UTC\_TIME alarm value.
3. Re-enable the UTC alarm by setting RTC\_CALALR.UTCEN.

### 33.5.4. Error Checking when Programming

Verification on user interface data is performed when accessing the century, year, month, date, day, hours, minutes, seconds and alarms. A check is performed on illegal BCD entries such as illegal date of the month with regard to the year and century configured.

If one of the time fields is not correct, the data is not loaded into the register/counter and a flag is set in the validity register. The user can not reset this flag. It is reset as soon as an acceptable value is programmed. This avoids any further side effects in the hardware. The same procedure is followed for the alarm.

The following checks are performed:

1. Century (check if it is in range 19–20)
2. Year (BCD entry check)

3. Date (check range 01–31)
4. Month (check if it is in BCD range 01–12, check validity regarding “date”)
5. Day (check range 1–7)
6. Hour (BCD checks: in 24-hour mode, check range 00–23 and check that AM/PM flag is not set if RTC is set in 24-hour mode; in 12-hour mode check range 01–12)
7. Minute (check BCD and range 00–59)
8. Second (check BCD and range 00–59)

**Notes:**

1. If the 12-hour mode is selected by means of the Mode register (RTC\_MR), a 12-hour value can be programmed and the returned value on RTC\_TIMR will be the corresponding 24-hour value. The entry control checks the value of the AM/PM indicator (bit 22 of RTC\_TIMR) to determine the range to be checked.
2. In UTC mode, no check is performed on the entries. The RTC does not report any failure.

### 33.5.5. RTC Internal Free-Running Counter Error Checking

To improve the reliability and security of the RTC, a permanent check is performed on the internal free-running counters to report non-BCD or invalid date/time values.

An error is reported by RTC\_SR.TDERR if an incorrect value has been detected. The flag can be cleared by setting the RTC\_SCCR.TDERRCLR.

In all cases, RTC\_SR.TDERR is set again if the source of the error has not been cleared before clearing RTC\_SR.TDERR. The clearing of the source of such error can be done by reprogramming a correct value on RTC\_CALR and/or RTC\_TIMR.

The RTC internal free-running counters may automatically clear the source of RTC\_SR.TDERR due to their roll-over (i.e., every 10 seconds for SECONDS[3:0] in RTC\_TIMR). In this case, RTC\_SR.TDERR is held high until a clear command is asserted by writing a 1 in RTC\_SCCR.TDERRCLR.

### 33.5.6. Updating Time/Calendar

#### 33.5.6.1. Calendar Mode

To update time and date, the RTC must be stopped by setting the corresponding field in the Control register (RTC\_CR). RTC\_CR.UPDTIM must be set to update time fields (hour, minute, second) and RTC\_CR.UPDCAL must be set to update calendar fields (century, year, month, date, day).

RTC\_SR.ACKUPD must then be read to 1 by either polling RTC\_SR or by enabling the acknowledge update interrupt by writing RTC\_IER.ACKUPD to ‘1’. Once RTC\_SR.ACKUPD is read to 1, it is mandatory to clear this flag by writing a 1 in RTC\_SCCR.ACKCLR, after which the user can write to the Time register (RTC\_TIMR), the Calendar register (RTC\_CALR), or both.

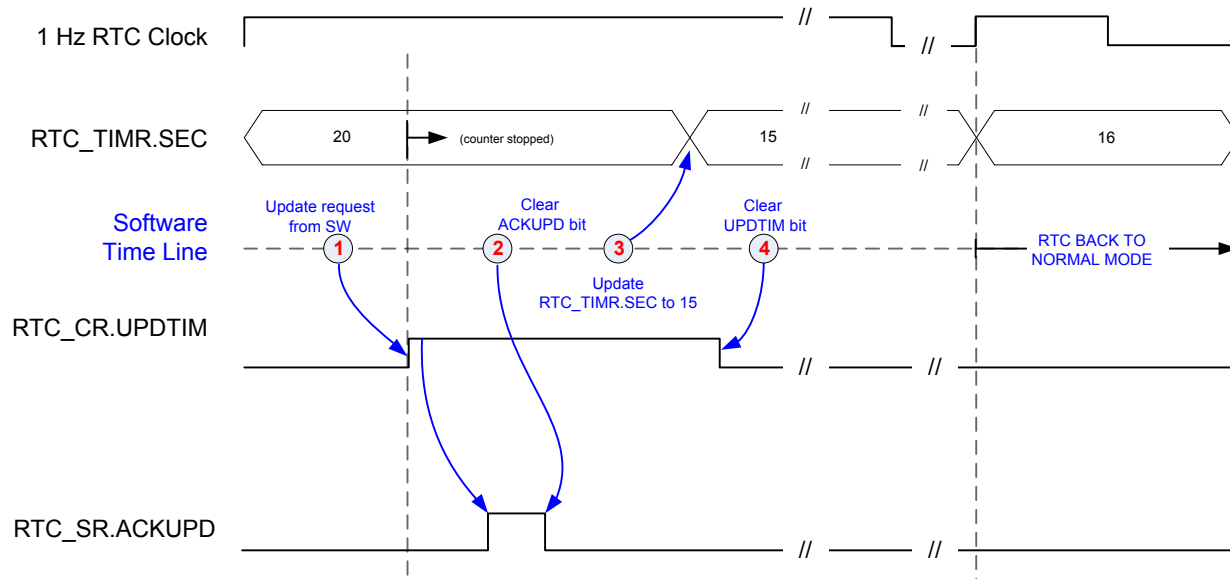

Once the update is finished, the user must write a ‘0’ in RTC\_CR.UPDTIM and/or RTC\_CR.UPDCAL.

The timing sequence of the time/calendar update is described in the figure below.

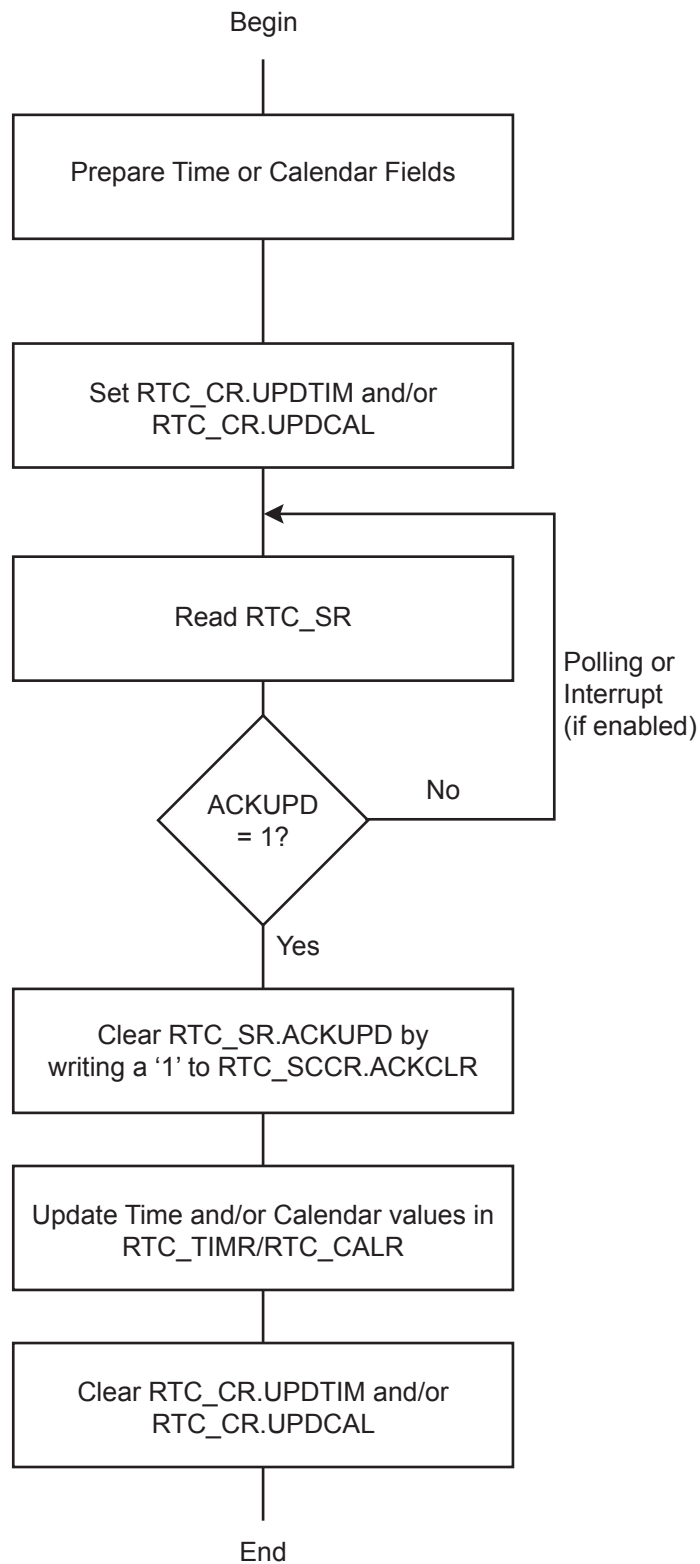

When entering the Programming mode of the calendar fields, the time fields remain enabled. When entering the Programming mode of the time fields, both the time and the calendar fields are stopped. This is due to the location of the calendar logical circuitry (downstream for low-power considerations).

In successive update operations, the user must first check that RTC\_CR.UPDTIM and RTC\_CR.UPDCAL read 0 before writing these bits to ‘1’.

**Figure 33.2.** Time/Calendar Update Timing Diagram

**Figure 33.3.** Calendar Mode Update Sequence

### 33.5.6.2. UTC Mode

To update the UTC time, the RTC must be stopped by writing a 1 in RTC\_CR.UPDTIM and RTC\_CR.UPDCAL.

RTC\_SR.ACKUPD must then be read to 1 by either polling RTC\_SR or by enabling the acknowledge update interrupt by writing a 1 in RTC\_IER.ACKUP. Once RTC\_SR.ACKUPD is read to 1, it is mandatory to clear this flag by writing a 1 in RTC\_SCCR.ACKCLR, after which the user can write to RTC\_TIMR.

Once the update is finished, the user must write a 0 in RTC\_CR.UPDTIM and a 0 in RTC\_CR.UPCAL.

In successive update operations, the user must first check that RTC\_CR.UPDTIM and RTC\_CR.UPDCAL read 0 before writing a 1 in these bits.

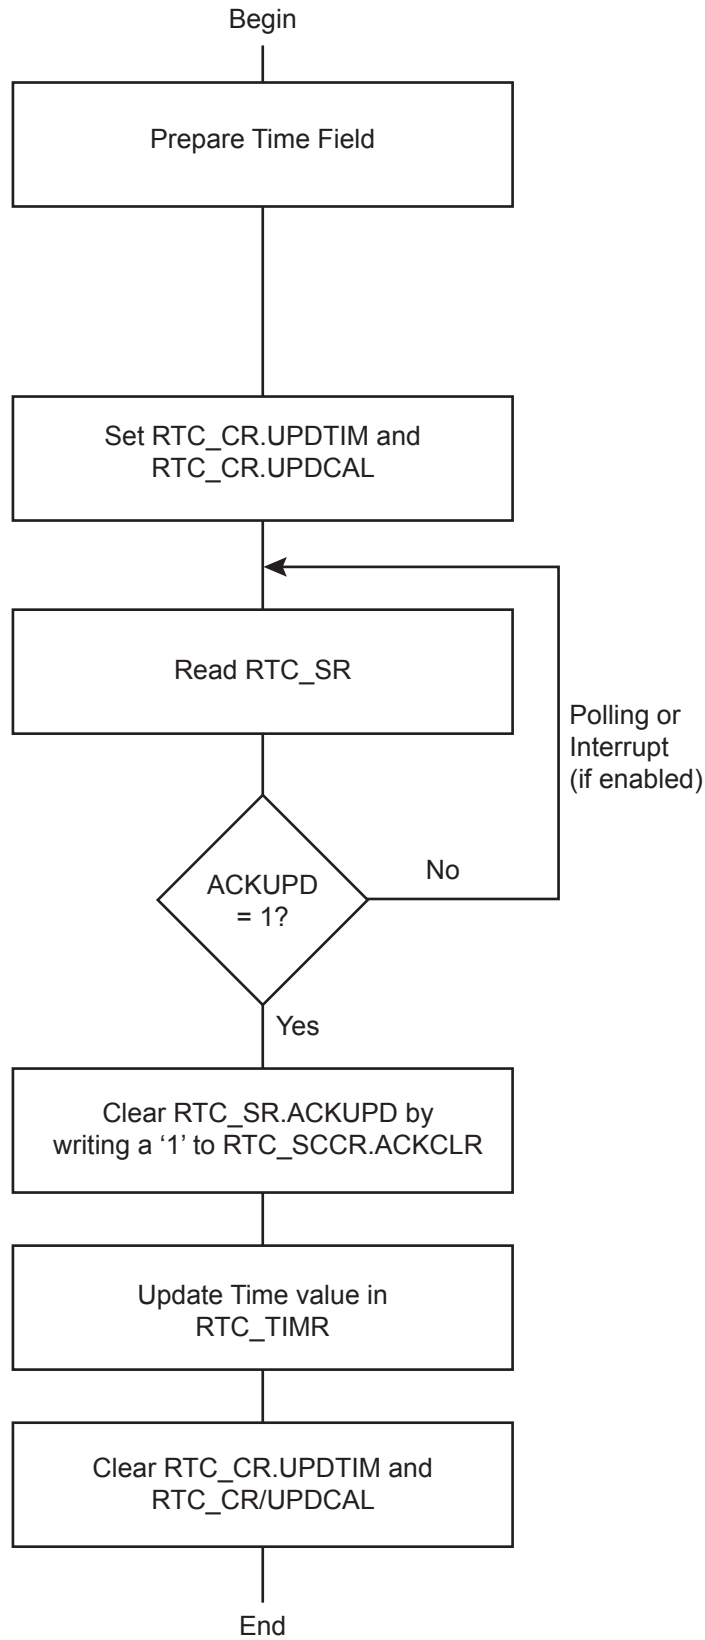

The timing sequence of the UTC time update is described in the figure below.

**Figure 33.4.** UTC Time Update Timing Diagram

**Figure 33.5.** UTC Mode Update Sequence

### 33.5.7. RTC Accurate Clock Calibration

The crystal oscillator that drives the RTC may not be as accurate as expected mainly due to temperature variation. The RTC is equipped with circuitry able to correct slow clock crystal drift.

To compensate for possible temperature variations over time, this accurate clock calibration circuitry can be programmed on-the-fly and also programmed during application manufacturing, in order to correct the crystal frequency accuracy at room temperature (20–25°C). The typical clock drift range at room temperature is  $\pm 20$  ppm.

In the device operating temperature range, the 32.768 kHz crystal oscillator clock inaccuracy can be up to -200 ppm.

The RTC clock calibration circuitry allows positive or negative correction in a range of 1.5 ppm to 1950 ppm.

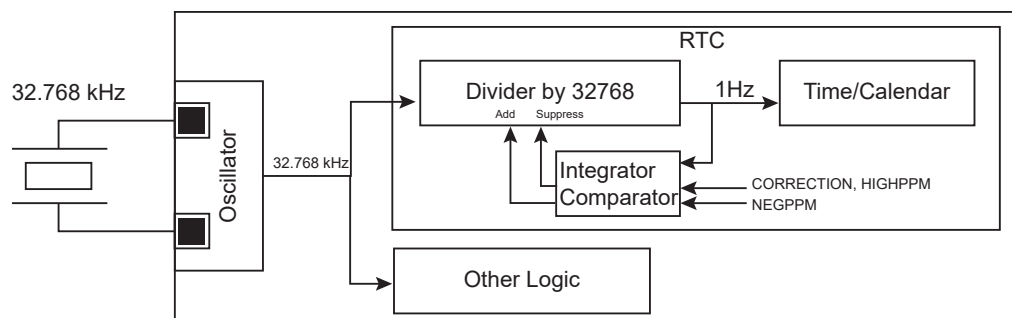

The calibration circuitry is fully digital. Thus, the configured correction is independent of temperature, voltage, process, etc., and no additional measurement is required to check that the correction is effective.

If the correction value configured in the calibration circuitry results from an accurate crystal frequency measure, the remaining accuracy is bounded by the values listed below:

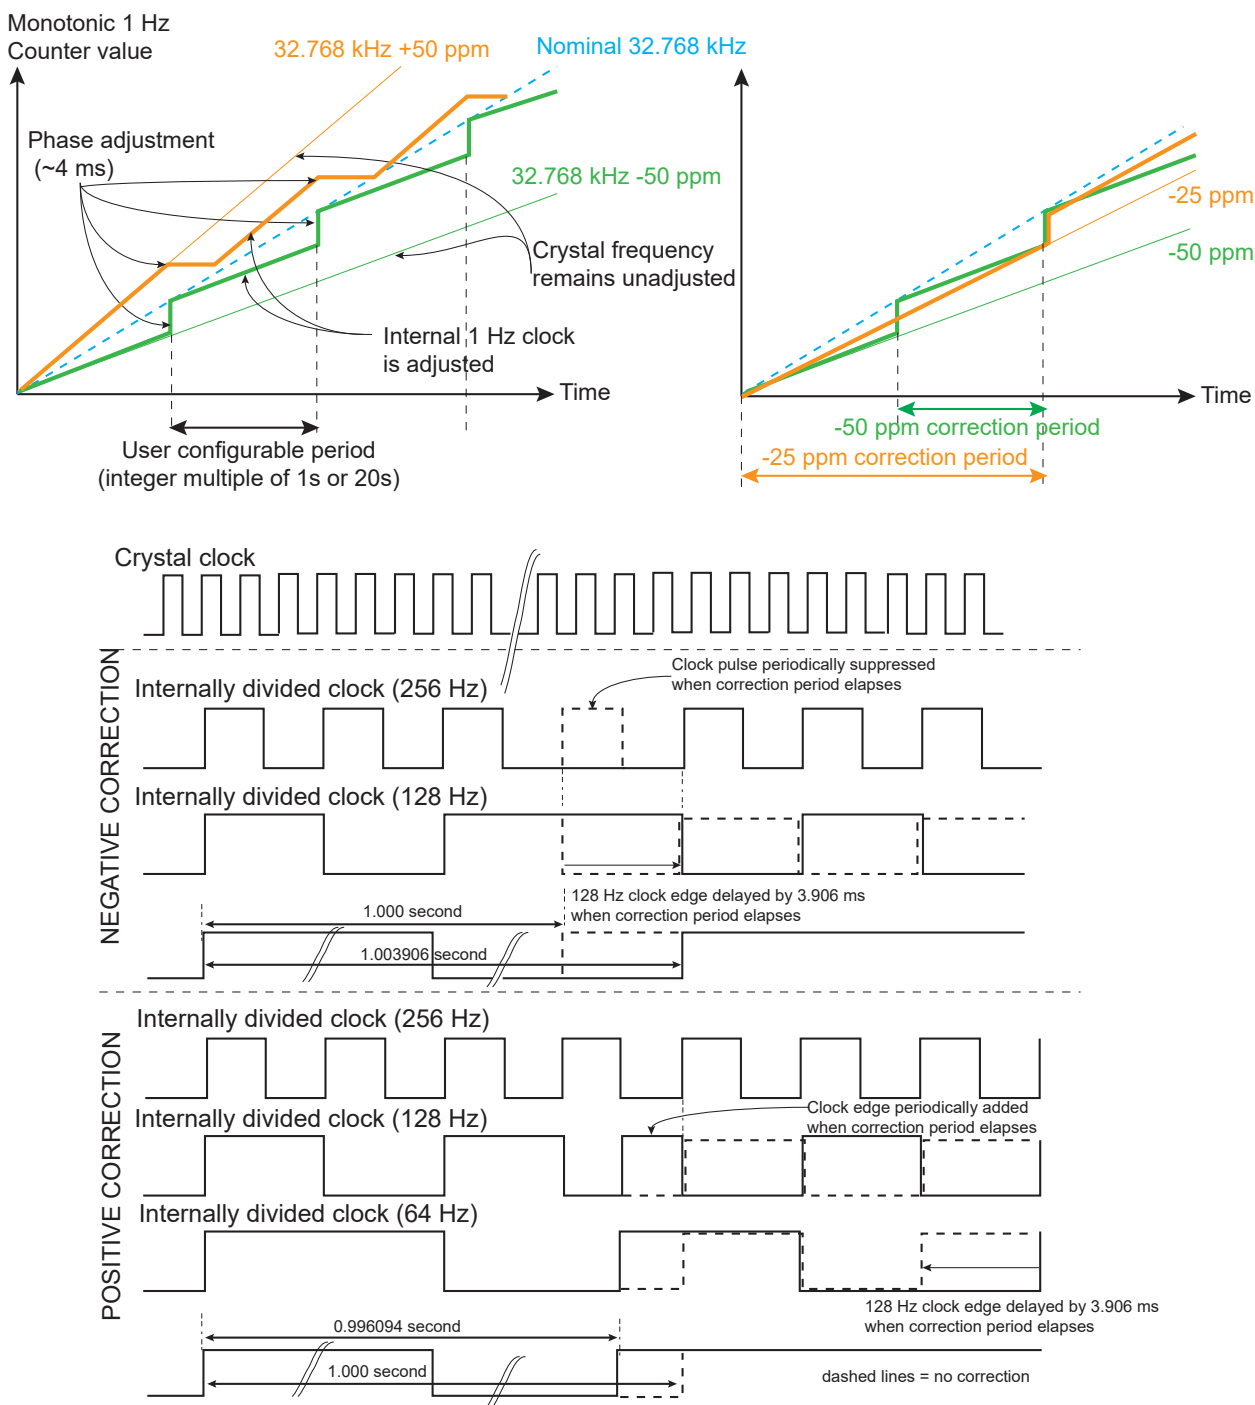

- Below 1 ppm, for an initial crystal drift between 1.5 ppm up to 20 ppm, and from 30 ppm to 90 ppm
- Below 2 ppm, for an initial crystal drift between 20 ppm up to 30 ppm, and from 90 ppm to 130 ppm
- Below 5 ppm, for an initial crystal drift between 130 ppm up to 200 ppm

The calibration circuitry does not modify the 32.768 kHz crystal oscillator clock frequency, but it acts by slightly modifying the 1 Hz clock period from time to time. The correction event occurs every  $1 + [(20 - (19 \times \text{HIGHPPM})) \times \text{CORRECTION}]$  seconds. When the period is modified, depending on the sign of the correction, the 1 Hz clock period increases or reduces by around 4 ms. Depending on the CORRECTION, NEGPPM and HIGHPPM values configured in RTC\_MR, the period interval between two correction events differs.

**Figure 33.6.** Calibration Circuitry

**Figure 33.7.** Calibration Circuitry Waveforms

Note that this adjustment does not take into account the temperature variation.

The frequency drift (up to -200 ppm) due to temperature variation can be compensated using a reference time if the application can access such a reference. If a reference time cannot be used, a temperature sensor can be placed close to the crystal oscillator in order to get the operating temperature of the crystal oscillator. Once obtained, the temperature may be converted using a

lookup table (describing the accuracy/temperature curve of the crystal oscillator used) and RTC\_MR configured accordingly. The calibration can be performed on-the-fly. This adjustment method is not based on a measurement of the crystal frequency/drift and therefore can be improved by means of the networking capability of the target application.

If no crystal frequency adjustment has been done during manufacturing, it is still possible to make adjustments. In the case where a reference time of the day can be obtained through a LAN/WAN network, it is possible to calculate the drift of the application crystal oscillator by comparing the values read on RTC\_TIMR and RTC\_CALR and programming RTC\_MR.HIGHPPM and RTC\_MR.CORRECTION according to the difference measured between the reference time and those of RTC\_TIMR and RTC\_CALR.

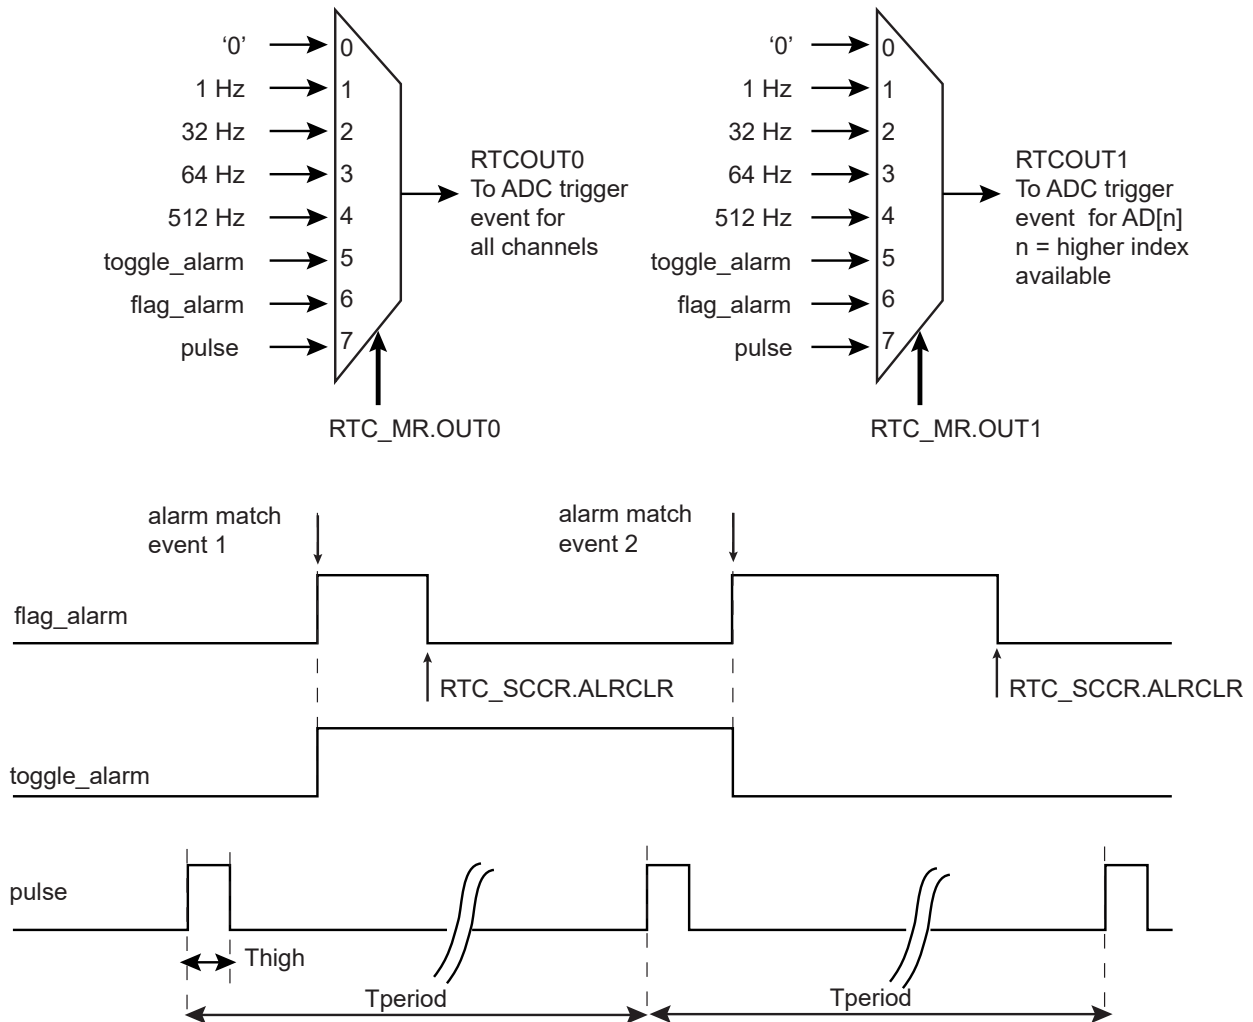

### 33.5.8. Waveform Generation

Waveforms can be generated in order to take advantage of the RTC inherent prescalers while the RTC is the only powered circuitry (Low-power mode of operation, Backup mode) or in any active mode. Entering Backup or Low-power operating modes does not affect the waveform generation outputs.

The RTC waveforms are internally routed to ADC trigger events and those events have a source driver selected among five possibilities. Two different triggers can be generated at a time, the first one is configurable in RTC\_MR.OUT0, while the second trigger is configurable in RTC\_MR.OUT1. RTC\_MR.OUT0 manages the trigger for channel AD[n:0] (where n is the higher index available (last channel)), while RTC\_MR.OUT1 manages the channel AD[n] only for specific modes. Refer to ADC\_MR.TRGSEL in section “Analog-to-Digital Converter (ADC) Controller” for selection of the measurement triggers and associated modes of operation.

When RTC\_MR.OUTx is set to 0, the associated output is stuck at 0 (reset value that can be used at any time to disable the waveform generation).

**Figure 33.8.** Waveform Generation for ADC Trigger Event

### 33.5.9. Tamper Control Registers and Detection Logic

The WKUP pins used for fast wake-up in PMC are also routed to the tamper detection logic. Any WKUP pin which is not already configured as source of fast wake-up can be configured and selected as a source of a tamper event.

The tamper event can be used to immediately clear (no peripheral clock required) the content of the GPBR, clear the keys stored in AES/TDES, clear the scrambling keys of QSPI/SDR/DDR/SMC memory controllers. Each of these peripherals embeds a configuration bit to allow/disallow the clear on tamper event.

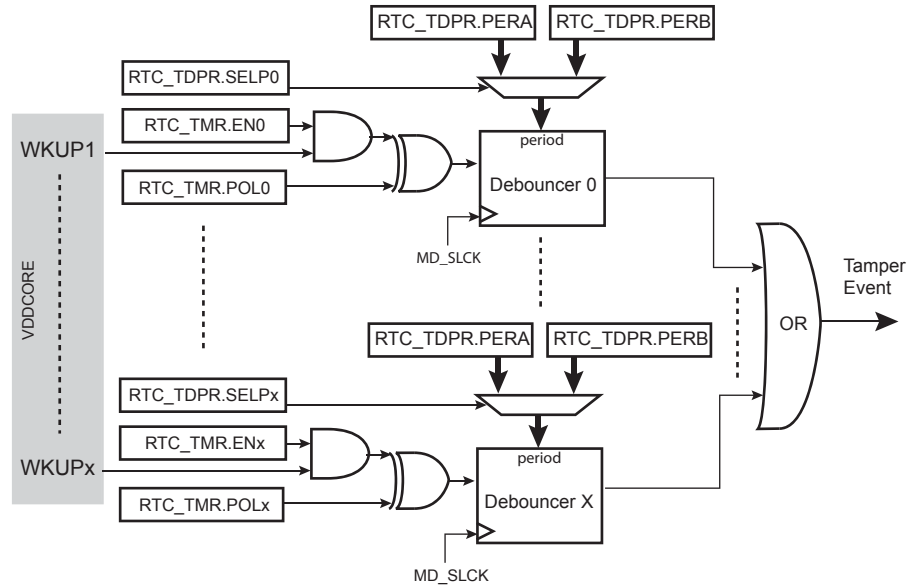

The polarity of each of the WKUP pins can be configured.

Each of the WKUP pins are debounced prior to create the tamper event.

The tamper event is asserted when one of the lines matches the configured polarity after the debouncing period (see the figure below).

The WKUP pins routed to tamper detection logic are all located on VDDCORE domain, thus there is no tamper detection event when the product is in Backup mode.

**Figure 33.9. Tamper Detection Circuitry**

To enable WKUPx pin to be a source of tamper event, not already configured for a fast wake-up (refer to PMC configuration), the bit `RTC_TMR.ENABLEx` must be written to 1.

The polarity of the WKUPx pin is configured in `RTC_TMR.POLx`.

Two debounce periods can be defined by configuring the fields `RTC_TDPR.PERAx` and `RTC_TDPR.PERB`.

For each WKUPx pin, the debounce period can be selected from either `RTC_TDPR.PERAx` or `RTC_TDPR.PERB` by configuring the bit `RTC_TDPR.SELPx`.

For safety/security reasons, it is possible to lock the tamper configuration registers by writing `RTC_TMR.TLOCK=1`. Once written to 1, the only way to clear this bit is to perform a VDDCORE reset.

### 33.5.10. Tamper Timestamping

As soon as a tamper is detected, the tamper counter is incremented and the RTC stores the time of the day, the date and the source of the tamper event in registers located in the backup area. Up to two tamper events can be stored.

In UTC mode, only the UTC time is stored. The date information is not relevant.

The tamper counter saturates at 15. Once this limit is reached, the exact number of tamper occurrences since the last read of stamping registers cannot be known.

The first set of timestamping registers (`RTC_TSTR0`, `RTC_TSDR0`, `RTC_TSSR0`) cannot be overwritten. Once they have been written, all data are stored until the registers are reset. Thus these registers store the first tamper occurrence after a read.

The second set of timestamping registers (`RTC_TSTR1`, `RTC_TSDR1`, `RTC_TSSR1`) are overwritten each time a tamper event is detected. Thus the date and the time data of the first and the second stamping registers may be equal. This occurs when the tamper counter value carried on `RTC_TSTR0.TEVCNT` equals 1. Thus this second set of registers stores the last occurrence of tamper before a read.

Reading a set of timestamping registers requires three accesses, one for the time of the day, one for the date and one for the tamper source.

Reading the third part (RTC\_TSSR0/1) of a timestamping register set clears the whole content of the registers (time, date and tamper source) and makes the timestamping registers available to store a new event.

## 33.6. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0	
0x00	RTC_CR	31:24									
		23:16							CALEVSEL[1:0]

### 33.6.1. RTC Control Register

**Name:** RTC\_CR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
							CALEVSEL[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
							TIMEVSEL[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	7	6	5	4	3	2	1	0
							UPDCAL	UPDTIM
Access							R/W	R/W
Reset							0	0

#### Bits 17:16 – CALEVSEL[1:0] Calendar Event Selection

The event that generates the flag CALEV in RTC\_SR depends on the value of CALEVSEL. In UTC mode, this field has no effect on RTC\_SR.

Value	Name	Description
0	WEEK	Week change (every Monday at time 00:00:00)
1	MONTH	Month change (every 01 of each month at time 00:00:00)
2	YEAR	Year change (every January 1 at time 00:00:00)
3	YEAR	Reserved

#### Bits 9:8 – TIMEVSEL[1:0] Time Event Selection

The event that generates the flag TIMEV in RTC\_SR depends on the value of TIMEVSEL. In UTC mode, this field has no effect on RTC\_SR.

Value	Name	Description
0	MINUTE	Minute change
1	HOURL	Hour change
2	MIDNIGHT	Every day at midnight
3	NOON	Every day at noon

#### Bit 1 – UPDCAL Update Request Calendar Register

Calendar counting consists of day, date, month, year and century counters. Calendar counters can be programmed once this bit is set and acknowledged by the RTC\_SR.ACKUPD bit.

In UTC mode, both UPDTIM and UPDCAL must be set to '1' in order to update the UTC time value.

Value	Name	Description
0	CLOSE_UPDATE	No effect or, if UPDCAL has been previously written to 1, stops the update procedure.
1	START_UPDATE	Stops the RTC calendar counting.

#### Bit 0 – UPDTIM Update Request Time Register

Time counting consists of second, minute and hour counters. Time counters can be programmed once this bit is set and acknowledged by the RTC\_SR.ACKUPD bit.

In UTC mode, both UPDTIM and UPDCAL must be set to '1' in order to update the UTC time value.

Value	Name	Description
0	CLOSE_UPDATE	No effect or, if UPDTIM has been previously written to 1, stops the update procedure.
1	START_UPDATE	Stops the RTC time counting.

### 33.6.2. RTC Mode Register

**Name:** RTC\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
			TPERIOD[1:0]			THIGH[2:0]		
Access			R/W	R/W		R/W	R/W	R/W
Reset			0	0		0	0	0
Bit	23	22	21	20	19	18	17	16
		OUT1[2:0]				OUT0[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0
Bit	15	14	13	12	11	10	9	8
	HIGHPPM		CORRECTION[6:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				NEGPPM		UTC		HRMOD
Access				R/W		R/W		R/W
Reset				0		0		0

#### Bits 29:28 – TPERIOD[1:0] Period of the Output Pulse

Value	Name	Description
0	P_1S	1 second
1	P_500MS	500 ms
2	P_250MS	250 ms
3	P_125MS	125 ms

#### Bits 26:24 – THIGH[2:0] High Duration of the Output Pulse

Value	Name	Description
0	H_31MS	31.2 ms
1	H_16MS	15.6 ms
2	H_4MS	3.91 ms
3	H_976US	976 $\mu$ s
4	H_488US	488 $\mu$ s
5	H_122US	122 $\mu$ s
6	H_30US	30.5 $\mu$ s
7	H_15US	15.2 $\mu$ s

#### Bits 22:20 – OUT1[2:0] ADC Last Channel Trigger Event Source Selection

Value	Name	Description
0	NO_WAVE	No waveform, stuck at '0'
1	FREQ1HZ	1-Hz square wave
2	FREQ32HZ	32-Hz square wave

Value	Name	Description
3	FREQ64HZ	64-Hz square wave
4	FREQ512HZ	512-Hz square wave
5	ALARM_TOGGLE	Output toggles when alarm flag rises
6	ALARM_FLAG	Output is a copy of the alarm flag
7	PROG_PULSE	Duty cycle programmable pulse

**Bits 18:16 – OUT0[2:0]** All ADC Channel Trigger Event Source Selection

Value	Name	Description
0	NO_WAVE	No waveform, stuck at '0'
1	FREQ1HZ	1-Hz square wave
2	FREQ32HZ	32-Hz square wave
3	FREQ64HZ	64-Hz square wave
4	FREQ512HZ	512-Hz square wave
5	ALARM_TOGGLE	Output toggles when alarm flag rises
6	ALARM_FLAG	Output is a copy of the alarm flag
7	PROG_PULSE	Duty cycle programmable pulse

**Bit 15 – HIGHPPM** HIGH PPM Correction

If the absolute value of the correction to be applied is lower than 30 ppm, it is recommended to clear HIGHPPM. HIGHPPM set to 1 is recommended for 30 ppm correction and above.

**Formula:**

If HIGHPPM = 0, then the clock frequency correction range is from 1.5 ppm up to 98 ppm. The RTC accuracy is less than 1 ppm for a range correction from 1.5 ppm up to 30 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\text{CORRECTION} = \frac{3906}{20 \times \text{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to being programmed into CORRECTION field.

If HIGHPPM = 1, then the clock frequency correction range is from 30.5 ppm up to 1950 ppm. The RTC accuracy is less than 1 ppm for a range correction from 30.5 ppm up to 90 ppm.

The correction field must be programmed according to the required correction in ppm; the formula is as follows:

$$\text{CORRECTION} = \frac{3906}{\text{ppm}} - 1$$

The value obtained must be rounded to the nearest integer prior to be programmed into CORRECTION field.

If NEGPPM is set to 1, the ppm correction is negative (used to correct crystals that are faster than the nominal 32.768 kHz).

Value	Name	Description
0	DISABLED	Lower range ppm correction with accurate correction (below 30ppm correction)
1	ENABLED	Higher range ppm correction with accurate correction (higher than 30ppm correction)

**Bits 14:8 – CORRECTION[6:0]** Slow Clock Correction

Value	Name	Description
0	DISABLED	No correction
1–127	–	The slow clock will be corrected according to the formula given in HIGHPPM description.

**Bit 4 – NEGPPM** Negative PPM Correction

See CORRECTION and HIGHPPM field descriptions.

NEGPPM must be cleared to correct a crystal slower than 32.768 kHz.

Value	Name	Description
0	DISABLED	Positive correction (the divider will be slightly higher than 32768)
1	ENABLED	Negative correction (the divider will be slightly lower than 32768)

#### Bit 2 – UTC UTC Time Format

Value	Name	Description
0	DISABLED	Gregorian calendar
1	ENABLED	UTC format

#### Bit 0 – HRMOD 12-/24-hour Mode

Value	Name	Description
0	24HOURS	24-hour mode is selected.
1	AMPM	12-hour mode is selected.

### 33.6.3. RTC Time Register (Default Mode)

**Name:** RTC\_TIMR (DEFAULT\_MODE)  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

In UTC mode, this register view is not relevant, see [RTC\\_TIMALR \(UTC\\_MODE\)](#).

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
		AMPM						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

**Bit 22 – AMPM** Ante Meridiem Post Meridiem Indicator

This bit is the AM/PM indicator in 12-hour mode.

Value	Description
0	AM.
1	PM.

**Bits 21:16 – HOUR[5:0]** Current Hour

The range that can be set is 1–12 (BCD) in 12-hour mode or 0–23 (BCD) in 24-hour mode.

**Bits 14:8 – MIN[6:0]** Current Minute

The range that can be set is 0–59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

**Bits 6:0 – SEC[6:0]** Current Second

The range that can be set is 0–59 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

### 33.6.4. RTC Time Register (UTC\_MODE)

**Name:** RTC\_TIMR (UTC\_MODE)  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This configuration is relevant only if UTC = 1 in RTC\_MR.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
	UTC_TIME[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	UTC_TIME[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	UTC_TIME[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	UTC_TIME[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – UTC\_TIME[31:0]** Current UTC Time  
Any value can be set.

### 33.6.5. RTC Calendar Register

**Name:** RTC\_CALR  
**Offset:** 0x0C  
**Reset:** 0x01411720  
**Property:** Read/Write

In UTC mode, values read in this register are not relevant.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
			DATE[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	1
Bit	23	22	21	20	19	18	17	16
	DAY[2:0]			MONTH[4:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8
	YEAR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	1	0	1	1	1
Bit	7	6	5	4	3	2	1	0
			CENT[6:0]					
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	1	0	0	0	0	0

#### Bits 29:24 – DATE[5:0] Current Day in Current Month

The range that can be set is 01–31 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

#### Bits 23:21 – DAY[2:0] Current Day in Current Week

The range that can be set is 1–7 (BCD).

The coding of the number (which number represents which day) is user-defined as it has no effect on the date counter.

#### Bits 20:16 – MONTH[4:0] Current Month

The range that can be set is 01–12 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

#### Bits 15:8 – YEAR[7:0] Current Year

The range that can be set is 00–99 (BCD).

The lowest four bits encode the units. The higher bits encode the tens.

#### Bits 6:0 – CENT[6:0] Current Century

The range that can be set is 20 (Gregorian).

The lowest four bits encode the units. The higher bits encode the tens.

**Note:** Value 20 (BCD) is always written in CENT whatever the value entered, thus there is no trigger event on RTC\_VER.NVCAL regarding CENT.

**33.6.6. RTC Time Alarm Register (Default Mode)**

**Name:** RTC\_TIMALR (DEFAULT\_MODE)  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

To change one of the SEC, MIN, HOUR fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to RTC\_TIMALR. The first access clears the enable corresponding to the field to change (SECEN, MINEN, HOUREN). If the field is already cleared, this access is not required. The second access performs the change of value (SEC, MIN, HOUR). The third access is required to re-enable the field by writing 1 in the SECEN, MINEN, HOUREN fields.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	HOUREN	AMPM						
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	MINEN							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	SECEN							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 23 – HOUREN** Hour Alarm Enable

Value	Name	Description
0	DISABLED	The hour-matching alarm is disabled.
1	ENABLED	The hour-matching alarm is enabled.

**Bit 22 – AMPM** AM/PM Indicator

This field is the alarm field corresponding to the BCD-coded hour counter.

**Bits 21:16 – HOUR[5:0]** Hour Alarm

This field is the alarm field corresponding to the BCD-coded hour counter.

**Bit 15 – MINEN** Minute Alarm Enable

Value	Name	Description
0	DISABLED	The minute-matching alarm is disabled.
1	ENABLED	The minute-matching alarm is enabled.

**Bits 14:8 – MIN[6:0] Minute Alarm**

This field is the alarm field corresponding to the BCD-coded minute counter.

**Bit 7 – SECEN Second Alarm Enable**

Value	Name	Description
0	DISABLED	The second-matching alarm is disabled.
1	ENABLED	The second-matching alarm is enabled.

**Bits 6:0 – SEC[6:0] Second Alarm**

This field is the alarm field corresponding to the BCD-coded second counter.

### 33.6.7. RTC Time Alarm Register (UTC\_MODE)

**Name:** RTC\_TIMALR (UTC\_MODE)  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This configuration is relevant only if UTC = 1 in RTC\_MR.

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
	UTC_TIME[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	UTC_TIME[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	UTC_TIME[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	UTC_TIME[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – UTC\_TIME[31:0] UTC\_TIME Alarm

This field is the alarm field corresponding to the UTC time counter. To change it, proceed as follows:

1. Disable the UTC alarm by clearing RTC\_CALALR.UTCEN if it is not already cleared.
2. Change the UTC\_TIME alarm value.
3. Enable the UTC alarm by setting RTC\_CALALR.UTCEN.

**33.6.8. RTC Calendar Alarm Register (Default Mode)**

**Name:** RTC\_CALALR (DEFAULT\_MODE)  
**Offset:** 0x14  
**Reset:** 0x01010000  
**Property:** Read/Write

In UTC mode, this register view is not relevant, see [RTC\\_CALALR \(UTC\\_MODE\)](#).

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

To change one of the DATE, MONTH fields, it is recommended to disable the field before changing the value and then re-enable it after the change has been made. This requires up to three accesses to RTC\_CALALR. The first access clears the enable corresponding to the field to change (DATEEN, MTHEN). If the field is already cleared, this access is not required. The second access performs the change of the value (DATE, MONTH). The third access is required to re-enable the field by writing 1 in DATEEN, MTHEN fields.

Bit	31	30	29	28	27	26	25	24
	DATEEN		DATE[5:0]					
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	1
Bit	23	22	21	20	19	18	17	16
	MTHEN			MONTH[4:0]				
Access	R/W			R/W	R/W	R/W	R/W	R/W
Reset	0			0	0	0	0	1
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bit 31 – DATEEN** Date Alarm Enable

Value	Name	Description
0	DISABLED	The date-matching alarm is disabled.
1	ENABLED	The date-matching alarm is enabled.

**Bits 29:24 – DATE[5:0]** Date Alarm

This field is the alarm field corresponding to the BCD-coded date counter.

**Bit 23 – MTHEN** Month Alarm Enable

Value	Name	Description
0	DISABLED	The month-matching alarm is disabled.
1	ENABLED	The month-matching alarm is enabled.

**Bits 20:16 – MONTH[4:0]** Month Alarm

This field is the alarm field corresponding to the BCD-coded month counter.

### 33.6.9. RTC Calendar Alarm Register (UTC\_MODE)

**Name:** RTC\_CALALR (UTC\_MODE)  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								UTCEN
Access								R/W
Reset								0

#### Bit 0 – UTCEN UTC Alarm Enable

Value	Name	Description
0	DISABLED	The UTC-matching alarm is disabled.
1	ENABLED	The UTC-matching alarm is enabled.

### 33.6.10. RTC Status Register

**Name:** RTC\_SR  
**Offset:** 0x18  
**Reset:** 0x00000004  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			TDERR	CALEV	TIMEV	SEC	ALARM	ACKUPD
Access			R	R	R	R	R	R
Reset			0	0	0	1	0	0

#### Bit 5 – TDERR Time and/or Date Free Running Error

If the RTC is configured in UTC mode, the value returned by this field is not relevant.

Value	Name	Description
0	CORRECT	The internal free running counters are carrying valid values since the last read of the Status register (RTC_SR).
1	ERR_TIMEDATE	The internal free running counters have been corrupted (invalid date or time, non-BCD values) since the last read and/or they are still invalid.

#### Bit 4 – CALEV Calendar Event

The calendar event is selected in RTC\_CR.TIMEVSEL and can be any one of the following events: week change, month change and year change. If the RTC is configured in UTC mode, the value returned by this field is not relevant.

Value	Name	Description
0	NO_CALEVENT	No calendar event has occurred since the last clear.
1	CALEVENT	At least one calendar event has occurred since the last clear.

#### Bit 3 – TIMEV Time Event

The time event is selected in RTC\_CR.TIMEVSEL and can be any one of the following events: minute change, hour change, noon, midnight (day change). If the RTC is configured in UTC mode, the value returned by this field is not relevant.

Value	Name	Description
0	NO_TIMEVENT	No time event has occurred since the last clear.
1	TIMEVENT	At least one time event has occurred since the last clear.

#### Bit 2 – SEC Second Event

Value	Name	Description
0	NO_SECEVENT	No second event has occurred since the last clear.
1	SECEVENT	At least one second event has occurred since the last clear.

#### Bit 1 – ALARM Alarm Flag

Value	Name	Description
0	NO_ALARMEVENT	No alarm matching condition occurred.
1	ALARMEVENT	An alarm matching condition has occurred.

#### Bit 0 – ACKUPD Acknowledge for Update

Value	Name	Description
0	FREERUN	Time and calendar registers cannot be updated.
1	UPDATE	Time and calendar registers can be updated.

**33.6.11. RTC Status Clear Command Register**

**Name:** RTC\_SCCR  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

To avoid missing clearing commands, wait for three slow clock cycles between two accesses to this register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Clears the corresponding status flag in the Status register (RTC\_SR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERRCLR	CALCLR	TIMCLR	SECCLR	ALRCLR	ACKCLR
Access			W	W	W	W	W	W
Reset			–	–	–	–	–	–

**Bit 5 – TDERRCLR** Time and/or Date Free Running Error Clear  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALCLR** Calendar Clear  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMCLR** Time Clear  
 If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECCLR** Second Clear

**Bit 1 – ALRCLR** Alarm Clear

**Bit 0 – ACKCLR** Acknowledge Clear

### 33.6.12. RTC Interrupt Enable Register

**Name:** RTC\_IER  
**Offset:** 0x20  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERREN	CALEN	TIMEN	SECEN	ALREN	ACKEN
Access			W	W	W	W	W	W
Reset			–	–	–	–	–	–

#### Bit 5 – **TDERREN** Time and/or Date Error Interrupt Enable

If the RTC is configured in UTC mode, this bit has no effect.

#### Bit 4 – **CALEN** Calendar Event Interrupt Enable

If the RTC is configured in UTC mode, this bit has no effect.

#### Bit 3 – **TIMEN** Time Event Interrupt Enable

If the RTC is configured in UTC mode, this bit has no effect.

#### Bit 2 – **SECEN** Second Event Interrupt Enable

#### Bit 1 – **ALREN** Alarm Interrupt Enable

#### Bit 0 – **ACKEN** Acknowledge Update Interrupt Enable

### 33.6.13. RTC Interrupt Disable Register

**Name:** RTC\_IDR  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERRDIS	CALDIS	TIMDIS	SECDIS	ALRDIS	ACKDIS
Access			W	W	W	W	W	W
Reset			–	–	–	–	–	–

**Bit 5 – TDERRDIS** Time and/or Date Error Interrupt Disable  
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 4 – CALDIS** Calendar Event Interrupt Disable  
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 3 – TIMDIS** Time Event Interrupt Disable  
If the RTC is configured in UTC mode, this bit has no effect.

**Bit 2 – SECDIS** Second Event Interrupt Disable

**Bit 1 – ALRDIS** Alarm Interrupt Disable

**Bit 0 – ACKDIS** Acknowledge Update Interrupt Disable

### 33.6.14. RTC Interrupt Mask Register

**Name:** RTC\_IMR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			TDERR	CAL	TIM	SEC	ALR	ACK
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

#### Bit 5 – TDERR Time and/or Date Error Mask

If the RTC is configured in UTC mode, this bit has no effect.

#### Bit 4 – CAL Calendar Event Interrupt Mask

If the RTC is configured in UTC mode, this bit is not relevant.

#### Bit 3 – TIM Time Event Interrupt Mask

If the RTC is configured in UTC mode, this bit is not relevant.

#### Bit 2 – SEC Second Event Interrupt Mask

#### Bit 1 – ALR Alarm Interrupt Mask

#### Bit 0 – ACK Acknowledge Update Interrupt Mask

### 33.6.15. RTC Valid Entry Register

**Name:** RTC\_VER  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read-only

If the RTC is configured in UTC mode, the values returned by this register are not relevant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					NVCALALR	NVTIMALR	NVCAL	NVTIM
Access					R	R	R	R
Reset					0	0	0	0

#### Bit 3 – NVCALALR Non-valid Calendar Alarm

Value	Description
0	No invalid data has been detected in RTC_CALALR (Calendar Alarm register).
1	RTC_CALALR has contained invalid data since it was last programmed.

#### Bit 2 – NVTIMALR Non-valid Time Alarm

Value	Description
0	No invalid data has been detected in RTC_TIMALR (Time Alarm register).
1	RTC_TIMALR has contained invalid data since it was last programmed.

#### Bit 1 – NVCAL Non-valid Calendar

Value	Description
0	No invalid data has been detected in RTC_CALR (Calendar register).
1	RTC_CALR has contained invalid data since it was last programmed.

#### Bit 0 – NVTIM Non-valid Time

Value	Description
0	No invalid data has been detected in RTC_TIMR (Time register).
1	RTC_TIMR has contained invalid data since it was last programmed.

**33.6.16. RTC TimeStamp Time Register 0 (Default Mode)**

**Name:** RTC\_TSTR0 (DEFAULT\_MODE)  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read-only

These fields are valid for non-UTC mode only.

RTC\_TSTR0 reports the timestamp of the first tamper event after reading RTC\_TSSR0.

Bit	31	30	29	28	27	26	25	24
	BACKUP				TEVCNT[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0
Bit	23	22	21	20	19	18	17	16
		AMPM			HOUR[5:0]			
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					MIN[6:0]			
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
					SEC[6:0]			
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC\_TSSR0)

Value	Description
0	The state of the system is different from Backup mode when the tamper event occurs.
1	The system is in Backup mode when the tamper event occurs.

**Bits 27:24 – TEVCNT[3:0]** Tamper Events Counter (cleared by reading RTC\_TSSR0)

Each time a tamper event occurs, this counter is incremented. This counter saturates at 15. Once this value is reached, it is no longer possible to know the exact number of tamper events.

If this field is not null, this implies that at least one tamper event occurred since the last register reset and that the values stored in timestamping registers are valid.

**Bit 22 – AMPM** AM/PM Indicator of the Tamper (cleared by reading RTC\_TSSR0)

**Bits 21:16 – HOUR[5:0]** Hours of the Tamper (cleared by reading RTC\_TSSR0)

**Bits 14:8 – MIN[6:0]** Minutes of the Tamper (cleared by reading RTC\_TSSR0)

**Bits 6:0 – SEC[6:0]** Seconds of the Tamper (cleared by reading RTC\_TSSR0)

**33.6.17. RTC TimeStamp Time Register 0 (UTC\_MODE)**

**Name:** RTC\_TSTR0 (UTC\_MODE)  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read-only

RTC\_TSTR0 reports the timestamp of the first tamper event after reading RTC\_TSSR0.

Bit	31	30	29	28	27	26	25	24
	BACKUP				TEVCNT[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0

**Bit 31 – BACKUP** System Mode of the Tamper (cleared by reading RTC\_TSSR0)

Value	Description
0	The state of the system is different from Backup mode when the tamper event occurs.
1	The system is in Backup mode when the tamper event occurs.

**Bits 27:24 – TEVCNT[3:0]** Tamper Events Counter (cleared by reading RTC\_TSSR0)

Each time a tamper event occurs, this counter is incremented. This counter saturates at 15. Once this value is reached, it is no more possible to know the exact number of tamper events. If this field is not null, this implies that at least one tamper event occurs since last register reset and that the values stored in timestamping registers are valid.

**33.6.18. RTC TimeStamp Time Register 1 (Default Mode)****Name:** RTC\_TSTR1 (DEFAULT\_MODE)**Offset:** 0xBC**Reset:** 0x00000000**Property:** Read-only

These fields are valid for non-UTC mode only.

RTC\_TSTR1 reports the timestamp of the last tamper event after reading RTC\_TSSR1.

1	MD_SLCK_4	The source of tamper must remain active for at least 4 monitoring domain slow clock cycles to generate a tamper event.
2	MD_SLCK_8	The source of tamper must remain active for at least 8 monitoring domain slow clock cycles to generate a tamper event.
3	MD_SLCK_16	The source of tamper must remain active for at least 16 monitoring domain slow clock cycles to generate a tamper event.
4	MD_SLCK_32	The source of tamper must remain active for at least 32 monitoring domain slow clock cycles to generate a tamper event.
5	MD_SLCK_64	The source of tamper must remain active for at least 64 monitoring domain slow clock cycles to generate a tamper event.
6	MD_SLCK_128	The source of tamper must remain active for at least 128 monitoring domain slow clock cycles to generate a tamper event.
7	MD_SLCK_256	The source of tamper must remain active for at least 256 monitoring domain slow clock cycles to generate a tamper event.

## 34. Shutdown Controller (SHDWC)

### 34.1. Description

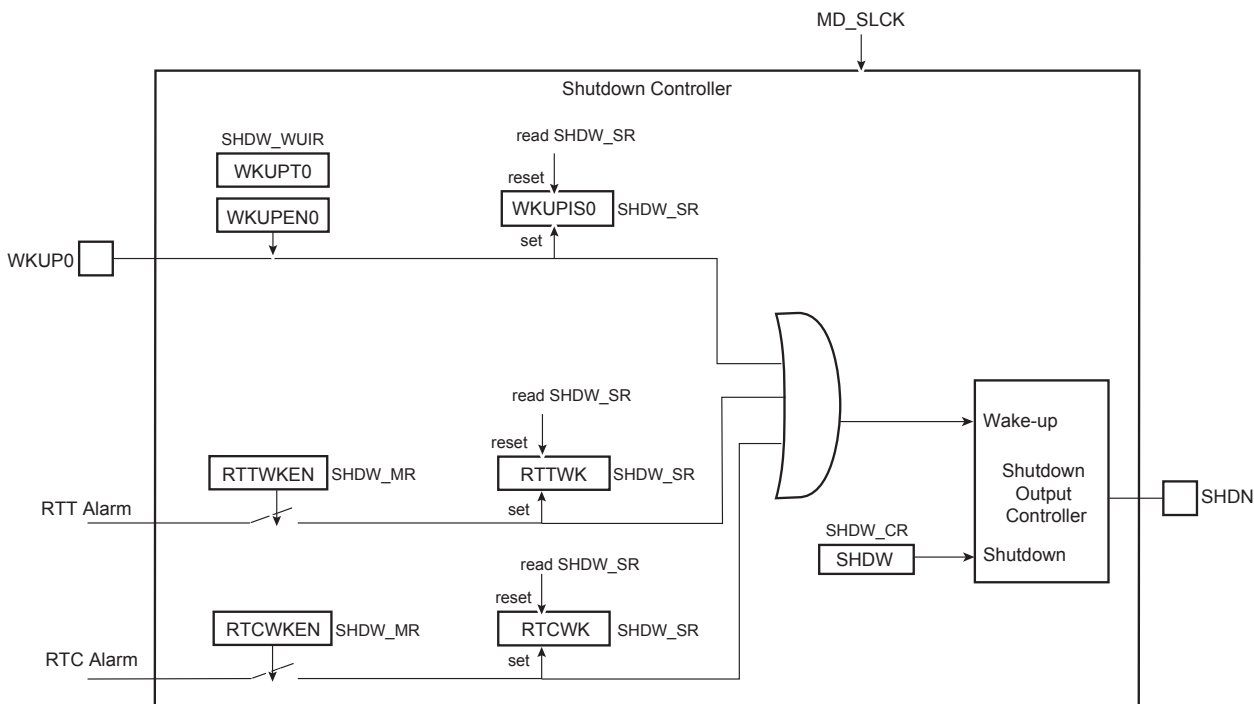

The Shutdown Controller (SHDWC) controls the SHDN output signal (to enable and disable an external power supply circuit), and manages the wake-up events detection.

### 34.2. Embedded Characteristics

- Shutdown Logic
  - Software assertion of the Shutdown Output Pin (SHDN)
  - Programmable de-assertion from wake-up events
- Wake-Up Logic
  - Programmable wake-up event detection input pins, and internal wake-up event from RTC and RTT

### 34.3. Block Diagram

Figure 34.1. SHDWC Block Diagram

### 34.4. I/O Lines Description

Table 34.1. I/O Lines Description

Name	Description	Type
WKUP0	Wake-up input	Input
SHDN	Shutdown output	Output

## 34.5. Product Dependencies

### 34.5.1. Power Management

The SHDWC is continuously clocked by the Monitoring Domain Slow Clock (MD\_SLCK). The Power Management Controller has no effect on the behavior of the SHDWC.

## 34.6. Functional Description

The SHDWC manages the main power supply. To do so, it is supplied with VDDBU and manages wake-up input pins and one output pin, SHDN.

A typical application connects the pin SHDN to the enable input of the device's power supply circuit. The wake-up inputs (WKUP0) connect to any push-buttons or signal that wake up the system.

The software is able to control the pin SHDN by writing the Control register (SHDW\_CR) with the bit SHDW at 1. The shutdown is taken into account only two MD\_SLCK cycles after the write of SHDW\_CR. This register is password-protected and so the value written should contain the correct key for the command to be taken into account. As a result, the SHDN pin is driven low and the system should be powered down.

### 34.6.1. Wake-Up Inputs

Any level change on the WKUP pin can trigger a wake-up. Wake-up is configured in the Mode register (SHDW\_MR) and Wake-Up Inputs register (SHDW\_WUIR). The transition detector can be programmed to detect either a positive or negative transition on the WKUP pin. The detection can also be disabled. Programming is performed by enabling the bit Wake-up Input (WKUPEN0) and defining the bit Wake-up Input Type (WKUPT0) in SHDW\_WUIR.

Moreover, a debouncing circuit can be programmed for WKUP. The debouncing circuit filters pulses on WKUP shorter than the programmed value in SHDW\_MR.WKUPDBC. If the programmed level change is detected on a pin, a counter starts. When the counter reaches the value programmed in WKUPDBC, the SHDN pin is released. If a new input change is detected before the counter reaches the corresponding value, the counter is stopped and cleared. WKUPI0 of the Status register (SHDW\_SR) reports the detection of the programmed events on WKUP with a reset after the read of SHDW\_SR.

The SHDWC can be programmed to activate the wake-up using the RTC and RTT alarms (detection of the rising edge event is synchronized with SLCK). This is done by writing SHDW\_MR.RTCWKEN and RTTWKEN. When enabled, the detection of RTC and RTT alarms is reported in SHDW\_SR.RTCWK and RTTWK. They are cleared after reading SHDW\_SR. When using the RTC and RTT alarms to wake up the system, the user must ensure that the RTC and RTT alarm status flags are cleared before shutting down the system. Otherwise, no rising edge of the status flags may be detected and the wake-up fails.

## 34.7. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

#### Bits 26:24 – WKUPDBC[2:0] Wake-up Inputs Debouncer Period

Value	Name	Description
0	IMMEDIATE	Immediate, no debouncing, detected active at least on one MD_SLCK edge
1	3_SLCK	WKUP shall be in its active state for at least 3 MD_SLCK periods
2	32_SLCK	WKUP shall be in its active state for at least 32 MD_SLCK periods
3	512_SLCK	WKUP shall be in its active state for at least 512 MD_SLCK periods
4	4096_SLCK	WKUP shall be in its active state for at least 4,096 MD_SLCK periods
5	32768_SLCK	WKUP shall be in its active state for at least 32,768 MD_SLCK periods

#### Bit 17 – RTCWKEN Real-time Clock Wake-up Enable

Value	Description
0	The RTC Alarm signal has no effect on the SHDWC.
1	The RTC Alarm signal forces the de-assertion of the SHDN pin.

#### Bit 16 – RTTWKEN Real-time Timer Wake-up Enable

Value	Description
0	The RTT Alarm signal has no effect on the SHDWC.
1	The RTT Alarm signal forces the de-assertion of the SHDN pin.

### 34.7.3. SHDW Status Register

**Name:** SHDW\_SR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The events are detected only when the system is in Backup mode.

Bit	31	30	29	28	27	26	25	24

#### Bit 16 – WKUPIS0 Wake-up 0 Input Status

Value	Name	Description
0	DISABLE	The wake-up 0 input is disabled, or was inactive at the time the debouncer triggered a wake-up event.
1	ENABLE	The wake-up 0 input was active at the time the debouncer triggered a wake-up event.

#### Bit 5 – RTCWK Real-time Clock Wake-up

Value	Description
0	No wake-up alarm from the RTC occurred since the last read of SHDW_SR.
1	At least one wake-up alarm from the RTC occurred since the last read of SHDW_SR.

#### Bit 4 – RTTWK Real-time Timer Wake-up

Value	Description
0	No wake-up alarm from the RTT occurred since the last read of SHDW_SR.
1	At least one wake-up alarm from the RTT occurred since the last read of SHDW_SR.

#### Bit 0 – WKUPS Wake-up Status

Value	Name	Description
0	NO	No wake-up due to the assertion of the wake-up pins has occurred since the last read of SHDW_SR.
1	PRESENT	At least one wake-up due to the assertion of the wake-up pins has occurred since the last read of SHDW_SR.

### 34.7.4. SHDWC Wake-up Inputs Register

**Name:** SHDW\_WUIR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								WKUPEN0
Access								R
Reset								0

#### Bit 16 – WKUPT0 Wake-up 0 Input Type

Value	Name	Description
0	LOW	A falling edge followed by a low level on the wake-up 0 input, for a period defined by WKUPDBC, forces wake-up of the core power supply.
1	HIGH	A rising edge followed by a high level on the wake-up 0 input, for a period defined by WKUPDBC, forces wake-up of the core power supply.

#### Bit 0 – WKUPEN0 Wake-up 0 Input Enable

Value	Name	Description
0	DISABLE	The wake-up 0 input has no wake-up effect.
1	ENABLE	The wake-up 0 input forces wake-up of the core power supply.

## 35. Periodic Interval Timer (PIT)

### 35.1. Description

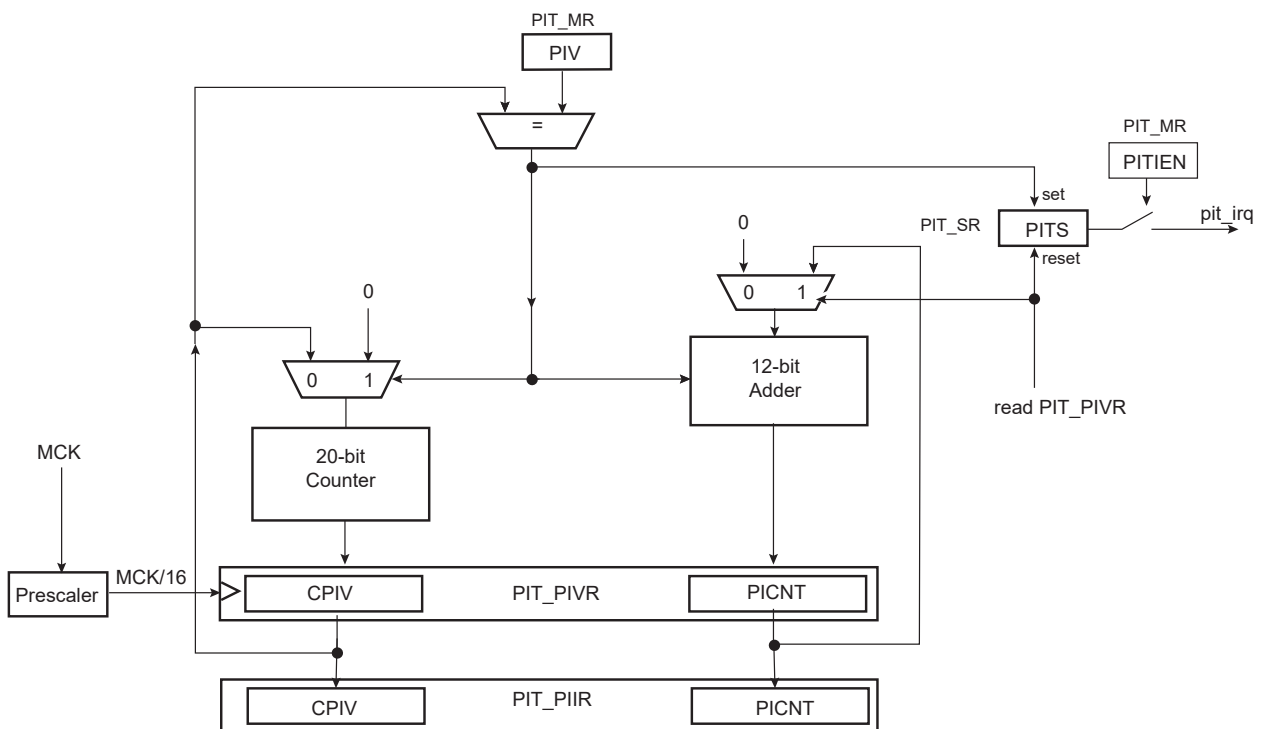

The Periodic Interval Timer (PIT) provides the operating system's scheduler interrupt. It is designed to offer maximum accuracy and efficient management, even for systems with long response time.

### 35.2. Embedded Characteristics

- 20-bit Programmable Counter plus 12-bit Interval Counter
- Reset-on-read Feature
- Both Counters Work on Main System Bus Clock/16

### 35.3. Block Diagram

Figure 35.1. Periodic Interval Timer

### 35.4. Functional Description

The Periodic Interval Timer (PIT) provides periodic interrupts for use by operating systems.

The PIT provides a programmable overflow counter and a reset-on-read feature. It is built around two counters: a 20-bit CPIV counter and a 12-bit PICNT counter. Both counters work at Main System Bus Clock /16.

The 20-bit CPIV counter increments from 0 up to a programmable overflow value set in the field PIV of the Mode register (PIT\_MR). When the counter CPIV reaches this value, it resets to 0 and increments PICNT. The status bit PITS in the Status register (PIT\_SR) rises and triggers an interrupt, provided the interrupt is enabled (PIT\_MR.PITIEN).

Writing a new PIV value in PIT\_MR does not reset/restart the counters.

When CPIV and PICNT values are obtained by reading the Periodic Interval Value register (PIT\_PIVR), the overflow counter (PICNT) is reset and PIT\_SR.PITS is cleared, thus acknowledging the interrupt. The value of PICNT gives the number of periodic intervals elapsed since the last read of PIT\_PIVR.

When CPIV and PICNT values are obtained by reading the Periodic Interval Image Register (PIT\_PIIIR), there is no effect on the counters CPIV and PICNT, nor on the bit PITS. For example, a profiler can read PIT\_PIIIR without clearing any pending interrupt, whereas a timer interrupt clears the interrupt by reading PIT\_PIVR.

The PIT may be enabled/disabled using PIT\_MR.PITEN (disabled on reset). PITEN only becomes effective when the CPIV value is 0. The figure below illustrates the PIT counting. After PITEN is reset (PITEN = 0), the CPIV goes on counting until the PIV value is reached, and is then reset. PIT restarts counting, only if PITEN is set again.

The PIT is stopped when the core enters debug state.

**Figure 35.2.** Enabling/Disabling PIT with PITEN

## 35.5. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0	
0x00	PIT_MR	31:24							PITIEN	PITEN

### 35.5.1. Periodic Interval Timer Mode Register

**Name:** PIT\_MR  
**Offset:** 0x00  
**Reset:** 0x000FFFFF  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode Register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
							PITIEN	PITEN
Access							R/W	R/W
Reset							0	0

Bit	23	22	21	20	19	18	17	16
					PIV[19:16]			
Access					R/W	R/W	R/W	R/W
Reset					1	1	1	1

Bit	15	14	13	12	11	10	9	8
	PIV[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	7	6	5	4	3	2	1	0
	PIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

#### Bit 25 – PITIEN Period Interval Timer Interrupt Enable

Value	Description
0	The bit PITS in PIT_SR has no effect on the interrupt.
1	The bit PITS in PIT_SR asserts an interrupt.

#### Bit 24 – PITEN Period Interval Timer Enabled

Value	Description
0	The Periodic Interval Timer is disabled when the PIV value is reached.
1	The Periodic Interval Timer is enabled.

#### Bits 19:0 – PIV[19:0] Periodic Interval Value

Defines the value compared with the primary 20-bit counter of the Periodic Interval Timer (CPIV). The period is equal to (PIV + 1).

### 35.5.2. Periodic Interval Timer Status Register

**Name:** PIT\_SR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								PITS
Access								R
Reset								0

#### Bit 0 – PITS Periodic Interval Timer Status

Value	Description
0	The Periodic Interval timer has not reached PIV since the last read of PIT_PIVR.
1	The Periodic Interval timer has reached PIV since the last read of PIT_PIVR.

### 35.5.3. Periodic Interval Timer Value Register

**Name:** PIT\_PIVR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Reading this register clears PITS in PIT\_SR.

Bit	31	30	29	28	27	26	25	24
	PICNT[11:4]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	PICNT[3:0]				CPIV[19:16]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CPIV[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CPIV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:20 – PICNT[11:0] Periodic Interval Counter

Returns the number of occurrences of periodic intervals since the last read of PIT\_PIVR.

#### Bits 19:0 – CPIV[19:0] Current Periodic Interval Value

Returns the current value of the periodic interval timer.

### 35.5.4. Periodic Interval Timer Image Register

**Name:** PIT\_PIRR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	PICNT[11:4]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	PICNT[3:0]				CPIV[19:16]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CPIV[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CPIV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:20 – PICNT[11:0] Periodic Interval Counter

Returns the number of occurrences of periodic intervals since the last read of PIT\_PIVR.

#### Bits 19:0 – CPIV[19:0] Current Periodic Interval Value

Returns the current value of the periodic interval timer.

### 36. 64-bit Periodic Interval Timer (PIT64B)

### 36.1. Description

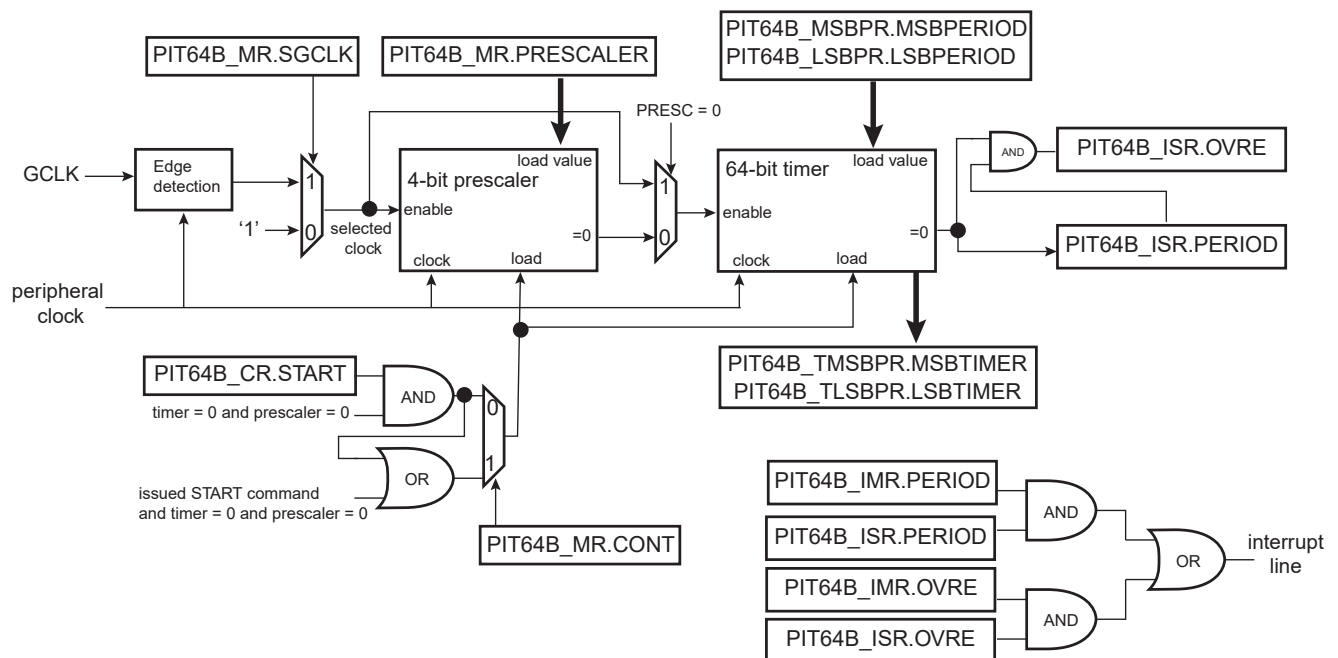

The 64-bit Periodic Interval Timer (PIT64B) provides the operating system scheduler interrupt, as well as any periodic source of interrupt to software. It is designed to offer maximum accuracy and efficient management, even for systems with long response times.

## 36.2. Embedded Characteristics

- 4-bit Prescaler
- 64-bit Timer
- Single Shot or Continuous Mode
- Safety/Security Access Reports
- Register Write protection

### 36.3. Block Diagram

### Figure 36.1. PIT64B Block Diagram

### 36.4. Product Dependencies

### 36.4.1. Power Management

The Power Management Controller (PMC) controls the PIT64B clock in order to save power. The programmer must first enable the PIT64B clock in the PMC before using the PIT64B.

After a hardware reset, the PIT64B clock is disabled by default.

### 36.4.2. Interrupt Generation

The PIT64B interface has an interrupt line connected to the Interrupt Controller.

Handling the PIT64B interrupt requires programming the Interrupt Controller before configuring the PIT64B.

## 36.5. Functional Description

### 36.5.1. Timer Clock Source

The two clock sources for the 64-bit timer are the peripheral clock and the generic clock (GCLK), which can be fully asynchronous to the peripheral clock. The selected clock can be prescaled before triggering the 64-bit timer.

The GCLK is selected as source clock for the prescaler when the SGCLK bit, in the Mode register (PIT64B\_MR), is written to 1. The prescaler is active as soon as PIT64B\_MR.PRESCALER>0.

If PIT64B\_MR.PRESCALER=0, the timer is triggered either on each rising edge detection event of the GCLK if PIT64B\_MR.SGCLK is written to 1, or on each rising edge of the peripheral clock.

If GCLK is selected, the frequency must be at least 3 times lower than the peripheral clock.

### 36.5.2. Single Period Mode

When the PIT64B\_MR.CONT bit is written to 0, the PIT64B produces a single timer event. The timer period starts as soon as the START bit, in the Control register (PIT64B\_CR), is written to 1. The period is defined by configuring the LSBPERIOD field in the LSB Period register (PIT64B\_LSBPR) and the MSBPERIOD field in the MSB Period register (PIT64B\_MSBPR). When the START command is issued, the 64-bit timer loads 0 and increments up to LSBPERIOD and MSBPERIOD field value minus 1, then automatically reloads 0 and stops.

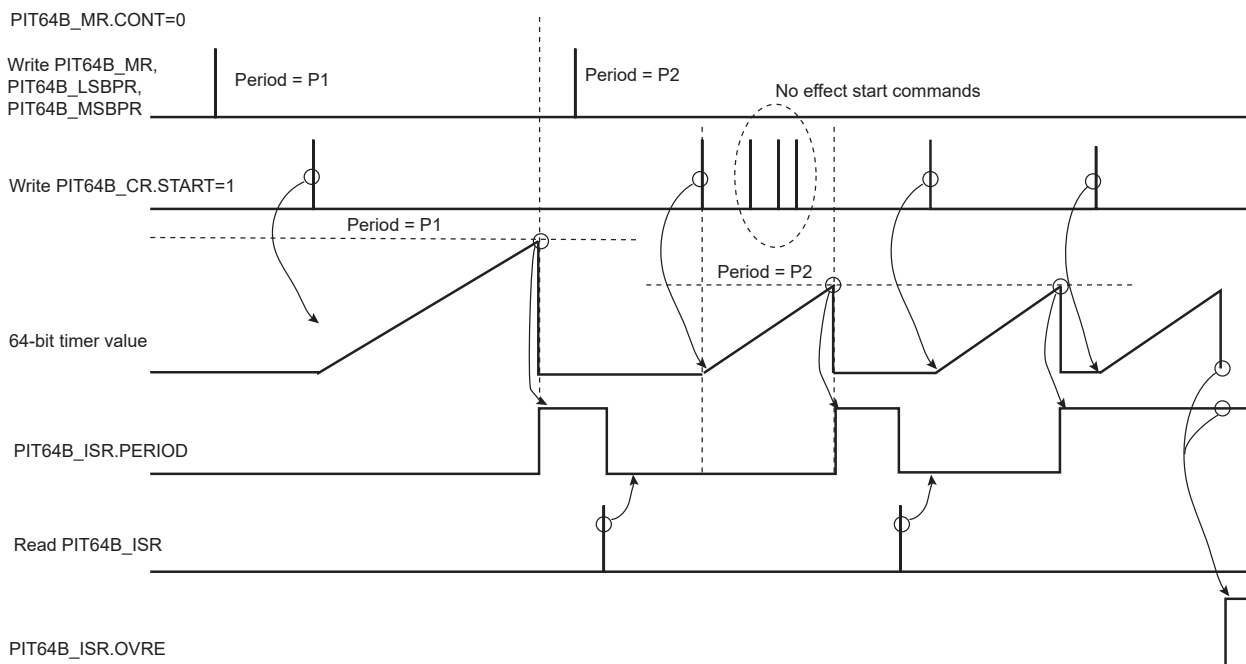

When time reaches the maximum value, the PERIOD flag, in the Interrupt Status register (PIT64B\_ISR), is set. No other period will be started until a new START command is issued.

After a period is started and while it is not elapsed, any new values written in PIT64B\_MR, PIT64B\_LSBPR or PIT64B\_MSBPR have no effect on the current period if bit PIT64B\_MR.SMOD=0 (see [Figure 36.2](#))

If PIT64B\_MR.SMOD=1 a start is also performed as soon as PIT64B\_LSBPR is written, thus a modification of the period can be performed on-the-fly with a single write operation if the period requires no more than 32 bits. When writing a 64-bit value, the 32-bit MSB part must be configured first, followed by the 32-bit LSB part (see [Figure 36.3](#)). When configuring a value lower or equal to 32 bits after processing a period defined on 64 bits, first PIT64B\_MSBPR must be written to 0, and then the 32-bit LSB must be written into PIT64B\_LSBPR.

If PIT64B\_CR.SWRST is written to 1, the current period is immediately stopped.

**Figure 36.2.** Single Waveform in Single Period Mode if bit PIT64B\_MR.SMOD=0

**Figure 36.3.** Waveform in Single Period Mode if bit PIT64B\_MR.SMOD=1

### 36.5.3. Continuous Period Mode

When the PIT64B\_MR.CONT bit is written to 1, the PIT64B continuously produces timer events. The timer is started as soon as the PIT64B\_CR.START bit is written to 1. The period is defined by configuring the PIT64B\_LSBPR.LSBPERIOD field and PIT64B\_MSBPR.MSBPERIOD field. When the START command is issued, the 64-bit timer loads 0 and increments up to LSBPERIOD and

MSBPERIOD field value minus 1, then automatically reloads 0 and restarts a new counting period until bit PIT64B\_CR.SWRST is written to 1.

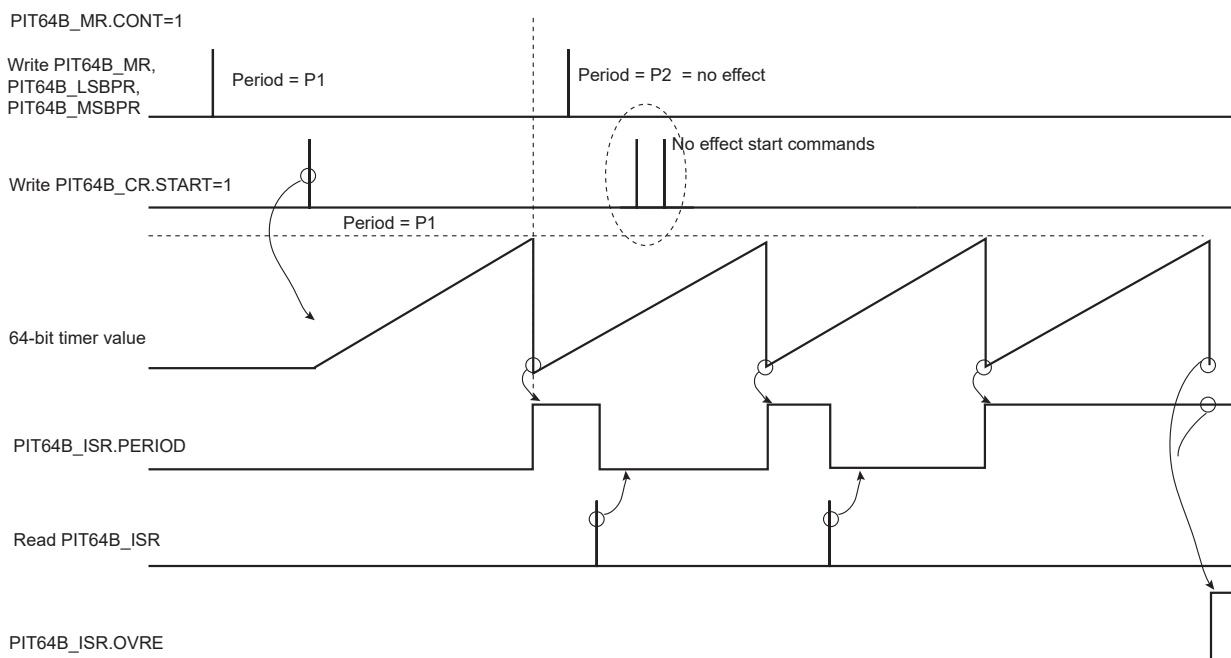

When the timer reaches its maximum value, the flag PIT64B\_ISR.PERIOD is set. PIT64B\_ISR.PERIOD is cleared when reading PIT64B\_ISR. If a new period elapses and the PIT64B\_ISR.PERIOD is 1, the PIT64B\_ISR.OVRE flag is set to indicate a potential latency at system level

After the START command has been issued, any new values written in PIT64B\_MR, PIT64B\_LSBPR or PIT64B\_MSBPR have no effect on the current period if bit PIT64B\_MR.SMOD=0 (see Figure 36.4). A software reset must be issued before configuring new values in PIT64B\_LSBPR and PIT64B\_MSBPR if bit PIT64B\_MR.SMOD=0.

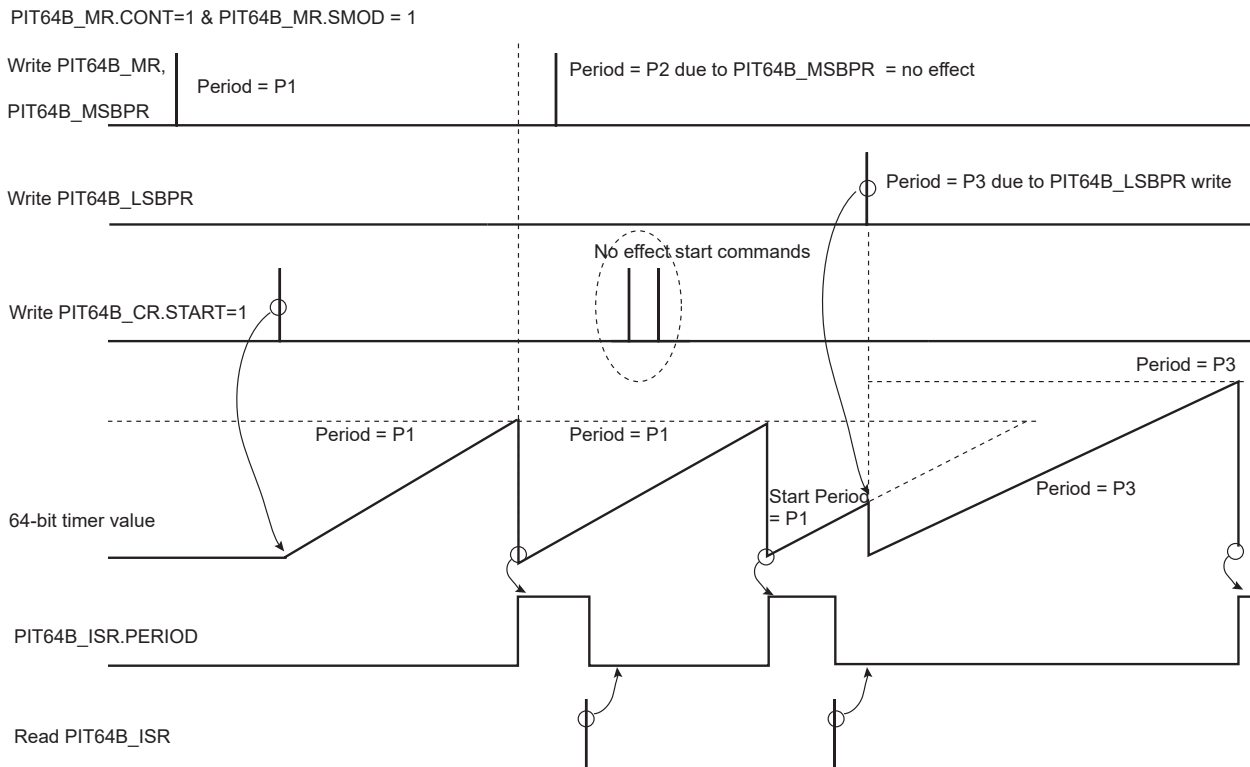

If PIT64B\_MR.SMOD=1 a start can be also performed as soon as PIT64B\_LSBPR is written, thus a modification of the period can be performed on-the-fly with a single write operation if the period requires no more than 32 bits. When writing a 64-bit value, the 32-bit MSB part must be configured first followed by a 32-bit LSB part (see Figure 36.5). When configuring a value lower or equal to 32 bits after processing a period defined on 64 bits, first PIT64B\_MSBPR must be written to 0, and then the 32-bit LSB must be written into PIT64B\_LSBPR.

If PIT64B\_CR.SWRST is written to 1, the current period is immediately stopped.

**Figure 36.4.** Waveform in Continuous Period Mode if bit PIT64B\_MR.SMOD=0

**Figure 36.5.** Waveform in Continuous Period Mode if bit PIT64B\_MR.SMOD=1

#### 36.5.4. Security and Safety Analysis and Reports

Several types of checks are performed when the PIT64B is running.

The peripheral clock of the PIT64B is monitored by a specific circuitry to detect abnormal waveforms on the internal clock that may affect the behavior of the PIT64B. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the CGD flag is set in the Write Protection Status register (PIT64B\_WPSR), an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal timer sequence of the PIT64B is also monitored and if an abnormal state is detected, the flag PIT64B\_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the PIT64B are monitored and if an incorrect access is performed, the flag PIT64B\_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the PIT64B\_WPSR.SWETYP field (see [PIT64B Write Protection Status Register](#) for details). For example, writing PIT64B\_MR, PIT64B\_LSBPR (if PIT64B\_MR.SMOD=0), PIT64B\_MSBR (if PIT64B\_MR.SMOD=0) when the timer is running (after a START command has been issued) is an error. PIT64B\_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when PIT64B\_WPSR is read.

If one of these flags is set, the PIT64B\_ISR.SECE flag is set and can trigger an interrupt if the SECE bit, in the Interrupt Mask register (PIT64B\_IMR), is '1'. SECE is cleared by reading PIT64B\_ISR.

#### 36.5.5. Register Write Protection

To prevent any single software error from corrupting PIT64B behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the [PIT64B Write Protection Mode Register](#) (PIT64B\_WPMR).

If a write access to a write-protected register is detected, the WPVS (Write Protection Violation Status) flag in the [PIT64B Write Protection Status Register](#) (PIT64B\_WPSR) is set and the WPVSR (Write Protection Violation Source) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PIT64B\_WPSR.

The following registers can be write-protected when WPEN is set in PIT64B\_WPMR:

- [PIT64B Mode Register](#)
- [PIT64B LSB Period Register](#)
- [PIT64B MSB Period Register](#)

**Note:** [PIT64B LSB Period Register](#) and [PIT64B MSB Period Register](#) are not write-protected if PIT64B\_MR.SMOD=1.

The following registers can be write-protected when WPITEN is set in PIT64B\_WPMR:

- [PIT64B Interrupt Enable Register](#)
- [PIT64B Interrupt Disable Register](#)

The following register can be write-protected when WPCREN is set in PIT64B\_WPMR:

- [PIT64B Control Register](#)

## 36.6. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

### 36.6.1. PIT64B Control Register

**Name:** PIT64B\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [PIT64B Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
								SWRST
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								START
Access								W
Reset								–

#### Bit 8 – SWRST Software Reset

Value	Description
0	No effect.
1	Performs a software reset, clears the configuration and stops any timer period in progress.

#### Bit 0 – START Start Timer

Value	Description
0	No effect.
1	The timer counter is started for 1 or more periods. If the START command is applied during a non-elapsed timer period, there is no effect. Thus, in Continuous mode, the SWRST command is the only command to stop the PIT64B.  If PIT64B_MR.SMOD=1 a start is also performed as soon as PIT64B_LSBPR is written (see <a href="#">Single Period Mode</a> and <a href="#">Continuous Period Mode</a> ).

### 36.6.2. PIT64B Mode Register

**Name:** PIT64B\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PIT64B Write Protection Mode Register](#).

When the timer is running, writing a value to this register has no effect. The value written is this register is loaded anytime before a START command is issued.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset					R/W	R/W	R/W	R/W
					0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access								
Reset				R/W	R/W			R/W
				0	0			0

#### Bits 11:8 – PRESCALER[3:0] Prescaler Period

Value	Description
0	A prescaler divider of 1 is used.
1–15	The 64-bit timer is incremented at each (PRESCALER+1)x selected period (see SGCLK).

#### Bit 4 – SMOD Start Mode

Value	Description
0	Writing PIT64B_LSBPR does not start the timer period.
1	Writing PIT64B_LSBPR starts the timer period.

#### Bit 3 – SGCLK Generic Clock Selection Enable

If GCLK is asynchronous to the peripheral clock, a jitter of 1 peripheral clock period is created on the periodic interval event when Continuous mode is selected.

Value	Description
0	The prescaler is triggered at each rising edge of “Peripheral clock” and the timer is triggered.
1	GCLK clock is selected as clock source of the 8-bit prescaler.

#### Bit 0 – CONT Continuous Mode

Value	Description
0	A single period interrupt is generated from a START command.

Value	Description
1	Continuous periodic interrupts are generated after a single START command.

### 36.6.3. PIT64B LSB Period Register

**Name:** PIT64B\_LSBPR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PIT64B Write Protection Mode Register](#) or if PIT64B\_MR.SMOD=1.

When the timer is running, if PIT64B\_MR.SMOD=0, writing a value to this register has no effect. The value written to this register must be loaded anytime before a START command is issued if PIT64B\_MR.SMOD=0. If PIT64B\_MR.SMOD=1, a write access to this register restarts a timer period.

Bit	31	30	29	28	27	26	25	24
	LSBPERIOD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – LSBPERIOD[31:0]** 32 LSB of the Timer Period

This field defines the 32 LSB of the timer period. The timer period is defined by selected clock x {MSBPERIOD,LSBPERIOD}.

**36.6.4. PIT64B MSB Period Register**

**Name:** PIT64B\_MSBPR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PIT64B Write Protection Mode Register](#).

When the timer is running, if PIT64B\_MR.SMOD=0, writing a value to this register has no effect. The value written to this register must be loaded anytime before a START command is issued if PIT64B\_MR.SMOD=0.

Bit	31	30	29	28	27	26	25	24
	MSBPERIOD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	MSBPERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – MSBPERIOD[31:0]** 32 MSB of the Timer Period

This field defines the 32 MSB of the timer period. The timer period is defined by selected clock x {MSBPERIOD,LSBPERIOD}.

### 36.6.5. PIT64B Interrupt Enable Register

**Name:** PIT64B\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [PIT64B Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset				–			–	–

**Bit 4 – SECE** Safety and/or Security Report Interrupt Enable

**Bit 1 – OVRE** Overrun Error Interrupt Enable

**Bit 0 – PERIOD** Elapsed Timer Period Interrupt Enable

### 36.6.6. PIT64B Interrupt Disable Register

**Name:** PIT64B\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [PIT64B Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

**Bit 4 – SECE** Safety and/or Security Report Interrupt Disable

**Bit 1 – OVRE** Overrun Error Interrupt Disable

**Bit 0 – PERIOD** Elapsed Timer Period Interrupt Disable

### 36.6.7. PIT64B Interrupt Mask Register

**Name:** PIT64B\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: Corresponding interrupt is not enabled.

1: Corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
				SECE			OVRE	PERIOD
Access				R			R	R
Reset				0			0	0

**Bit 4 – SECE** Safety and/or Security Report Interrupt Mask

**Bit 1 – OVRE** Overrun Error Interrupt Mask

**Bit 0 – PERIOD** Elapsed Timer Period Interrupt Mask

### 36.6.8. PIT64B Interrupt Status Register

**Name:** PIT64B\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
				SECE			OVRE	PERIOD
Access				R			R	R
Reset				0			0	0

#### Bit 4 – SECE Safety/Security Report (cleared on read)

Value	Description
0	There has been no security report in PIT64B_WPSR since the last read of PIT64B_ISR.
1	One security flag has been set in PIT64B_WPSR since the last read of PIT64B_ISR.

#### Bit 1 – OVRE Overrun Error (cleared on read)

Value	Description
0	No multiple rollovers occurred since the last read of PIT64B_ISR.
1	More than 1 rollover occurred since the last read of PIT64B_ISR.

#### Bit 0 – PERIOD Elapsed Timer Period Status Flag (cleared on read)

Value	Description
0	No timer rollover occurred since the last read of PIT64B_ISR.
1	A timer rollover occurred since the last read of PIT64B_ISR.

### 36.6.9. PIT64B Timer LSB Register

**Name:** PIT64B\_TLSBR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	LSBTIMER[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	LSBTIMER[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	LSBTIMER[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	LSBTIMER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – LSBTIMER[31:0]** Current 32 LSB of the Timer  
This field returns the 32 LSB of the current timer value.

**36.6.10. PIT64B Timer MSB Register****Name:** PIT64B\_TMSBR**Offset:** 0x24**Reset:** 0x00000000**Property:** Read-only

When operating with a timer value greater than 32 bits (PIT64B\_MSBPR.MSBPERIOD > 0), the PIT64B\_TMSBR must be read first, followed by the read of PIT64B\_TMSBR. This sequence generates an atomic read of the 64-bit timer value whatever the lapse of time between the accesses. When operating with a timer value up to 32 bits (PIT64B\_MSBPR.MSBPERIOD=0), reading PIT64B\_TMSBR is not required.

Bit	31	30	29	28	27	26	25	24
	MSBTIMER[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	MSBTIMER[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

	MSBTIMER[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MSBTIMER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – MSBTIMER[31:0]** Current 32 MSB of the Timer

This field returns the 32 MSB of the current timer value.

**36.6.11. PIT64B Write Protection Mode Register**

**Name:** PIT64B\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				FIRSTE		WPCREN	WPITEN	WPEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x504954	PASSWD	Writing any other value in this field aborts the write operation of the WPCREN, WPITEN and WPEN bits. Always reads as 0.

**Bit 4 – FIRSTE** First Error Report Enable

Value	Description
0	The last write protection violation source is reported in PIT64B_WPSR.WPVSR and the last software control error type is reported in PIT64B_WPSR.SWETYP. The PIT64B_ISR.SECE flag is set at the first error occurring within a series.
1	Only the first write protection violation source is reported in PIT64B_WPSR.WPVSR and only the first software control error type is reported in PIT64B_WPSR.SWETYP. The PIT64B_ISR.SECE flag is set at the first error occurring within a series.

**Bit 2 – WPCREN** Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x504954 ("PIT" in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x504954 ("PIT" in ASCII).

**Bit 1 – WPITEN** Write Protection Interruption Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x504954 ("PIT" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x504954 ("PIT" in ASCII).

**Bit 0 – WPEN** Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x504954 ("PIT" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x504954 ("PIT" in ASCII).

**36.6.12. PIT64B Write Protection Status Register**

**Name:** PIT64B\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS						SWETYP[1:0]	
Access	R						R	R
Reset	0						0	0

Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

**Bit 31 – ECLASS** Software Error Class (cleared on read)

0 (WARNING): An abnormal access that does not affect system functionality.

1 (ERROR): A write access is performed into PIT64B\_MR, PIT64B\_LSBR, PIT64B\_MSBR while the PIT64B is running.

**Bits 25:24 – SWETYP[1:0]** Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (warning).
1	WRITE_RO	A write access has been performed on a read-only register (warning).
2	UNDEF_RW	Access to an undefined address (warning).
3	WEIRD_ACTION	A write access is performed into PIT64B_MR, PIT64B_LSBR, PIT64B_MSBR while the PIT64B is running (abnormal).

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source

When WPVS=1, WPVSR indicates the register address offset at which a write access has been attempted.

When WPVS=0 and SWE=1, WPVSR reports the address of the incorrect software access. As soon as WPVS=1, WPVSR returns the address of the write-protected violation.

**Bit 3 – SWE** Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of PIT64B_WPSR.
1	A software error has occurred since the last read of PIT64B_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of PIT64B_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of PIT64B_WPSR. This flag can only be set under abnormal operating conditions.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of PIT64B_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of PIT64B_WPSR. This flag can only be set in case of abnormal clock signal waveform (glitch).

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of the PIT64B_WPSR.
1	A write protection violation has occurred since the last read of the PIT64B_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

## 37. Debug Unit (DBGU)

### 37.1. Description

The Debug Unit (DBGU) provides a single entry point from the processor for access to all the debug capabilities of the product.

The DBGU features a two-pin UART that can be used for communication and trace purposes and offers an ideal medium for in-situ programming solutions.

Moreover, the association with a DMA controller permits packet handling for these tasks with processor time reduced to a minimum.

The DBGU also makes the Debug Communication Channel (DCC) signals provided by the In-circuit Emulator of the Arm processor visible to the software. These signals indicate the status of the DCC read and write registers and generate an interrupt to the Arm processor, making possible the handling of the DCC under interrupt control.

Chip identifier registers permit recognition of the device and its revision. These registers indicate the sizes and types of the on-chip memories, as well as the set of embedded peripherals.

A Force NTRST capability enables the software to decide whether to prevent access to the system via the In-circuit Emulator (ICE). This disables system access through the processor's ICE, thus protecting the code stored in ROM by asserting the NTRST line of the processor's ICE.

### 37.2. Embedded Characteristics

- ICE Access Prevention
- Debug Communication Channel (DCC) Support
- Chip ID Registers
- Two-pin UART
  - Independent receiver and transmitter with a common programmable baud rate generator
  - Baud rate can be driven by processor-independent generic source clock
  - Even, odd, mark or space parity generation
  - Parity, framing and overrun error detection
  - Automatic Echo, Local loopback and Remote Loopback Channel modes
  - Digital filter on receive line
  - Interrupt generation
  - Support for two DMA channels with connection to receiver and transmitter
  - Receiver timeout
  - Register write protection

## 37.3. Block Diagram

Figure 37.1. DBGU Block Diagram

Table 37.1. DBGU Pin Description

Pin Name	Description	Type
DRXD	DBGU Receive Data	Input
DTXD	DBGU Transmit Data	Output

## 37.4. Product Dependencies

### 37.4.1. I/O Lines

The DBGU pins are multiplexed with PIO lines. The user must first configure the corresponding PIO Controller to enable I/O line operations of the DBGU.

### 37.4.2. Power Management

The DBGU clock can be controlled through the Power Management Controller (PMC). In this case, the user must first configure the PMC to enable the DBGU clock.

### 37.4.3. Interrupt Sources

The DBGU interrupt line is connected to one of the interrupt sources of the Interrupt Controller. Interrupt handling requires programming of the Interrupt Controller before configuring the DBGU.

## 37.5. Functional Description

The DBGU operates in Asynchronous mode only and supports only 8-bit character handling (with parity). It has no clock pin.

The DBGU is made up of a receiver and a transmitter that operate independently, and a common baud rate generator. Receiver timeout and transmitter time guard are not implemented. However, all the implemented features are compatible with those of a standard USART.

### 37.5.1. Baud Rate Generator

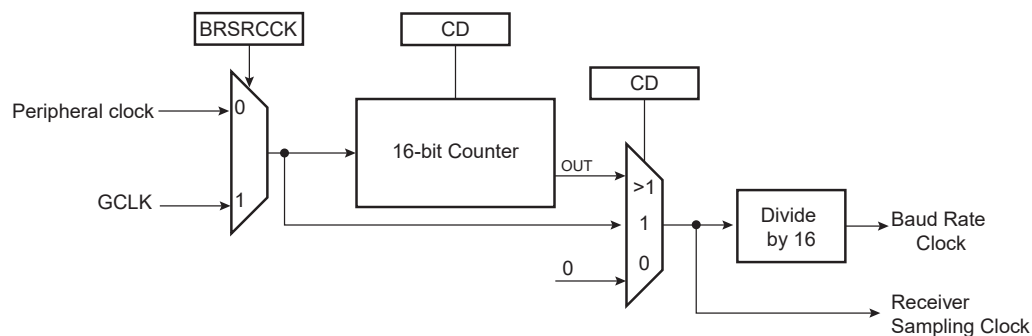

The baud rate generator provides the bit period clock named baud rate clock to both the receiver and the transmitter.

The baud rate clock is the peripheral clock divided by 16 times the clock divisor (CD) value written in the Baud Rate Generator register (DBGU\_BRGR). If DBGU\_BRGR is set to 0, the baud rate clock is disabled and the DBGU remains inactive. The maximum allowable baud rate is peripheral clock or GCLK divided by 16. The minimum allowable baud rate is peripheral clock divided by  $(16 \times 65536)$ . The clock source driving the baud rate generator (peripheral clock or GCLK) can be selected by writing the bit BRSRCCK in DBGU\_MR.

If GCLK is selected, the baud rate is independent of the processor/bus clock. Thus the processor clock can be changed while DBGU is enabled. The processor clock frequency changes must be performed only by programming the field PRES in PMC\_MCKR (see PMC section). Other methods to modify the processor/bus clock frequency (PLL multiplier, etc.) are forbidden when DBGU is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

**Figure 37.2.** Baud Rate Generator

### 37.5.2. Receiver

#### 37.5.2.1. Receiver Reset, Enable and Disable

After device reset, the DBGU receiver is disabled and must be enabled before being used. The receiver can be enabled by writing the Control register (DBGU\_CR) with the bit RXEN at 1. At this command, the receiver starts looking for a start bit.

The programmer can disable the receiver by writing DBGU\_CR with the bit RXDIS at 1. If the receiver is waiting for a start bit, it is immediately stopped. However, if the receiver has already detected a start bit and is receiving the data, it waits for the stop bit before actually stopping its operation.

The receiver can be put in reset state by writing DBGU\_CR with the bit RSTRX at 1. In this case, the receiver immediately stops its current operations and is disabled, whatever its current state. If RSTRX is applied when data is being processed, this data is lost.

#### 37.5.2.2. Start Detection and Data Sampling

The DBGU only supports asynchronous operations, and this affects only its receiver. The DBGU receiver detects the start of a received character by sampling the DRXD signal until it detects a valid start bit. A low level (space) on DRXD is interpreted as a valid start bit if it is detected for more than seven cycles of the sampling clock, which is 16 times the baud rate. Hence, a space that is longer than 7/16 of the bit period is detected as a valid start bit. A space which is 7/16 of a bit period or shorter is ignored and the receiver continues to wait for a valid start bit.

When a valid start bit has been detected, the receiver samples the DRXD at the theoretical midpoint of each bit. It is assumed that each bit lasts 16 cycles of the sampling clock (1-bit period) so the bit sampling point is eight cycles (0.5-bit period) after the start of the bit. The first sampling point is therefore 24 cycles (1.5-bit periods) after detecting the falling edge of the start bit.

Each subsequent bit is sampled 16 cycles (1-bit period) after the previous one.

**Figure 37.3. Start Bit Detection**

**Figure 37.4. Character Reception**

Example: 8-bit, parity enabled 1 stop

### 37.5.2.3. Receiver Ready

When a complete character is received, it is transferred to the Receive Holding register (DBGU\_RHR) and the RXRDY status bit in the Status register (DBGU\_SR) is set. The bit RXRDY is automatically cleared when DBGU\_RHR is read.

**Figure 37.5. Receiver Ready**

### 37.5.2.4. Receiver Overrun

The OVRE status bit in DBGU\_SR is set if DBGU\_RHR has not been read by the software (or the DMA Controller) since the last transfer, the RXRDY bit is still set and a new character is received. OVRE is cleared when the software writes a 1 to the bit RSTSTA (Reset Status) in DBGU\_CR.

**Figure 37.6. Receiver Overrun**

### 37.5.2.5. Parity Error

Each time a character is received, the receiver calculates the parity of the received data bits, in accordance with the field PAR in the Mode register (DBGU\_MR). It then compares the result with the received parity bit. If different, the parity error bit PARE in DBGU\_SR is set at the same time RXRDY is set. The parity bit is cleared when DBGU\_CR is written with the bit RSTSTA (Reset Status) at 1. If a new character is received before the reset status command is written, the PARE bit remains at 1.

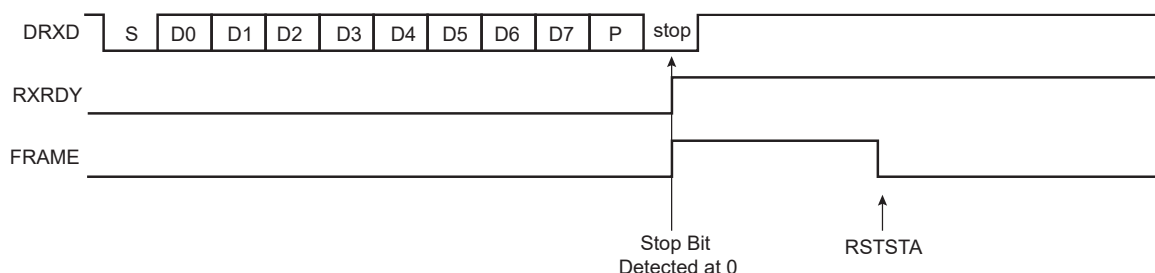

**Figure 37.7.** Parity Error

### 37.5.2.6. Receiver Framing Error

When a start bit is detected, it generates a character reception when all the data bits have been sampled. The stop bit is also sampled and when it is detected at 0, the FRAME (Framing Error) bit in DBGU\_SR is set at the same time the RXRDY bit is set. The FRAME bit remains high until the Control register (DBGU\_CR) is written with the bit RSTSTA at 1.

**Figure 37.8.** Receiver Framing Error

### 37.5.2.7. Receiver Digital Filter

The DBGU embeds a digital filter on the receive line. It is disabled by default and can be enabled by writing a logical 1 in the FILTER bit of DBGU\_MR. When enabled, the receive line is sampled using the 16x bit clock and a three-sample filter (majority 2 over 3) determines the value of the line.

### 37.5.2.8. Receiver Timeout

The Receiver Timeout provides support in handling variable-length frames. This feature detects an idle condition on the DRXD line. When a timeout is detected, the bit TIMEOUT in DBGU\_SR rises and can generate an interrupt, thus indicating to the driver an end of frame.

The timeout delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Timeout register (DBGU\_RTOR). If the TO field is written to 0, the Receiver Timeout is disabled and no timeout is detected. The TIMEOUT bit remains at 0. Otherwise, the receiver loads an 8-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the TIMEOUT bit rises. Then, the user can either:

- stop the counter clock until a new character is received. This is performed by writing a one to the STTTO (Start timeout) bit in DBGU\_CR. In this case, the idle state on DRXD before a new character is received does not provide a timeout. This prevents having to handle an interrupt before a character is received and allows waiting for the next idle state on DRXD after a frame is received, or

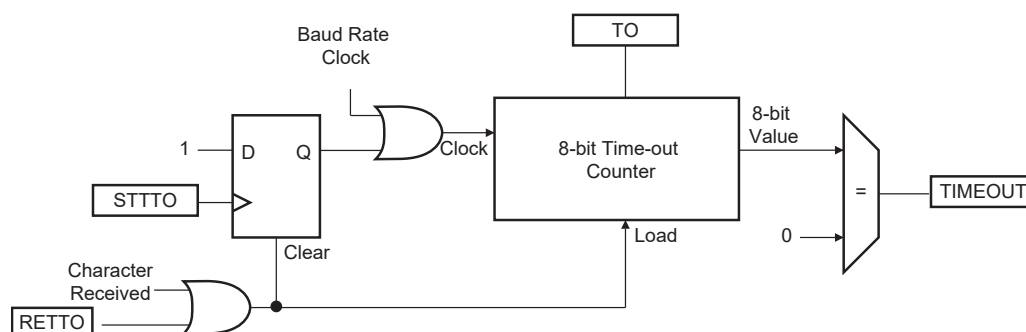

- obtain an interrupt while no character is received. This is performed by writing a one to the RETTO (Reload and start timeout) bit in DBGU\_CR. If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

If STTTO is performed, the counter clock is stopped until a first character is received. The idle state on DRXD before the start of the frame does not provide a timeout. This prevents having to obtain a periodic interrupt and enables a wait of the end of frame when the idle state on DRXD is detected.

If RETTO is performed, the counter starts counting down immediately from the TO value. This enables generation of a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

The following figure shows the block diagram of the Receiver Timeout feature.

**Figure 37.9.** Receiver Timeout Block Diagram

The following table gives the maximum timeout period for some standard baud rates.

**Table 37.2.** Maximum Timeout Period

Baud Rate (bit/s)	Bit Time ( $\mu$ s)	Timeout ( $\mu$ s)
600	1,667	425,085
1,200	833	212,415
2,400	417	106,335
4,800	208	53,040
9,600	104	26,520
14,400	69	17,595
19,200	52	13,260
28,800	35	8,925
38,400	26	6,630
56,000	18	4,590
57,600	17	4,335
200,000	5	1,275

## 37.5.3. Transmitter

### 37.5.3.1. Transmitter Reset, Enable and Disable

After device reset, the DBGU transmitter is disabled and must be enabled before being used. The transmitter is enabled by writing DBGU\_CR with the bit TXEN at 1. From this command, the transmitter waits for a character to be written in the Transmit Holding register (DBGU\_THR) before actually starting the transmission.

The programmer can disable the transmitter by writing DBGU\_CR with the bit TXDIS at 1. If the transmitter is not operating, it is immediately stopped. However, if a character is being processed

into the internal shift register and/or a character has been written in the DBGU\_THR, the characters are completed before the transmitter is actually stopped.

The programmer can also put the transmitter in its reset state by writing the DBGU\_CR with the bit RSTTX at 1. This immediately stops the transmitter, whether or not it is processing characters.

### 37.5.3.2. Transmit Format

The DBGU transmitter drives the pin DTXD at the baud rate clock speed. The line is driven depending on the format defined in DBGU\_MR and the data stored in the internal shift register. One start bit at level 0, then the 8 data bits, from the lowest to the highest bit, one optional parity bit and one stop bit at 1 are consecutively shifted out as shown in the following figure. The field PARE in DBGU\_MR defines whether or not a parity bit is shifted out. When a parity bit is enabled, it can be selected between an odd parity, an even parity, or a fixed space or mark bit.

**Figure 37.10.** Character Transmission

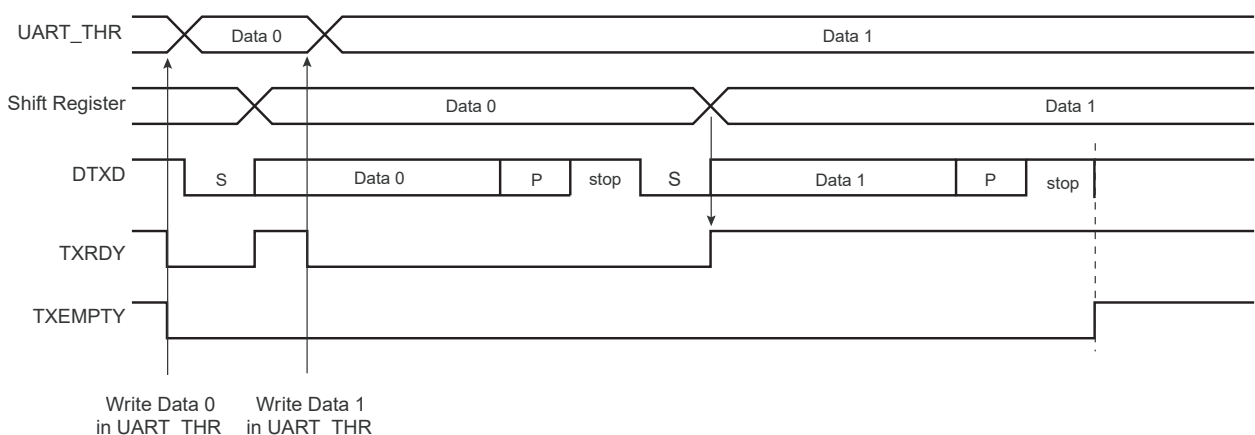

### 37.5.3.3. Transmitter Control

When the transmitter is enabled, the bit TXRDY (Transmitter Ready) is set in DBGU\_SR. The transmission starts when the programmer writes in the DBGU\_THR, and after the written character is transferred from DBGU\_THR to the internal shift register. The TXRDY bit remains high until a second character is written in DBGU\_THR. As soon as the first character is completed, the last character written in DBGU\_THR is transferred into the internal shift register and TXRDY rises again, showing that the holding register is empty.

When both the internal shift register and DBGU\_THR are empty, i.e., all the characters written in DBGU\_THR have been processed, the TXEMPTY bit rises after the last stop bit has been completed.

**Figure 37.11.** Transmitter Control

### 37.5.4. DMA Support

Both the receiver and the transmitter of the DBGU are connected to a DMA Controller (DMAC) channel.

The DMA Controller channels are programmed via registers that are mapped within the DMAC user interface.

#### 37.5.5. Register Write Protection

To prevent any single software error from corrupting DBGU behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [DBGU Write Protection Mode Register](#).

The following registers can be write-protected:

- [DBGU Mode Register](#)
- [DBGU Baud Rate Generator Register](#)
- [DBGU Receiver Timeout Register](#)
- [Debug Unit Force NTRST Register](#)

#### 37.5.6. Test Modes

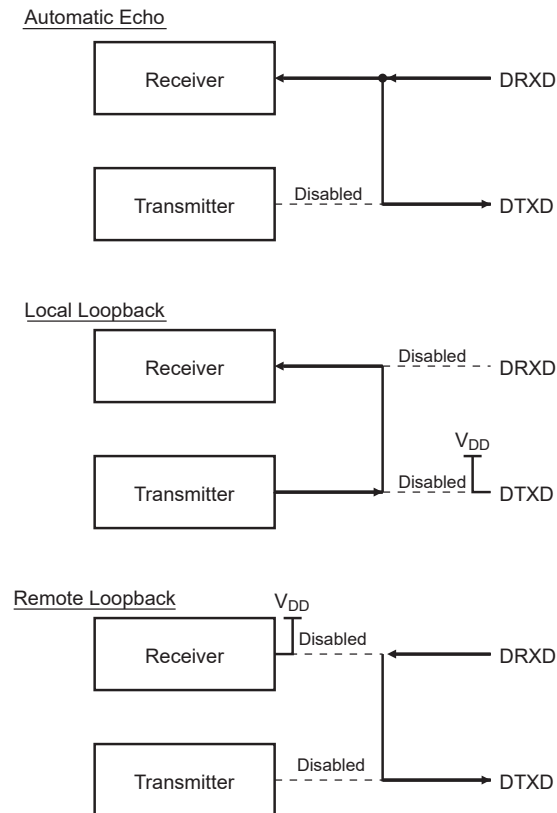

The DBGU supports three test modes. These modes of operation are programmed by using the CHMODE field in DBGU\_MR.

The Automatic Echo mode allows a bit-by-bit retransmission. When a bit is received on the DRXD line, it is sent to the DTXD line. The transmitter operates normally, but has no effect on the DTXD line.

The Local loopback mode allows the transmitted characters to be received. DTXD and DRXD pins are not used and the output of the transmitter is internally connected to the input of the receiver. The DRXD pin level has no effect and the DTXD line is held high, as in idle state.

The Remote loopback mode directly connects the DRXD pin to the DTXD line. The transmitter and the receiver are disabled and have no effect. This mode allows a bit-by-bit retransmission.

**Figure 37.12.** Test Modes

### 37.5.7. Debug Communication Channel Support

The DBGU handles the COMMRX and COMMTX signals that come from the Debug Communication Channel of the Arm processor and are driven by the In-circuit Emulator.

The Debug Communication Channel contains two registers that are accessible through the ICE Breaker on the JTAG side and through the coprocessor 0 on the Arm processor side.

As a reminder, the following instructions are used to read and write the Debug Communication Channel:

```
MRC p14, 0, Rd, c1, c0, 0
```

Returns the debug communication data read register into Rd.

```
MCR p14, 0, Rd, c1, c0, 0
```

Writes the value in Rd to the debug communication data write register.

The COMMRX and COMMTX bits which indicate, respectively, that the read register has been written by the debugger but not yet read by the processor, and that the write register has been written by the processor and not yet read by the debugger, are wired on the two highest bits of DBGU\_SR. These bits can generate an interrupt. This feature can be used to handle under interrupt a debug link between a debug monitor running on the target system and a debugger.

### 37.5.8. Chip Identifier

The DBGU features two chip identifier registers, DBGU Chip ID register (DBGU\_CIDR) and DBGU Extension ID register (DBGU\_EXID). Both registers contain a hard-wired value that is read-only.

**Table 37.3.** DBGU\_CIDR and DBGU\_EXID Reset Values

Device Name	DBGU_CIDR	DBGU_EXID
SAM9X60	0x819B35Ax	0x00000000
		0x000000C4 (SL1)
		0x000000C5 (SL2)
		0x000000C6 (SL3)

### 37.5.9. ICE Access Prevention

The DBGU allows blockage of access to the system through the Arm processor's ICE interface. This feature is implemented via the Force NTRST register (DBGU\_FNR), that allows assertion of the NTRST signal of the ICE interface. Writing the bit FNTRST (Force NTRST) to 1 in this register prevents any activity on the TAP controller.

**Notes:**

1. During ROM code execution, this bit is set (JTAG access is disabled).
2. This bit has no more effect once the JTAG access is disabled in the OTPC.

## 37.6. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	DBGU_CR	31:24								
		23:16								
		15:8					STTTO	RETTO		RSTSTA
		7:0	TXDIS	TXEN	RXDIS	RXEN	RSTTX	RSTRX		
0x04	DBGU_MR	31:24								
		23:16								
		15:8	CHMODE[1:0]			BRSRCCK	PAR[2:0]			
		7:0				FILTER				
0x08	DBGU_IER	31:24	COMMRX	COMMTX						
		23:16								
		15:8							TXEMPTY	TIMEOUT
		7:0	PARE	FRAME	OVRE				TXRDY	RXRDY
0x0C	DBGU_IDR	31:24	COMMRX	COMMTX						
		23:16								
		15:8							TXEMPTY	TIMEOUT
		7:0	PARE	FRAME	OVRE				TXRDY	RXRDY
0x10	DBGU_IMR	31:24	COMMRX	COMMTX						
		23:16								
		15:8							TXEMPTY	TIMEOUT
		7:0	PARE	FRAME	OVRE				TXRDY	RXRDY
0x14	DBGU_SR	31:24	COMMRX	COMMTX						
		23:16								
		15:8							TXEMPTY	TIMEOUT
		7:0	PARE	FRAME	OVRE				TXRDY	RXRDY

**37.6.1. DBGU Control Register**

**Name:** DBGU\_CR  
**Offset:** 0x0000  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					STTTO	RETTO		RSTSTA
Access					W	W		W
Reset					–	–		–

Bit	7	6	5	4	3	2	1	0
	TXDIS	TXEN	RXDIS	RXEN	RSTTX	RSTRX		
Access	W	W	W	W	W	W		
Reset	–	–	–	–	–	–		

**Bit 11 – STTTO** Start Timeout

Value	Description
0	No effect.
1	Starts waiting for a character before clocking the timeout counter. Resets status bit DBGU_SR.TIMEOUT.

**Bit 10 – RETTO** Rearm Timeout

Value	Description
0	No effect.
1	Restarts timeout.

**Bit 8 – RSTSTA** Reset Status

Value	Description
0	No effect.
1	Resets the status bits PARE, FRAME and OVRE in DBGU_SR.

**Bit 7 – TXDIS** Transmitter Disable

Value	Description
0	No effect.
1	The transmitter is disabled. If a character is being processed and a character has been written in DBGU_THR and RSTTX is not set, both characters are completed before the transmitter is stopped.

**Bit 6 – TXEN** Transmitter Enable

Value	Description
0	No effect.

Value	Description
1	The transmitter is enabled if TXDIS is 0.

#### Bit 5 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	The receiver is disabled. If a character is being processed and RSTRX is not set, the character is completed before the receiver is stopped.

#### Bit 4 – RXEN Receiver Enable

Value	Description
0	No effect.
1	The receiver is enabled if RXDIS is 0.

#### Bit 3 – RSTTX Reset Transmitter

Value	Description
0	No effect.
1	The transmitter logic is reset and disabled. If a character is being transmitted, the transmission is aborted.

#### Bit 2 – RSTRX Reset Receiver

Value	Description
0	No effect.
1	The receiver logic is reset and disabled. If a character is being received, the reception is aborted.

### 37.6.2. DBGU Mode Register

**Name:** DBGU\_MR  
**Offset:** 0x0004  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access	CHMODE[1:0]			BRSRCCK		PAR[2:0]		
Reset	R/W	R/W		R/W	R/W	R/W	R/W	
Reset	0	0		0	0	0	0	
Bit	7	6	5	4	3	2	1	0
Access				FILTER				
Reset				R/W				
Reset				0				

#### Bits 15:14 – CHMODE[1:0] Channel Mode

Value	Name	Description
0	NORMAL	Normal mode
1	AUTOMATIC	Automatic echo
2	LOCAL_LOOPBACK	Local loopback
3	REMOTE_LOOPBACK	Remote loopback

#### Bit 12 – BRSRCCK Baud Rate Source Clock

0 (PERIPH\_CLK): The baud rate is driven by the peripheral clock

1 (GCLK): The baud rate is driven by a PMC-programmable clock GCLK (see section Power Management Controller (PMC)).

#### Bits 11:9 – PAR[2:0] Parity Type

Value	Name	Description
0	EVEN	Even Parity
1	ODD	Odd Parity
2	SPACE	Space: parity forced to 0
3	MARK	Mark: parity forced to 1
4	NO	No parity

#### Bit 4 – FILTER Receiver Digital Filter

0 (DISABLED): DBGU does not filter the receive line.

1 (ENABLED): DBGU filters the receive line using a three-sample filter (16x-bit clock) (2 over 3 majority).

### 37.6.3. DBGU Interrupt Enable Register

**Name:** DBGU\_IER  
**Offset:** 0x0008  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
	COMMRX	COMMTX						
Access	W	W						
Reset	–	–						
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							TXEMPTY	TIMEOUT
Access							W	W
Reset							–	–
Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE				TXRDY	RXRDY
Access	W	W	W				W	W
Reset	–	–	–				–	–

**Bit 31 – COMMRX** Enable COMMRX (from Arm) Interrupt

**Bit 30 – COMMTX** Enable COMMTX (from Arm) Interrupt

**Bit 9 – TXEMPTY** Enable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Enable Timeout Interrupt

**Bit 7 – PARE** Enable Parity Error Interrupt

**Bit 6 – FRAME** Enable Framing Error Interrupt

**Bit 5 – OVRE** Enable Overrun Error Interrupt

**Bit 1 – TXRDY** Enable TXRDY Interrupt

**Bit 0 – RXRDY** Enable RXRDY Interrupt

### 37.6.4. DBGU Interrupt Disable Register

**Name:** DBGU\_IDR  
**Offset:** 0x000C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
	COMMRX	COMMTX						
Access	W	W						
Reset	–	–						
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							TXEMPTY	TIMEOUT
Access							W	W
Reset							–	–
Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE				TXRDY	RXRDY
Access	W	W	W				W	W
Reset	–	–	–				–	–

**Bit 31 – COMMRX** Disable COMMRX (from Arm) Interrupt

**Bit 30 – COMMTX** Disable COMMTX (from Arm) Interrupt

**Bit 9 – TXEMPTY** Disable TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Disable Timeout Interrupt

**Bit 7 – PARE** Disable Parity Error Interrupt

**Bit 6 – FRAME** Disable Framing Error Interrupt

**Bit 5 – OVRE** Disable Overrun Error Interrupt

**Bit 1 – TXRDY** Disable TXRDY Interrupt

**Bit 0 – RXRDY** Disable RXRDY Interrupt

### 37.6.5. DBGU Interrupt Mask Register

**Name:** DBGU\_IMR  
**Offset:** 0x0010  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
	COMMRX	COMMTX						
Access	R	R						
Reset	0	0						

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
							TXEMPTY	TIMEOUT
Access							R	R
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE				TXRDY	RXRDY
Access	R	R	R				R	R
Reset	0	0	0				0	0

**Bit 31 – COMMRX** Mask COMMRX (from Arm) Interrupt

**Bit 30 – COMMTX** Mask COMMTX (from Arm) Interrupt

**Bit 9 – TXEMPTY** Mask TXEMPTY Interrupt

**Bit 8 – TIMEOUT** Mask Timeout Interrupt

**Bit 7 – PARE** Mask Parity Error Interrupt

**Bit 6 – FRAME** Mask Framing Error Interrupt

**Bit 5 – OVRE** Mask Overrun Error Interrupt

**Bit 1 – TXRDY** Disable TXRDY Interrupt

**Bit 0 – RXRDY** Mask RXRDY Interrupt

### 37.6.6. DBGU Status Register

**Name:** DBGU\_SR  
**Offset:** 0x0014  
**Reset:** –  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	COMMRX	COMMTX						
Access	R	R						
Reset	–	–						

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
							TXEMPTY	TIMEOUT
Access							R	R
Reset							–	–

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE				TXRDY	RXRDY
Access	R	R	R				R	R
Reset	–	–	–				–	–

#### Bit 31 – COMMRX Debug Communication Channel Read Status

Value	Description
0	COMMRX from the Arm processor is inactive.
1	COMMRX from the Arm processor is active.

#### Bit 30 – COMMTX Debug Communication Channel Write Status

Value	Description
0	COMMTX from the Arm processor is inactive.
1	COMMTX from the Arm processor is active.

#### Bit 9 – TXEMPTY Transmitter Empty

Value	Description
0	There are characters in DBGU_THR, or characters are being processed by the transmitter, or the transmitter is disabled.
1	There are no characters in DBGU_THR and there are no characters being processed by the transmitter.

#### Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been any timeout since the last Start timeout command (DBGU_CR.STTTO), or the Timeout register is 0.
1	There has been a timeout since the last Start timeout command (DBGU_CR.STTTO).

#### Bit 7 – PARE Parity Error

Value	Description
0	No parity error has occurred since the last RSTSTA.
1	At least one parity error has occurred since the last RSTSTA.

#### Bit 6 – FRAME Framing Error

Value	Description
0	No framing error has occurred since the last RSTSTA.
1	At least one framing error has occurred since the last RSTSTA.

#### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA.
1	At least one overrun error has occurred since the last RSTSTA.

#### Bit 1 – TXRDY Transmitter Ready

Value	Description
0	A character has been written to DBGU_THR and not yet transferred to the internal shift register, or the transmitter is disabled.
1	There is no character written to DBGU_THR that is not yet transferred to the internal shift register.

#### Bit 0 – RXRDY Receiver Ready

Value	Description
0	No character has been received since the last read of DBGU_RHR, or the receiver is disabled.
1	At least one complete character has been received, transferred to DBGU_RHR, and not yet read.

### 37.6.7. DBGU Receiver Holding Register

**Name:** DBGU\_RHR  
**Offset:** 0x0018  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	RXCHR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – RXCHR[7:0]** Received Character  
Last received character if RXRDY is set.

### 37.6.8. DBGU Transmit Holding Register

**Name:** DBGU\_THR  
**Offset:** 0x001C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	TXCHR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 7:0 – TXCHR[7:0] Character to be Transmitted

Next character to be transmitted after the current character if TXRDY is not set.

### 37.6.9. DBGU Baud Rate Generator Register

**Name:** DBGU\_BRGR  
**Offset:** 0x0020  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	CD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – CD[15:0] Clock Divisor

Value	Description
0	Baud rate clock is disabled.
1	1 to 65,535: If BRSRCCK = 0: $CD = \frac{f_{\text{peripheral clock}}}{16 \times \text{Baud Rate}}$ If BRSRCCK = 1: $CD = \frac{f_{\text{GCLKx}}}{16 \times \text{Baud Rate}}$

### 37.6.10. DBGU Receiver Timeout Register

**Name:** DBGU\_RTOR  
**Offset:** 0x0028  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	TO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 7:0 – TO[7:0] Timeout Value

Value	Description
0	The receiver timeout is disabled.
1–255	The receiver timeout is enabled and the timeout delay is TO x bit period.

### 37.6.11. DBGU Chip ID Register

**Name:** DBGU\_CIDR  
**Offset:** 0x0040  
**Reset:** –  
**Property:** Read-only

For detailed reset values, refer to [Chip Identifier](#).

Bit	31	30	29	28	27	26	25	24
	EXT	CHID[30:24]						
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	CHID[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	CHID[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	CHID[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–

#### Bit 31 – EXT Extension Flag

Value	Description
0	Chip ID has a single register definition without extension.
1	An extended Chip ID exists.

#### Bits 30:0 – CHID[30:0] Chip ID Value

### 37.6.12. DBGU Chip ID Extension Register

**Name:** DBGU\_EXID  
**Offset:** 0x0044  
**Reset:** –  
**Property:** Read-only

For detailed reset values, refer to [Chip Identifier](#).

Bit	31	30	29	28	27	26	25	24
	EXID[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	EXID[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	EXID[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	EXID[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – EXID[31:0]** Chip ID Extension  
Read as 0 if DBGU\_CIDR.EXT=0.

### 37.6.13. Debug Unit Force NTRST Register

**Name:** DBGU\_FNR  
**Offset:** 0x0048  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								FNTRST
Access								R/W
Reset								0

#### Bit 0 – FNTRST Force NTRST

Value	Description
0	NTRST of the Arm processor's TAP controller is driven by the power_on_reset signal.
1	NTRST of the Arm processor's TAP controller is held low.

### 37.6.14. DBGU Write Protection Mode Register

**Name:** DBGU\_WPMR  
**Offset:** 0x00E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x554152	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x554152 (DBGU in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x554152 (DBGU in ASCII).

## 38. Special Function Registers (SFR)

### 38.1. Description

Special Function Registers (SFR) manage specific aspects of the integrated memory, bridge implementations, processor and other functionality not controlled elsewhere.

### 38.2. Embedded Characteristics

- 32-bit Special Function Registers Control Specific Behavior of the Product

## 38.3. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00 ... 0x03	Reserved									
0x04	SFR_CCFG_EBICSA	31:24							DDR_MP_EN	NFD0_ON_D16
		23:16				DQIEN_F				EBI_DRIVE
		15:8							EBI_DBPDC	EBI_DBPUC
		7:0			EBI_CS5A	EBI_CS4A	EBI_CS3A		EBI_CS1A	
0x08 ... 0x0F	Reserved									
0x10	SFR_OHCIICR	31:24								
		23:16	UDPPUDIS							
		15:8						SUSP2	SUSP1	SUSP0
		7:0			APPSTART	ARIE		RES2	RES1	RES0
0x14	SFR_OHCIISR	31:24								
		23:16								
		15:8								
		7:0						RIS2	RIS1	RIS0
0x18 ... 0x33	Reserved									
0x34	SFR_UTMIHSTRIM	31:24								
		23:16							SLOPE2[2:0]	
		15:8			SLOPE1[2:0]				SLOPE0[2:0]	
		7:0								
0x38	SFR_UTMIFSTRIM	31:24			ZP_CAL[2:0]				ZN_CAL[2:0]	
		23:16			ZP[2:0]				ZN[2:0]	
		15:8								
		7:0								
0x3C	SFR_UTMISWAP	31:24								
		23:16								
		15:8								
		7:0						PORT2	PORT1	PORT0
0x40 ... 0x7B	Reserved									
0x7C	SFR_LS	31:24								
		23:16								MEM_POWER_GATING_ULP1_EN
		15:8							LS9	LS8

### 38.3.1. EBI Chip Select Register

**Name:** SFR\_CCFG\_EBICSA  
**Offset:** 0x04  
**Reset:** 0x00000300  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
							DDR_MP_EN	NFD0_ON_D16
Access							R/W	R/W
Reset							0	0

Bit	23	22	21	20	19	18	17	16
				DQIEN_F				EBI_DRIVE
Access				R/W				R/W
Reset				0				0

Bit	15	14	13	12	11	10	9	8
							EBI_DBPDC	EBI_DBPUC
Access							R/W	R/W
Reset							1	1

Bit	7	6	5	4	3	2	1	0
			EBI_CS5A	EBI_CS4A	EBI_CS3A		EBI_CS1A	
Access			R/W	R/W	R/W		R/W	
Reset			0	0	0		0	

#### Bit 25 – DDR\_MP\_EN DDR Multi-port Enable

Value	Description
0	DDR Multi-port is disabled (default).
1	DDR Multi-port is enabled, performance is increased.

#### Bit 24 – NFD0\_ON\_D16 NAND Flash Databus Selection

Value	Description
0	NAND Flash I/Os are connected to D0–D7 (default).
1	NAND Flash I/Os are connected to D16–D23.

#### Bit 20 – DQIEN\_F Force Analog Input Comparator Configuration

Value	Description
0	No effect
1	Enables the input comparator in the VDDIOM I/O data lines. This bit must be set to one in an initialization phase whenever an MPDDRC external component (DDR2 or LPDDR) and an SMC external component (e.g., NAND Flash) are multiplexed on the D0–D15 bus.

#### Bit 16 – EBI\_DRIVE EBI I/O Drive Configuration

Value	Description
0	EBI D0–D15 Low Drive
1	EBI D0–D15 High Drive

#### Bit 9 – EBI\_DBPDC EBI Data Bus Pulldown Configuration

Value	Description
0	EBI D0–D15 Data Bus bits are not internally pulled down.
1	EBI D0–D15 Data Bus bits are internally pulled down to the ground.

#### Bit 8 – EBI\_DBPUC EBI Data Bus Pullup Configuration

Value	Description
0	EBI D0–D15 Data Bus bits are internally pulled up to the VDDIOM power supply.
1	EBI D0–D15 Data Bus bits are not internally pulled up.

#### Bit 5 – EBI\_CS5A EBI Chip Select 5 Assignment

Value	Description
0	EBI Chip Select 5 is only assigned to the Static Memory Controller and EBI_NCS5 behaves as defined by the SMC.
1	EBI Chip Select 5 is assigned to the Static Memory Controller.

#### Bit 4 – EBI\_CS4A EBI Chip Select 4 Assignment

Value	Description
0	EBI Chip Select 4 is only assigned to the Static Memory Controller and EBI_NCS4 behaves as defined by the SMC.
1	EBI Chip Select 4 is assigned to the Static Memory Controller.

#### Bit 3 – EBI\_CS3A EBI Chip Select 3 Assignment

Value	Description
0	EBI Chip Select 3 is only assigned to the Static Memory Controller and EBI_NCS3 behaves as defined by the SMC.
1	EBI Chip Select 3 is assigned to the Static Memory Controller and the NAND Flash Logic is activated.

#### Bit 1 – EBI\_CS1A EBI Chip Select 1 Assignment

Value	Description
0	EBI Chip Select 1 is assigned to the Static Memory Controller (SMC).
1	EBI Chip Select 1 is assigned to the MPDDRC or the SDRAMC controller.

**38.3.2. OHCI Interrupt Configuration Register**

**Name:** SFR\_OHCIICR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	UDPPUDIS							
Reset	R/W

Reset						R/W	R/W	R/W
						0	0	0
Bit	7	6	5	4	3	2	1	0
Access			APPSTART	ARIE		RES2	RES1	RES0
Reset			R/W	R/W		R/W	R/W	R/W
			0	0		0	0	0

**Bit 23 – UDPPUDIS** Reserved

Value	Description
0	Must write 0.

**Bits 8, 9, 10 – SUSP** USB PORTx

Value	Description
0	Does not suspend USB PORTx.
1	Forces PORTx suspend.

**Bit 5 – APPSTART** Reserved

Value	Description
0	Must write 0.

**Bit 4 – ARIE** OHCI Asynchronous Resume Interrupt Enable

Value	Description
0	Disables interrupt.
1	Enables interrupt.

**Bits 0, 1, 2 – RESx** USB PORTx Reset

Value	Description
0	No effect (USB PORTx reset released, default value)
1	Resets USB PORTx.

### 38.3.3. OHCI Interrupt Status Register

**Name:** SFR\_OHCIISR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						RIS2	RIS1	RIS0
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 0, 1, 2 – RIS OHCI Resume Interrupt Status Port x

Value	Description
0	OHCI port resume is not detected.
1	OHCI port resume is detected.

### 38.3.4. UTMI High-Speed Trimming Register

**Name:** SFR\_UTMIHSTRIM  
**Offset:** 0x34  
**Reset:** 0x00044433  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x534652	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

**Bit 0 – WPEN Write Protection Enable**

Value	Description
0	Disables write protection if WPKEY corresponds to 0x534652 ("SFR" in ASCII).
1	Enables write protection if WPKEY corresponds to 0x534652 ("SFR" in ASCII).

## 39. Slow Clock Controller (SCKC)

### 39.1. Description

The System Controller embeds a Slow Clock Controller (SCKC). The SCKC selects the slow clock for the RTT and the RTC from one of two sources:

- External 32.768 kHz crystal oscillator
- Embedded 32 kHz (typical) slow RC oscillator

### 39.2. Embedded Characteristics

- Embedded 32 kHz (Typical) Slow RC Oscillator or 32.768 kHz Crystal Oscillator Selector
- VDDDBU-Powered

### 39.3. Block Diagram

Figure 39.1. SCKC Block Diagram

### 39.4. Functional Description

The TD\_OSCSEL bit located in the Slow Clock Controller Configuration register (SCKC\_CR) is in the backup domain and its value is kept while VDDDBU is present.

The embedded 32 kHz (typical) slow RC oscillator is always enabled as soon as VDDDBU is established. The Slow Clock Selector command TD\_OSCSEL bit selects the slow clock source of the RTT and the RTC.

After the VDDDBU Power-On-Reset, the default configuration is TD\_OSCSEL = 0.

The programmer controls the slow clock switching by software, so precautions must be taken during the switching phase.

#### 39.4.1. Switching from Embedded 32 kHz RC Oscillator to 32.768 kHz Crystal Oscillator

The sequence to switch from the embedded 32 kHz (typical) slow RC oscillator to the 32.768 kHz crystal oscillator is the following:

1. Switch the main system bus clock to a source different from slow clock (PLL or Main Oscillator) through the Power Management Controller.
2. Switch from the embedded 32 kHz RC oscillator to the 32.768 kHz crystal oscillator by writing a 1 to the TD\_OSCSEL bit.
3. Wait 39000 slow clock cycles for internal resynchronization.

#### 39.4.2. Bypassing the 32.768 kHz Crystal Oscillator

The sequence to bypass the 32.768 kHz crystal oscillator is the following:

1. An external clock must be connected on XIN32.
2. Enable the bypass path by writing a 1 to the OSC32BYP bit.
3. Disable the 32.768 kHz crystal oscillator by writing a 0 to the OSC32EN bit.

#### 39.4.3. Switching from 32.768 kHz Crystal Oscillator to Embedded 32 kHz RC Oscillator

The sequence to switch from the 32.768 kHz crystal oscillator to the embedded 32 kHz (typical) RC oscillator is the following:

1. Switch the main system bus clock to a source different from slow clock (PLL or Main Oscillator).
2. Switch from the 32.768 kHz crystal oscillator to the embedded RC oscillator by writing a 0 to the TD\_OSCSEL bit.
3. Wait 5 slow clock cycles for internal resynchronization.
4. Disable the 32.768 kHz crystal oscillator by writing a 0 to the OSC32EN bit.

## 39.5. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	SCKC_CR	31:24								TD_OSCSEL
		23:16								
		15:8								
		7:0						OSC32BYP	OSC32EN	

### 39.5.1. Slow Clock Controller Configuration Register

**Name:** SCKC\_CR  
**Offset:** 0x0  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the System Controller Write Protection Mode register (SYSC\_WPMR).

Bit	31	30	29	28	27	26	25	24
								TD_OSCSEL
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						OSC32BYP	OSC32EN	
Access						R/W	R/W	
Reset						0	0	

#### Bit 24 – TD\_OSCSEL Timing Domain Slow Clock Selector

Value	Description
0 (RC)	Slow clock of the timing domain is driven by the embedded 32 kHz (typical) RC oscillator.
1 (XTAL)	Slow clock of the timing domain is driven by the 32.768 kHz crystal oscillator.

#### Bit 2 – OSC32BYP 32.768 kHz Crystal Oscillator Bypass

Value	Description
0	32.768 kHz crystal oscillator is not bypassed.
1	32.768 kHz crystal oscillator is bypassed and accepts an external slow clock on XIN32.

#### Bit 1 – OSC32EN 32.768 kHz Crystal Oscillator

Value	Description
0	32.768 kHz crystal oscillator is disabled.
1	32.768 kHz crystal oscillator is enabled.

## 40. Clock Generator

### 40.1. Description

The Clock Generator user interface is embedded within the Power Management Controller and is described in the [Register Summary](#). However, the Clock Generator registers are named CKGR\_.

### 40.2. Embedded Characteristics

The Clock Generator is made up of:

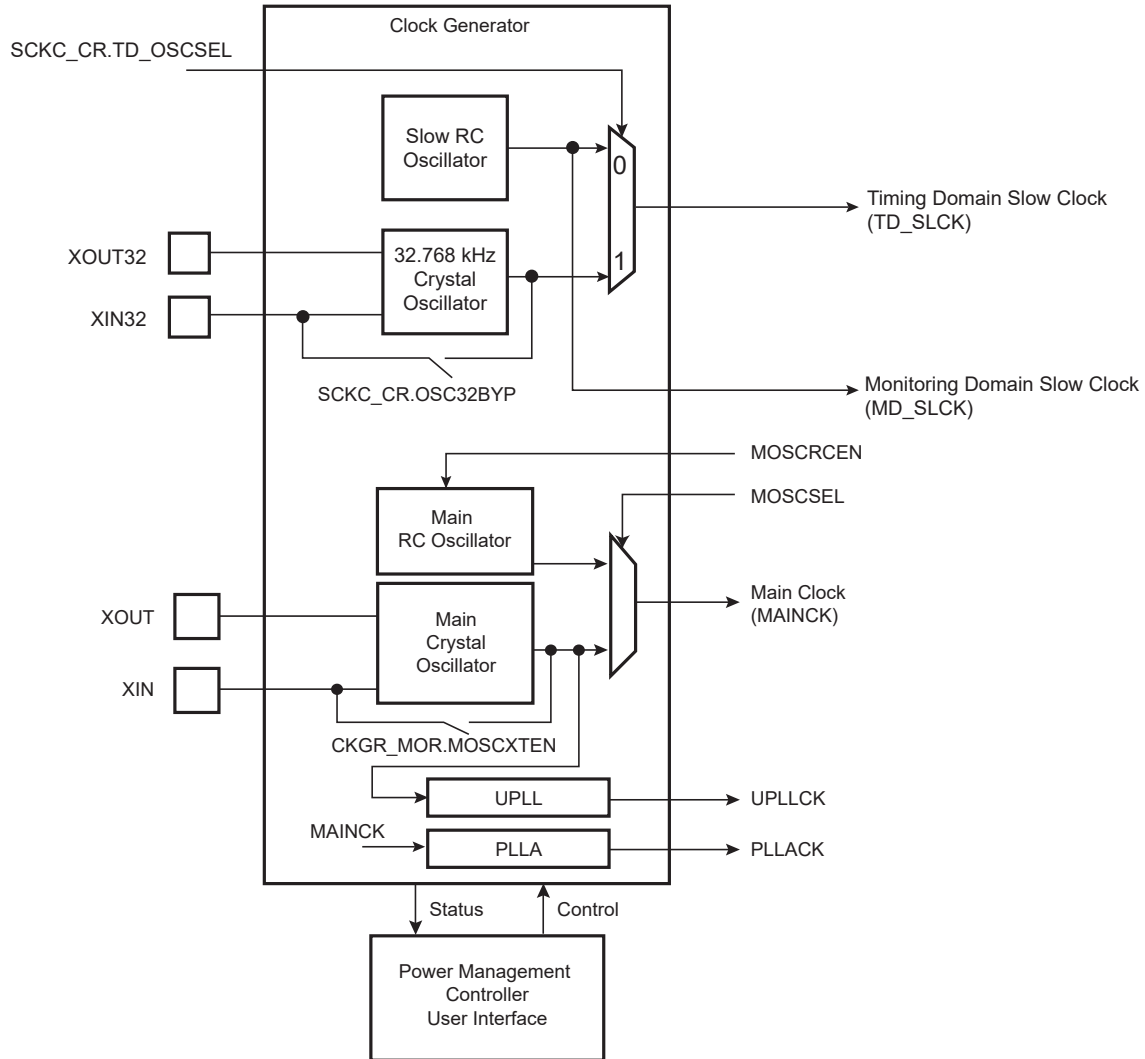

- Oscillators
  - A low-power 32.768 kHz oscillator supporting crystals, resonators and Bypass mode (referred to as “32.768 KHz crystal oscillator” throughout the document)
  - An embedded always-on, slow RC oscillator generating a typical 32 kHz clock
  - A 12 to 48 MHz oscillator supporting crystals, resonators and Bypass mode (referred to as “main crystal oscillator” throughout the document)
  - A main RC oscillator generating a typical 12 MHz clock
- Two fractional-N PLLs with an input range of 12 to 48 MHz and an internal frequency range of 600 to 1200 MHz

The Clock Generator provides the following clocks:

- MD\_SLCK—Monitoring domain slow clock. This clock, sourced from the always-on slow RC oscillator only, is the only permanent clock of the system and feeds safety-critical functions of the device (WDT, RSTC, SCKC, frequency monitors and detectors, PMC start-up time counters).
- TD\_SLCK—Timing domain slow clock. This clock, sourced from the 32.768 kHz crystal oscillator or the always-on slow RC oscillator, is routed to the RTC and RTT peripherals.
- MAINCK—Output of the main clock oscillator selection. This clock is either the main crystal oscillator or the main RC oscillator.
- PLL Clocks—Outputs of embedded PLLs

## 40.3. Block Diagram

Figure 40.1. Clock Generator Block Diagram

## 40.4. Slow Clock

The PMC does not control the slow clock generation. The control of the slow clock is performed by the Slow Clock Controller (SCKC) which embeds a slow clock generator that is supplied with the VDDDBU power supply. As soon as VDDDBU is supplied, both the 32.768 kHz crystal oscillator and the slow RC oscillator are powered, but only the slow RC oscillator is enabled.

MD\_SLCK is always generated by the slow RC oscillator.

TD\_SLCK is generated either by the 32.768 kHz crystal oscillator or by the slow RC oscillator.

The TD\_SLCK source clock selection is made via the TD\_OSCSEL bit in the Slow Clock Controller Configuration register (SCKC\_CR).

### 40.4.1. Slow RC Oscillator (32 kHz typical)

The slow RC oscillator is a permanent clock that is the source clock of MD\_SLCK and the default source clock of TD\_SLCK.

Compared to the 32.768 kHz crystal oscillator, this oscillator offers a faster start-up time and is less exposed to the external environment, as it is fully integrated. However, its output frequency is

subject to larger variations with supply voltage, temperature and manufacturing process. Therefore, the user must take these variations into account when this oscillator is used as a time base (start-up counter, frequency monitor, etc.). Refer to the section “Electrical Characteristics”.

#### 40.4.2. 32.768 kHz Crystal Oscillator

By default, the 32.768 kHz oscillator is disabled. To use this oscillator, the XIN32 and XOUT32 pins must be connected to a 32.768 kHz crystal or to a ceramic resonator. Refer to the section “Electrical Characteristics” for appropriate loading capacitors selection on XIN32 and XOUT32.

To select the 32.768 kHz crystal oscillator as the source of TD\_SLCK, SCKC\_CR.TD\_OSCSEL must be set to 1. The switch of TD\_SLCK source is glitch-free.

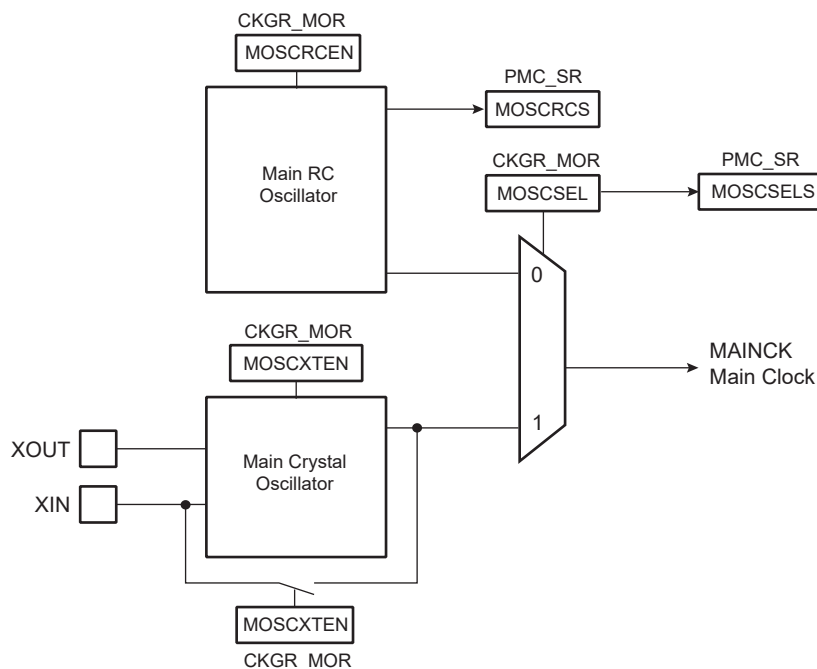

The user can also set the 32.768 kHz crystal oscillator in Bypass mode instead of connecting a crystal. In this case, the user must provide the external clock signal on XIN32. For input characteristics of the XIN32 pin, refer to the section “Electrical Characteristics”. To enter Bypass mode, the OSC32BYP bit of the Slow Clock Controller Configuration register (SCKC\_CR) must be set to 1 prior to setting SCKC\_CR.TD\_OSCSEL.

### 40.5. Main Clock

The main clock (MAINCK) has two sources:

- A main RC oscillator with a fast start-up time and that is selected by default to start the system
- A main crystal oscillator with Bypass mode

**Figure 40.2.** Main Clock (MAINCK) Block Diagram

#### 40.5.1. Main RC Oscillator

After reset, the main RC oscillator is enabled. This oscillator is selected as the source of MAINCK. MAINCK is the default clock selected to start the system.

The main RC oscillator is calibrated in production. For output frequency specifications, refer to the section “Electrical Characteristics”.

The software can disable or enable the main RC oscillator with the MOSCRGEN bit in the Clock Generator Main Oscillator register (CKGR\_MOR).

When disabling the main RC oscillator by clearing the CKGR\_MOR.MOSCRGEN bit, the PMC\_SR.MOSCRCS bit is automatically cleared, indicating that the oscillator is off.

Setting the MOSCRCS bit in the Power Management Controller Interrupt Enable Register (PMC\_IER) triggers an interrupt to the processor.

#### 40.5.2. Main Crystal Oscillator

After reset, the main crystal oscillator is disabled and is not selected as the source of MAINCK.

The software enables or disables this oscillator in order to reduce power consumption via CKGR\_MOR.MOSCXTEN.

When disabling this oscillator by clearing CKGR\_MOR.MOSCXTEN, the PMC\_SR.MOSCXTS status bit is automatically cleared, indicating the oscillator is off. To activate the Main Crystal Oscillator Bypass mode, see [Bypassing the Main Crystal Oscillator](#).

When enabling this oscillator, the user must initiate the start-up time counter. The start-up time depends on the characteristics of the external device connected to this oscillator.

When CKGR\_MOR.MOSCXTEN and CKGR\_MOR.MOSCXTST are written to enable this oscillator, XIN and XOUT are driven by the main crystal oscillator. PMC\_SR.MOSCXTS is cleared and the counter starts counting down on MD\_SLCK divided by 8 from the CKGR\_MOR.MOSCXTST value. Since the CKGR\_MOR.MOSCXTST value is coded with 8 bits, the start-up time can be programmed up to 2048 MD\_SLCK periods, corresponding to about 62 ms when running at 32.768 kHz.

When the start-up time counter reaches '0', PMC\_SR.MOSCXTS is set, indicating that the oscillator is stabilized. Setting the MOSCXTS bit in the Interrupt Mask Register (PMC\_IMR) can trigger an interrupt to the processor.

#### 40.5.3. Main Clock Source Selection

The source of MAINCK can be selected from the following:

- the main RC oscillator
- the main crystal oscillator
- an external clock signal provided on the XIN input (Bypass mode of the main crystal oscillator)

The advantage of the main RC oscillator is its fast start-up time. By default, this oscillator is selected to start the system and it must be selected prior to entering ULP1 mode.

The advantage of the main crystal oscillator is its high level of accuracy.

The selection of the oscillator is made by configuring CKGR\_MOR.MOSCSEL. The switchover of the MAINCK source is glitch-free, thus the switchover can be performed even if MCK is fed by MAINCK. PMC\_SR.MOSCSELS indicates when the switch sequence is done.

Setting PMC\_IMR.MOSCSELS triggers an interrupt to the processor.

#### 40.5.4. Bypassing the Main Crystal Oscillator

Prior to bypassing the main crystal oscillator, the XOUT pin must be grounded and the external clock frequency provided on the XIN pin must be stable and within the values specified in the XIN Clock characteristics in the section "Electrical Characteristics". Then the main crystal oscillator must be enabled by setting the CKGR\_MOR.MOSCXTEN bit to 1.

#### 40.5.5. Main Frequency Counter

The main frequency counter measures the main RC oscillator or the main crystal oscillator against the MD\_SLCK and is managed by CKGR\_MCFR.

During the measurement period, the main frequency counter increments at the speed of the clock defined by the bit CKGR\_MCFR.CCSS.

A measurement is started in the following cases:

- When CKGR\_MCFR.RCMEAS is written to '1'.
- When the main RC oscillator is selected as the source of MAINCK and when this oscillator is stable (i.e., when the MOSCRCS bit is set)
- When the main crystal oscillator is selected as the source of MAINCK and when this oscillator is stable (i.e., when the MOSCXTS bit is set)
- When MAINCK source selection is modified

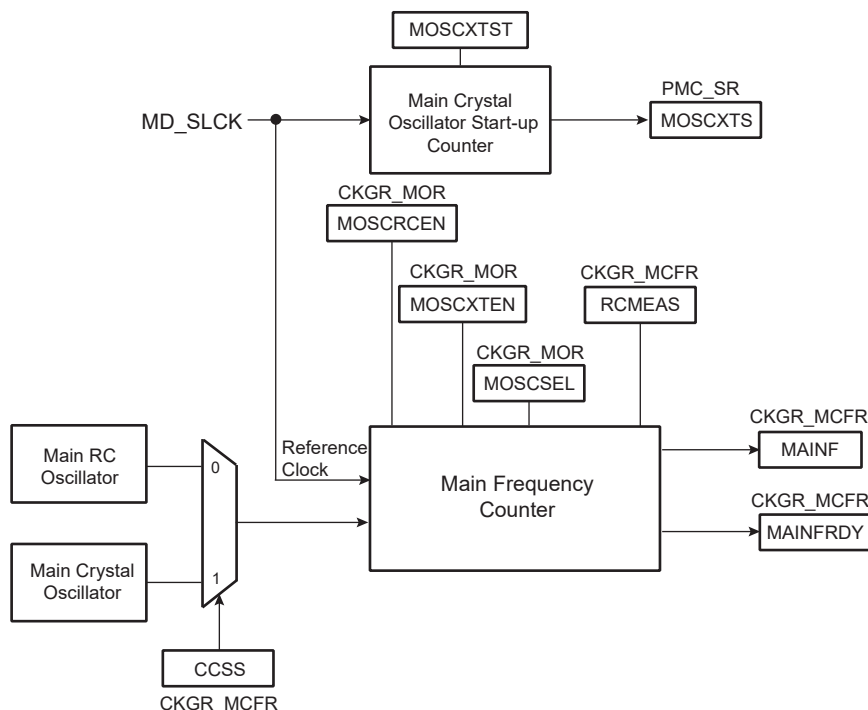

The measurement period ends at the 16th falling edge of MD\_SLCK, the MAINFRDY bit in CKGR\_MCFR is set and the counter stops counting. Its value can be read in the MAINF field of CKGR\_MCFR and gives the number of clock cycles during 16 periods of MD\_SLCK, so that the frequency of the main RC oscillator or main crystal oscillator can be determined.

When switching the source of MAINCK from the main RC oscillator to the main crystal oscillator, follow the programming sequence below to ensure that the oscillator is present and that its frequency is valid:

1. Enable the main crystal oscillator by setting CKGR\_MOR.MOSCXTEN. Configure the CKGR\_MOR.MOSCXTST field with the main crystal oscillator start-up time as defined in the section "Electrical Characteristics".
2. Wait for PMC\_SR.MOSCXTS flag to rise, indicating the end of a start-up period of the main crystal oscillator.
3. Select the main crystal oscillator as the source clock of the main frequency counter by setting CKGR\_MCFR.CCSS.
4. Initiate a frequency measurement by setting CKGR\_MCFR.RCMEAS.
5. Read CKGR\_MCFR.MAINFRDY until its value equals 1.
6. Read CKGR\_MCFR.MAINF and compute the value of the main crystal frequency.

If the MAINF value is valid, software can switch MAINCK to the main crystal oscillator. See [Main Clock Source Selection](#).

**Figure 40.3.** Main Frequency Counter Block Diagram

## 40.6. PLL Controls

The PMC embeds 2 PLLs (PLLA and UPLL) that are controlled by the **PMC\_PLL\_CTRL0**, **PMC\_PLL\_CTRL1**, **PMC\_PLL\_SSR**, **PMC\_PLL\_ACR** and **PMC\_PLL\_UPDATE** registers. Each PLL is accessed in read or write through its index as defined in the table below, corresponding to the register field **PMC\_PLL\_UPDT.ID**. At any time, **PLL\_CTRL0**, **PLL\_CTRL1** and **PLL\_ACR** reflect the controls for the PLL with index **PMC\_PLL\_UPDT.ID**. When the **UPDATE** bit is set in **PMC\_PLL\_UPDT**, the PLL of index **PMC\_PLL\_UPDT.ID** is updated with the content of registers **PLL\_CTRL0**, **PLL\_CTRL1** and **PLL\_ACR**.

PLLA is fed by **MAINCK** while UPLL is fed by the main crystal oscillator. Each PLL has a constraint on the frequency it can generate on its clock output. Refer to the section “Electrical Characteristics”.

The table below describes all PLLs with their names and source clocks. For maximum frequency, refer to the section “Electrical Characteristics”.

**Table 40.1.** PLL IDs

Index	Name	Clock Source
0	PLLA	MAINCK
1	UPLL	MAINXTAL

### 40.6.1. Divider and Phase Lock Loop Programming

Each PLL is controlled the same way. The internal clock frequency is configured by setting **PMC\_PLL\_CTRL1.MUL** and **PMC\_PLL\_CTRL1.FRACR**.

PLLA can apply a division ratio on this internal clock to generate the clock for the PMC (**PLLACK**). UPLL always divides the internal clock by two to generate the clock for the PMC (**UPLLCK**) and the UTMI USB.

The **COREPLLCK** operating frequency is defined by the following formula:

$$f_{\text{COREPLLCK}} = f_{\text{ref}} \left( \text{MUL} + 1 + \frac{\text{FRACR}}{2^{22}} \right)$$

The PLLA clock frequency is defined by the following formula:

$$f_{\text{PLLA Clock}} = \frac{f_{\text{COREPLLCK}}}{(\text{DIVPMC} + 1)}$$

The UPLL clock frequency is defined by the following formula:

$$f_{\text{UPLL Clock}} = \frac{f_{\text{COREUPLLCK}}}{2}$$

Each PLL sends a lock signal to the PMC to indicate its lock status. Once the lock signal has risen, the clock generated by the PLL is stable and can be sent to the PMC.

This signal reports the lock status of the PLL by setting the corresponding PMC\_PLL\_CTRL0.ENLOCK to '1'.

If the lock status is disabled, a start-up time can be used instead in the PMC\_PLL\_UPDT register. The start-up time is expressed as a number of MD\_SLCK cycles. Once the counter has reached the specified value, a flag rises. The start-up time field can only be written while all PLLs are disabled (i.e., their PLEN fields are null).

If both a start-up time and the lock are enabled, the lock sent by the PLL is read once the start-up time has elapsed.

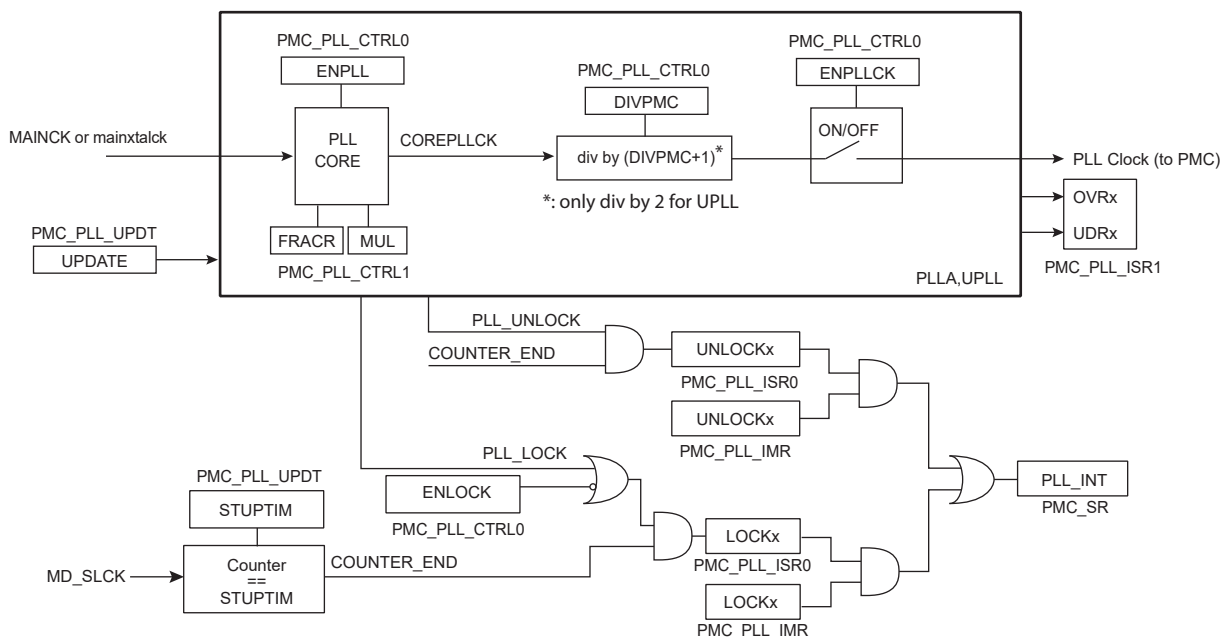

If neither the start-up time nor the lock are enabled, there is no way to know the lock status of the PLL.

The PLL also embeds an unlock status that informs when the PLL lock is lost. When enabled, this status is read once the start-up time (if defined) has elapsed.

The lock and unlock status can be used as interrupts.

See the following figure.

**Figure 40.4.** PLL Controls

Follow the steps below to enable a PLL:

1. Define the ID (ID=n) and start-up time by configuring the fields PMC\_PLL\_UPDT.ID and PMC\_PLL\_UPDT.STUPTIM. Set PMC\_PLL\_UPDT.UPDATE to '0'.
2. Configure PMC\_PLL\_ACR. See recommended values in the Electrical Characteristics section.
3. Define the MUL and FRACR to be applied to PLL(n) in PMC\_PLL\_CTRL1.  
If UPLL is being configured, follow Step 4. to Step 7., otherwise jump to Step 8.
4. Write PMC\_PLL\_ACR.UTMIBG to '1' to enable the UTMI internal bandgap.
5. Wait 10  $\mu$ s.
6. Write PMC\_PLL\_ACR.UTMIVR to '1' to enable the UTMI internal regulator.
7. Wait 10  $\mu$ s.
8. Set PMC\_PLL\_UPDT.UPDATE to '1'. PMC\_PLL\_UPDT.ID must equal the one written during Step 1., otherwise the update is cancelled.
9. In PMC\_PLL\_CTRL0, write a '1' to ENLOCK and to ENPLL and configure DIVPMC (for PLLA only, as UPLL has a fixed divider value) and ENPLLCK.
10. Set PMC\_PLL\_UPDT.UPDATE to '1'. PMC\_PLL\_UPDT.ID must equal the one written during Step 1. otherwise the update is cancelled.
11. Wait for the lock bit to rise by polling the PMC\_PLL\_ISR0 or by enabling the corresponding interrupt in PMC\_PLL\_IER.
12. Disable the interrupt (if enabled).
13. Enable the unlock interrupt to quickly detect a failure on the generation of the PLL clock.

Once enabled (PMC\_PLL\_CTRL0.ENPLL=1), the PLL core generates its core clock (COREPLLCK).

Once the PLL has been enabled and has locked, the PLL configuration can be modified without switching off the cell.

The clock generated by the PLL is sent to the PMC if ENPLLCK is set to '1' and the PMC\_PLL\_UPDT.UPDATE bit has then been written to '1'.

To disable a PLL, the following sequence must be applied:

1. If the PLL drives a section of the system that is active, modify the source clock of the system.
2. Define the ID (ID=n) of the PLL to be switched off in PMC\_UPDT. The bit UPDATE in this register must be set at 0 in this step.
3. In PMC\_PLL\_CTRL0, set ENPLLCK to 0 and leave ENPLL at '1'.
4. Set PMC\_PLL\_UPDT.UPDATE to '1'. PMC\_PLL\_UPDT.ID must equal the one written during step 2, otherwise the update is cancelled.
5. Write a '0' to PMC\_PLL\_CTRL0.ENPLL.
6. If a UPLL is being powered down, write a '0' to PMC\_PLL\_ACR.UTMIBG and PMC\_PLL\_ACR.UTMIVR.
7. Set PMC\_PLL\_UPDT.UPDATE to '1'. PMC\_PLL\_UPDT.ID must equal the one written during Step 2., otherwise the update is cancelled.

#### 40.6.2. PLL Unlock

Each PLL has an unlock flag. It is recommended to set the UNLOCK interrupt by setting the corresponding PMC\_PLL\_IER.UNLOCK bit to quickly detect a failure on PLL clock generation.

The rise of a PLL unlock signal implies a failure in the normal operation of the PLL (input clock loss, for example). In this case, the PLL keeps operating but stops trying to lock the input clock. A manual clock switching to a stable clock should be performed to ensure CPU\_CLK integrity.

### 40.6.3. Spread Spectrum

Spread spectrum is obtained by slightly modifying the PLL target frequency. Two parameters are used to configure the spread spectrum:

- STEP—the frequency step
- NSTEP—the number of times the STEP will be applied

The spread spectrum can be applied only if the PLL is already enabled and locked. Once the spread spectrum has been enabled, it is no longer possible to modify the target frequency of the PLL. Prior to change the PLL frequency, the spread spectrum must be disabled and a period of  $2 \times \text{NSTEP}$  cycles of the PLL source clock must elapse.

When enabled, the spread spectrum logic modifies the fractional part of the PLL. The fractional factor applied to the PLL is in the following range:  $\text{FRACR} - (64 \times \text{STEP} \times \text{NSTEP})$  up to  $\text{FRACR}$ .

Starting from the base frequency of the PLL configured in `PMC_PLL_CTRL1` (`MUL`, `FRACR`), the spread spectrum mechanism decreases the PLL frequency, and when the minimum is reached, the PLL frequency is increased up to the value configured through the `PMC_PLL_CTRL1` register (the PLL frequency never overpasses that value).

**Figure 40.5.** Spread Spectrum Mechanism

## 41. Power Management Controller (PMC)

### 41.1. Description

The Power Management Controller (PMC) optimizes power consumption by controlling all system and user peripheral clocks. The PMC enables/disables the clock inputs to many of the peripherals and to the processor.

The Slow Clock Controller (SCKC) selects the source of TD\_SLCK (drives the real-time part (RTT/RTC)). The source of MD\_SLCK (drives the rest of the system controller: wake-up logic, watchdog, PMC, etc.) is always the slow RC oscillator.

By default, at start-up, the chip runs out of MCK using the main RC oscillator.

### 41.2. Embedded Characteristics

The Power Management Controller provides the following clocks:

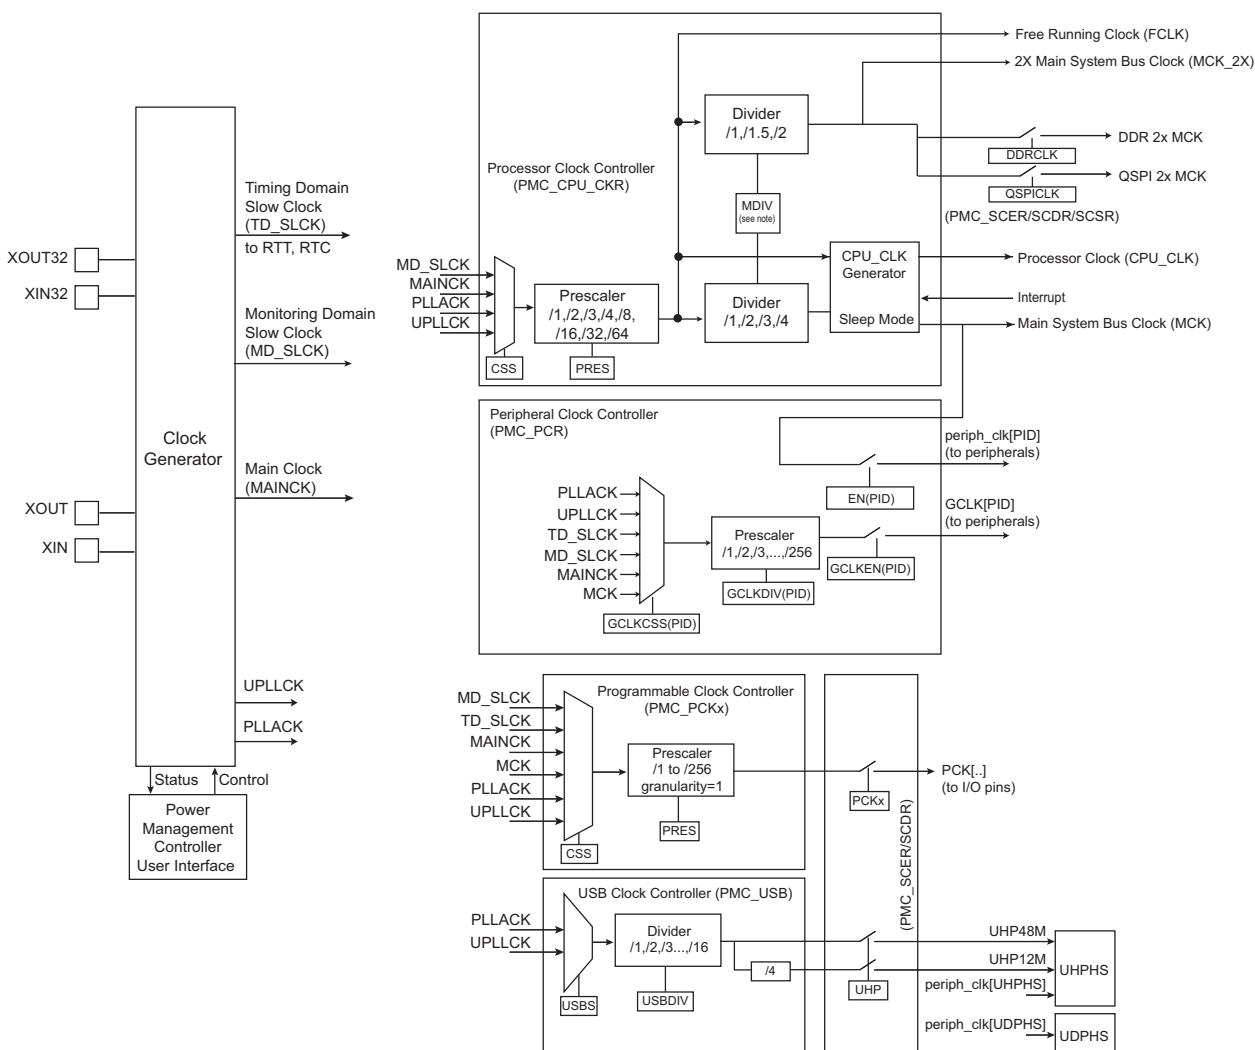

- Main System Bus Clock (MCK)—programmable from a few hundred Hz to the maximum operating frequency of the device. It is available to the modules running permanently.
- Processor Clock (CPU\_CLK)—can be tuned through a frequency scaler module and automatically switched off when entering the processor in Sleep mode.
- Free-Running Processor Clock (FCLK)—the source clock of CPU\_CLK. Is not affected when Sleep mode is activated.
- UHDP Clocks (UHP48M and UHP12M)—required by USB Host Device Port operations.
- Peripheral Clocks with independent on/off control, provided to the peripherals. Each peripheral clock is inherited from MCK.
- Programmable Clock Outputs (PCKx), selected from the clock generator outputs to drive the device PCKx pins.
- Generic Clock (GCLK) with controllable division and on/off control, independent of MCK and CPU\_CLK. Provided to selected peripherals. Refer to the table “Peripheral Identifiers” for more details on GCLK availability per peripheral.

The Power Management Controller also provides the following features on clocks:

- A main crystal oscillator failure detector
- A 32.768 kHz crystal oscillator frequency monitor
- A frequency counter on main crystal oscillator or main RC oscillator
- An MCK failure detector

## 41.3. Block Diagram

Figure 41.1. General Clock Distribution Block Diagram

Note: MDIV should always be different from 0 when using DDR memories. If MDIV must be set to 0, first switch the DDR memories to Self-refresh mode and disable DDRCLK.

## 41.4. Processor Clock Controller

The PMC features a Processor Clock (CPU\_CLK) controller that implements the processor Sleep mode. CPU\_CLK can be disabled by executing the WFI (WaitForInterrupt) processor instruction.

CPU\_CLK is enabled after a reset and is automatically re-enabled by any enabled interrupt. The processor Sleep mode is entered by disabling CPU\_CLK, which is automatically re-enabled by any enabled interrupt, or by the reset of the product.

When processor Sleep mode is entered, the current instruction is finished before the CPU\_CLK is stopped, but this does not prevent data transfers from other hosts of the system bus.

The clock selection is done in PMC\_CPU\_CKR.CSS.

The prescaler is configured in PMC\_CPU\_CKR.PRES.

The Processor Clock Controller also generates a main system bus clock, MCK, which is a subdivision of the CPU\_CLK.

Only one of CSS, PRES and MDIV fields can be modified at a time. When one of these parameters is modified, no other modification can be performed on these fields as long as the MCKRDY status flag is low.

Any modification in CSS, PRES or MDIV fields must never lead to generate an MCK frequency that is greater than the maximum allowed system frequency. When changing the source clock of the system to a faster clock, the fields must be modified using the following order: MDIV, PRES and then CSS. When changing the source clock of the system to a slower clock, the fields must be modified using the following order: CSS, PRES and then MDIV.

If the destination clock does not exist, the switching is not performed. The CPU\_CLK keeps running with the previous clock and the system must be reset to run correctly again.

#### 41.5. USB Clock Controller

The user can select the PLLA or the UPLL output as the USB source clock by writing PMC\_USB.USBS. If using the USB, the user must program the PLL to generate an appropriate frequency depending on PMC\_USB.USBDIV.

When the PLL output is stable, i.e., the LOCK bit is set, the USB device and host clocks can be enabled by setting the UHP bits in the System Clock Enable register (PMC\_SCER). To save power on this peripheral when it is not used, the user can set the UHP bits in the System Clock Disable register (PMC\_SCDR). The UHP bits in the System Clock Status register (PMC\_SCSR) gives the activity of this clock. The USB device and host ports requires both the 48 MHz signal and the peripheral clock. The USB peripheral clock may be controlled by means of the Peripheral Clock Controller.

#### 41.6. Free-Running Processor Clock

The Free-Running Processor clock (FCLK) used for sampling interrupts and clocking debug blocks ensures that interrupts can be sampled, and sleep events can be traced, while the processor is sleeping.

#### 41.7. Peripheral and Generic Clock Controller

The PMC controls the clocks of the embedded peripherals by means of the Peripheral Control register (PMC\_PCR). With this register, the user can enable and disable the different clocks used by the peripherals:

- Peripheral clocks (periph\_clk[PID]), routed to every peripheral and derived from MCK. It is mandatory to enable this clock before using a peripheral.
- Generic clocks (GCLK[PID]), routed to selected peripherals only (refer to the “Peripheral Identifiers” table). These clocks are independent of the core and bus clocks (CPU\_CLK, MCK and periph\_clk[PID]). They are generated by selection and division of available sources. The list of available source clocks depends on the peripheral. Refer to the description of each peripheral to know available sources and limitations to be applied to GCLK[PID] compared to periph\_clk[PID].

To configure a peripheral's clocks, PMC\_PCR.CMD must be written to '1' and PMC\_PCR.PID must be written with the index of the corresponding peripheral. All other configuration fields must be correctly set.

To read the current clock configuration of a peripheral, PMC\_PCR must be first accessed with PMC\_PCR.CMD bit written to '0' and PMC\_PCR.PID field written with the index of the corresponding peripheral. This write does not modify the configuration of the peripheral. The PMC\_PCR can then be read to know the configuration status of the corresponding PID.

The status of the peripheral clock activity can be read in the Peripheral Clock Status registers (PMC\_CSRx).

The status of the peripheral generic clock activity can be read in the Generic Clock Status registers (PMC\_GCSRx).

When a peripheral or a generic clock is disabled, it is immediately stopped. These clocks are disabled after a reset. The source and the division ratio of generic clocks must not be modified while the peripheral is enabled. The generic clock configuration must be set before the peripheral is enabled.

To stop a peripheral clock, it is recommended that the system software wait until the peripheral has executed its last programmed operation before disabling the clock. This is to avoid data corruption or erroneous behavior of the system.

## 41.8. Programmable Clock Output Controller

The PMC controls two signals to be output on the external pins PCKx. Each signal can be independently programmed via the Programmable Clock registers (PMC\_PCKx).

PCKx can be independently selected between MD\_SLCK, TD\_SLCK, MAINCK, MCK and any PLLCK by configuring PMC\_PCKx.CSS. Each output signal can also be divided by 1 to 256 by configuring PMC\_PCKx.PRES.

Each output signal can be enabled and disabled by writing a '1' to the corresponding bits PMC\_SCER.PCKx and PMC\_SCDR.PCKx, respectively. The status of the active programmable output clocks is given in PMC\_SCSR.PCKx.

The status flag PMC\_SR.PCKRDYx indicates that the clock configured through the PMC\_PCKx register is correctly established.

As the Programmable Clock Controller does not manage with glitch prevention when switching clocks, it is strongly recommended to disable PCKx before any configuration change and to re-enable it once the change is performed.

## 41.9. Ultra-Low Power Mode and Fast Start-Up

The following sections provide a brief description of the Ultra-Low Power mode features of the device as seen from the PMC. A more detailed description, including power consumption and wake-up time figures, can be found in the section "Electrical Characteristics".

### 41.9.1. ULP1 Mode

When the system is in Ultra-Low Power 1 (ULP1) mode, all clocks of the system except MD\_SLCK are stopped. The source clock of all MCKx must be set to the main clock, and the source of the main clock must be set to main RC oscillator.

Prior to instructing the device to enter ULP1 mode:

1. Select Main RC as the source of MAINCK by configuring CKGR\_MOR.MOSCSEL to '0'.
2. Select MAINCK as the source of MCK by configuring PMC\_CPU\_CKR.CSS to '1'.
3. Disable the PLL if enabled and disable the main crystal oscillator by setting CKGR\_MOR.MOSCXTEN to '0'.
4. Wait for two SLCK clock cycles.
5. Clear the internal wake-up sources.
6. Verify that none of the enabled external wake-up inputs (WKUP) hold an active polarity.

The system enters ULP1 mode by setting CKGR\_MOR.ULP1. The PMC registers must not be accessed immediately after this access.

### 41.9.2. Fast Start-Up

At exit from ULP1 mode, the device allows the processor to restart in several microseconds only if the C-code function that manages the ULP1 mode entry and exit is linked to and executed from on-chip SRAM.

A fast start-up occurs upon the detection of a programmed level on one of the wake-up inputs (WKUP) or upon an active alarm from the RTC, RTT, USB Controller or Wake-up on LAN 0 and 1

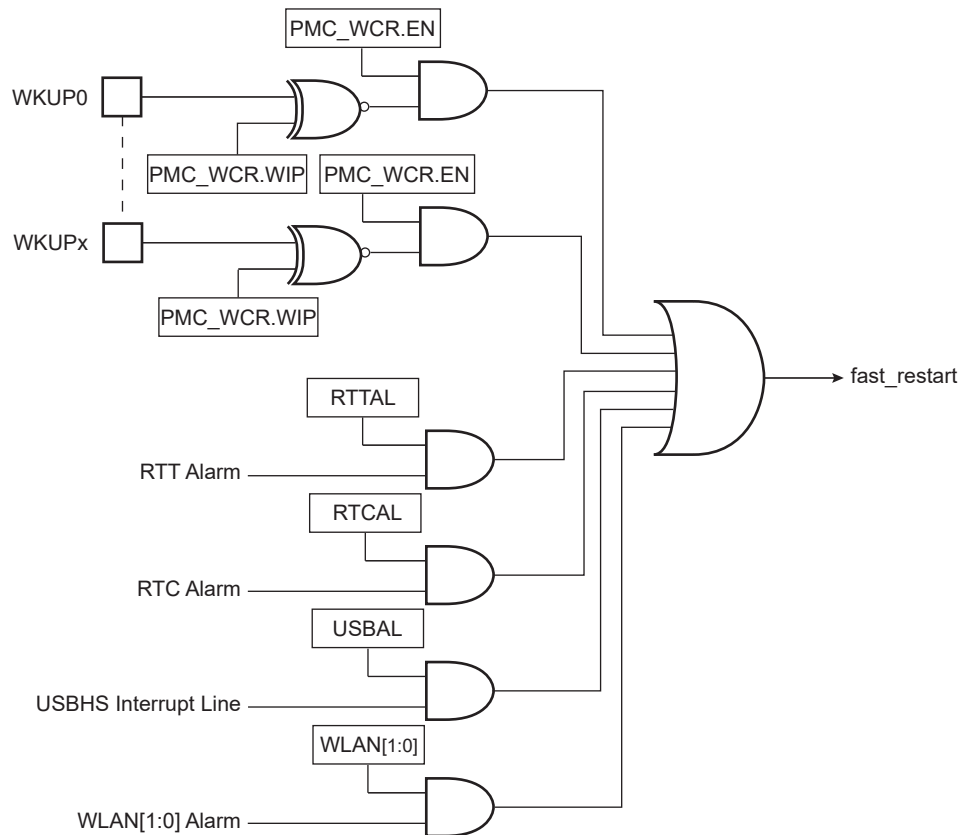

alarms. The polarity of each of the wake-up inputs is programmable in the PMC Wake-Up Control Register (PMC\_WCR).

**WARNING** The duration of the WKUPx pins active level must be greater than four MAINCK cycles.

The fast start-up circuitry, as shown in the following figure, is fully asynchronous and provides a fast start-up signal to the PMC. As soon as the fast start-up signal is asserted, the main RC oscillator restarts automatically.

**Figure 41.2.** Fast Start-Up Circuitry

Each wake-up input pin can be configured to generate a fast start-up event by setting the corresponding bits in PMC\_WCR.

To configure a wake-up pin, a write access must be performed in PMC\_WCR (CMD='1'). Field PID must be written with the ID of the wake-up pin, WIP set to the polarity of the wake-up pin and EN set to enable/disable the wake-up pin.

To read the configuration status of a wake-up pin, PMC\_WCR.PID must be written with the ID of the wake-up pin and the CMD bit set to '0'. Then the next read access to PMC\_WCR sends the configuration status of the wake-up pin specified in PID.

Each alarm can be enabled to generate a fast start-up event by setting the corresponding bit in PMC\_FSMR.

The user interface does not provide any status for fast start-up. The status can be read in the PIO Controller and the status registers of the RTC, RTT and USB Controller.

## 41.10. Main Crystal Oscillator Failure Detection

The main crystal oscillator failure detector monitors the main crystal oscillator against the slow RC oscillator and provides an automatic switchover of the MAINCK source to the main RC oscillator in case of failure detection.

The failure detector can be enabled or disabled by configuring CKGR\_MOR.CFDEN. It cannot be enabled if the main crystal oscillator is disabled. It must be disabled before disabling the main crystal oscillator.

It is also disabled in either of the following cases:

- after a VDDCORE reset
- when the main crystal oscillator is disabled (MOSCXTEN = 0)

A failure is detected by means of a counter incrementing on the main crystal oscillator output and detection logic is triggered by the slow RC oscillator which is automatically enabled when CFDEN = 1.

The counter is cleared when the slow RC oscillator clock signal is low and enabled when the signal is high. Thus, the failure detection time is one slow RC oscillator period. If, during the high level period of the slow RC oscillator clock signal, less than eight main crystal oscillator clock periods have been counted, then a failure is reported. Note that when enabling the failure detector, up to two cycles of the slow RC oscillator are needed to detect a failure of the main crystal oscillator.

If a main crystal oscillator failure is detected, PMC\_SR.CFDEV and PMC\_SR.FOS both indicate a failure event. PMC\_SR.CFDEV is cleared on read of PMC\_SR, and PMC\_SR.FOS is cleared by writing a '1' to the FOCLR bit in the PMC Fault Output Clear register (PMC\_FOCR).

Only PMC\_SR.CFDEV can generate an interrupt if the corresponding interrupt source is enabled in PMC\_IER. The current status of the clock failure detection can be read at any time from PMC\_SR.CFDS.

**Figure 41.3.** Clock Failure Detection Example

Note: Ratio of clock periods is for illustration purposes only.

If the CKGR\_MOR.AUTOMAINSW bit is set to '1', the source of MAINCK automatically switches to the MAIN RC oscillator. If the main RC oscillator was previously powered off, it is first powered on before switching. If the CKGR\_MOR.AUTOCPUW bit is set to '1', the source of MCK automatically switches to MAINCK.

If the main crystal oscillator is selected as the source of MAINCK, the PMC can be configured to automatically select the main RC oscillator as the source of MAINCK in case of a main crystal oscillator failure detection by setting the CKGR\_MOR.AUTOMAINSW to '1'. Additionally, if the source of CPU\_CLK is a PLL driven by the main crystal oscillator, the PMC can be configured to automatically select the MAINCK as the source of CPU\_CLK in case of a main crystal oscillator failure detection by setting the CKGR\_MOR.AUTOCPUW to '1'. CKGR\_MOR.AUTOMAINSW must be set to '1' prior to setting CKGR\_MOR.AUTOCPUW to '1'.

Six slow RC oscillator clock cycles are necessary to detect and switch from the main crystal oscillator to the main RC oscillator.

#### 41.11. 32.768 kHz Crystal Oscillator Frequency Monitor

The frequency of the 32.768 kHz crystal oscillator can be monitored by configuring CKGR\_MOR.XT32KFME. Prior to enabling the monitoring, the 32.768 kHz crystal oscillator must be started and its start-up time be elapsed. Refer to the section “Slow Clock Controller (SCKC)” for details on the slow clock generator.

An error flag (PMC\_SR.XT32KERR) is asserted when the 32.768 kHz crystal oscillator frequency is out of its nominal frequency value (i.e., 32.768 kHz). The error flag can be cleared only if the monitoring is disabled.

The frequency drift is computed with the main RC oscillator. The permitted drift of the crystal is 10000 ppm (1%), which allows any standard crystal to be used.

The monitored clock frequency is declared invalid if at least four consecutive 32.768 kHz crystal oscillator clock period measurement results are over the nominal period.

The error flag can be defined as an interrupt source of the PMC by setting PMC\_IER.XT32KERR. This flag is also routed to the Reset Controller (RSTC) and may generate a reset of the device.

#### 41.12. MCK Frequency Monitor

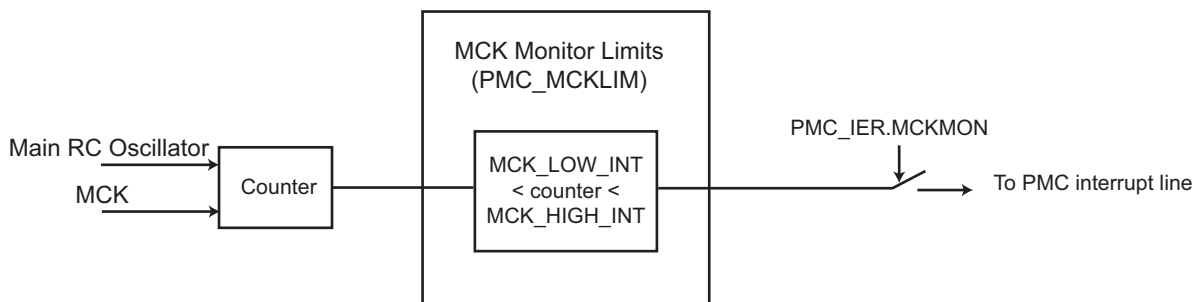

The frequency of MCK can be monitored with the main RC oscillator. This monitoring can only be performed if the MCK frequency is at least three times faster than the embedded main RC oscillator. This function is enabled by writing a ‘1’ to PMC\_IER.MCKMON.

An error on the MCK frequency can lead to a PMC interrupt.

When the corresponding PMC interrupt is enabled, the status of the MCK monitoring can be read on PMC\_SR.MCKMON. This status is cleared on read.

Once enabled, the monitor continuously counts the number of MCK cycles within 15 cycles of the embedded main RC oscillator. The result is then compared to threshold values defined in the PMC\_MCKLIM register. Two levels of threshold can be defined to generate an interrupt.

**Figure 41.4.** MCK Frequency Monitor

#### 41.13. Recommended Programming Sequence

Follow the steps below to program the PMC:

1. If the main crystal oscillator is not required, the PLL can be directly configured (step 5) else this oscillator must be started (step 2).
2. Verify the existence and frequency value of the main crystal oscillator following the sequence defined in [Main Frequency Counter](#).
3. If the main crystal oscillator is enabled and valid, the source of MAINCK can be switched to the main crystal oscillator by writing CKGR\_MOR.MOSCSEL to 1 else the PLL can be directly configured.

4. Wait for the end of the MAINCK source switching by either polling the MOSCSELS or setting the corresponding interrupt.
5. Configure the PLLs by following the setup defined in [Divider and Phase Lock Loop Programming](#) (if not required, proceed to step 6).
6. Configure the MCK division ratio by setting PMC\_CPU\_CKR.MDIV. Available values are 0, 1, 2, 3. MCK output is the CPU\_CLK frequency divided by 1, 2, 3 or 4, depending on the value programmed in MDIV.  
By default, MDIV is cleared, which indicates that the CPU\_CLK is equal to MCK.
7. Wait for the end of the MCK ratio switching by either polling the MCKRDY or setting the corresponding interrupt.
8. Select the division ratio of CPU\_CLK by setting PMC\_CPU\_CKR.PRES.  
PRES is used to define the CPU\_CLK and MCK prescaler. The user can choose between different values (1, 2, 3, 4, 8, 16, 32, 64). Prescaler output is the selected clock source frequency divided by the PRES value.
9. Wait for the end of the CPU\_CLK ratio switching by either polling the MCKRDY or setting the corresponding interrupt.
10. Select the source clock of CPU\_CLK by setting PMC\_CPU\_CKR.CSS.  
CSS is used to select the clock source of MCK and CPU\_CLK. By default, the selected clock source is MAINCK.
11. Wait for the end of the CPU\_CLK source switching by either polling the MCKRDY or setting the corresponding interrupt.  
PMC\_CPU\_CKR must not be programmed in a single write operation.  
Reconfiguring MDIV, PRES and CSS fields must always be done by following the right order of operation described above (steps 6 to 11).
12. Configure the programmable clocks (PCKx):  
PCKx are controlled via registers PMC\_SCER, PMC\_SCDR and PMC\_SCSR.  
PCKx can be enabled and/or disabled via PMC\_SCER and PMC\_SCDR. Two PCKx can be used. PMC\_SCSR indicates which PCKx is enabled. By default all PCKx are disabled.  
PMC\_PCKx registers are used to configure PCKx as described in [Programmable Clock Output Controller](#).
13. Enable the peripheral and generic clocks.  
Once all of the previous steps have been completed, the peripheral and generic clocks can be configured via register PMC\_PCR as described in [Peripheral and Generic Clock Controller](#).

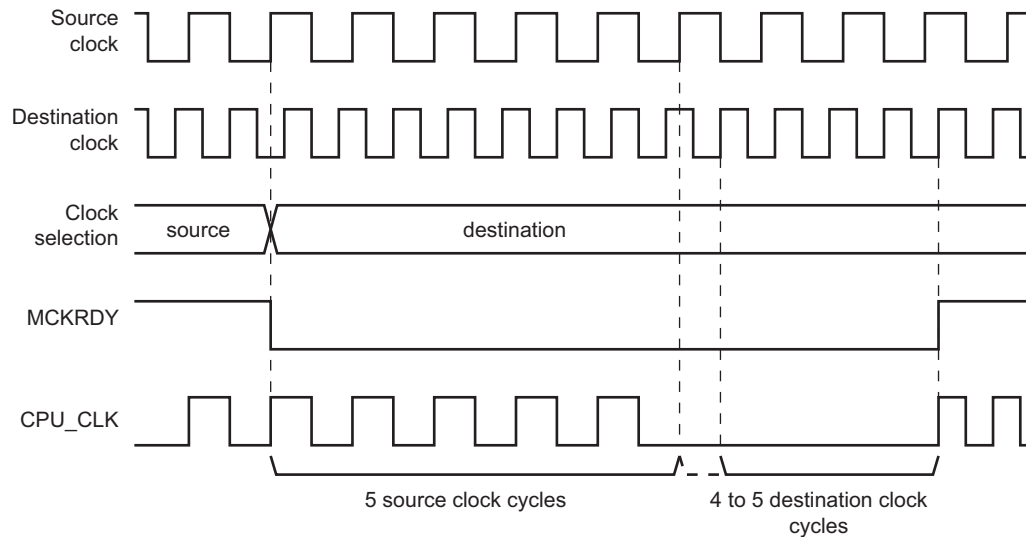

## 41.14. Clock Switching Details

### 41.14.1. CPU Clock Switching Timings

The glitch-free clock switcher implemented to control the sources of CPU\_CLK and MCK performs clock switching in 5 clock cycles of the currently used clock plus 5 cycles of the target clock.

The clock switching is effective once MCKRDY rises. See the following figure.

**Figure 41.5.** Switch CPU Clock (CPU\_CLK) from Source Clock to Destination Clock

### 41.15. Register Write Protection

To prevent any single software error from corrupting PMC behavior, certain registers in the address space can be write-protected by setting the WPEN bit or the WPITEN bit in the [PMC Write Protection Mode Register](#) (PMC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [PMC Write Protection Status Register](#) (PMC\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the PMC\_WPSR.

The following registers are write-protected when the WPEN bit is set in PMC\_WPMR:

- [PMC System Clock Enable Register](#)
- [PMC System Clock Disable Register](#)
- [PMC PLL Control Register 0](#)
- [PMC PLL Control Register 1](#)
- [PMC PLL Spread Spectrum Register](#)
- [PMC PLL Analog Control Register](#)
- [PMC PLL Update Register](#)
- [PMC Clock Generator Main Oscillator Register](#)
- [PMC Clock Generator Main Clock Frequency Register](#)
- [PMC CPU Clock Register](#)
- [PMC USB Clock Register](#)
- [PMC Programmable Clock Register](#)
- [PMC Fast Start-Up Mode Register](#)
- [PMC Wake-Up Control Register](#)
- [PMC Peripheral Control Register](#)
- [PMC MCK Monitor Limits Register](#)

The following interrupt registers are write-protected when the WPITEN bit is set in PMC\_WPMR:

- [PMC Interrupt Enable Register](#)

- [PMC Interrupt Disable Register](#)
- [PMC PLL Interrupt Enable Register](#)
- [PMC PLL Interrupt Disable Register](#)

## 41.16. Register Summary

**Bit 19 – QSPICLK** QSPI 2x Clock Enable

Value	Description
0	No effect.
1	Enables the QSPI 2x clock.

**Bits 8, 9 – PCKx** Programmable Clock x Output Enable

Value	Description
0	No effect.
1	Enables the corresponding Programmable Clock output.

**Bit 6 – UHP** USB Host OHCI Clocks Enable

Value	Description
0	No effect.
1	Enables the UHP48M and UHP12M OHCI clocks.

**Bit 2 – DDRCK** MPDDRC/SDRAMC Clock Enable

Value	Description
0	No effect.
1	Enables the MPDDRC or SDRAMC clock.

**41.16.2. PMC System Clock Disable Register**

**Name:** PMC\_SCDR  
**Offset:** 0x0004  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

**Bit 19 – QSPICLK** QSPI 2x Clock Disable

Value	Description
0	No effect.
1	Disables the QSPI 2x clock.

**Bits 8, 9 – PCKx** Programmable Clock x Output Disable

Value	Description
0	No effect.
1	Disables the corresponding Programmable Clock output.

**Bit 6 – UHP** USB Host OHCI Clocks Disable

Value	Description
0	No effect.
1	Disables the UHP48M and UHP12M OHCI clocks.

**Bit 2 – DDRCK** MPDDRC/SDRAMC Clock Disable

Value	Description
0	No effect.
1	Disables the MPDDRC or SDRAMC clock.

### 41.16.3. PMC System Clock Status Register

**Name:** PMC\_SCSR  
**Offset:** 0x0008  
**Reset:** 0x00000001  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset		0				0		

#### Bit 19 – QSPICLK QSPI 2x Clock Status

Value	Description
0	The QSPI 2x clock is disabled.
1	The QSPI 2x clock is enabled.

#### Bits 8, 9 – PCKx Programmable Clock x Output Status

Value	Description
0	The corresponding Programmable Clock output is disabled.
1	The corresponding Programmable Clock output is enabled.

#### Bit 6 – UHP USB Host OHCI Clocks Status

Value	Description
0	The UHP48M and UHP12M OHCI clocks are disabled.
1	The UHP48M and UHP12M OHCI clocks are enabled.

#### Bit 2 – DDRCK MPDDRC/SDRAMC Clock Status

Value	Description
0	The MPDDRC or SDRAMC clock is disabled.
1	The MPDDRC or SDRAMC clock is enabled.

**41.16.4. PMC PLL Control Register 0**

**Name:** PMC\_PLL\_CTRL0  
**Offset:** 0x000C  
**Reset:** 0x00000000  
**Property:** Read/Write

All fields defined here are applied to the PLL defined by the last ID field written in the PMC\_PLL\_UPDT register.

Bit	31	30	29	28	27	26	25	24
	ENLOCK		ENPLLCK	ENPLL				
Access	R/W		R/W	R/W				
Reset	0		0	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 31 – ENLOCK** Enable PLL Lock

Value	Description
0	The lock signal sent by the PLL is ignored. The PLL is considered as locked once the start-up time defined by PMC_PLL_UPDT.STUPTIM has elapsed.
1	The PLL is considered as locked once the start-up time defined by PMC_PLL_UPDT.STUPTIM has elapsed and the lock signal sent by the PLL has risen.

**Bit 29 – ENPLLCK** Enable PLL Clock for PMC

This feature is available for all PLLs and is configurable only when the DIVPMC field is programmed to 0.

Value	Description
0	The clock generated by the PLL is not sent to the PMC.
1	The clock generated by the PLL is sent to the PMC.

**Bit 28 – ENPLL** Enable PLL

Value	Description
0	The PLL is off.
1	The PLL is on.

**Bits 7:0 – DIVPMC[7:0]** Divider for PMC

Specifies the division ratio applied to the internal PLL clock before being sent to the PMC. The frequency is defined by the following formula:

$$f_{\text{PLL Clock}} = \frac{f_{\text{COREPLLCK}}}{(\text{DIVPMC} + 1)}$$

**41.16.5. PMC PLL Control Register 1**

**Name:** PMC\_PLL\_CTRL1  
**Offset:** 0x0010  
**Reset:** 0x00000000  
**Property:** Read/Write

All fields defined here are applied to the PLL defined by the last ID field written in the PMC\_PLL\_UPDT register.

	STEP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 28 – ENSPREAD** Spread Spectrum Enable

Value	Description
0	The spread spectrum is not applied to the PLL.
1	The spread spectrum is applied to the PLL.

**Bits 23:16 – NSTEP[7:0]** Spread Spectrum Number of Steps

Specifies how many times STEP is applied to the PLL ratio. The value of NSTEP must be equal to or greater than 1.

**Bits 15:0 – STEP[15:0]** Spread Spectrum Step Size

When the spread spectrum is active, this field defines the step size that will be applied the PMC\_PLL\_CTRL1.FRACR factor. The step is applied on the LSB of PMC\_PLL\_CTRL1.FRACR.

**41.16.7. PMC PLL Analog Control Register**

**Name:** PMC\_PLL\_ACR  
**Offset:** 0x0018  
**Reset:** 0x00020033  
**Property:** Read/Write

This register must be loaded with the recommended values described in the Electrical Characteristics section.

All fields defined here are applied to the PLL defined by the last ID field written in the PMC\_PLL\_UPDT register.

Bit	31	30	29	28	27	26	25	24
			LOOP_FILTER[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	1	1	0	0	1	1

**Bits 29:24 – LOOP\_FILTER[5:0]** Loop Filter Selection

**Bits 18:16 – LOCK\_THR[2:0]** PLL Lock Threshold Value Selection

**Bit 13 – UTMIBG** UPLL Bandgap Control

This bit has no effect when applied to PLLA.

Value	Description
0	The UPLL bandgap is switched off.
1	The UPLL bandgap is switched on.

**Bit 12 – UTMIVR** UPLL Voltage Regulator Control

This bit has no effect when applied to PLLA.

Value	Description
0	The UPLL voltage regulator is switched off.
1	The UPLL voltage regulator is switched on.

**Bits 11:0 – CONTROL[11:0]** PLL CONTROL Value Selection

On PLLA, this field controls the DCO analog filters:

Field	Description
CONTROL[1:0]	Analog VCO filter selection

.....continued

Field	Description
CONTROL[4:2]	Process configuration
CONTROL[6:5]	VCO gain configuration
CONTROL[7]	Offset frequency adjustment
CONTROL[8]	External pad connection
CONTROL[9]	Test mode dedicated
CONTROL[10]	DAC mode
CONTROL[11]	Enable output phases

On UPLL, this field controls the following PLL ports:

Field	Description
CONTROL[1:0]	Not used
CONTROL[4:2]	Process configuration
CONTROL[6:5]	VCO gain configuration
CONTROL[7]	Offset frequency adjustment
CONTROL[11:8]	Not used

### 41.16.8. PMC PLL Update Register

**Name:** PMC\_PLL\_UPDT  
**Offset:** 0x001C  
**Reset:** 0x00030000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
			STUPTIM[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	1	1
Bit	15	14	13	12	11	10	9	8
								UPDATE
Access								W
Reset								0
Bit	7	6	5	4	3	2	1	0
								ID
Access								R/W
Reset								0

#### Bits 21:16 – STUPTIM[5:0] Start-up Time

The start-up time is defined as a number of MD\_SLCK cycles and is the same for all PLLs. STUPTIM can be modified only if all PLLs are off.

Value	Description
0	Only the lock of the PLL is considered to know the lock status of the PLL. If the lock of the PLL is not enabled, the lock never rises.
Other values	If PMC_PLL_CTRL0.ENLOCK is low, specifies the start-up time of the PLL. If PMC_PLL_CTRL0.ENLOCK is high, specifies how long the LOCK signal of the PLL is masked before being read.

#### Bit 8 – UPDATE PLL Setting Update (write-only)

Value	Description
0	No effect.
1	The PLL configuration written in PMC_PLL_CTRL0 and PMC_PLL_CTRL1 are applied to the PLL defined by the last ID written in the PMC_PLL_CTRL0 register.

#### Bit 0 – ID PLL ID

When writing a PLL control register (PMC\_PLL\_CTRLx), this ID specifies which PLL is impacted by written fields.

When reading a PLL control register (PMC\_PLL\_CTRLx), this ID specifies which PLL fields are read.

Value	Name
0	PLLA
1	UTMI PLL

**41.16.9. PMC Clock Generator Main Oscillator Register**

**Name:** CKGR\_MOR  
**Offset:** 0x0020  
**Reset:** 0x00000028  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

**Note:** Bit 5 is always read at 1.

Bit	31	30	29	28	27	26	25	24
		AUTOCPUW	AUTOMAINSW			XT32KFME	CFDEN	MOSCSEL

					MOSCRCE	ULP1		MOSCXTEN
Access					R/W	W		R/W
Reset					1	0		0

**Bit 30 – AUTOCPUW** Automatic Processor Clock Source Switching

Value	Description
0	A main crystal oscillator failure detection has no effect on the processor clock source selection.
1	If a main crystal oscillator failure is detected, the processor clock source selection automatically switches to the main clock.

**Bit 29 – AUTOMAINSW** Automatic Main Clock Source Switching

Value	Description
0	A main crystal oscillator failure detection has no effect on the main clock source selection.
1	If a main crystal oscillator failure is detected, the main clock source selection automatically switches to the main RC.

**Bit 26 – XT32KFME** 32.768 kHz Crystal Oscillator Frequency Monitoring Enable

Value	Description
0	The 32.768 kHz crystal oscillator frequency monitoring is disabled.
1	The 32.768 kHz crystal oscillator frequency monitoring is enabled.

**Bit 25 – CFDEN** Clock Failure Detector Enable

Value	Description
0	The clock failure detector is disabled.
1	The clock failure detector is enabled.

## Bit 24 – MOSCSEL Main Clock Oscillator Selection

Value	Description
0	The main RC oscillator is selected.
1	The main crystal oscillator is selected.

## Bits 23:16 – KEY[7:0] Write Access Password

Value	Name	Description
0x37	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

## Bits 15:8 – MOSCXTST[7:0] Main Crystal Oscillator Start-up Time

Specifies the number of MD\_SLCK cycles multiplied by 8 for the main crystal oscillator start-up time.

## Bit 3 – MOSCRGEN Main RC Oscillator Enable

When MOSCRGEN is set, the MOSCRCS flag is set once the main RC oscillator start-up time is achieved.

Value	Description
0	The main RC oscillator is disabled.
1	The main RC oscillator is enabled.

## Bit 2 – ULP1 ULP1 Mode Command (write-only)

Value	Description
0	No effect.
1	Puts the device in ULP1 mode.

## Bit 0 – MOSCXTEEN Main Crystal Oscillator Enable

A crystal must be connected between XIN and XOUT or a clock signal must be provided on XIN with XOUT grounded.

When MOSCXTEEN is set, the MOSCXTS flag is set once the main crystal oscillator start-up time is achieved.

Value	Description
0	The main crystal oscillator is disabled.
1	The main crystal oscillator is enabled or in bypass.

**41.16.10.PMC Clock Generator Main Clock Frequency Register**

**Name:** CKGR\_MCFR  
**Offset:** 0x0024  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
								CCSS
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16
				RCMEAS				MAINFRDY
Access				W				R/W
Reset				0				0

Bit	15	14	13	12	11	10	9	8
	MAINF[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MAINF[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 24 – CCSS** Counter Clock Source Selection

Value	Description
0	The measured clock of the MAINF counter is the main RC oscillator.
1	The measured clock of the MAINF counter is the main crystal oscillator.

**Bit 20 – RCMEAS** RC Oscillator Frequency Measure (write-only)

The measurement is performed on the main frequency (i.e., not limited to the main RC oscillator only). If the source of MAINCK is the main crystal oscillator, the restart of measurement may not be required because of the stability of crystal oscillators.

Value	Description
0	No effect.
1	Restarts measuring of the frequency of MAINCK. MAINF carries the new frequency as soon as a low-to-high transition occurs on the MAINFRDY flag.

**Bit 16 – MAINFRDY** Main Clock Frequency Measure Ready

To ensure that a correct value is read on the MAINF field, the MAINFRDY flag must be read at '1' then another read access must be performed on the register to get a stable value on the MAINF field.

Value	Description
0	The MAINF value is not valid or the measured oscillator is disabled or a measure has just been started by means of RCMEAS.
1	The measured oscillator has been enabled previously and the MAINF value is available.

**Bits 15:0 – MAINF[15:0]** Main Clock Frequency

Gives the number of cycles of the clock selected by the bit CCSS within 16 MD\_SLCK periods. To calculate the frequency of the measured clock:

$$f_{\text{SELCLK}} = (\text{MAINF} \times f_{\text{MD\_SLCK}}) / 16$$

where frequency is in MHz.

**41.16.11.PMC CPU Clock Register**

**Name:** PMC\_CPU\_CKR  
**Offset:** 0x0028  
**Reset:** 0x00000001  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

The CSS, PRES and MDIV fields cannot be modified simultaneously. If more than one field modification is required, proceed sequentially: modify the first field and wait for PMC\_SR.MCKRDY high, then modify the second field and wait for PMC\_SR.MCKRDY high, etc.

Bit	31	30	29	28	27	26	25	24

		0	0	0			0	1

**Bits 10:8 – MDIV[2:0] MCK Division**

Value	Name	Description
0	EQ_PCK	MCK is FCLK divided by 1. MCK_2X is FCLK divided by 1.
1	PCK_DIV2	MCK is FCLK divided by 2. MCK_2X is FCLK divided by 1.
2	PCK_DIV4	MCK is FCLK divided by 4. MCK_2X is FCLK divided by 2.
3	PCK_DIV3	MCK is FCLK divided by 3. MCK_2X is FCLK divided by 1.5.

**Bits 6:4 – PRES[2:0] Processor Clock Prescaler**

Value	Name	Description
0	CLK_1	Selected clock
1	CLK_2	Selected clock divided by 2
2	CLK_4	Selected clock divided by 4
3	CLK_8	Selected clock divided by 8
4	CLK_16	Selected clock divided by 16
5	CLK_32	Selected clock divided by 32
6	CLK_64	Selected clock divided by 64
7	CLK_3	Selected clock divided by 3

**Bits 1:0 – CSS[1:0] MCK Source Selection**

Value	Name	Description
0	SLOW_CLK	MD_SLCK is selected.
1	MAIN_CLK	MAINCK is selected.
2	PLLACK	PLLACK is selected.
3	UPLLCK	UPLLCK is selected.

#### 41.16.12.PMC USB Clock Register

**Name:** PMC\_USB  
**Offset:** 0x0038  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [PMC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset				0	0	0	0	0

**Bits 15:8 – PRES[7:0] Programmable Clock Prescaler**

Value	Description
0–255	The selected clock is divided by PRES+1.

**Bits 4:0 – CSS[4:0] Programmable Clock Source Selection**

Values not listed are considered “reserved”.

Value	Name	Description
0	MD_SLOW_CLK	MD_SLCK is selected.
1	TD_SLOW_CLOCK	TD_SLCK is selected.
2	MAINCK	MAINCK is selected.
3	MCK	MCK is selected.
4	PLLA	PLLA is selected.
5	UPLL	UPLL is selected.

**41.16.14.PMC Interrupt Enable Register**

**Name:** PMC\_IER  
**Offset:** 0x0060  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [PMC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
							PLL_INT	
Access							W	
Reset							–	
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
					MCKRDY			MOSCXTS
Access					R			R
Reset					1			0

**Bit 25 – PLL\_INT** PLL Interrupt Status

Value	Description
0	No PLL interrupt has occurred.
1	A PLL interrupt has occurred. PLL interrupt is defined by the configuration of PMC_IMR.

**Bit 24 – GCLKRDY** GCLK Ready

Value	Description
0	A GCLK is not ready to use (clock switching in progress).
1	All GCLKs are switched to their selected source clock and ready to use.

**Bit 23 – MCKMON** Main System Bus Clock Monitor Error

This status is cleared on read.

Value	Description
0	Main system bus clock is correct or the CPU clock monitor is disabled.
1	Main system bus clock is incorrect or has been incorrect for an elapsed period of time since the monitoring has been enabled.

**Bit 21 – XT32KERR** Slow Crystal Oscillator Error

Value	Description
0	The frequency of the 32.768 kHz crystal oscillator is correct (32.768 kHz $\pm$ 1%) or the monitoring is disabled.
1	The frequency of the 32.768 kHz crystal oscillator is incorrect or has been incorrect for an elapsed period of time since the monitoring has been enabled.

**Bit 20 – FOS** Clock Failure Detector Fault Output Status

Value	Description
0	The fault output of the clock failure detector is inactive.
1	The fault output of the clock failure detector is active. This status is cleared by writing a '1' to FOCLR in PMC_FOCR.

#### Bit 19 – CFDS Clock Failure Detector Status

Value	Description
0	A clock failure of the main crystal oscillator clock is not detected.
1	A clock failure of the main crystal oscillator clock is detected.

#### Bit 18 – CFDEV Clock Failure Detector Event

Value	Description
0	No clock failure detection of the main crystal oscillator clock has occurred since the last read of PMC_SR.
1	At least one clock failure detection of the main crystal oscillator clock has occurred since the last read of PMC_SR.

#### Bit 17 – MOSCRCS Main RC Oscillator Status

Value	Description
0	The main RC oscillator is not stabilized.
1	The main RC oscillator is stabilized.

#### Bit 16 – MOSCELS Main Clock Source Oscillator Selection Status

Value	Description
0	Selection is in progress.
1	Selection is done.

#### Bits 8, 9 – PCKRDYx Programmable Clock Ready Status

Value	Description
0	Programmable clock x is not ready.
1	Programmable clock x is ready.

#### Bit 3 – MCKRDY Main System Bus Clock Status

Value	Description
0	Main system bus clock is not ready.
1	Main system bus clock is ready.

#### Bit 0 – MOSCXTS Main Crystal Oscillator Status

Value	Description
0	The main crystal oscillator is not stabilized.
1	The main crystal oscillator is stabilized.

**41.16.17.PMC Interrupt Mask Register**

**Name:** PMC\_IMR  
**Offset:** 0x006C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
							PLL_INT	
Access							W

#### Bits 24, 25 – WLANx Wake-Up on LAN[x] Enable

Value	Description
0	The Wake-up on LAN[x] alarm has no effect on the PMC.
1	The Wake-up on LAN[x] alarm enables a fast restart signal to the PMC.

#### Bit 18 – USBAL USB Alarm Enable

Value	Description
0	The USB alarm has no effect on the PMC.
1	The USB alarm enables a fast restart signal to the PMC.

#### Bit 17 – RTCAL RTC Alarm Enable

Value	Description
0	The RTC alarm has no effect on the PMC.
1	The RTC alarm enables a fast restart signal to the PMC.

#### Bit 16 – RTTAL RTT Alarm Enable

Value	Description
0	The RTT alarm has no effect on the PMC.
1	The RTT alarm enables a fast restart signal to the PMC.

**41.16.19.PMC Wake-Up Control Register**

**Name:** PMC\_WCR  
**Offset:** 0x0074  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

**Bit 24 – CMD** Command

Value	Description
0	Read mode.
1	Write mode.

**Bit 17 – WIP** Wake-Up Input Polarity

Defines the active polarity of the selected wake-up input. If the corresponding wake-up input is enabled at the WIP level, it enables a fast restart signal.

Value	Description
0	Active polarity is low.
1	Active polarity is high.

**Bit 16 – EN** Wake-Up Input Enable

Value	Description
0	The selected wake-up input has no effect on the PMC.
1	The selected wake-up input enables a fast restart signal to the PMC.

**Bits 3:0 – WKPIONB[3:0]** Wake-Up Input Number

Defines which wake-up source is to be modified during a write access (CMD is set to '1') or which wake-up source status is read on the next read access to this register (CMD is set to '0').

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x504D43	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

**Bit 1 – WPITEN Write Protection Interrupt Enable**

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).

**Bit 0 – WPEN Write Protection Enable**

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x504D43 ("PMC" in ASCII).

**41.16.22.PMC Write Protection Status Register**

**Name:** PMC\_WPSR  
**Offset:** 0x0084

Access								R
Reset								0

**Bits 23:8 – WPVSR[15:0] Write Protection Violation Source**

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

**Bit 0 – WPVS Write Protection Violation Status**

Value	Description
0	No write protection violation has occurred since the last read of the PMC_WPSR.
1	A write protection violation has occurred since the last read of the PMC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

**41.16.23.PMC Peripheral Control Register**

**Name:** PMC\_PCR  
**Offset:** 0x0088  
**Reset:** 0x00000000  
**Property:** Read/Write

Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

**Bit 31 – CMD** Command

Value	Description
0	Read mode.
1	Write mode.

**Bit 29 – GCLKEN** Generic Clock Enable

Value	Description
0	The selected generic clock is disabled.
1	The selected generic clock is enabled.

**Bit 28 – EN** Enable

Value	Description
0	The selected peripheral clock is disabled.
1	The selected peripheral clock is enabled.

**Bits 27:20 – GCLKDIV[7:0]** Generic Clock Division Ratio

Generic clock is the selected clock period divided by GCLKDIV + 1.  
 GCLKDIV must not be changed while the peripheral selects GCLKx (bit rate, etc.).

**Bits 12:8 – GCLKCSS[4:0]** Generic Clock Source Selection

Value	Name	Description
0	MD_SLOW_CLK	MD_SLCK is selected.
1	TD_SLOW_CLOCK	TD_SLCK is selected.
2	MAINCK	MAINCK is selected.

Value	Name	Description
3	MCK	MCK is selected.
4	PLLA	PLLA is selected.
5	UPLL	UPLL is selected.

**Bits 6:0 – PID[6:0] Peripheral ID**

Peripheral ID selection.

Not all GCLK inputs are available on all peripherals.

Refer to identifier definitions in the table “Peripheral Identifiers”.

#### 41.16.24.PMC MCK Monitor Limits Register

**Name:** PMC\_MCKLIM  
**Offset:** 0x009C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset	0	0	0	0	0	0	0	0

**Bits 15:8 – MCK\_HIGH\_IT[7:0]** MCK Monitoring High IT Limit  
Beyond this limit, the MCK frequency monitor generates an interrupt.

**Bits 7:0 – MCK\_LOW\_IT[7:0]** MCK Monitoring Low IT Limit  
Below this limit, the MCK frequency monitor generates an interrupt.

**41.16.25.PMC Peripheral Clock Status Register 0**

**Name:** PMC\_CSR0  
**Offset:** 0x00A0  
**Reset:** 0x00000000  
**Property:** Read-only

“PIDx” refers to identifiers as defined in the table “Peripheral Identifiers”.

The following configuration values are valid for all listed bit names of this register:

0: The corresponding peripheral clock is disabled.

1: The corresponding peripheral clock is enabled.

Bit	31	30	29	28	27	26	25	24
		PID30	PID29	PID28	PID27	PID26	PID25	PID24

0	UPLL is not in Overflow state.
1	UPLL encountered an overflow.

#### Bit 16 – OVRA PLLA Overflow

Value	Description
0	PLLA is not in Overflow state.
1	PLLA encountered an overflow.

#### Bit 1 – UDRU UPLL Underflow

Value	Description
0	UPLL is not in Underflow state.
1	UPLL encountered an underflow.

#### Bit 0 – UDRA PLLA Underflow

Value	Description
0	PLLA is not in Underflow state.
1	PLLA encountered an underflow.

## 42. Parallel Input/Output Controller (PIO)

### 42.1. Description

The Parallel Input/Output Controller (PIO) manages up to 32 fully programmable input/output lines. Each I/O line may be dedicated as a general-purpose I/O or be assigned to a function of an embedded peripheral. This ensures effective optimization of the pins of the product.

Each I/O line is associated with a bit number in all of the 32-bit registers of the 32-bit wide user interface.

Each I/O line of the PIO Controller features the following:

- An input change interrupt enabling level change detection on any I/O line
- Additional Interrupt modes enabling rising edge, falling edge, low-level or high-level detection on any I/O line
- A glitch filter providing rejection of glitches lower than one-half of peripheral clock cycle
- A debouncing filter providing rejection of unwanted pulses from key or push button operations
- Multi-drive capability similar to an open drain I/O line
- Control of the I/O line pullup and pulldown
- Input visibility and output control

The PIO Controller also features a synchronous output providing up to 32 bits of data output in a single write operation.

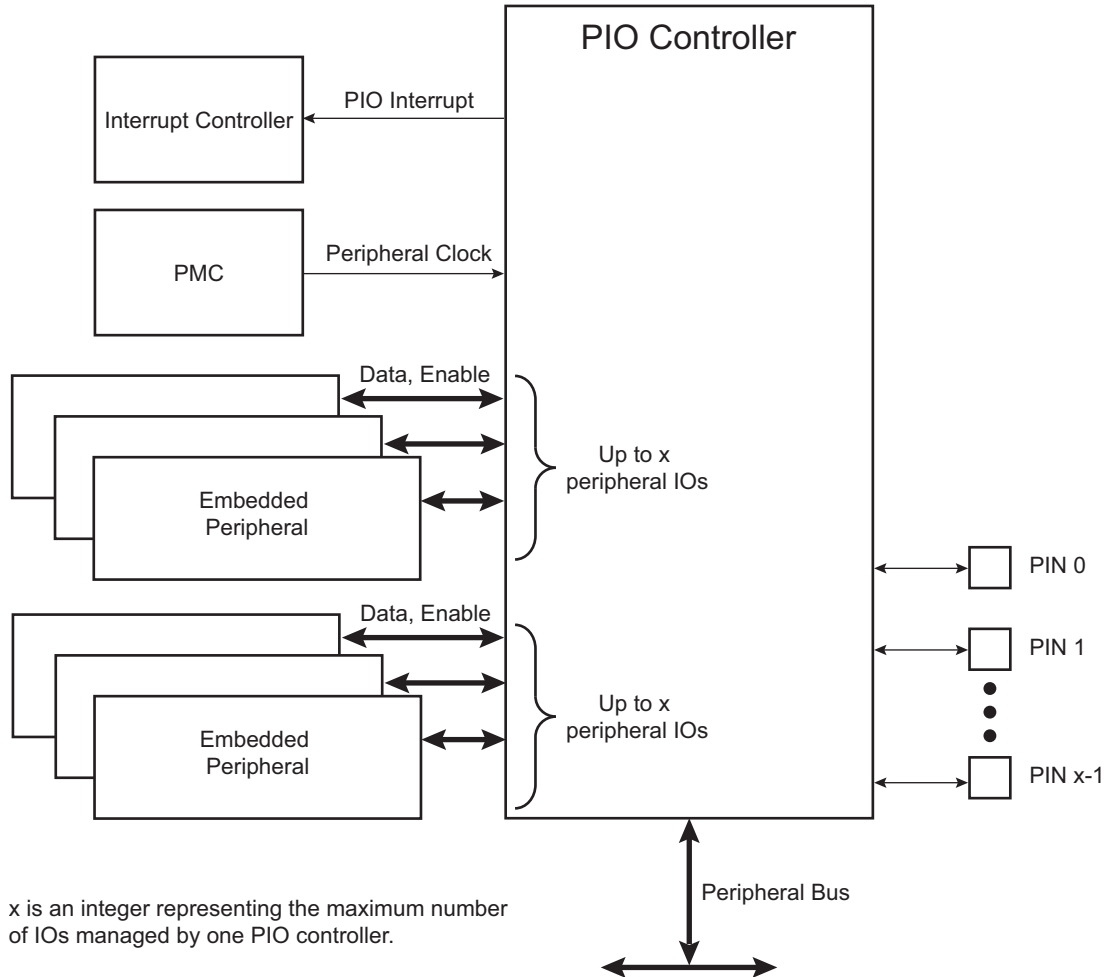

### 42.2. Embedded Characteristics

- Up to 32 Programmable I/O Lines
- Fully Programmable through Set/Clear Registers
- Multiplexing of Four Peripheral Functions per I/O Line
- For each I/O Line (Whether Assigned to a Peripheral or Used as General Purpose I/O)
  - Input change interrupt
  - Programmable glitch filter
  - Programmable debouncing filter
  - Multi-drive option enables driving in open drain
  - Programmable pullup on each I/O line
  - Pin Data Status register provides visibility of the level on the pin at any time
  - Additional interrupt modes on a programmable event: Rising Edge, Falling Edge, Low-Level or High-Level
- Synchronous Output, Provides Set and Clear of Several I/O Lines in a Single Write
- Register Write Protection
- Programmable Schmitt Trigger Inputs
- Programmable Slewrate per I/O Line
- Programmable I/O Drive

## 42.3. Block Diagram

Figure 42.1. Block Diagram

## 42.4. Product Dependencies

### 42.4.1. Pin Multiplexing

Each pin is configurable, depending on the product, as either a general-purpose I/O line only, or as an I/O line multiplexed with one or two peripheral I/Os. As the multiplexing is hardware defined and thus product-dependent, the hardware designer and programmer must carefully determine the configuration of the PIO Controllers required by their application. When an I/O line is general-purpose only, i.e., not multiplexed with any peripheral I/O, programming of the PIO Controller regarding the assignment to a peripheral has no effect and only the PIO Controller can control how the pin is driven by the product.

### 42.4.2. External Interrupt Lines

The interrupt signals FIQ and IRQ0 to IRQn are generally multiplexed through the PIO Controllers. However, it is not necessary to assign the I/O line to the interrupt function as the PIO Controller has no effect on inputs and the external interrupt lines are used only as inputs.

#### 42.4.3. Power Management

The Power Management Controller controls the peripheral clock in order to save power. Writing any of the registers of the user interface does not require the peripheral clock to be enabled. This means that the configuration of the I/O lines does not require the peripheral clock to be enabled.

However, when the clock is disabled, not all of the features of the PIO Controller are available, including glitch filtering. Note that the input change interrupt, the interrupt modes on a programmable event and the read of the pin level require the clock to be validated.

After a hardware reset, the peripheral clock is disabled by default.

The user must configure the Power Management Controller before any access to the input line information.

#### 42.4.4. Interrupt Sources

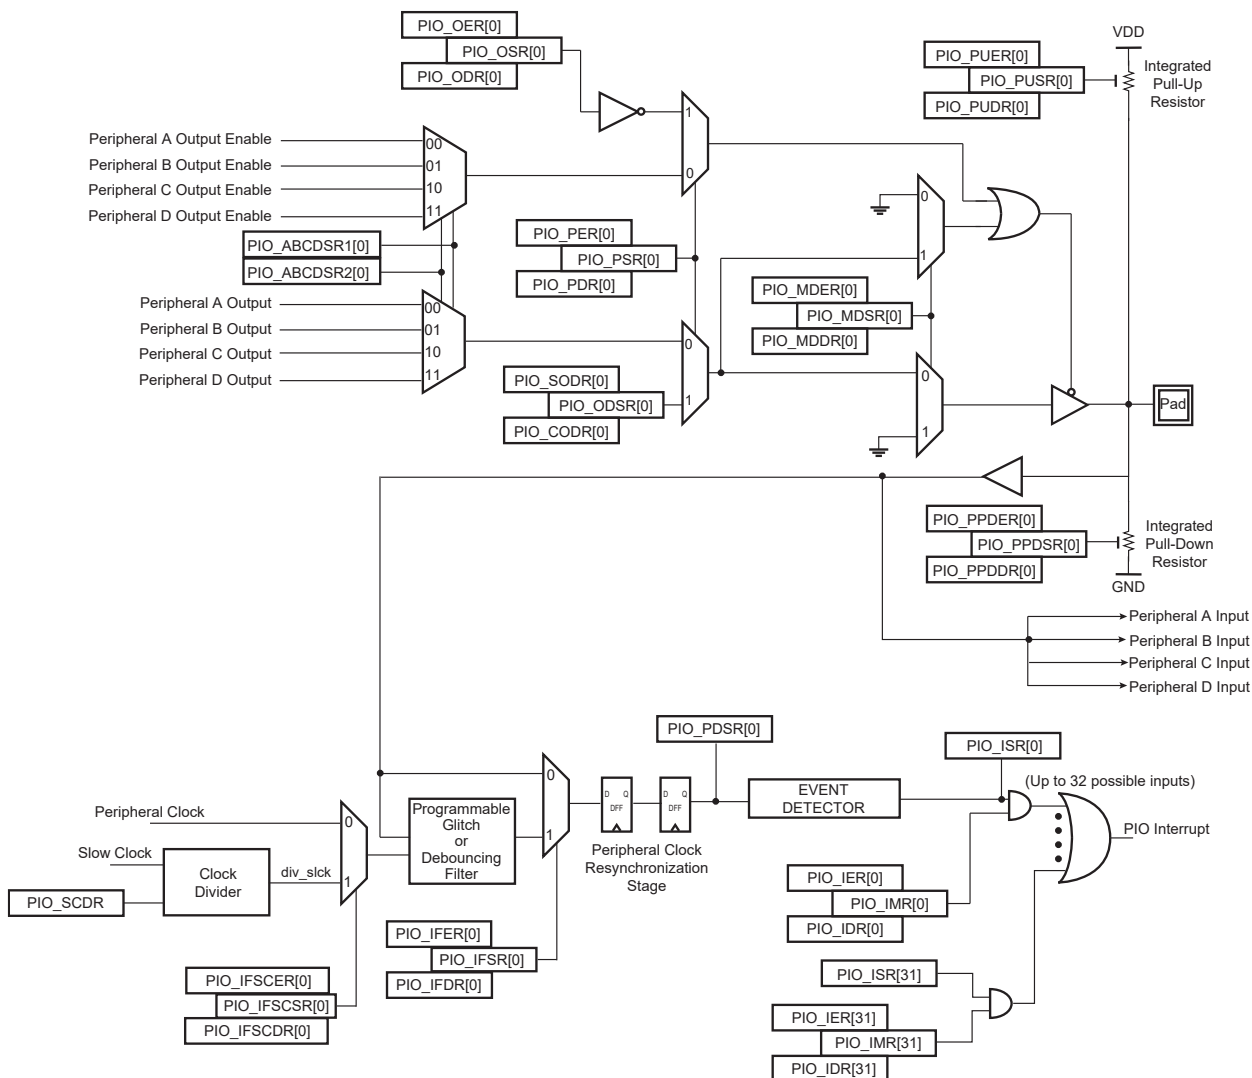

For interrupt handling, the PIO Controllers are considered as user peripherals. This means that the PIO Controller interrupt lines are connected among the interrupt sources. Refer to the PIO Controller peripheral identifier in the Peripheral Identifiers table to identify the interrupt sources dedicated to the PIO Controllers. Using the PIO Controller requires the Interrupt Controller to be programmed first.

The PIO Controller interrupt can be generated only if the peripheral clock is enabled.

#### 42.5. Functional Description

The PIO Controller features up to 32 fully-programmable I/O lines. Most of the control logic associated to each I/O is represented in the following figure. In this description each signal shown represents one of up to 32 possible indexes.

Figure 42.2. I/O Line Control Logic

#### 42.5.1. Pullup and Pulldown Resistor Control

Each I/O line is designed with an embedded pullup resistor and an embedded pulldown resistor. The pullup resistor can be enabled or disabled by writing to the Pull-Up Enable Register (PIO\_PUER) or Pull-Up Disable Register (PIO\_PUDR), respectively. Writing to these registers results in setting or clearing the corresponding bit in the Pull-Up Status Register (PIO\_PUSR). Reading a one in PIO\_PUSR means the pullup is disabled and reading a zero means the pullup is enabled. The pulldown resistor can be enabled or disabled by writing the Pull-Down Enable Register (PIO\_PPDER) or the Pull-Down Disable Register (PIO\_PPDDR), respectively. Writing in these registers results in setting or clearing the corresponding bit in the Pull-Down Status Register (PIO\_PPDSR). Reading a one in PIO\_PPDSR means the pullup is disabled and reading a zero means the pulldown is enabled.

Enabling the pulldown resistor while the pullup resistor is still enabled is not possible. In this case, the write of PIO\_PPDER for the relevant I/O line is discarded. Likewise, enabling the pullup resistor while the pulldown resistor is still enabled is not possible. In this case, the write of PIO\_PUER for the relevant I/O line is discarded.

Control of the pullup resistor is possible regardless of the configuration of the I/O line.

After reset, depending on the I/O, pullup or pulldown can be set.

#### 42.5.2. I/O Line or Peripheral Function Selection

When a pin is multiplexed with one or two peripheral functions, the selection is controlled with the Enable Register (PIO\_PER) and the Disable Register (PIO\_PDR). The Status Register (PIO\_PSR) is the result of the set and clear registers and indicates whether the pin is controlled by the corresponding peripheral or by the PIO Controller. A value of zero indicates that the pin is controlled by the corresponding on-chip peripheral selected in the Peripheral ABCD Select registers (PIO\_ABCDSR1 and PIO\_ABCDSR2). A value of one indicates the pin is controlled by the PIO Controller.

If a pin is used as a general-purpose I/O line (not multiplexed with an on-chip peripheral), PIO\_PER and PIO\_PDR have no effect and PIO\_PSR returns a one for the corresponding bit.

After reset, the I/O lines are controlled by the PIO Controller, i.e., PIO\_PSR resets at one. However, in some events, it is important that PIO lines are controlled by the peripheral (as in the case of memory chip select lines that must be driven inactive after reset, or for address lines that must be driven low for booting out of an external memory). Thus, the reset value of PIO\_PSR is defined at the product level and depends on the multiplexing of the device.

#### 42.5.3. Peripheral A or B or C or D Selection

The PIO Controller provides multiplexing of up to four peripheral functions on a single pin. The selection is performed by writing PIO\_ABCDSR1 and PIO\_ABCDSR2.

For each pin:

- The corresponding bit at level zero in PIO\_ABCDSR1 and the corresponding bit at level zero in PIO\_ABCDSR2 means peripheral A is selected.
- The corresponding bit at level one in PIO\_ABCDSR1 and the corresponding bit at level zero in PIO\_ABCDSR2 means peripheral B is selected.
- The corresponding bit at level zero in PIO\_ABCDSR1 and the corresponding bit at level one in PIO\_ABCDSR2 means peripheral C is selected.
- The corresponding bit at level one in PIO\_ABCDSR1 and the corresponding bit at level one in PIO\_ABCDSR2 means peripheral D is selected.

Note that multiplexing of peripheral lines A, B, C and D only affects the output line. The peripheral input lines are always connected to the pin input (see the figure [I/O Line Control Logic](#)).

Writing in PIO\_ABCDSR1 and PIO\_ABCDSR2 manages the multiplexing regardless of the configuration of the pin. However, assignment of a pin to a peripheral function requires a write in PIO\_ABCDSR1 and PIO\_ABCDSR2 in addition to a write in PIO\_PDR.

After reset, PIO\_ABCDSR1 and PIO\_ABCDSR2 are zero, thus indicating that all the PIO lines are configured on peripheral A. However, peripheral A generally does not drive the pin as the PIO Controller resets in I/O Line mode.

If the software selects a peripheral A, B, C or D which does not exist for a pin, no alternate functions are enabled for this pin and the selection is taken into account. The PIO Controller does not carry out checks to prevent selection of a peripheral which does not exist.

#### 42.5.4. Output Control

When the I/O line is assigned to a peripheral function, i.e., the corresponding bit in PIO\_PSR is at zero, the drive of the I/O line is controlled by the peripheral. Peripheral A or B or C or D depending on the value in PIO\_ABCDSR1 and PIO\_ABCDSR2 determines whether the pin is driven or not.

When the I/O line is controlled by the PIO Controller, the pin can be configured to be driven. This is done by writing the Output Enable Register (PIO\_OER) and Output Disable Register (PIO\_ODR). The results of these write operations are detected in the Output Status Register (PIO\_OSR). When a bit in this register is at zero, the corresponding I/O line is used as an input only. When the bit is at one, the corresponding I/O line is driven by the PIO Controller.

The level driven on an I/O line can be determined by writing in the Set Output Data Register (PIO\_SODR) and the Clear Output Data Register (PIO\_CODR). These write operations, respectively, set and clear the Output Data Status Register (PIO\_ODSR), which represents the data driven on the I/O lines. Writing in PIO\_OER and PIO\_ODR manages PIO\_OSR whether the pin is configured to be controlled by the PIO Controller or assigned to a peripheral function. This enables configuration of the I/O line prior to setting it to be managed by the PIO Controller.

Similarly, writing in PIO\_SODR and PIO\_CODR affects PIO\_ODSR. This is important as it defines the first level driven on the I/O line.

#### 42.5.5. Synchronous Data Output

Clearing one or more PIO line(s) and setting another one or more PIO line(s) synchronously cannot be done by using PIO\_SODR and PIO\_CODR. It requires two successive write operations into two different registers. To overcome this, the PIO Controller offers a direct control of PIO outputs by single write access to PIO\_ODSR. Only bits unmasked by the Output Write Status Register (PIO\_OWSR) are written. The mask bits in PIO\_OWSR are set by writing to the Output Write Enable Register (PIO\_OWER) and cleared by writing to the Output Write Disable Register (PIO\_OWDR).

After reset, the synchronous data output is disabled on all the I/O lines as PIO\_OWSR resets at 0x0.

#### 42.5.6. Multi-Drive Control (Open Drain)

Each I/O can be independently programmed in open drain by using the multi-drive feature. This feature permits several drivers to be connected on the I/O line which is driven low only by each device. An external pullup resistor (or enabling of the internal one) is generally required to guarantee a high level on the line.

The multi-drive feature is controlled by the Multi-driver Enable Register (PIO\_MDER) and the Multi-driver Disable Register (PIO\_MDDR). The multi-drive can be selected whether the I/O line is controlled by the PIO Controller or assigned to a peripheral function. The Multi-driver Status Register (PIO\_MDSR) indicates the pins that are configured to support external drivers.

After reset, the multi-drive feature is disabled on all pins, i.e., PIO\_MDSR resets at value 0x0.

#### 42.5.7. Output Line Timings

The following figure shows how the outputs are driven either by writing PIO\_SODR or PIO\_CODR, or by directly writing PIO\_ODSR. This last case is valid only if the corresponding bit in PIO\_OWSR is set. The Output Line Timings figure also shows when the feedback in the Pin Data Status Register (PIO\_PDSR) is available.

**Figure 42.3.** Output Line Timings

#### 42.5.8. Inputs

The level on each I/O line can be read through PIO\_PDSR. This register indicates the level of the I/O lines regardless of their configuration, whether uniquely as an input, or driven by the PIO Controller, or driven by a peripheral.

Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSR reads the levels present on the I/O line at the time the clock was disabled.

#### 42.5.9. Input Glitch and Debouncing Filters

Optional input glitch and debouncing filters are independently programmable on each I/O line.

The glitch filter can filter a glitch with a duration of less than 1/2 peripheral clock and the debouncing filter can filter a pulse of less than 1/2 period of a programmable divided slow clock.

The selection between glitch filtering or debounce filtering is done by writing in the PIO Input Filter Slow Clock Disable register (PIO\_IFSCDR) and the PIO Input Filter Slow Clock Enable register (PIO\_IFSCER). Writing PIO\_IFSCDR and PIO\_IFSCER, respectively, sets and clears bits in the Input Filter Slow Clock Status register (PIO\_IFSCSR).

The current selection status can be checked by reading the PIO\_IFSCSR.

- If PIO\_IFSCSR[i] = 0: The glitch filter can filter a glitch with a duration of less than 1/2 main system bus clock period.
- If PIO\_IFSCSR[i] = 1: The debouncing filter can filter a pulse with a duration of less than 1/2 programmable divided slow clock period.

For the debouncing filter, the period of the divided slow clock is defined by writing in the DIV field of the Slow Clock Divider Debouncing register (PIO\_SCDR):

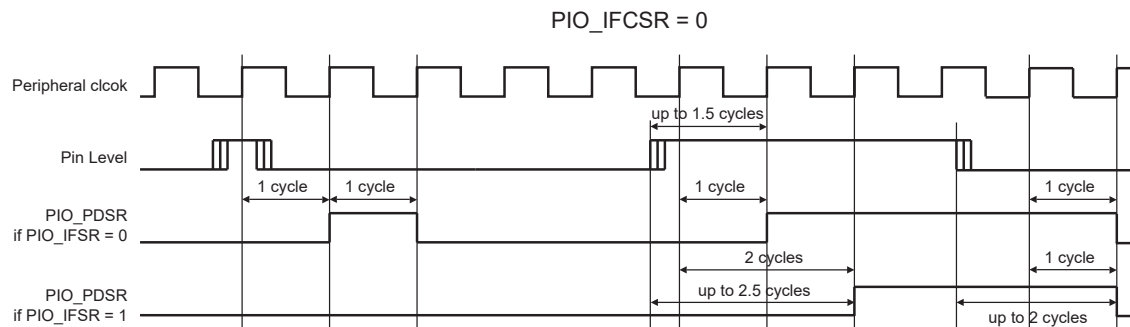

$$t_{div\_slck} = ((DIV + 1) \times 2) \times t_{slck}$$

When the glitch or debouncing filter is enabled, a glitch or pulse with a duration of less than 1/2 selected clock cycle (selected clock represents peripheral clock or divided slow clock depending on PIO\_IFSCDR and PIO\_IFSCER programming) is automatically rejected, while a pulse with a duration of one selected clock (peripheral clock or divided slow clock) cycle or more is accepted. For pulse durations between 1/2 selected clock cycle and one selected clock cycle, the pulse may or may not be taken into account, depending on the precise timing of its occurrence. Thus for a pulse to be visible, it must exceed one selected clock cycle, whereas for a glitch to be reliably filtered out, its duration must not exceed 1/2 selected clock cycle.

The filters also introduce some latencies, illustrated in the following two figures.

The glitch filters are controlled by the Input Filter Enable register (PIO\_IFER), the Input Filter Disable register (PIO\_IFDR) and the Input Filter Status register (PIO\_IFSR). Writing PIO\_IFER and PIO\_IFDR respectively sets and clears bits in PIO\_IFSR. This last register enables the glitch filter on the I/O lines.

When the glitch and/or debouncing filter is enabled, it does not modify the behavior of the inputs on the peripherals. It acts only on the value read in PIO\_PDSR and on the input change interrupt detection. The glitch and debouncing filters require that the peripheral clock is enabled.

**Figure 42.4. Input Glitch Filter Timing****Figure 42.5. Input Debouncing Filter Timing**

#### 42.5.10. Input Edge/Level Interrupt

The PIO Controller can be programmed to generate an interrupt when it detects an edge or a level on an I/O line. The Input Edge/Level interrupt is controlled by writing the Interrupt Enable Register (PIO\_IER) and the Interrupt Disable Register (PIO\_IDR), which enable and disable the input change interrupt respectively by setting and clearing the corresponding bit in the Interrupt Mask Register (PIO\_IMR). As input change detection is possible only by comparing two successive samplings of the input of the I/O line, the peripheral clock must be enabled. The Input Change interrupt is available regardless of the configuration of the I/O line, i.e., configured as an input only, controlled by the PIO Controller or assigned to a peripheral function.

By default, the interrupt can be generated at any time an edge is detected on the input.

Some additional interrupt modes can be enabled/disabled by writing in the Additional Interrupt Modes Enable Register (PIO\_AIMER) and Additional Interrupt Modes Disable Register (PIO\_AIMDR). The current state of this selection can be read through the Additional Interrupt Modes Mask Register (PIO\_AIMMR).

These additional modes are:

- Rising edge detection
- Falling edge detection
- Low-level detection
- High-level detection

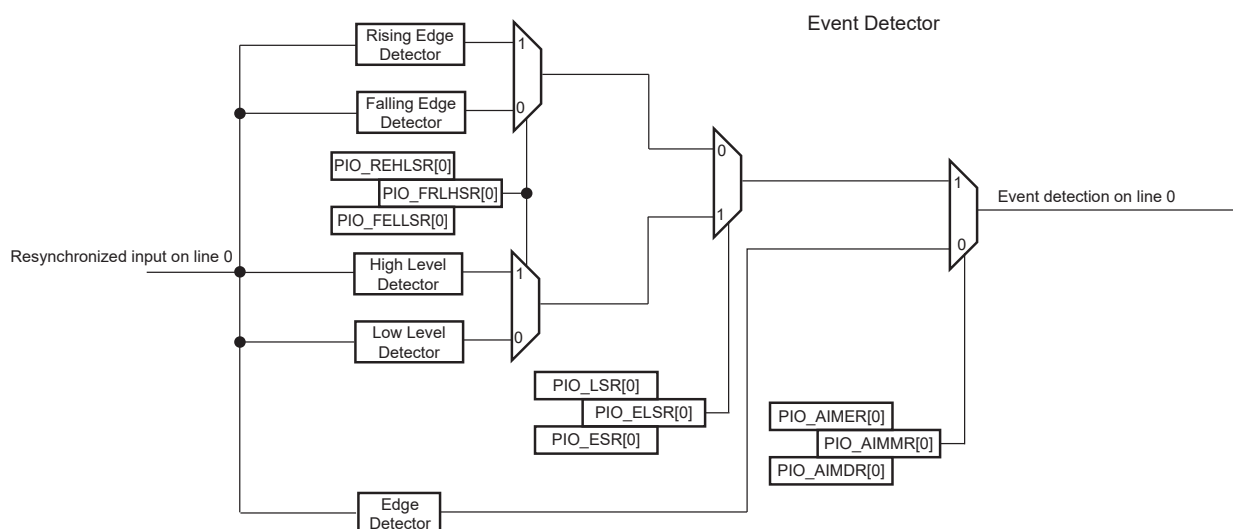

In order to select an additional interrupt mode:

- The type of event detection (edge or level) must be selected by writing in the Edge Select Register (PIO\_ESR) and Level Select Register (PIO\_LSR) which select, respectively, the edge and level detection. The current status of this selection is accessible through the Edge/Level Status Register (PIO\_ELSR).
- The polarity of the event detection (rising/falling edge or high/low-level) must be selected by writing in the Falling Edge/Low-Level Select Register (PIO\_FELLSR) and Rising Edge/High-Level Select Register (PIO\_REHLSR) which allow to select falling or rising edge (if edge is selected in PIO\_ELSR) edge or high- or low-level detection (if level is selected in PIO\_ELSR). The current status of this selection is accessible through the Fall/Rise - Low/High Status Register (PIO\_FRLHSR).

When an input edge or level is detected on an I/O line, the corresponding bit in the Interrupt Status Register (PIO\_ISR) is set. If the corresponding bit in PIO\_IMR is set, the PIO Controller interrupt line is asserted. The interrupt signals of the 32 channels are ORed-wired together to generate a single interrupt signal to the interrupt controller.

When the software reads PIO\_ISR, all the interrupts are automatically cleared. This signifies that all the interrupts that are pending when PIO\_ISR is read must be handled. When an Interrupt is enabled on a "level", the interrupt is generated as long as the interrupt source is not cleared, even if some read accesses in PIO\_ISR are performed.

**Figure 42.6.** Event Detector on Input Lines (Figure Represents Line 0)

Example of interrupt generation on following lines:

- Rising edge on PIO line 0
- Falling edge on PIO line 1
- Rising edge on PIO line 2
- Low-level on PIO line 3
- High-level on PIO line 4
- High-level on PIO line 5
- Falling edge on PIO line 6
- Rising edge on PIO line 7
- Any edge on the other lines

The following table provides the required configuration for this example.

**Table 42.1.** Configuration for Example Interrupt Generation

Configuration	Description
Interrupt Mode	All the interrupt sources are enabled by writing 32'hFFFF_FFFF in PIO_IER. Then the additional Interrupt mode is enabled for lines 0 to 7 by writing 32'h0000_00FF in PIO_AIMER.
Edge or Level Detection	Lines 3, 4 and 5 are configured in level detection by writing 32'h0000_0038 in PIO_LSR. The other lines are configured in edge detection by default, if they have not been previously configured. Otherwise, lines 0, 1, 2, 6 and 7 must be configured in edge detection by writing 32'h0000_00C7 in PIO_ESR.
Falling/Rising Edge or Low/High-Level Detection	Lines 0, 2, 4, 5 and 7 are configured in rising edge or high-level detection by writing 32'h0000_00B5 in PIO_REHLSR. The other lines are configured in falling edge or low-level detection by default if they have not been previously configured. Otherwise, lines 1, 3 and 6 must be configured in falling edge/low-level detection by writing 32'h0000_004A in PIO_FELLSR.

**Figure 42.7.** Input Change Interrupt Timings When No Additional Interrupt Modes

#### 42.5.11. Programmable Schmitt Trigger

It is possible to configure each input for the Schmitt trigger. By default the Schmitt trigger is active. Disabling the Schmitt trigger is requested when using the QTouch® Library.

#### 42.5.12. I/O Lines Programming Example

The programming example shown in the following table is used to obtain the following configuration:

- 4-bit output port on I/O lines 0 to 3 (should be written in a single write operation), open-drain, with pullup resistor
- Four output signals on I/O lines 4 to 7 (to drive LEDs for example), driven high and low, no pullup resistor, no pulldown resistor
- Four input signals on I/O lines 8 to 11 (to read push-button states for example), with pullup resistors, glitch filters and input change interrupts
- Four input signals on I/O line 12 to 15 to read an external device status (polled, thus no input change interrupt), no pullup resistor, no glitch filter
- I/O lines 16 to 19 assigned to peripheral A functions with pullup resistor
- I/O lines 20 to 23 assigned to peripheral B functions with pulldown resistor
- I/O lines 24 to 27 assigned to peripheral C with input change interrupt, no pullup resistor and no pulldown resistor
- I/O lines 28 to 31 assigned to peripheral D, no pullup resistor and no pulldown resistor

**Table 42.2.** Programming Example

Register	Value to be Written
PIO_PER	0x0000_FFFF

PIO_ABCDSR2	0xFF00_0000
PIO_OWER	0x0000_000F
PIO_OWDR	0x0FFF_FFF0

#### 42.5.13. Register Write Protection

To prevent any single software error from corrupting PIO behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [PIO Write Protection Mode Register](#) (PIO\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [PIO Write Protection Status Register](#) (PIO\_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading PIO\_WPSR.

The following registers can be write-protected:

- [PIO Enable Register](#)
- [PIO Disable Register](#)
- [PIO Output Enable Register](#)
- [PIO Output Disable Register](#)
- [PIO Input Filter Enable Register](#)
- [PIO Input Filter Disable Register](#)
- [PIO Multi-driver Enable Register](#)
- [PIO Multi-driver Disable Register](#)
- [PIO Pull-Up Disable Register](#)
- [PIO Pull-Up Enable Register](#)
- [PIO Peripheral ABCD Select Register 1](#)
- [PIO Peripheral ABCD Select Register 2](#)
- [PIO Output Write Enable Register](#)
- [PIO Output Write Disable Register](#)

- [PIO Pad Pull-Down Disable Register](#)
- [PIO Pad Pull-Down Enable Register](#)

## 42.6. Register Summary

Each I/O line controlled by the PIO Controller is associated with a bit in each of the PIO Controller User Interface registers. Each register is 32 bits wide. If a parallel I/O line is not defined, writing to the corresponding bits has no effect. Undefined bits read zero. If the I/O line is not multiplexed with any peripheral, the I/O line is controlled by the PIO Controller and PIO\_PSR returns one systematically.

Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 –**  
**P** PIO Clear Output Data

Value	Description
0	No effect.
1	Clears the data to be driven on the I/O line.

**42.6.12. PIO Output Data Status Register**

**Name:** PIO\_ODSR  
**Offset:** 0x0038  
**Reset:** –  
**Property:** Read-only  
 or Read/Write

PIO\_ODSR is Read-only or Read/Write depending on PIO\_OWSR I/O lines.

Value	Description
0	The data to be driven on the I/O line is 0.
1	The data to be driven on the I/O line is 1.

### 42.6.13. PIO Pin Data Status Register

**Name:** PIO\_PDSR

**Offset:** 0x003C

**Property:** Read-only

Reset values depend on the level of the I/O lines.

Reading the I/O line levels requires the clock of the PIO Controller to be enabled, otherwise PIO\_PDSR reads the levels present on the I/O line at the time the clock was disabled.

	P15	P14	P13	P12	P11	P10	P9	P8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	P7	P6	P5	P4	P3	P2	P1	P0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – P PIO Input Change Interrupt Status**

Value	Description
0	No input change has been detected on the I/O line since PIO_ISR was last read or since reset.
1	At least one input change has been detected on the I/O line since PIO_ISR was last read or since reset.

## 42.6.18. PIO Multi-driver Enable Register

**Name:** PIO\_MDER  
**Offset:** 0x0050  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [PIO Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	P31	P30	P29	P28	P27	P26	P25	P24
Access	W	W	W	W	W	W	W	W

	P7	P6	P5	P4	P3	P2	P1	P0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 –**  
**P** PIO Multi-drive Enable

Value	Description
0	No effect.
1	Enables multi-drive on the I/O line.

## 42.6.19. PIO Multi-driver Disable Register

**Name:** PIO\_MDDR  
**Offset:** 0x0054  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [PIO Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	P31	P30	P29	P28	P27	P26	P25	P24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – P** PIO I/O Line Index

Selects the I/O event type triggering an interrupt.

Value	Description
0	The interrupt source is a both-edge detection event.
1	The interrupt source is described by the registers PIO_ELSR and PIO_FRLHSR.

## 42.6.39. PIO Edge Select Register

**Name:** PIO\_ESR  
**Offset:** 0x00C0  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	P31	P30	P29	P28	P27	P26	P25	P24
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16

	P7	P6	P5	P4	P3	P2	P1	P0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 –**  
**P** PIO Rising Edge/High-Level Interrupt Selection

Value	Description
0	No effect.
1	The interrupt source is set to a rising edge detection or high-level detection event, depending on PIO_ELSR.

#### 42.6.44. PIO Fall/Rise - Low/High Status Register

**Name:** PIO\_FRLHSR  
**Offset:** 0x00D8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	P31	P30	P29	P28	P27	P26	P25	P24
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	P23	P22	P21	P20	P19	P18	P17	P16
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	P15	P14	P13	P12	P11	P10	P9	P8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	P7	P6	P5	P4	P3	P2	P1	P0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – P PIO Edge/Level Interrupt Source Selection**

Value	Description
0	The interrupt source is a falling edge detection (if PIO_ELSR = 0) or low-level detection event (if PIO_ELSR = 1).
1	The interrupt source is a rising edge detection (if PIO_ELSR = 0) or high-level detection event (if PIO_ELSR = 1).

**42.6.45. PIO Write Protection Mode Register**

**Name:** PIO\_WPMR  
**Offset:** 0x00E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x50494F	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

**Bit 0 – WPEN Write Protection Enable**

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x50494F ("PIO" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x50494F ("PIO" in ASCII).

## 42.6.46. PIO Write Protection Status Register

**Name:** PIO\_WPSR  
**Offset:** 0x00E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the PIO_WPSR.
1	A write protection violation has occurred since the last read of the PIO_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 42.6.47. PIO Schmitt Trigger Register

**Name:** PIO\_SCHMITT  
**Offset:** 0x0100  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	SCHMITT31	SCHMITT30	SCHMITT29	SCHMITT28	SCHMITT27	SCHMITT26	SCHMITT25	SCHMITT24
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	SCHMITT23	SCHMITT22	SCHMITT21	SCHMITT20	SCHMITT19	SCHMITT18	SCHMITT17	SCHMITT16
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	DR7	DR6	DR5	DR4	DR3	DR2	DR1	DR0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – DRx** Drive of PIO Line

Value	Name	Description
0	LOW_DRIVE	Lowest drive
1	HIGH_DRIVE	Highest drive

# Image Subsystem

## 43. Overview

### 43.1. Components

The image subsystem is composed of two sections: Image and Display, with parallel interfaces. Their components are:

- Image capture:
  - Image Sensor Interface (ISI)
- Display:
  - LCD Controller with parallel interface (LCDC)
  - 2D Graphical Engine (GFX2D)

### 43.2. Product Dependencies

#### 43.2.1. Clocks

All clocks are controlled by the PMC, which is part of the system controller.

#### 43.2.2. Interrupts

Refer to the table [Peripheral Identifiers](#).

#### 43.2.3. Reset

Image peripherals are connected to the processor and peripherals reset line.

#### 43.2.4. I/Os

The LCDC and ISI peripherals share many I/Os in the VDDIOP1 power rail. For this reason, both of them have mutually exclusive usage. Refer to the [Pin Description](#) table.

### 43.3. Special Functions in SFR

None.

## 44. LCD Controller (LCDC)

### 44.1. Description

The LCD Controller (LCDC) consists of logic for transferring LCD image data from an external display buffer to an LCD module. The LCD has one display input buffer per overlay that fetches pixels through the single system bus host interface and a lookup table to allow palletized display configurations. The LCD controller is programmable on a per overlay basis, and supports different LCD resolutions, window sizes, image formats and pixel depths.

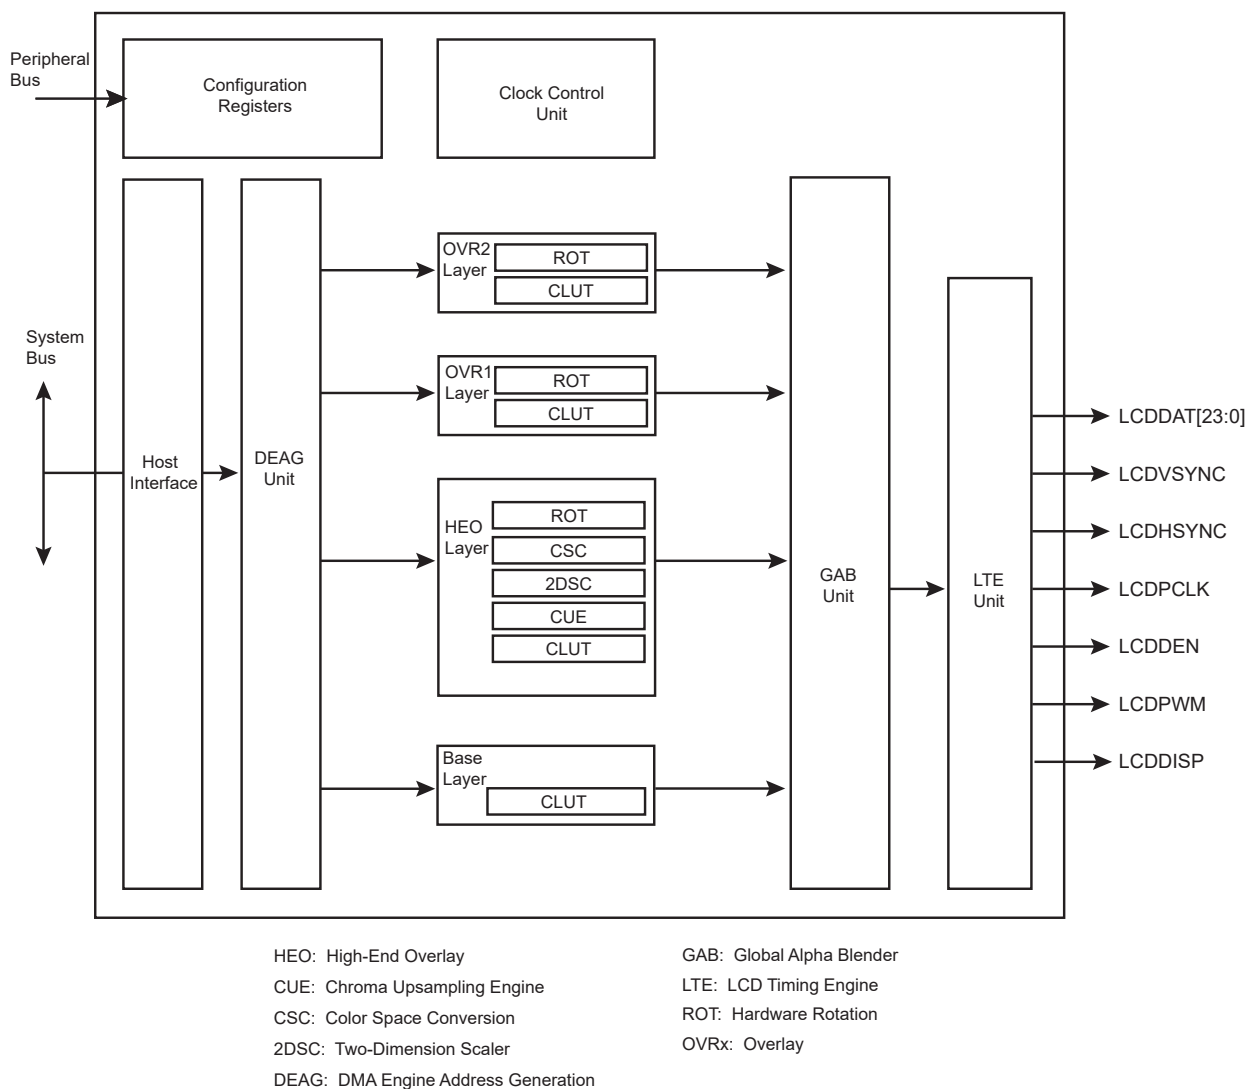

The LCD is connected to the system bus as a hot for reading pixel data. It also integrates an APB interface to configure its registers.

### 44.2. Embedded Characteristics

- Single System Bus Host Interface
- Supports Single Scan Active TFT Display
- Supports 12-, 16-, 18- and 24-bit Output Mode
- Supports Spatial Dithering for 12-, 16-, 18-bit Output Mode
- Asynchronous Output Mode Supported
- 1, 2, 4, 8 bits per Pixel (Palletized)
- 12, 16, 18, 19, 24, 25 and 32 bits per Pixel (Non-palletized)
- Supports One Base Layer (Background)
- Supports Overlay 1 Layer
- Supports Overlay 2 Layer
- Supports High-End Overlay (HEO) Layer
- High-End Overlay supports 4:2:0 Planar Mode and Semiplanar Mode
- High-End Overlay supports 4:2:2 Planar Mode, Semiplanar Mode and Packed
- High-End Overlay includes Chroma Upsampling Unit
- Little Endian Memory Organization
- Programmable Timing Engine, with Integer Clock Divider
- Programmable Polarity for Data, Line Synchro and Frame Synchro
- Up to 1024x768 (XGA) with Overlay (Application-Dependent). Still Image up to WXGA.
- Color Lookup Table with up to 256 Entries and Predefined 8-bit Alpha
- Programmable Negative and Positive Row Striding for all Layers
- Programmable Negative and Positive Pixel Striding for Layers
- Horizontal and Vertical Rescaling Unit with Edge Interpolation and Independent Non-Integer Ratio, up to 1024x768
- Hidden Layer Removal supported
- Integrates Fully Programmable Color Space Conversion
- Blender Function Supports Arbitrary 8-bit Alpha Value and Chroma Keying
- DMA User Interface uses Linked List Structure and Add-to-queue Structure

## 44.3. Block Diagram

Figure 44.1. LCDC Block Diagram

## 44.4. I/O Lines Description

Table 44.1. I/O Lines Description

Name	Description	Type
LCDPWM	Contrast control signal, using Pulse Width Modulation	Output
LCDHSYNC	Horizontal Synchronization Pulse	Output
LCDVSYNC	Vertical Synchronization Pulse	Output
LCDDAT[23:0]	LCD 24-bit data bus	Output
LCDDEN	Data Enable	Output
LCDDISP	Display Enable signal	Output
LCDPCLK	Pixel Clock	Output

## 44.5. Product Dependencies

### 44.5.1. I/O Lines

The pins used for interfacing the LCD Controller may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the LCD Controller are not used by the application, they can be used for other purposes by the PIO Controller.

### 44.5.2. Power Management

The LCD Controller is not continuously clocked. Before using it, the user must first enable the LCDC peripheral and generic (GCLK) clocks in the Power Management Controller.

### 44.5.3. Interrupt Sources

The LCD Controller interrupt line is connected to one of the internal sources of the interrupt controller. Using the LCD Controller interrupt requires prior programming of the interrupt controller.

## 44.6. Functional Description

The LCD module integrates the following digital blocks:

- DMA Engine Address Generation (DEAG)—this block performs data prefetch and requests access to the system bus interface.
- Input Overlay FIFO—stores the stream of pixels
- Color Lookup Table (CLUT)—these 256 RAM-based lookup table entries are selected when the color depth is set to 1, 2, 4 or 8 bpp.
- Chroma Upsampling Engine (CUE)—this block is selected when the input image sampling format is YUV (Y'CbCr) 4:2:0 and converts it to higher quality 4:4:4 image.
- Color Space Conversion (CSC)—changes the color space from YUV to RGB
- Two Dimension Scaler (2DSC)—resizes the image
- Global Alpha Blender (GAB)—performs programmable 256-level alpha blending
- Output FIFO—stores the blended pixel prior to display
- LCD Timing Engine—provides a fully programmable HSYNC-VSYNC interface

The DMA controller reads the image through the system bus host interface. The LCD controller engine formats the display data, then the GAB performs alpha blending if required, and writes the final pixel into the output FIFO. The programmable timing engine drives a valid pixel onto the LCDDAT[23:0] display bus.

### 44.6.1. Timing Engine Configuration

#### 44.6.1.1. Pixel Clock Period Configuration

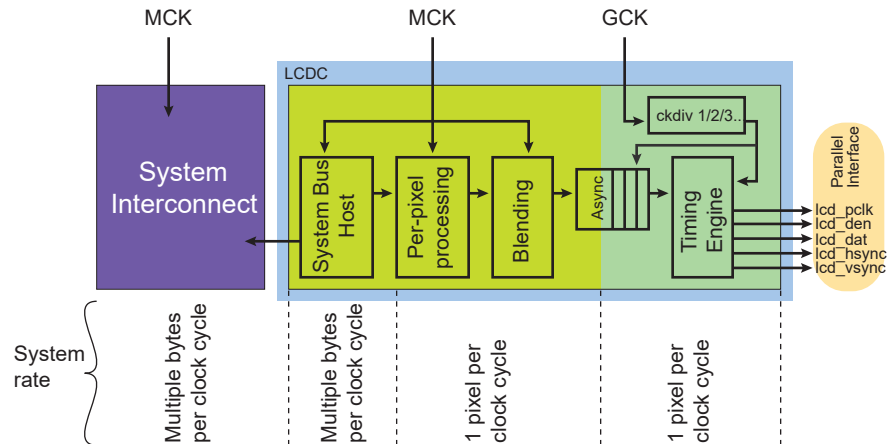

The pixel clock (LCDPCLK) generated by the timing engine is the source clock divided by the field CLKDIV in the LCDC\_LCDCFG0 register. The source clock is the GCLK clock.

Pixel clock period formula:

$$\text{LCD\_PCLK} = \frac{\text{source clock}}{\text{CLKDIV} + 2}$$

The pixel clock polarity is also programmable.

**Figure 44.2.** LCD Controller Pixel Processing and Timing Engine Clock Scheme

#### 44.6.1.2. Horizontal and Vertical Synchronization Configuration

The following fields are used to configure the timing engine:

- LCDC\_LCDCFG1.HSPW
- LCDC\_LCDCFG1.VSPW
- LCDC\_LCDCFG2.VFPW
- LCDC\_LCDCFG2.VBPW
- LCDC\_LCDCFG3.HFPW
- LCDC\_LCDCFG3.HBPW
- LCDC\_LCDCFG4.PPL
- LCDC\_LCDCFG4.RPF

The polarity of output signals is also programmable.

#### 44.6.1.3. Timing Engine Powerup Software Operation

The following sequence is used to enable the display:

1. Configure LCD timing parameters, signal polarity and clock period.
2. Enable the pixel clock by writing a one to bit LCDC\_LCDEN.CLKEN.
3. Poll bit LCDC\_LCDSCR.CLKSTS to check that the clock is running.
4. Enable Horizontal and Vertical Synchronization by writing a one to bit LCDC\_LCDEN.SYNCEN.
5. Poll bit LCDC\_LCDSCR.LCDSTS to check that the synchronization is up.
6. Enable the display power signal by writing a one to bit LCDC\_LCDEN.DISPEN.
7. Poll bit LCDC\_LCDSCR.DISPSTS to check that the power signal is activated.

The field LCDC\_LCDCFG5.GUARDTIME is used to configure the number of frames before the assertion of the DISP signal.

#### 44.6.1.4. Timing Engine Powerdown Software Operation

The following sequence is used to disable the display:

1. Disable the DISP signal by writing bit LCDC\_LCDDIS.DISPDIS.
2. Poll bit LCDC\_LCDSCR.DISPSTS to verify that the DISP is no longer activated.
3. Disable the HSYNC and VSYNC signals by writing a one to bit LCDC\_LCDDIS.SYNCDIS.
4. Poll bit LCDC\_LCDSCR.LCDSTS to check that the synchronization is off.

- Disable the pixel clock by writing a one to bit LCDC\_LCDDIS.CLKDIS.

## 44.6.2. DMA Software Operations

### 44.6.2.1. DMA Channel Descriptor (DSCR) Alignment and Structure

The DMA Channel Descriptor (DSCR) must be aligned on a 32-bit boundary.

The DMA Channel Descriptor structure contains three fields:

- DSCR.CHXADDR: Frame Buffer base address register
- DSCR.CHXCTRL: Transfer Control register
- DSCR.CHXNEXT: Next Descriptor Address register

**Table 44.2.** DMA Channel Descriptor Structure

System Memory	Structure Field for Channel CHX
DSCR + 0x0	ADDR
DSCR + 0x4	CTRL
DSCR + 0x8	NEXT

### 44.6.2.2. Enabling a DMA Channel

Follow the steps below to enable a DMA channel:

- Check the status of the channel by reading the CHXCHSR register.
- Write the channel descriptor (DSCR) structure in the system memory by writing DSCR.CHXADDR Frame base address, DSCR.CHXCTRL channel control and DSCR.CHXNEXT next descriptor location.
- If more than one descriptor is expected, the field DFETCH of DSCR.CHXCTRL is set to '1' to enable the descriptor fetch operation.
- Write the DSCR.CHXNEXT register with the address location of the descriptor structure and set DFETCH field of the DSCR.CHXCTRL register to '1'.
- Enable the relevant channel by writing one to the CHEN field of the CHXCHER register.
- An interrupt may be raised if unmasked when the descriptor has been loaded.

### 44.6.2.3. Disabling a DMA Channel

Follow the steps below to disable a DMA channel:

- Clearing the DFETCH bit in the DSCR.CHXCTRL field of the DSCR structure disables the channel at the end of the frame.
- Setting the DSCR.CHXNEXT field of the DSCR structure disables the channel at the end of the frame.
- Writing one to the CHDIS field of the CHXCHDR register disables the channel at the end of the frame.
- Writing one to the CHRST field of the CHXCHDR register disables the channel immediately. This may occur in the middle of the image.
- Polling CHSR field in the CHXCHSR register until the channel is successfully disabled.

### 44.6.2.4. DMA Dynamic Linking of a New Transfer Descriptor

- Write the new descriptor structure in the system memory.
- Write the address of the new structure in the CHXHEAD register.
- Add the new structure to the queue of descriptors by writing one to the A2QEN field of the CHXCHER register.
- The new descriptor is added to the queue on the next frame.

- An interrupt is raised if unmasked, when the head descriptor structure has been loaded by the DMA channel.

#### 44.6.2.5.DMA Interrupt Generation

The DMA Controller operation sets the following interrupt flags in the Interrupt Status register CHXISR:

- DMA field indicates that the DMA transfer is completed.
- DSCR field indicates that the descriptor structure is loaded in the DMA controller.
- ADD field indicates that a descriptor has been added to the descriptor queue.
- DONE field indicates that the channel transfer has terminated and the channel is automatically disabled.

#### 44.6.2.6.DMA Address Alignment Requirements

When programming the DSCR.CHXADDR field of the DSCR structure, the following requirement must be met.

**Table 44.3.** DMA Address Alignment when CLUT Mode is Selected

CLUT Mode	DMA Address Alignment
1 bpp	8 bits
2 bpp	8 bits
4 bpp	8 bits
8 bpp	8 bits

**Table 44.4.** DMA Address Alignment when RGB Mode is Selected

RGB Mode	DMA Address Alignment
12 bpp RGB 444	16 bits
16 bpp ARGB 4444	16 bits
16 bpp RGBA 4444	16 bits
16 bpp RGB 565	16 bits
16 bpp TRGB 1555	16 bits
18 bpp RGB 666	32 bits
18 bpp RGB 666 PACKED	8 bits
19 bpp TRGB 1666	32 bits
19 bpp TRGB 1666	8 bits
24 bpp RGB 888	32 bits
24 bpp RGB 888 PACKED	8 bits
25 bpp TRGB 1888	32 bits
32 bpp ARGB 8888	32 bits
32 bpp RGBA 8888	32 bits

**Table 44.5.** DMA Address Alignment when YUV Mode is Selected

YUV Mode	DMA Address Alignment
32 bpp AYCrCb	32 bits
16 bpp YCrCb 4:2:2	32 bits
16 bpp semiplanar YCrCb 4:2:2	Y 8 bits
	CrCb 16 bits
16 bpp planar YCrCb 4:2:2	Y 8 bits
	Cr 8 bits
	Cb 8 bits

.....continued

YUV Mode	DMA Address Alignment
12 bpp YCrCb 4:2:0	Y 8 bits
	CrCb 16 bits
12 bpp YCrCb 4:2:0	Y 8 bits
	Cr 8 bits
	Cb 8 bits

### 44.6.3. Overlay Software Configuration

#### 44.6.3.1. System Bus Access Attributes

These attributes are defined to improve bandwidth of the overlay.

- LOCKDIS bit—When set to '1', the system bus lock signal is not asserted when the PSTRIDE value is different from zero (rotation in progress).
- ROTDIS bit—When set to '1', the Pixel Striding optimization is disabled.
- DLBO bit—When set to '1', only defined burst lengths are performed when the DMA channel retrieves the data from the memory.
- BLEN field—Defines the maximum burst length of the DMA channel.
- SIF bit—Defines the targeted DMA interface.

#### 44.6.3.2. Color Attributes

- CLUTMODE field—Selects the Color Lookup Table mode.
- RGBMODE field—Selects the RGB mode.
- YUVMODE field—Selects the Luminance Chrominance mode.

#### 44.6.3.3. Window Position, Size, Scaling and Striding Attributes

- XPOS and YPOS fields—Defines the position of the overlay window.
- XSIZE and YSIZE fields—Defines the size of the displayed window.
- XMEMSIZE and YMEMSIZE fields—Defines the size of the image frame buffer.
- XSTRIDE and PSTRIDE fields—Defines the line and pixel striding.
- XFACTOR and YFACTOR fields—Defines the scaling ratio.

The position and size attributes are to be programmed to keep the window within the display area.

When the Color Lookup Table mode is enabled, the restrictions detailed in the following table apply on the horizontal and vertical window sizes.

**Table 44.6.** Color Lookup Table Mode and Window Size

CLUT Mode	X-Y Size Requirement
1 bpp	Multiple of 8 pixels
2 bpp	Multiple of 4 pixels
4 bpp	Multiple of 2 pixels
8 bpp	Free size

Pixel striding is disabled when CLUT mode is enabled.

**Table 44.7.** Window Size

Mode	X-Y Requirement, Scaling Turned Off	X-Y Requirement, Scaling Turned On	XMEM_SIZE-YMEM_SIZE Requirement, Scaling Turned On
ARGB/TRGB/CLUT	Free size	XSIZE ≥ 3 pixels YSIZE ≥ 3 pixels	XMEM_SIZE ≥ 3 pixels YMEM_SIZE ≥ 3 pixels

.....continued

Mode	X-Y Requirement, Scaling Turned Off	X-Y Requirement, Scaling Turned On	XMEM_SIZE-YMEM_SIZE Requirement, Scaling Turned On
AYCbCr 4:4:4	Free size	XSIZE $\geq$ 3 pixels YSIZE $\geq$ 3 pixels	XMEM_SIZE $\geq$ 3 pixels YMEM_SIZE $\geq$ 3 pixels
YCbCr 4:2:2 Packed	XSIZE $\geq$ 6 pixels Free YSIZE	XSIZE $\geq$ 6 pixels YSIZE $\geq$ 3 pixels	XMEM_SIZE $\geq$ 6 pixels, even YMEM_SIZE $\geq$ 3 pixels
YCbCr 4:2:2 Semiplanar	XSIZE $\geq$ 6 pixels Free YSIZE	XSIZE $\geq$ 6 pixels YSIZE $\geq$ 3 pixels	XMEM_SIZE $\geq$ 6 pixels YMEM_SIZE $\geq$ 3 pixels
YCbCr 4:2:2 Planar	XSIZE $\geq$ 6 pixels Free YSIZE	XSIZE $\geq$ 6 pixels YSIZE $\geq$ 3 pixels	XMEM_SIZE $\geq$ 6 pixels YMEM_SIZE $\geq$ 3 pixels
YCbCr 4:2:0 Semiplanar	XSIZE $\geq$ 6 pixels YSIZE $\geq$ 6 pixels	XSIZE $\geq$ 6 pixels YSIZE $\geq$ 6 pixels	XMEM_SIZE $\geq$ 6 pixels YMEM_SIZE $\geq$ 6 pixels
YCbCr 4:2:0 Planar	XSIZE $\geq$ 6 pixels YSIZE $\geq$ 6 pixels	XSIZE $\geq$ 6 pixels YSIZE $\geq$ 6 pixels	XMEM_SIZE $\geq$ 6 pixels YMEM_SIZE $\geq$ 6 pixels

#### 44.6.3.4.Overlay Blender Attributes

When two or more video layers are used, alpha blending is performed to define the final image displayed. Each window has its own blending attributes.

- CRKEY bit—Enables the chroma keying and match logic.
- INV bit—Performs bit inversion at pixel level.
- ITER2BL bit—When written to '1', the iterated data path is selected.
- ITER bit—When written to '1', the iterated value is used in the iterated data path, otherwise the iterated value is set to 0.
- REVALPHA bit—Uses the reverse alpha value.
- GAEN bit—Enables the global alpha value in the data path.
- LAEN bit—Enables the local alpha value from the pixel.
- OVR bit—When written to '1', the overlay is selected as an input of the blender.
- DMA bit—The DMA data path is activated.
- REP bit—Enables the bit replication to fill the 24-bit internal data path.
- DSTKEY bit—When written to '1', Destination keying is enabled.
- GA field—Defines the global alpha value.

#### 44.6.3.5.Overlay Attributes Software Operation

1. When required, write the overlay attributes configuration registers.
2. Set UPDATEEN field of the CHXCHER register.
3. Poll UPDATESR field in the CHXCHSR, the update applies when that field is reset.

**44.6.6. Chrominance Upsampling Unit**

Both the 4:2:2 and the 4:2:0 input formats are supported by the LCD module. In 4:2:2, the two chrominance components are sampled at half the luminance sample rate. The horizontal chrominance resolution is halved. When this input format is selected, the chrominance upsampling unit uses two chrominances to interpolate the missing component.

In 4:2:0, Cr and Cb components are subsampled at a factor of two vertically and horizontally. When this input mode is selected, the chrominance upsampling unit uses two and four chroma components to generate the missing horizontal and vertical components.

**Figure 44.3.** 4:2:2 Upsampling Algorithm

Vertical and Horizontal upsampling 4:2:2 to 4:4:4 conversion 90 or 270 degrees

**Figure 44.6.** 4:2:0 Upsampling Algorithm

$$\text{Chroma}\left[\frac{x}{2}, 0\right] = \frac{\text{Cr}[0, 0] + \text{Cr}[0, x]}{2}$$

$$\text{Chroma}\left[0, \frac{y}{2}\right] = \frac{\text{Cr}[0, 0] + \text{Cr}[0, y]}{2}$$

$$\text{Chroma}\left[\frac{x}{2}, \frac{y}{2}\right] = \frac{\text{Cr}[0, 0] + \text{Cr}[x, 0] + \text{Cr}[y, 0] + \text{Cr}[x, y]}{4}$$

$$\text{Chroma}\left[x, \frac{y}{2}\right] = \frac{\text{Cr}[x, 0] + \text{Cr}[x, y]}{2}$$

$$\text{Chroma}\left[\frac{x}{2}, y\right] = \frac{\text{Cr}[0, y] + \text{Cr}[x, y]}{2}$$

#### 44.6.6.1. Chrominance Upsampling Algorithm

1. Read line n from chrominance cache and interpolate  $[x/2, 0]$  chrominance component filling the  $1 \times 2$  kernel with line n. If the chrominance cache is empty, then fetch the first line from external memory and interpolate from the external memory. Duplicate the last chrominance at the end of line.
2. Fetch line n+1 from external memory, write line n + 1 to chrominance cache, read line n from the chrominance cache. Interpolate  $[0, y/2]$ ,  $[x/2, y/2]$  and  $[x, y/2]$  filling the  $2 \times 2$  kernel with lines n and n+1. Duplicate the last chrominance line to generate the last interpolated line.
3. Repeat step 1 and step 2.

#### 44.6.7. Line and Pixel Striding

The LCD module includes a technique to increment the memory address by a programmable amount when the end of line has been reached. This offset is referred to as XSTRIDE and is defined

on a per overlay basis. Additionally, the PSTRIDE field allows a programmable jump at the pixel level. Pixel stride is the value from one pixel to the next.

#### 44.6.7.1. Line Striding

When the end of line has been reached, the DMA address counter points to the next pixel address. The channel DMA address register is added to the XSTRIDE field, and then updated. If XSTRIDE is set to '0', the DMA address register remains unchanged. The XSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The XSTRIDE field is a two's complement number. The following formula applies at the line boundary and indicates how the DMA controller computes the next pixel address. The function Sizeof() returns the number of bytes required to store a pixel.

$$\text{NextPixelAddress} = \text{CurrentPixelAddress} + \text{Sizeof}(\text{pixel}) + \text{XSTRIDE}$$

#### 44.6.7.2. Pixel Striding

The DMA channel engine may optionally fetch non-contiguous pixels. The channel DMA address register is added to the PSTRIDE field and then updated. If PSTRIDE is set to zero, the DMA address register remains unchanged and pixels are contiguous. The PSTRIDE field of the channel configuration register is aligned to the pixel size boundary. The PSTRIDE is a two's complement number. The following formula applies at the pixel boundary and indicates how the DMA controller computes the next pixel address. The function Sizeof() returns the number of bytes required to store a pixel.

$$\text{NextPixelAddress} = \text{CurrentPixelAddress} + \text{Sizeof}(\text{pixel}) + \text{PSTRIDE}$$

#### 44.6.8. Color Space Conversion Unit

The color space conversion unit converts Luminance Chrominance color space into the Red Green Blue color space. The conversion matrix is defined below and is fully programmable through the LCD user interface.

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} \text{CSCRY} & \text{CSCRU} & \text{CSCRV} \\ \text{CSCGY} & \text{CSCGU} & \text{CSCGV} \\ \text{CSCBY} & \text{CSCBU} & \text{CSCBV} \end{bmatrix} \cdot \begin{bmatrix} Y - \text{Yoff} \\ \text{Cb} - \text{Cboff} \\ \text{Cr} - \text{Croff} \end{bmatrix}$$

Color space conversion coefficients are defined with the following equation:

$$\text{CSC}_{ij} = \frac{1}{2^7} \cdot \left[ -2^9 \cdot c_9 + \sum_{n=0}^8 c_n \cdot 2^n \right]$$

Color space conversion coefficients are defined with one sign bit, 2 integer bits and 7 fractional bits. The range of the CSC<sub>ij</sub> coefficients is defined below with a step of 1/128.

$$-4 \leq \text{CSC}_{ij} \leq 3.9921875$$

Additionally, a set scaling factor {Yoff, Cboff, Croff} can be applied.

#### 44.6.9. Two-Dimension Scaler

The High-End Overlay (HEO) data path includes a hardware scaler that allows an image resize in both the horizontal and the vertical directions.

##### 44.6.9.1. Video Scaler Description

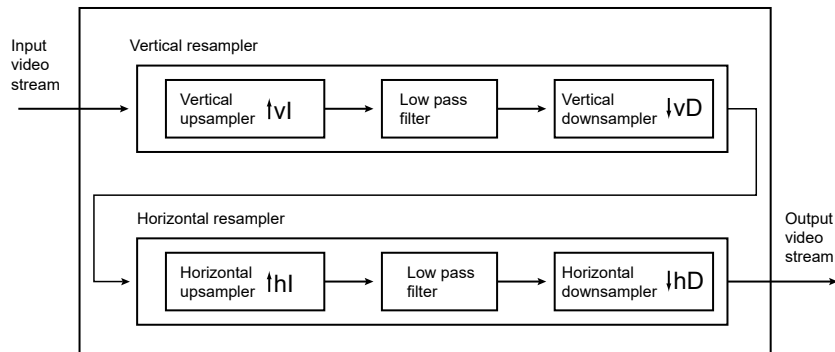

The scaling operation is based on a vertical and horizontal resampling algorithm. The sampling rate of the original image is increased when the video is upscaled, and decreased when the video is downscaled. A Vertical resampler is used to perform a vertical interpolation by a factor of vI, and a decimation by a factor of vD. A Horizontal resampler is used to perform a vertical interpolation by a factor of hI, and a decimation by a factor of hD. The horizontal and vertical low pass filters are both designed to minimize the aliasing effect. The frequency response of the low pass filter has the following characteristics:

$$H(\omega) = \begin{cases} I & \text{when } 0 \leq |\omega| \leq \min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) \\ 0 & \text{otherwise} \end{cases}$$

Taking into account the linear phase condition and anticipating the filter length M, the desired frequency response is modified.

$$H(\omega) = \begin{cases} Ie^{-j\omega\frac{M}{2}} & \text{when } 0 \leq |\omega| \leq \min\left(\frac{\pi}{I}, \frac{\pi}{D}\right) \\ 0 & \text{otherwise} \end{cases}$$

**Figure 44.7.** Video Resampler Architecture

The impulse response of the defined low pass filter is:

$$h(n) = \begin{cases} I \times \frac{\omega_c}{\pi} & \text{when } n = 0 \\ I \times \frac{\omega_c}{\pi} \times \frac{\sin \omega_c n}{\omega_c n} & \text{otherwise} \end{cases}$$

Or, for the filter of length M:

$$h(n) = \begin{cases} I \times \frac{\omega_c}{\pi} & \text{when } n = \frac{M}{2} \\ I \times \frac{\omega_c}{\pi} \times \frac{\sin \omega_c n - M/2}{\omega_c (n - \frac{M}{2})} & \text{otherwise} \end{cases}$$

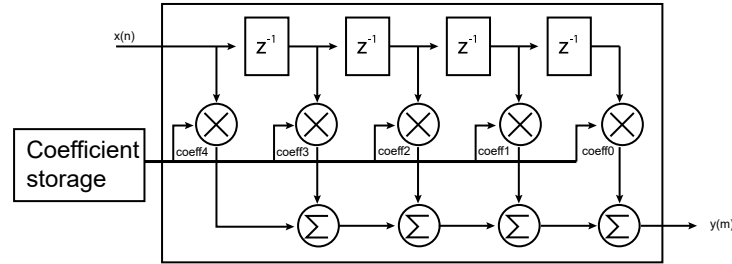

This ideal filter is non-causal and cannot be realized. The unit sample response  $h(n)$  is infinite in duration and must be truncated depending on the expected length M of the filter. This truncation is equivalent to the multiplication of the impulse response by a window function  $w(n)$ .

**Table 44.46.** Window Function for a Filter Length M

Name of Window Function	Time Domain Sequence $w(n)$
Barlett	$1 - \frac{2 \times \left  n - \frac{M-1}{2} \right }{M-1}$
Blackman	$0.42 - 0.5 \times \cos \frac{2\pi n}{M-1} + 0.08 \times \cos \frac{4\pi n}{M-1}$
Hamming	$0.54 - 0.46 \times \cos \frac{2\pi n}{M-1}$
Hanning	$0.5 - 0.5 \times \cos \frac{2\pi n}{M-1}$

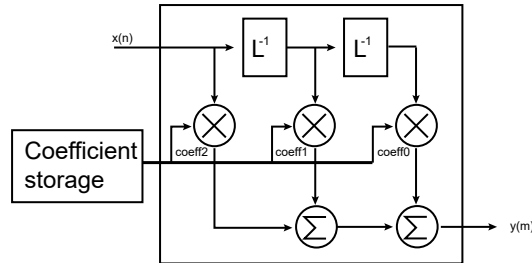

The horizontal resampler includes an 8-phase 5-tap filter equivalent to a 40-tap FIR described in the figure below.

**Figure 44.8.** Horizontal Resampler Filter Architecture

The vertical resampler includes an 8-phase 3-tap filter equivalent to a 24-tap FIR described in the figure below.

**Figure 44.9.** Vertical Resampler Filter Architecture

#### 44.6.9.2.Horizontal Scaler

The XMEMSIZE field of the LCD\_C\_HEOCFG4 register indicates the horizontal size minus one of the image in the system memory. The XSIZE field of the LCD\_C\_HEOCFG3 register contains the horizontal size minus one of the window. The SCALEN bit of the LCD\_C\_HEOCFG13 register is set to '1'. The scaling factor is programmed in the XFACTOR field of the LCD\_C\_HEOCFG13 register. Use the following algorithm to find the XFACTOR value:

$$XFACTOR_{1st} = \text{floor}\left(\frac{8 \times 256 \times XMEMSIZE - 256 \times XPHIDEF}{XSIZE}\right)$$

$$XFACTOR_{1st} = XFACTOR_{1st} + 1$$

$$XMEMSIZE_{max} = \text{floor}\left(\frac{XFACTOR_{1st} \times XSIZE + 256 \times XPHIDEF}{2048}\right)$$

$$\begin{cases} XFACTOR = XFACTOR_{1st} - 1 & \text{when}(XMEMSIZE_{max} > XMEMSIZE) \\ XFACTOR = XFACTOR_{1st} & \text{otherwise} \end{cases}$$

#### 44.6.9.3.Vertical Scaler

The YMEMSIZE field of the LCD\_C\_HEOCFG4 register indicates the vertical size minus one of the image in the system memory. The YSIZE field of the LCD\_C\_HEOCFG3 register contains the vertical size minus one of the window. The SCALEN bit of the LCD\_C\_HEOCFG13 register is set to one. The scaling factor is programmed in the YFACTOR field of the LCD\_C\_HEOCFG13 register.

$$YFACTOR_{1st} = \text{floor}\left(\frac{8 \times 256 \times YMEMSIZE - 256 \times YPHIDEF}{YSIZE}\right)$$

$$YFACTOR_{1st} = YFACTOR_{1st} + 1$$

$$YMEMSIZE_{max} = \text{floor}\left(\frac{YFACTOR_{1st} \times YSIZE + 256 \times YPHIDEF}{2048}\right)$$

$$\left\{ \begin{array}{l} \text{YFACTOR} = \text{YFACTOR}_{1\text{st}} - 1 \text{ when } (\text{YMEMSIZE}_{\text{max}} > \text{YMEMSIZE}) \\ \text{YFACTOR} = \text{YFACTOR}_{1\text{st}} \text{ otherwise} \end{array} \right.$$

#### 44.6.10. Color Combine Unit

##### 44.6.10.1. Window Overlay

The LCD module provides hardware support for multiple “overlay plane” that can be used to display windows on top of the image without destroying the image located below. The overlay image can use any color depth. Using the overlay alleviates the need to re-render the occluded portion of the image. When pixels are combined together through the alpha blending unit, a new color is created. This new pixel is called an iterated pixel and is passed to the next blending stage. Then, this pixel may be combined again with another pixel. The VIDPRI bit located in the LCDC\_HEOCFG12 register configures the video priority algorithm used to display the layers. When the VIDPRI bit is written to ‘0’, the OVR1 layer is located above the HEO layer. When the VIDPRI bit is written to ‘1’, OVR1 is located below the HEO layer.

**Figure 44.10.** Overlay Example with Two Different Video Prioritization Algorithms

##### 44.6.10.2. Base Layer with Window Overlay Optimization

When the base layer is combined with at least one active overlay (100% opacity overlay), by default, the whole base layer frame is retrieved from the memory though it is not visible.

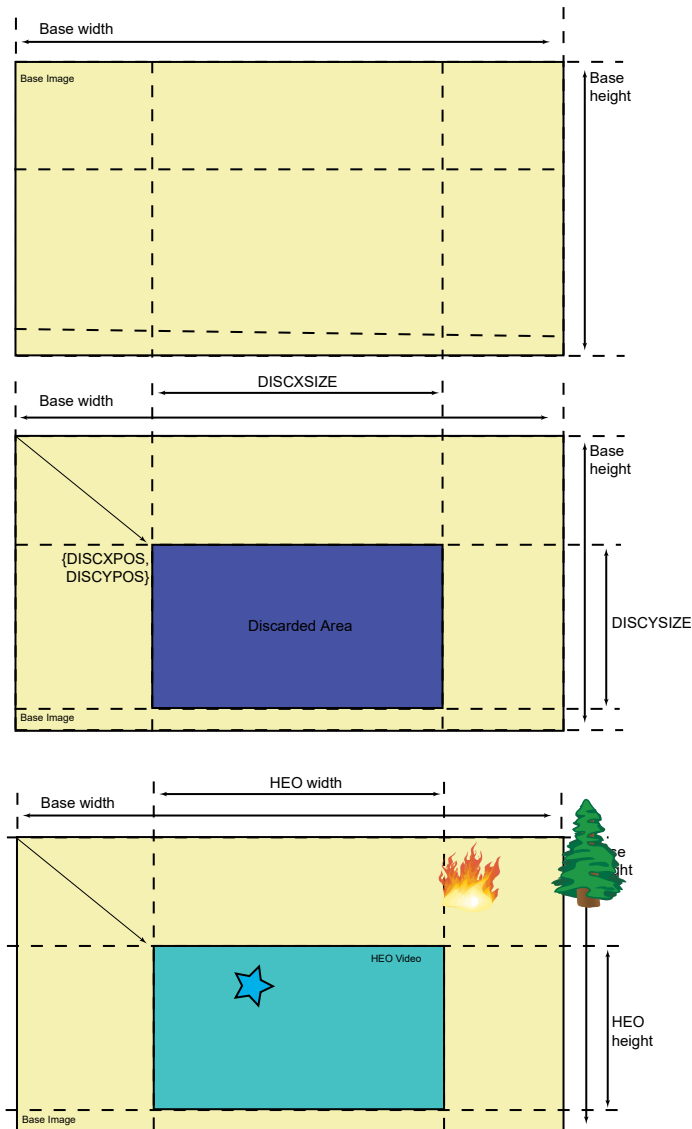

To optimize the system bandwidth, the LCDC can be configured to prevent the useless data from being fetched from system memory.

The following registers are used to disable an invisible area of the base layer:

- LCDC\_BASECFG5:
  - field DISCXPOS (Discard Area Horizontal Position)
  - field DISCYPOS (Discard Area Vertical Position)
- LCDC\_BASECFG6:
  - field DISCXSIZE (Discard Area Horizontal Size)
  - field DISCYSIZE (Discard Area Vertical Size)
- LCDC\_BASECFG4: bit DISCEN (Discard Area Enable)

Each time the overlay window is resized and/or moved, these configuration registers must be reconfigured according to the new overlay window features.

**Figure 44.11.** Base Layer Discard Area

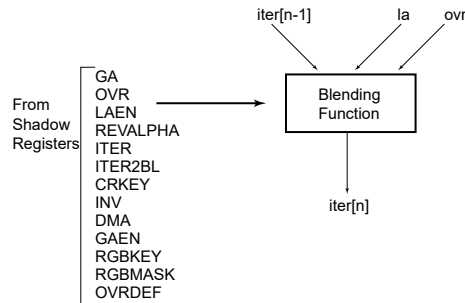

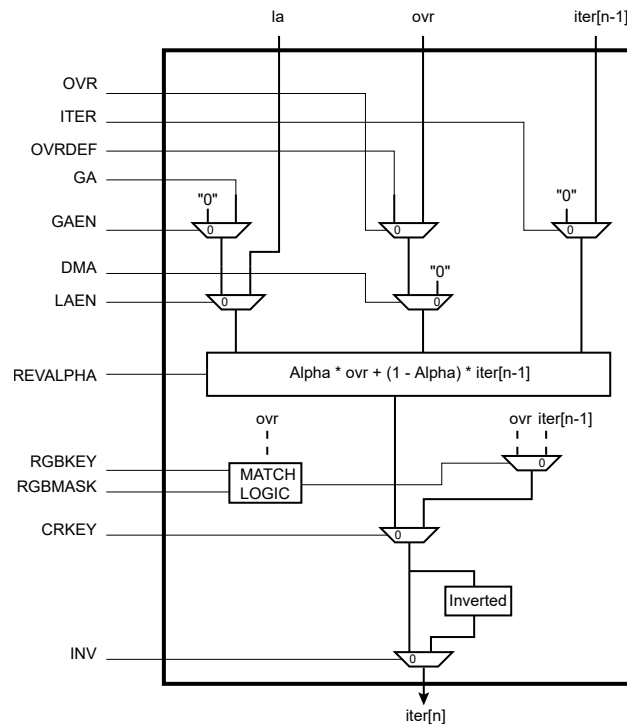

#### 44.6.10.3.Overlay Blending

The blending function requires two pixels (one iterated from the previous blending stage and one from the current overlay color) and a set of blending configuration parameters. These parameters define the color operation.

**Figure 44.12.** Alpha Blender Function

**Figure 44.13.** Alpha Blender Database

#### 44.6.10.4.Window Blending

**Figure 44.14.** 256-level Alpha Blending

Video Prioritization Algorithm 1: OVR1 > HEO > BASE

#### 44.6.10.5.Color Keying

Color keying involves a method of bit-block image transfer (Blit). This entails blitting one image onto another where not all the pixels are copied. Blitting usually involves two bitmaps: a source bitmap and a destination bitmap. A raster operation (ROP) is performed to define whether the iterated color or the overlay color is to be visible or not.

##### 44.6.10.5.1.Source Color Keying

If the masked overlay color matches the color key, the iterated color is selected and Source Color Keying is activated using the following configuration sequence:

1. Select the overlay to blit.
2. Write a '0' to DSTKEY.
3. Activate Color Keying by writing a '1' to CRKEY.
4. Configure the Color Key by writing RKEY, GKEY and BKEY fields.
5. Configure the Color Mask by writing RKEY, GKEY and BKEY fields.

When the field RMASK, GMASK, or BMASK is configured to '0', the comparison is disabled and the raster operation is activated.

##### 44.6.10.5.2.Destination Color Keying

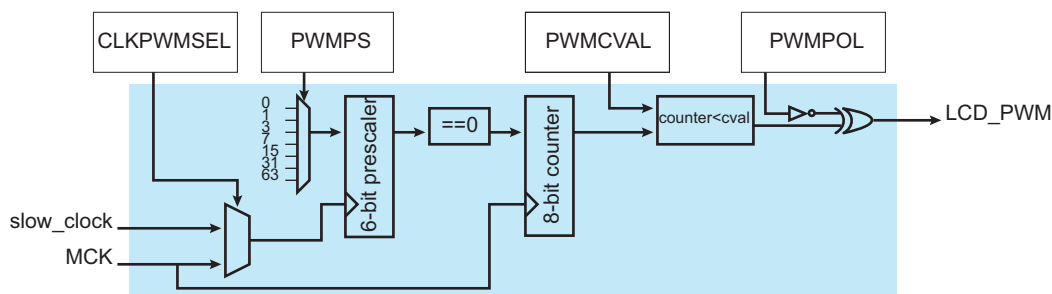

If the iterated masked color matches the color key then the overlay color is selected, Destination Color Keying is activated using the following configuration sequence:

1. Select the overlay to blit.
2. Write a '1' to DSTKEY.
3. Activate Color Keying by writing a '1' to CRKEY bit
4. Configure the Color Key by writing RKEY, GKEY and BKEY fields.
5. Configure the Color Mask by writing RKEY, GKEY and BKEY fields.

When the field RMASK, GMASK, or BMASK is configured to '0', the comparison is disabled and the raster operation is activated.

## 44.6.11. LCDC PWM Controller

Figure 44.15. PWM Controller Block Diagram

This block generates the LCD contrast control signal (LCDPWM) to make possible the control of the display's contrast by software. This is an 8-bit PWM (Pulse Width Modulation) signal that can be converted to an analog voltage with a simple passive filter.

The PWM module has a free-running counter whose value is compared against a compare register (PWCVAL field of the LCDC\_LCDCFG6 register). If the value in the counter is less than that in the register, the output brings the value of the signal polarity (PWMPOL) bit in the PWM control register: LCDC\_LCDCFG6. Otherwise, the opposite value is output. Thus, a periodic waveform with a pulse width proportional to the value in the compare register is generated.

Due to the comparison mechanism, the output pulse has a width between zero and 255 PWM counter cycles. Thus by adding a simple passive filter outside the chip, an analog voltage between 0 and  $(255/256) \times V_{DD}$  can be obtained (for the positive polarity case, or between  $(1/256) \times V_{DD}$  and  $V_{DD}$  for the negative polarity case). Other voltage values can be obtained by adding active external circuitry.

For PWM mode, the counter frequency can be adjusted to four different values using the PWMPOL field of the LCDC\_LCDCFG6 register.

The PWM module can be fed with the slow clock or the system clock, depending on the CLKPWMSEL bit of the LCDC\_CFG0 register.

LCD display panels have different backlight specifications in terms of minimum/maximum values for PWM frequency. If the LCDC PWM frequency range does not match the LCD display panel, it is possible to use the product standalone PWM controller to drive the backlight.

## 44.6.12. LCD Overall Performance

### 44.6.12.1. Color Lookup Table (CLUT)

Table 44.47. CLUT Pixel Performance

CLUT Mode	Pixels/Cycle	Rotation	Scaling
1 bpp	64	Not supported	Supported
2 bpp	32	Not supported	Supported
3 bpp	16	Not supported	Supported
4 bpp	8	Not supported	Supported

#### 44.6.12.2.RGB Mode Fetch Performance

**Table 44.48.** RGB Mode Performance

RGB Mode	Pixels/Cycle Memory Burst Mode	Rotation Peak Random Memory Access (pixels/ cycle)		Scaling Burst Mode or Rotation Optimization Available
		Rotation Optimization (see Note 1)	Normal Mode	
12 bpp	4	1	0.2	Supported
16 bpp	4	1	0.2	Supported
18 bpp	2	1	0.2	Supported
18 bpp RGB PACKED	2.666	Not supported	0.2	Supported
19 bpp	2	1	0.2	Supported

12 bpp 4:2:0 semiplanar	5.32	0.8	0.16	Supported
12 bpp 4:2:0 planar	5.32	0.66	0.132	Supported

#### 44.6.13. Input FIFO

The LCD module includes one input FIFO per overlay. These input FIFOs are used to buffer the system bus burst and serialize the stream of pixels.

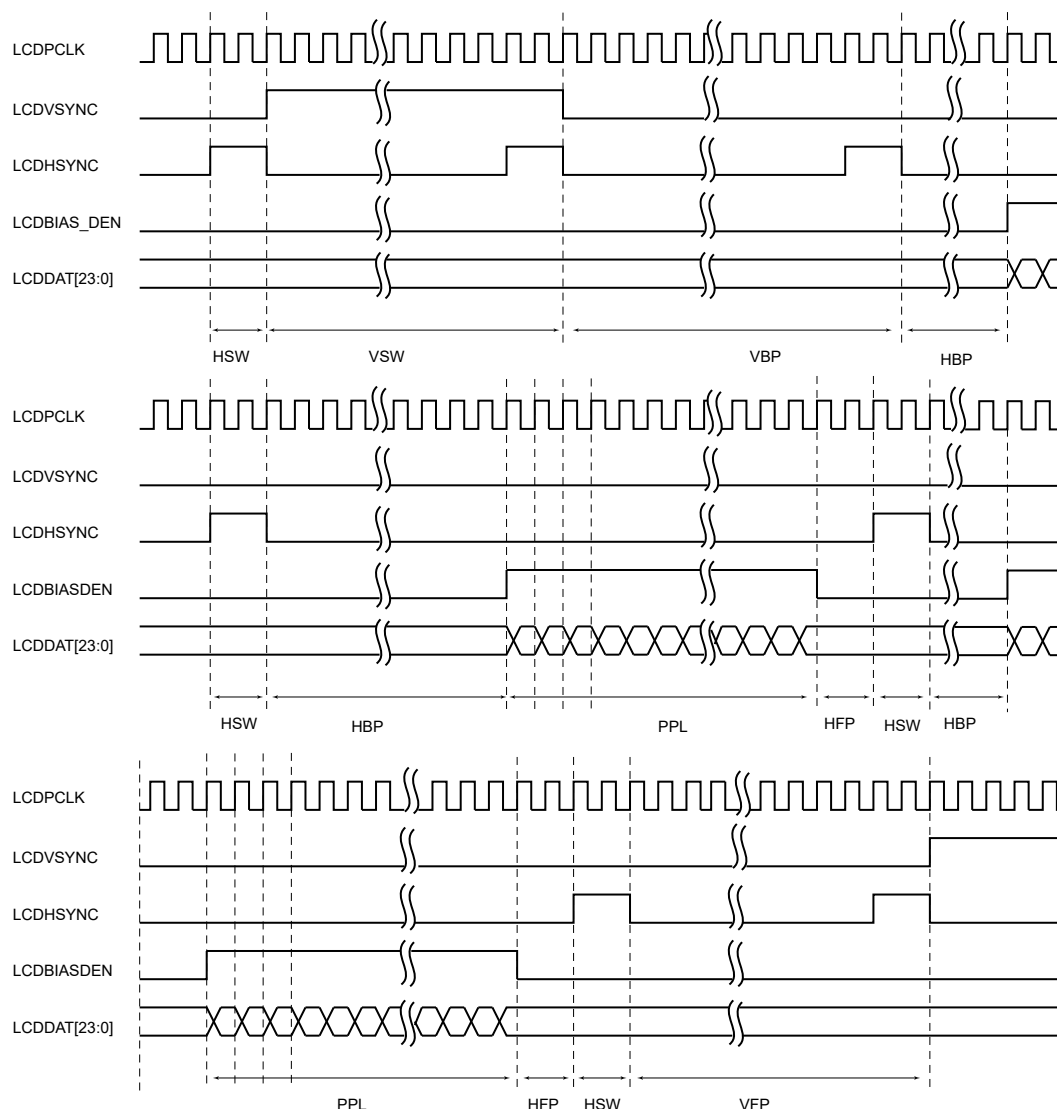

#### 44.6.14. Output FIFO

The LCD module includes one output FIFO that stores the blended pixel.

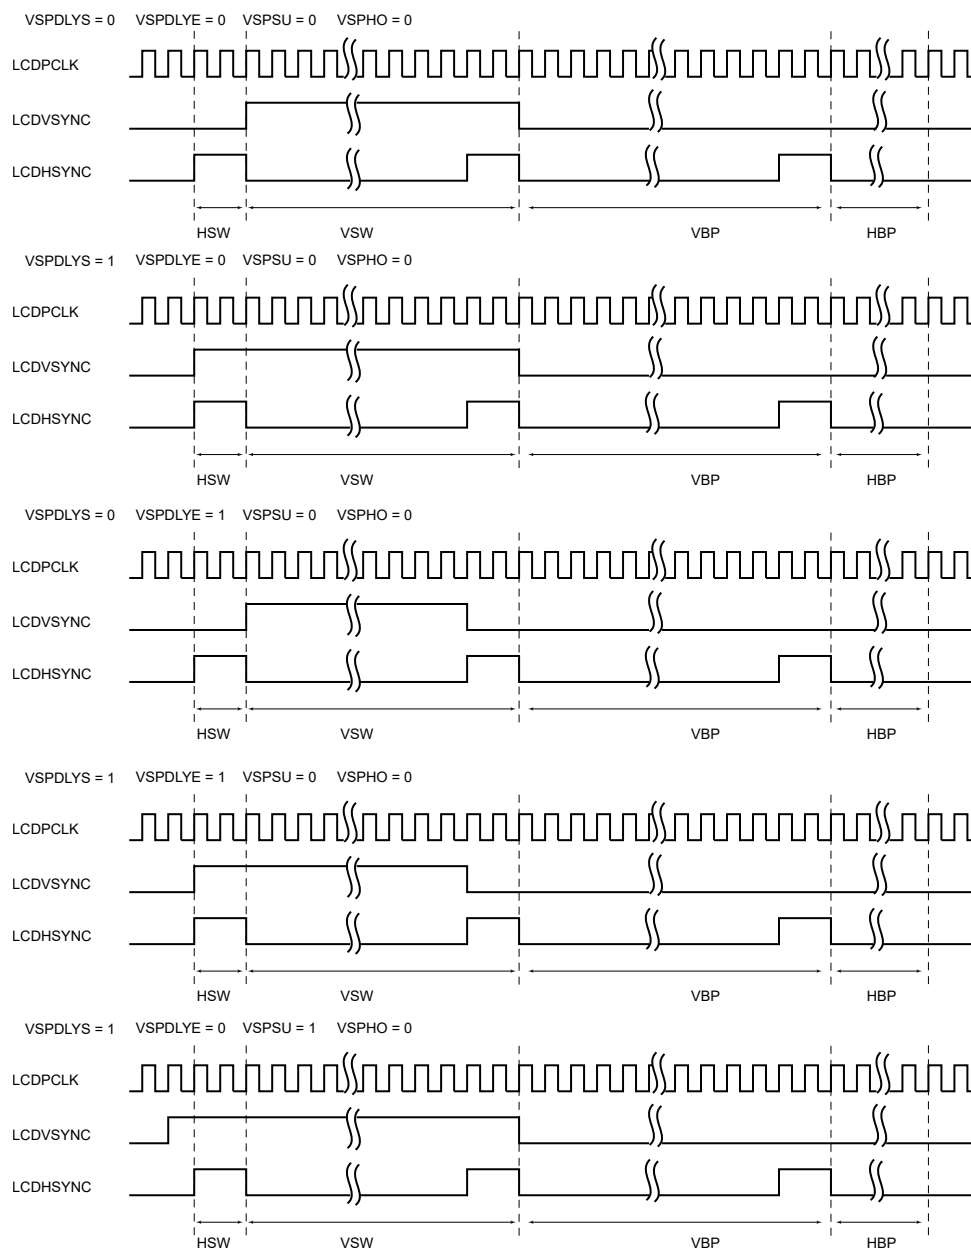

#### 44.6.15. Output Timing Generation

##### 44.6.15.1.Active Display Timing Mode

**Bits 23:16 – CLKDIV[7:0]** LCD Controller Clock Divider

8-bit width clock divider for pixel clock (LCDPCLK). The pixel clock period formula is:  
 $LCDPCLK = \text{source clock} / (CLKDIV + 2)$   
 where source clock is the GCK clock.

**Bit 13 – CGDISPP** Clock Gating Disable Control for the Post Processing Layer

Value	Description
0	Automatic Clock Gating is enabled for the Post Processing Layer.
1	Clock is running continuously.

**Bit 11 – CGDISHEO** Clock Gating Disable Control for the High-End Overlay

Value	Description
0	Automatic Clock Gating is enabled for the High-End Overlay Layer.
1	Clock is running continuously.

**Bit 10 – CGDISOVR2** Clock Gating Disable Control for the Overlay 2 Layer

Value	Description
0	Automatic Clock Gating is enabled for the Overlay 2 Layer.
1	Clock is running continuously.

**Bit 9 – CGDISOVR1** Clock Gating Disable Control for the Overlay 1 Layer

Value	Description
0	Automatic Clock Gating is enabled for the Overlay 1 Layer.
1	Clock is running continuously.

**Bit 8 – CGDISBASE** Clock Gating Disable Control for the Base Layer

Value	Description
0	Automatic Clock Gating is enabled for the Base Layer.
1	Clock is running continuously.

**Bit 3 – CLKPWMSEL** LCD Controller PWM Clock Source Selection

Value	Description
0	The slow clock is selected and feeds the PWM module.
1	The system clock is selected and feeds the PWM module.

**Bit 0 – CLKPOL** LCD Controller Clock Polarity

Value	Description
0	Data/Control signals are launched on the rising edge of the pixel clock.
1	Data/Control signals are launched on the falling edge of the pixel clock.

## 44.7.2. LCD Controller Configuration Register 1

### Bits 25:16 – VSPW[9:0] Vertical Synchronization Pulse Width

Width of the LCDVSYNC pulse, given in number of lines. Width is (VSPW+1) lines.

### Bits 9:0 – HSPW[9:0] Horizontal Synchronization Pulse Width

Width of the LCDHSYNC pulse, given in pixel clock cycles. Width is (HSPW+1) LCDPCLK cycles.

### 44.7.3. LCD Controller Configuration Register 2

#### Bits 25:16 – VBPW[9:0] Vertical Back Porch Width

This field indicates the number of lines at the beginning of the Frame. The blanking interval is equal to VBPW lines.

#### Bits 9:0 – VFPW[9:0] Vertical Front Porch Width

This field indicates the number of lines at the end of the Frame. The blanking interval is equal to (VFPW+1) lines.

#### 44.7.4. LCD Controller Configuration Register 3

**Name:** LCDC\_LCDCFG3  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

**Bits 25:16 – HBPW[9:0]** Horizontal Back Porch Width

Number of pixel clock cycles inserted at the beginning of the line. The interval is equal to (HBPW+1) LCDPCLK cycles.

**Bits 9:0 – HFPW[9:0]** Horizontal Front Porch Width

Number of pixel clock cycles inserted at the end of the active line. The interval is equal to (HFPW+1) LCDPCLK cycles.

#### 44.7.5. LCD Controller Configuration Register 4

**Name:** LCDC\_LCDCFG4  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

**Bits 26:16 – RPF[10:0]** Number of Active Row Per Frame

Number of active lines in the frame. The frame height is equal to (RPF+1) lines.

**Bits 10:0 – PPL[10:0]** Number of Pixels Per Line

Number of pixels in the frame. The number of active pixels in the frame is equal to (PPL+1) pixels.

**44.7.6. LCD Controller Configuration Register 5**

**Name:** LCDC\_LCDCFG5  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset			R/W	R/W			R/W	R/W
Bit	7	6	5	4	3	2	1	0
Access	DISPDLY	DITHER		DISPPOL	VSPDLYE	VSPDLYS	VSPOL	HSPOL
Reset	R/W	R/W		R/W	R/W	R/W	R/W	R/W

**Bits 23:16 – GUARDTIME[7:0]** LCD DISPLAY Guard Time  
 Number of frames inserted during startup before LCDDISP assertion.  
 Number of frames inserted after LCDDISP reset.

**Bit 13 – VSPHO** LCD Controller Vertical synchronization Pulse Hold Configuration

Value	Description
0	The vertical synchronization pulse is asserted synchronously with horizontal pulse edge.
1	The vertical synchronization pulse is held active one pixel clock cycle after the horizontal pulse.

**Bit 12 – VSPSU** LCD Controller Vertical synchronization Pulse Setup Configuration

Value	Description
0	The vertical synchronization pulse is asserted synchronously with horizontal pulse edge.
1	The vertical synchronization pulse is asserted one pixel clock cycle before the horizontal pulse.

**Bits 9:8 – MODE[1:0]** LCD Controller Output Mode

Value	Name	Description
0	OUTPUT_12BPP	LCD Output mode is set to 12 bits per pixel
1	OUTPUT_16BPP	LCD Output mode is set to 16 bits per pixel
2	OUTPUT_18BPP	LCD Output mode is set to 18 bits per pixel
3	OUTPUT_24BPP	LCD Output mode is set to 24 bits per pixel

**Bit 7 – DISPDLY** LCD Controller Display Power Signal Synchronization

Value	Description
0	The LCDDISP signal is asserted synchronously with the second active edge of the horizontal pulse.

Value	Description
1	The LCDDISP signal is asserted asynchronously with both edges of the horizontal pulse.

#### Bit 6 – DITHER LCD Controller Dithering

Value	Description
0	Dithering logical unit is disabled
1	Dithering logical unit is activated

#### Bit 4 – DISPPOL Display Signal Polarity

Value	Description
0	Active High
1	Active Low

#### Bit 3 – VSPDLYE Vertical Synchronization Pulse End

Value	Description
0	The second active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse.
1	The second active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse.

#### Bit 2 – VSPDLYS Vertical Synchronization Pulse Start

Value	Description
0	The first active edge of the Vertical synchronization pulse is synchronous with the second edge of the horizontal pulse.
1	The first active edge of the Vertical synchronization pulse is synchronous with the first edge of the horizontal pulse.

#### Bit 1 – VSPOL Vertical Synchronization Pulse Polarity

Value	Description
0	Active High
1	Active Low

#### Bit 0 – HSPOL Horizontal Synchronization Pulse Polarity

Value	Description
0	Active High
1	Active Low

**44.7.7. LCD Controller Configuration Register 6**

**Name:** LCDC\_LCDCFG6  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	PWMCVAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
				PWMPOL		PWMPPS[2:0]		
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

**Bits 15:8 – PWMCVAL[7:0]** LCD Controller PWM Compare Value

PWM compare value. Used to adjust the analog value obtained after an external filter to control the contrast of the display.

**Bit 4 – PWMPOL** LCD Controller PWM Signal Polarity

This bit defines the polarity of the PWM output signal.

Value	Description
0	The output pulses are low level.
1	The output pulses are high level (the output is high whenever the value in the counter is less than value CVAL).

**Bits 2:0 – PWMPPS[2:0]** PWM Clock Prescaler

Selects the configuration of the counter prescaler module.

Value	Name	Description
000	DIV_1	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}$
001	DIV_2	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/2$
010	DIV_4	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/4$
011	DIV_8	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/8$
100	DIV_16	The counter advances at a rate of $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/16$
101	DIV_32	The counter advances at a of rate $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/32$
110	DIV_64	The counter advances at a of rate $f_{\text{COUNTER}} = f_{\text{PWM\_SELECTED\_CLOCK}}/64$

#### 44.7.8. LCD Controller Configuration Register 7

**Name:** LCDC\_LCDCFG7  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							ROW[10:8]	
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

##### Bits 10:0 – ROW[10:0] Row Identifier For Row Interrupt Signal

When the LCD controller timing engine row pointer reaches the field ROW, an interrupt is triggered. This field indicates a line in reverse order, i.e., ROW 0 is the last line and ROW height-1 the first line displayed.

#### 44.7.9. LCD Controller Enable Register

**Name:** LCDC\_LCDEN  
**Offset:** 0x20  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					PWMEN	DISPEN	SYNCEN	CLKEN
Access					W	W	W	W
Reset					–	–	–	–

##### Bit 3 – PWMEN LCD Controller Pulse Width Modulation Enable

Value	Description
0	No effect
1	PWM is enabled.

##### Bit 2 – DISPEN LCD Controller DISP Signal Enable

Value	Description
0	No effect
1	LCDDISP signal is generated.

##### Bit 1 – SYNCEN LCD Controller Horizontal and Vertical Synchronization Enable

Value	Description
0	No effect
1	Both horizontal and vertical synchronization (LCDVSYNC and LCDHSYNC) signals are generated.

##### Bit 0 – CLKEN LCD Controller Pixel Clock Enable

Value	Description
0	No effect
1	Pixel clock logical unit is activated.

#### 44.7.10. LCD Controller Disable Register

**Name:** LCDC\_LCDDIS  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					PWMRST	DISPRST	SYNCRST	CLKRST
Access					W	W	W	W
Reset					–	–	–	–

Bit	7	6	5	4	3	2	1	0
					PWMDIS	DISPDIS	SYNCDIS	CLKDIS
Access					W	W	W	W
Reset					–	–	–	–

##### Bit 11 – PWMRST LCD Controller PWM Reset

Value	Description
0	No effect.
1	Resets the PWM module. The duty cycle may be violated.

##### Bit 10 – DISPRST LCD Controller DISP Signal Reset

Value	Description
0	No effect.
1	Resets the DISP signal.

##### Bit 9 – SYNCRST LCD Controller Horizontal and Vertical Synchronization Reset

Value	Description
0	No effect.
1	Resets the timing engine. The horizontal and vertical pulse widths are both violated.

##### Bit 8 – CLKRST LCD Controller Clock Reset

Value	Description
0	No effect.
1	Resets the pixel clock generator module. The pixel clock duty cycle may be violated.

##### Bit 3 – PWMDIS LCD Controller Pulse Width Modulation Disable

Value	Description
0	No effect.
1	Disables the pulse width modulation signal.

**Bit 2 – DISPDIS** LCD Controller DISP Signal Disable

Value	Description
0	No effect.
1	Disables the DISP signal.

**Bit 1 – SYNCDIS** LCD Controller Horizontal and Vertical Synchronization Disable

Value	Description
0	No effect.
1	Disables the synchronization signals after the end of the frame.

**Bit 0 – CLKDIS** LCD Controller Pixel Clock Disable

Value	Description
0	No effect.
1	Disables the pixel clock.

#### 44.7.11. LCD Controller Status Register

**Name:** LCDC\_LCDSR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
				SIPSTS	PWMSTS	DISPSTS	LCDSTS	CLKSTS
Access				R	R	R	R	R
Reset				0	0	0	0	0

##### Bit 4 – SIPSTS Synchronization In Progress

Value	Description
0	Clock domain synchronization is terminated.
1	Synchronization is in progress. Access to the registers LCDC_LCDCCFG[0..6], LCDC_LCDEN and LCDC_LCDDIS has no effect.

##### Bit 3 – PWMSTS LCD Controller PWM Signal Status

Value	Description
0	PWM is disabled.
1	PWM signal is activated.

##### Bit 2 – DISPSTS LCD Controller DISP Signal Status

Value	Description
0	DISP is disabled.
1	DISP signal is activated.

##### Bit 1 – LCDSTS LCD Controller Synchronization status

Value	Description
0	Timing engine is disabled.
1	Timing engine is running.

##### Bit 0 – CLKSTS Clock Status

Value	Description
0	Pixel clock is disabled.

Value	Description
1	Pixel clock is running.

#### 44.7.12. LCD Controller Interrupt Enable Register

**Name:** LCDC\_LCDIER  
**Offset:** 0x2C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
				FIFOERRIE	ROWIE	DISPIE	DISIE	SOFIE
Access				W	W	W	W	W
Reset				–	–	–	–	–

**Bit 13 – PPIE** Post Processing Interrupt Enable

**Bit 11 – HEOIE** High-End Overlay Interrupt Enable

**Bit 10 – OVR2IE** Overlay 2 Interrupt Enable

**Bit 9 – OVR1IE** Overlay 1 Interrupt Enable

**Bit 8 – BASEIE** Base Layer Interrupt Enable

**Bit 4 – FIFOERRIE** Output FIFO Error Interrupt Enable

**Bit 3 – ROWIE** Row Interrupt Enable

**Bit 2 – DISPIE** Powerup/Powerdown Sequence Terminated Interrupt Enable

**Bit 1 – DISIE** LCD Disable Interrupt Enable

**Bit 0 – SOFIE** Start of Frame Interrupt Enable

### 44.7.13. LCD Controller Interrupt Disable Register

**Name:** LCDC\_LCDIDR  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

				FIFOERRID	ROWID	DISPID	DISID	SOFID
Access				W	W	W	W	W
Reset				–	–	–	–	–

**Bit 13 – PPID** Post Processing Interrupt Disable

**Bit 11 – HEOID** High-End Overlay Interrupt Disable

**Bit 10 – OVR2ID** Overlay 2 Interrupt Disable

**Bit 9 – OVR1ID** Overlay 1 Interrupt Disable

**Bit 8 – BASEID** Base Layer Interrupt Disable

**Bit 4 – FIFOERRID** Output FIFO Error Interrupt Disable

**Bit 3 – ROWID** Row Interrupt Disable

**Bit 2 – DISPID** Powerup/Powerdown Sequence Terminated Interrupt Disable

**Bit 1 – DISID** LCD Disable Interrupt Disable

**Bit 0 – SOFID** Start of Frame Interrupt Disable

#### 44.7.14. LCD Controller Interrupt Mask Register

**Name:** LCDC\_LCDIMR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

**Bit 13 – PPIM** Post Processing Interrupt Mask

**Bit 11 – HEOIM** High-End Overlay Interrupt Mask

**Bit 10 – OVR2IM** Overlay 2 Interrupt Mask

**Bit 9 – OVR1IM** Overlay 1 Interrupt Mask

**Bit 8 – BASEIM** Base Layer Interrupt Mask

**Bit 4 – FIFOERRIM** Output FIFO Error Interrupt Mask

**Bit 3 – ROWIM** Row Interrupt Mask

**Bit 2 – DISPIM** Powerup/Powerdown Sequence Terminated Interrupt Mask

**Bit 1 – DISIM** LCD Disable Interrupt Mask

**Bit 0 – SOFIM** Start of Frame Interrupt Mask

**44.7.15. LCD Controller Interrupt Status Register**

**Name:** LCDC\_LCDISR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
			PP		HEO	OVR2	OVR1	BASE
Access			R		R	R	R	R
Reset			0		0	0	0	0

Bit	7	6	5	4	3	2	1	0
				FIFOERR	ROW	DISP	DIS	SOF
Access				R	R	R	R	R
Reset				0	0	0	0	0

**Bit 13 – PP** Post Processing Raw Interrupt Status

Value	Description
0	No Post Processing interrupt detected since last read of LCDC_PPISR
1	Indicates that Post Processing interrupt is pending. This flag is reset as soon as the LCDC_PPISR is read.

**Bit 11 – HEO** High-End Overlay Raw Interrupt Status

Value	Description
0	No High-End layer interrupt detected since last read of LCDC_HEOISR.
1	Indicates that a High-End layer interrupt is pending. This flag is reset as soon as the LCDC_HEOISR is read.

**Bit 10 – OVR2** Overlay 2 Raw Interrupt Status

Value	Description
0	No Overlay 2 layer interrupt detected since last read of LCDC_OVR2ISR.
1	Indicates that an Overlay 2 layer interrupt is pending. This flag is reset as soon as the LCDC_OVR2ISR is read.

**Bit 9 – OVR1** Overlay 1 Raw Interrupt Status

Value	Description
0	No Overlay 1 layer interrupt detected since last read of LCDC_OVR1ISR.
1	Indicates that an Overlay 1 layer interrupt is pending. This flag is reset as soon as the LCDC_OVR1ISR is read.

**Bit 8 – BASE** Base Layer Raw Interrupt Status

Value	Description
0	No base layer interrupt detected since last read of LCDC_BASEISR.
1	Indicates that a base layer interrupt is pending. This flag is reset as soon as the LCDC_BASEISR is read.

#### Bit 4 – FIFOERR Output FIFO Error

Value	Description
0	No underflow has occurred in the output FIFO since last read of LCDC_LCDISR.
1	Indicates that an underflow has occurred in the output FIFO. This flag is reset after a read operation.

#### Bit 3 – ROW Row Interrupt Status

Value	Description
0	No detection since last read of the LCDC_LCDISR.
1	Indicates that a row event has been detected. This flag is reset after a read operation.

#### Bit 2 – DISP Powerup/Powerdown Sequence Terminated Interrupt Status

Value	Description
0	Powerup sequence or powerdown sequence has not yet terminated.
1	Indicates the powerup sequence or powerdown sequence has terminated. This flag is reset after a read operation.

#### Bit 1 – DIS LCD Disable Interrupt Status

Value	Description
0	Horizontal and vertical timing generator has not yet been disabled.
1	Indicates that the horizontal and vertical timing generator has been disabled. This flag is reset after a read operation.

#### Bit 0 – SOF Start of Frame Interrupt Status

Value	Description
0	No detection since last read of LCDC_LCDISR.
1	Indicates that a start of frame event has been detected. This flag is reset after a read operation.

#### 44.7.16. LCD Controller Attribute Register

**Name:** LCDC\_ATTR  
**Offset:** 0x3C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			PPA2Q		HEOA2Q	OVR2A2Q	OVR1A2Q	BASEA2Q
Access			W		W	W	W	W
Reset			–		–	–	–	–

Bit	7	6	5	4	3	2	1	0
			PP		HEO	OVR2	OVR1	BASE
Access			W		W	W	W	W
Reset			–		–	–	–	–

##### Bit 13 – PPA2Q Post-Processing Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_PPHEAD register to the descriptor list.

##### Bit 11 – HEOA2Q High-End Overlay Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_HEOHEAD register to the descriptor list.

##### Bit 10 – OVR2A2Q Overlay 2 Update Add to Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_OVR2HEAD register to the descriptor list.

##### Bit 9 – OVR1A2Q Overlay 1 Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_OVR1HEAD register to the descriptor list.

##### Bit 8 – BASEA2Q Base Layer Update Add To Queue

Value	Description
0	No effect.
1	Add the descriptor pointed to by the LCDC_BASEHEAD register to the descriptor list.

### Bit 5 – PP Post-Processing Update Attribute

Value	Description
0	No effect.
1	Update the PP window attribute.

### Bit 3 – HEO High-End Overlay Update Attribute

Value	Description
0	No effect.
1	Update the HEO window attribute.

### Bit 2 – OVR2 Overlay 2 Update Attribute

Value	Description
0	No effect.
1	Update the OVR2 window attribute.

### Bit 1 – OVR1 Overlay 1 Update Attribute

Value	Description
0	No effect.
1	Update the OVR1 window attribute.

### Bit 0 – BASE Base Layer Update Attribute

Value	Description
0	No effect.
1	Update the BASE window attributes.

#### 44.7.17. LCD Controller QoS Configuration Register

**Name:** LCDC\_QOSCFG  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset			0	0			0	0

Bit	7	6	5	4	3	2	1	0
			QOS1CFG[1:0]					QOSLOCK
Access			R/W	R/W				R/W
Reset			0	0				0

##### Bits 13:12 – QOS3CFG[1:0] Quality Of Service for 2 to 3 Transition

This field indicates the FIFO threshold of the LCD that triggers a QoS change. The basic unit is 1/8 of the output FIFO depth.

##### Bits 9:8 – QOS2CFG[1:0] Quality Of Service for 1 to 2 Transition

This field indicates the FIFO threshold of the LCD that triggers a QoS change. The basic unit is 1/8 of the output FIFO depth.

##### Bits 5:4 – QOS1CFG[1:0] Quality Of Service for 0 to 1 Transition

This field indicates the FIFO threshold of the LCD that triggers a QoS change. The basic unit is 1/8 of the output FIFO depth.

##### Bit 0 – QOSLOCK Quality Of Service Lock

Value	Description
0	Quality of Service operation does not use the bus lock attribute to increase its memory bandwidth
1	Quality of Service operation uses the bus lock attribute to increase its memory bandwidth.

#### 44.7.18. LCD Controller QoS 1 Metrics Register

**Name:** LCDC\_QOS1M  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

##### Bits 8:0 – LEVEL[8:0] Minimum FIFO Level

This field indicates the lowest FIFO level reached. This field is updated on a per-frame basis.

## 44.7.22. Base Layer Channel Enable Register

**Name:** LCDC\_BASECHER  
**Offset:** 0x00000060  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						A2QEN	UPDATEEN	CHEN
Access						W	W	W
Reset						–	–	–

### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates windows attributes on the next start of frame.

### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

### 44.7.23. Base Layer Channel Disable Register

**Name:** LCDC\_BASECHDR  
**Offset:** 0x00000064  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								CHRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								CHDIS
Access								W
Reset								–

#### Bit 8 – CHRST Channel Reset

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

#### Bit 0 – CHDIS Channel Disable

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

#### 44.7.24. Base Layer Channel Status Register

**Name:** LCDC\_BASECHSR  
**Offset:** 0x00000068  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						A2QSR	UPDATESR	CHSR
Access						R	R	R
Reset						0	0	0

##### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

##### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

##### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

#### 44.7.25. Base Layer Interrupt Enable Register

**Name:** LCDC\_BASEIER

**Offset:** 0x0000006C

**Reset:** –

**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Enable

**Bit 5 – DONE** End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

## 44.7.26. Base Layer Interrupt Disable Register

**Name:** LCDC\_BASEIDR  
**Offset:** 0x00000070  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Disable

**Bit 5 – DONE** End of List Interrupt Disable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

#### 44.7.27. Base Layer Interrupt Mask Register

**Name:** LCDC\_BASEIMR  
**Offset:** 0x00000074  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

**Bit 6 – OVR** Overflow Interrupt Mask

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

## 44.7.28. Base Layer Interrupt Status Register

**Name:** LCDC\_BASEISR  
**Offset:** 0x00000078  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

### Bit 6 – OVR Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_BASEISR
1	An overflow occurred. This flag is reset after a read operation.

### Bit 5 – DONE End of List Detected

Value	Description
0	No End of List condition occurred since last read of LCDC_BASEISR
1	End of List condition has occurred. This flag is reset after a read operation.

### Bit 4 – ADD Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_BASEISR
1	The descriptor pointed to by the LCDC_BASEHEAD register has been loaded successfully. This flag is reset after a read operation.

### Bit 3 – DSCR DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_BASEISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

### Bit 2 – DMA End of DMA Transfer

Value	Description
0	No end of DMA transfer has been detected since last read of LCDC_BASEISR

Value	Description
1	End of Transfer has been detected. This flag is reset after a read operation.

#### 44.7.29. Base DMA Head Register

**Name:** LCDC\_BASEHEAD  
**Offset:** 0x0000007C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	HEAD[29:22]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	HEAD[21:14]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	HEAD[13:6]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	HEAD[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

**Bits 31:2 – HEAD[29:0]** DMA Head Pointer  
The Head Pointer points to a new descriptor.

### 44.7.30. Base DMA Address Register

**Name:** LCDC\_BASEADDR  
**Offset:** 0x00000080  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bit 5 – DONEIEN** End of List Interrupt Enable

Value	Description
0	End of list interrupt is disabled
1	End of list interrupt is enabled

**Bit 4 – ADDIEN** Add Head Descriptor to Queue Interrupt Enable

Value	Description
0	Transfer descriptor added to queue interrupt is enabled
1	Transfer descriptor added to queue interrupt is disabled

**Bit 3 – DSCRIEN** Descriptor Loaded Interrupt Enable

Value	Description
0	Transfer descriptor loaded interrupt is enabled
1	Transfer descriptor loaded interrupt is disabled

**Bit 2 – DMAIEN** End of DMA Transfer Interrupt Enable

Value	Description
0	DMA transfer completed interrupt is enabled
1	DMA transfer completed interrupt is disabled

**Bit 1 – LFETCH** Lookup Table Fetch Enable

Value	Description
0	Lookup Table DMA fetch is disabled
1	Lookup Table DMA fetch is enabled

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

Value	Description
0	Transfer Descriptor fetch is disabled
1	Transfer Descriptor fetch is enabled

#### 44.7.32. Base DMA Next Register

**Name:** LCDC\_BASENEXT  
**Offset:** 0x00000088  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for a burst of 2 and 3 beats.
1	Only defined length burst is used (SINGLE, INCR4, INCR8 and INCR16).

**Bits 5:4 – BLEN[1:0]** System Bus Burst Length

Value	Name	Description
0	AHB_SINGLE	System bus access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_INCR4	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. A system bus INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_INCR8	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. A system bus INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_INCR16	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. A system bus INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

**44.7.34. Base Layer Configuration Register 1**

Access					R/W		R/W	R/W
Reset					0		0	0

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

##### Bit 11 – DISCEN Discard Area Enable

Value	Description
0	The whole frame is retrieved from memory.
1	The DMA channel discards the area located at screen coordinate {DISCXPOS, DISCYPOS}.

##### Bit 9 – REP Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

##### Bit 8 – DMA Use DMA Data Path

Value	Description
0	The default color is used on the Base Layer.
1	The DMA channel retrieves the pixels stream from the memory.

#### 44.7.38. Base Layer Configuration Register 5

**Name:** LCDC\_BASECFG5  
**Offset:** 0x000000A0  
**Reset:** 0x00000000  
**Property:** Read/Write

Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						A2QEN	UPDATEEN	CHEN
Access						W	W	W
Reset						–	–	–

##### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

##### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates window attributes (size, alpha blending, etc.) on the next start of frame.

##### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

#### 44.7.41. Overlay 1 Channel Disable Register

**Name:** LCDC\_OVR1CHDR  
**Offset:** 0x00000164  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
								CHRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								CHDIS
Access								W
Reset								–

##### Bit 8 – CHRST Channel Reset

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

##### Bit 0 – CHDIS Channel Disable

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

#### 44.7.42. Overlay 1 Channel Status Register

**Name:** LCDC\_OVR1CHSR  
**Offset:** 0x00000168  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						A2QSR	UPDATESR	CHSR
Access						R	R	R
Reset						0	0	0

##### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

##### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

##### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

#### 44.7.43. Overlay 1 Interrupt Enable Register

**Name:** LCDC\_OVR1IER  
**Offset:** 0x0000016C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Enable

**Bit 5 – DONE** End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

#### 44.7.44. Overlay 1 Interrupt Disable Register

**Name:** LCDC\_OVR1IDR  
**Offset:** 0x00000170  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		W	W	W	W	W		
Reset		–	–	–	–	–		

**Bit 6 – OVR** Overflow Interrupt Disable

**Bit 5 – DONE** End of List Interrupt Disable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Disable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Disable

**Bit 2 – DMA** End of DMA Transfer Interrupt Disable

#### 44.7.45. Overlay 1 Interrupt Mask Register

**Name:** LCDC\_OVR1IMR  
**Offset:** 0x00000174  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

**Bit 6 – OVR** Overflow Interrupt Mask

**Bit 5 – DONE** End of List Interrupt Mask

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Mask

**Bit 3 – DSCR** Descriptor Loaded Interrupt Mask

**Bit 2 – DMA** End of DMA Transfer Interrupt Mask

#### 44.7.46. Overlay 1 Interrupt Status Register

**Name:** LCDC\_OVR1ISR  
**Offset:** 0x00000178  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

##### Bit 6 – OVR Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_OVR1ISR
1	An overflow occurred. This flag is reset after a read operation.

##### Bit 5 – DONE End of List Detected

Value	Description
0	No End of List condition has occurred since last read of LCDC_OVR1ISR
1	End of List condition has occurred. This flag is reset after a read operation.

##### Bit 4 – ADD Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR1ISR
1	The descriptor pointed to by the LCDC_OVR1HEAD register has been loaded successfully. This flag is reset after a read operation.

##### Bit 3 – DSCR DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR1ISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

##### Bit 2 – DMA End of DMA Transfer

Value	Description
0	No End of Transfer has been detected since last read of LCDC_OVR1ISR

Value	Description
1	End of Transfer has been detected. This flag is reset after a read operation.

#### 44.7.47. Overlay 1 Head Register

**Name:** LCDC\_OVR1HEAD  
**Offset:** 0x0000017C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset			0	0				

**Bit 13 – LOCKDIS** Hardware Rotation Lock Disable

Value	Description
0	System bus lock signal is asserted when a rotation is performed.
1	System bus lock signal is cleared when a rotation is performed.

**Bit 12 – ROTDIS** Hardware Rotation Optimization Disable

Value	Description
0	Rotation optimization is enabled.
1	Rotation optimization is disabled.

**Bit 8 – DLBO** Defined Length Burst Only for Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for a burst of 2 and 3 beats.
1	Only defined length burst is used (SINGLE, INCR4, INCR8 and INCR16).

**Bits 5:4 – BLEN[1:0]** System Bus Burst Length

Value	Name	Description
0	AHB_BLEN_SINGLE	System bus access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_BLEN_INCR4	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. A system bus INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.

Value	Name	Description
2	AHB_BLEN_INCR8	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. A system bus INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_BLEN_INCR16	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. A system bus INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

##### Bits 26:16 – YSIZE[10:0] Vertical Window Size

Overlay 1 window height in pixels. The window height is set to (YSIZE + 1).  
The following constraint must be met:  $YPOS + YSIZE \leq RPF$

##### Bits 10:0 – XSIZE[10:0] Horizontal Window Size

Overlay 1 window width in pixels. The window width is set to (XSIZE + 1).  
The following constraint must be met:  $XPOS + XSIZE \leq PPL$

#### 44.7.55. Overlay 1 Configuration Register 4

**Name:** LCDC\_OVR1CFG4  
**Offset:** 0x0000019C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – GA[7:0]** Blender Global Alpha  
 Global alpha blender for the current layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

Value	Description
0	Source Chroma keying is enabled.
1	Destination Chroma keying is used.

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

**Bit 8 – DMA** Blender DMA Layer Enable

Value	Description
0	The default color is used on the Overlay 1 Layer.
1	The DMA channel retrieves the pixels stream from the memory.

**Bit 7 – OVR** Blender Overlay Layer Enable

Value	Description
0	Overlay pixel color is set to the default overlay pixel color.
1	Overlay pixel color is set to the DMA channel pixel color.

**Bit 6 – LAEN** Blender Local Alpha Enable

Value	Description
0	Local alpha blending coefficient is disabled.
1	Local alpha blending coefficient is enabled.

#### Bit 5 – GAEN Blender Global Alpha Enable

Value	Description
0	Global alpha blending coefficient is disabled.
1	Global alpha blending coefficient is enabled.

#### Bit 4 – REVALPHA Blender Reverse Alpha

Value	Description
0	Pixel difference is multiplied by alpha.
1	Pixel difference is multiplied by 1 - alpha.

#### Bit 3 – ITER Blender Use Iterated Color

Value	Description
0	Pixel difference is set to 0.
1	Pixel difference is set to the iterated pixel value.

#### Bit 2 – ITER2BL Blender Iterated Color Enable

Value	Description
0	Final adder stage operand is set to 0.
1	Final adder stage operand is set to the iterated pixel value.

#### Bit 1 – INV Blender Inverted Blender Output Enable

Value	Description
0	Iterated pixel is the blended pixel.
1	Iterated pixel is the inverted pixel.

#### Bit 0 – CRKEY Blender Chroma Key Enable

Value	Description
0	Chroma key matching is disabled.
1	Chroma key matching is enabled.

#### 44.7.61. Overlay 2 Channel Enable Register

**Name:** LCDC\_OVR2CHER  
**Offset:** 0x00000260  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
						A2QEN	UPDATEEN	CHEN
Access						W	W	W
Reset						–	–	–

##### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

##### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates windows attributes on the next start of frame.

##### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

## 44.7.62. Overlay 2 Channel Disable Register

**Name:** LCDC\_OVR2CHDR  
**Offset:** 0x00000264  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset

								CHRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								CHDIS
Access								W
Reset								–

### Bit 8 – CHRST Channel Reset

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

### Bit 0 – CHDIS Channel Disable

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

#### 44.7.63. Overlay 2 Channel Status Register

**Name:** LCDC\_OVR2CHSR  
**Offset:** 0x00000268  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Reset								

Bit	7	6	5	4	3	2	1	0
						A2QSR	UPDATESR	CHSR
Access						R	R	R
Reset						0	0	0

##### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

##### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

##### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

#### 44.7.64. Overlay 2 Interrupt Enable Register

**Name:** LCDC\_OVR2IER  
**Offset:** 0x0000026C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset								

Bit	7	6	5	4	3	2	1	0
		OVR	DONE	ADD	DSCR	DMA		
Access		R	R	R	R	R		
Reset		0	0	0	0	0		

### Bit 6 – OVR Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_OVR2ISR
1	An overflow occurred. This flag is reset after a read operation.

### Bit 5 – DONE End of List Detected

Value	Description
0	No End of List condition occurred since last read of LCDC_OVR2ISR
1	End of List condition has occurred. This flag is reset after a read operation.

### Bit 4 – ADD Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR2ISR
1	The descriptor pointed to by the LCDC_OVR2HEAD register has been loaded successfully. This flag is reset after a read operation.

### Bit 3 – DSCR DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_OVR2ISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

### Bit 2 – DMA End of DMA Transfer

Value	Description
0	No End of Transfer has been detected since last read of LCDC_OVR2ISR

Value	Description
1	End of Transfer has been detected. This flag is reset after a read operation.

#### 44.7.68. Overlay 2 Head Register

**Name:** LCDC\_OVR2HEAD  
**Offset:** 0x0000027C  
**Reset:** 0x00000000  
**Property:** Read/Write

### Bit 5 – DONEIEN End of List Interrupt Enable

Value	Description
0	End of list interrupt is disabled.
1	End of list interrupt is enabled.

### Bit 4 – ADDIEN Add Head Descriptor to Queue Interrupt Enable

Value	Description
0	Transfer descriptor added to queue interrupt is enabled.
1	Transfer descriptor added to queue interrupt is disabled.

### Bit 3 – DSCRIEN Descriptor Loaded Interrupt Enable

Value	Description
0	Transfer descriptor loaded interrupt is enabled.
1	Transfer descriptor loaded interrupt is disabled.

### Bit 2 – DMAIEN End of DMA Transfer Interrupt Enable

Value	Description
0	DMA transfer completed interrupt is enabled.
1	DMA transfer completed interrupt is disabled.

### Bit 1 – LFETCH Lookup Table Fetch Enable

Value	Description
0	Lookup Table DMA fetch is disabled.
1	Lookup Table DMA fetch is enabled.

**Bit 0 – DFETCH** Transfer Descriptor Fetch Enable

Value	Description
0	Transfer Descriptor fetch is disabled.
1	Transfer Descriptor fetch is enabled.

#### 44.7.71. Overlay 2 Next Register

**Name:** LCDC\_OVR2NEXT  
**Offset:** 0x00000288  
**Reset:** 0x00000000  
**Property:** Read/Write

Access			R/W	R/W				
Reset			0	0				

**Bit 13 – LOCKDIS** Hardware Rotation Lock Disable

Value	Description
0	System bus lock signal is asserted when a rotation is performed.
1	System bus lock signal is cleared when a rotation is performed.

**Bit 12 – ROTDIS** Hardware Rotation Optimization Disable

Value	Description
0	Rotation optimization is enabled.
1	Rotation optimization is disabled.

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for 2 and 3 beats burst.
1	Only defined length burst is used (SINGLE, INCR4, INCR8 and INCR16).

**Bits 5:4 – BLEN[1:0]** System Bus Burst Length

Value	Name	Description
0	AHB_SINGLE	System bus access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_INCR4	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. A system bus INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.

Value	Name	Description
2	AHB_INCR8	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. A system bus INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_INCR16	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. A system bus INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

##### Bits 26:16 – YSIZE[10:0] Vertical Window Size

Overlay 2 window height in pixels. The window height is set to (YSIZE + 1).  
The following constraint must be met:  $YPOS + YSIZE \leq RPF$

##### Bits 10:0 – XSIZE[10:0] Horizontal Window Size

Overlay 2 window width in pixels. The window width is set to (XSIZE + 1).  
The following constraint must be met:  $XPOS + XSIZE \leq PPL$

#### 44.7.76. Overlay 2 Configuration Register 4

**Name:** LCDC\_OVR2CFG4  
**Offset:** 0x0000029C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 23:16 – RDEF[7:0] Red Default

Default Red color when the Overlay 1 DMA channel is disabled.

### Bits 15:8 – GDEF[7:0] Green Default

Default Green color when the Overlay 1 DMA channel is disabled.

### Bits 7:0 – BDEF[7:0] Blue Default

Default Blue color when the Overlay 1 DMA channel is disabled.

## 44.7.79. Overlay 2 Configuration Register 7

**Name:** LCDC\_OVR2CFG7  
**Offset:** 0x000002A8  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – RKEY[7:0]** Red Color Component Chroma Key  
Reference Red chroma key used to match the Red color of the current overlay.

**Bits 15:8 – GKEY[7:0]** Green Color Component Chroma Key  
Reference Green chroma key used to match the Green color of the current overlay.

**Bits 7:0 – BKEY[7:0]** Blue Color Component Chroma Key  
Reference Blue chroma key used to match the Blue color of the current overlay.

## 44.7.80. Overlay 2 Configuration Register 8

**Name:** LCDC\_OVR2CFG8  
**Offset:** 0x000002AC  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

**Bits 23:16 – GA[7:0]** Blender Global Alpha  
 Global alpha blender for the current layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

Value	Description
0	Source Chroma keying is enabled.
1	Destination Chroma keying is used.

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

**Bit 8 – DMA** Blender DMA Layer Enable

Value	Description
0	The default color is used on the Overlay 1 Layer.
1	The DMA channel retrieves the pixels stream from the memory.

**Bit 7 – OVR** Blender Overlay Layer Enable

Value	Description
0	Overlay pixel color is set to the default overlay pixel color.
1	Overlay pixel color is set to the DMA channel pixel color.

**Bit 6 – LAEN** Blender Local Alpha Enable

Value	Description
0	Local alpha blending coefficient is disabled.
1	Local alpha blending coefficient is enabled.

#### Bit 5 – GAEN Blender Global Alpha Enable

Value	Description
0	Global alpha blending coefficient is disabled.
1	Global alpha blending coefficient is enabled.

#### Bit 4 – REVALPHA Blender Reverse Alpha

Value	Description
0	Pixel difference is multiplied by alpha.
1	Pixel difference is multiplied by 1 - alpha.

#### Bit 3 – ITER Blender Use Iterated Color

Value	Description
0	Pixel difference is set to 0.
1	Pixel difference is set to the iterated pixel value.

#### Bit 2 – ITER2BL Blender Iterated Color Enable

Value	Description
0	Final adder stage operand is set to 0.
1	Final adder stage operand is set to the iterated pixel value.

#### Bit 1 – INV Blender Inverted Blender Output Enable

Value	Description
0	Iterated pixel is the blended pixel.
1	Iterated pixel is the inverted pixel.

#### Bit 0 – CRKEY Blender Chroma Key Enable

Value	Description
0	Chroma key matching is disabled.
1	Chroma key matching is enabled.

## 44.7.82. High-End Overlay Channel Enable Register

**Name:** LCDC\_HEOCHER  
**Offset:** 0x00000360  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
						A2QEN	UPDATEEN	CHEN
Access						W	W	W
Reset						–	–	–

### Bit 2 – A2QEN Add To Queue Enable

Value	Description
0	No effect
1	Indicates that a valid descriptor has been written to memory, its memory location should be written to the DMA head pointer. The A2QSR status bit is set to one, and it is reset by hardware as soon as the descriptor pointed to by the DMA head pointer is added to the list.

### Bit 1 – UPDATEEN Update Overlay Attributes Enable

Value	Description
0	No effect
1	Updates windows attributes on the next start of frame.

### Bit 0 – CHEN Channel Enable

Value	Description
0	No effect
1	Enables the DMA channel

### 44.7.83. High-End Overlay Channel Disable Register

**Name:** LCDC\_HEOCHDR  
**Offset:** 0x00000364  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

								CHRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								CHDIS
Access								W
Reset								–

#### Bit 8 – CHRST Channel Reset

Value	Description
0	No effect
1	Resets the layer immediately. The frame is aborted.

#### Bit 0 – CHDIS Channel Disable

Value	Description
0	No effect
1	Disables the layer at the end of the current frame. The frame is completed.

#### 44.7.84. High-End Overlay Channel Status Register

**Name:** LCDC\_HEOCHSR  
**Offset:** 0x00000368  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Reset								

Bit	7	6	5	4	3	2	1	0
						A2QSR	UPDATESR	CHSR
Access						R	R	R
Reset						0	0	0

##### Bit 2 – A2QSR Add To Queue Status

Value	Description
0	Add to queue not pending
1	Add to queue pending

##### Bit 1 – UPDATESR Update Overlay Attributes In Progress Status

Value	Description
0	No update pending
1	Overlay attributes will be updated on the next frame

##### Bit 0 – CHSR Channel Status

Value	Description
0	Layer disabled
1	Layer enabled

#### 44.7.85. High-End Overlay Interrupt Enable Register

**Name:** LCDC\_HEOIER  
**Offset:** 0x0000036C  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

**Bit 19 – V** DSCR Descriptor Loaded for V Chrominance Interrupt Enable

**Bit 18 – V** DMA End of DMA for V Chrominance Transfer Interrupt Enable

**Bit 14 – U** OVR Overflow for U or UV Chrominance Interrupt Enable

**Bit 13 – U** DONE End of List for U or UV Chrominance Interrupt Enable

**Bit 12 – U** ADD Head Descriptor Loaded for U or UV Chrominance Interrupt Enable

**Bit 11 – U** DSCR Descriptor Loaded for U or UV Chrominance Interrupt Enable

**Bit 10 – U** DMA End of DMA Transfer for U or UV Chrominance Interrupt Enable

**Bit 6 – O** VR Overflow Interrupt Enable

**Bit 5 – D** ONE End of List Interrupt Enable

**Bit 4 – ADD** Head Descriptor Loaded Interrupt Enable

**Bit 3 – DSCR** Descriptor Loaded Interrupt Enable

**Bit 2 – DMA** End of DMA Transfer Interrupt Enable

#### 44.7.86. High-End Overlay Interrupt Disable Register

**Name:** LCDC\_HEOIDR  
**Offset:** 0x00000370  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

**Bit 22 – VOV** Overflow Detected for V Component

Value	Description
0	No overflow occurred since last read of LCDC_HEOISR
1	An overflow occurred. This flag is reset after a read operation.

**Bit 21 – V** DONE End of List Detected for V Component

Value	Description
0	No End of List condition occurred since last read of LCDC_HEOISR
1	End of List condition has occurred. This flag is reset after a read operation.

**Bit 20 – V** ADD Head Descriptor Loaded for V Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	The descriptor pointed to by the LCDC_HEOVHEAD register has been loaded successfully. This flag is reset after a read operation.

**Bit 19 – V** DSCR DMA Descriptor Loaded for V Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 18 – V** DMA End of DMA Transfer for V Component

Value	Description
0	No End of Transfer has been detected since last read of LCDC_HEOISR

Value	Description
1	End of Transfer has been detected. This flag is reset after a read operation.

**Bit 14 – UOVR** Overflow Detected for U Component

Value	Description
0	No overflow occurred since last read of LCDC_HEOISR
1	An overflow occurred. This flag is reset after a read operation.

**Bit 13 – UDONE** End of List Detected for U Component

Value	Description
0	No End of List condition occurred since last read of LCDC_HEOISR
1	End of List condition has occurred. This flag is reset after a read operation.

**Bit 12 – UADD** Head Descriptor Loaded for U Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	The descriptor pointed to by the LCDC_HEOUHEAD register has been loaded successfully. This flag is reset after a read operation.

**Bit 11 – UDSCR** DMA Descriptor Loaded for U Component

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 10 – UDMA** End of DMA Transfer for U Component

Value	Description
0	No End of Transfer has been detected since last read of LCDC_HEOISR
1	End of Transfer has been detected. This flag is reset after a read operation.

**Bit 6 – OVR** Overflow Detected

Value	Description
0	No overflow occurred since last read of LCDC_HEOISR
1	An overflow occurred. This flag is reset after a read operation.

**Bit 5 – DONE** End of List Detected

Value	Description
0	No End of List condition occurred since last read of LCDC_HEOISR
1	End of List condition has occurred. This flag is reset after a read operation.

**Bit 4 – ADD** Head Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	The descriptor pointed to by the LCDC_HEOHEAD register has been loaded successfully. This flag is reset after a read operation.

**Bit 3 – DSCR** DMA Descriptor Loaded

Value	Description
0	No descriptor has been loaded since last read of LCDC_HEOISR
1	A descriptor has been loaded successfully. This flag is reset after a read operation.

**Bit 2 – DMA** End of DMA Transfer

Value	Description
0	No end of transfer has been detected since last read of LCDC_HEOISR
1	End of Transfer has been detected. This flag is reset after a read operation.

## 44.7.89. High-End Overlay DMA Head Register

**Name:** LCDC\_HEOHEAD  
**Offset:** 0x0000037C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	HEAD[29:22]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Access	R/W	R/W	R/W	R/W				
Reset	0	0	0	0				

**Bit 13 – LOCKDIS** Hardware Rotation Lock Disable

Value	Description
0	System bus lock signal is asserted when a rotation is performed.
1	System bus lock signal is cleared when a rotation is performed.

**Bit 12 – ROTDIS** Hardware Rotation Optimization Disable

Value	Description
0	Rotation optimization is enabled.
1	Rotation optimization is disabled.

**Bit 8 – DLBO** Defined Length Burst Only For Channel Bus Transaction

Value	Description
0	Undefined length INCR burst is used for a burst of 2 and 3 beats.
1	Only defined length burst is used (SINGLE, INCR4, INCR8 and INCR16).

**Bits 7:6 – BLENUV[1:0]** System Bus Burst Length for U-V Channel

Value	Name	Description
0	AHB_SINGLE	System bus access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_INCR4	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. A system bus INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.

Value	Name	Description
2	AHB_INCR8	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. A system bus INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_INCR16	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. A system bus INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

**Bits 5:4 – BLEN[1:0] System Bus Burst Length**

Value	Name	Description
0	AHB_BLEN_SINGLE	System bus access is started as soon as there is enough space in the FIFO to store one data. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.
1	AHB_BLEN_INCR4	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 4 data. A system bus INCR4 Burst is used. SINGLE, INCR and INCR4 bursts are used. INCR is used for a burst of 2 and 3 beats.
2	AHB_BLEN_INCR8	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 8 data. A system bus INCR8 Burst is used. SINGLE, INCR, INCR4 and INCR8 bursts are used. INCR is used for a burst of 2 and 3 beats.
3	AHB_BLEN_INCR16	System bus access is started as soon as there is enough space in the FIFO to store a total amount of 16 data. A system bus INCR16 Burst is used. SINGLE, INCR, INCR4, INCR8 and INCR16 bursts are used. INCR is used for a burst of 2 and 3 beats.

Reset	R/W 0	R/W 0	R/W 0	R/W 0			R/W 0	R/W 0

**Bit 20 – DSCALEOPT** Down Scaling Bandwidth Optimization

Value	Description
0	Scaler Optimization is disabled.
1	Scaler Optimization is enabled; only relevant pixels are retrieved from memory to fill the scaler filter.

**Bit 17 – YUV422SWP** YUV 4:2:2 Swap

Value	Description
0	The two Y components of the YUV 4:2:2 packed data stream are not swapped
1	The two Y components of the YUV 4:2:2 packed data stream are swapped

**Bit 16 – YUV422ROT** YUV 4:2:2 Rotation

This bit is relevant only when a rotation angle of 90 degrees or 270 degrees is used.

Value	Description
0	Chroma Upsampling kernel is configured to use 0 and 180 degrees algorithm
1	Chroma Upsampling kernel is configured to use the 4:2:2 Rotation Algorithm.

**Bits 15:12 – YUVMODE[3:0]** YUV Mode Input Selection

Value	Name	Description
0	32BPP_AYCBGR	32 bpp AYCbCr 444
1	16BPP_YCBCR_MODE0	16 bpp Cr(n)Y(n+1)Cb(n)Y(n) 422
2	16BPP_YCBCR_MODE1	16 bpp Y(n+1)Cr(n)Y(n)Cb(n) 422

4	16BPP_YCBCR_MODE3	16 bpp Y(n+1)Cb(n)Y(n)Cr(n) 422

Value	Name	Description
5	16BPP_YCBCR_SEMIPLANAR	16 bpp Semiplanar 422 YCbCr
6	16BPP_YCBCR_PLANAR	16 bpp Planar 422 YCbCr
7	12BPP_YCBCR_SEMIPLANAR	12 bpp Semiplanar 420 YCbCr
8	12BPP_YCBCR_PLANAR	12 bpp Planar 420 YCbCr

**Bits 9:8 – CLUTMODE[1:0]** Color Lookup Table Mode Input Selection

Value	Name	Description
0	CLUT_1BPP	Color Lookup Table mode set to 1 bit per pixel
1	CLUT_2BPP	Color Lookup Table mode set to 2 bits per pixel
2	CLUT_4BPP	Color Lookup Table mode set to 4 bits per pixel
3	CLUT_8BPP	Color Lookup Table mode set to 8 bits per pixel

**Bits 7:4 – RGBMODE[3:0]** RGB Mode Input Selection

Value	Name	Description
0	12BPP_RGB_444	12 bpp RGB 444
1	16BPP_ARGB_4444	16 bpp ARGB 4444
2	16BPP_RGBA_4444	16 bpp RGBA 4444
3	16BPP_RGB_565	16 bpp RGB 565
4	16BPP_TRGB_1555	16 bpp TRGB 1555
5	18BPP_RGB_666	18 bpp RGB 666
6	18BPP_RGB_666PACKED	18 bpp RGB 666 PACKED
7	19BPP_TRGB_1666	19 bpp TRGB 1666
8	19BPP_TRGB_PACKED	19 bpp TRGB 1666 PACKED
9	24BPP_RGB_888	24 bpp RGB 888
10	24BPP_RGB_888_PACKED	24 bpp RGB 888 PACKED
11	25BPP_TRGB_1888	25 bpp TRGB 1888
12	32BPP_ARGB_8888	32 bpp ARGB 8888
13	32BPP_RGBA_8888	32 bpp RGBA 8888

**Bit 1 – YUVEN** YUV Color Space Enable  
Color Space is YUV

Value	Description
0	Color space is RGB
1	Color space is YUV

**Bit 0 – CLUTEN** Color Lookup Table Mode Enable

Value	Description
0	RGB mode is selected.
1	Color Lookup Table mode is selected.

**Bits 23:16 – GA[7:0]** Blender Global Alpha  
Global alpha blender for the current layer.

**Bit 12 – VIDPRI** Video Priority

Value	Description
0	OVR1 layer is above HEO layer.
1	OVR1 layer is below HEO layer.

**Bit 10 – DSTKEY** Destination Chroma Keying

Value	Description
0	Source Chroma keying is enabled.
1	Destination Chroma keying is used.

**Bit 9 – REP** Use Replication logic to expand RGB color to 24 bits

Value	Description
0	When the selected pixel depth is less than 24 bpp the pixel is shifted and least significant bits are set to 0.
1	When the selected pixel depth is less than 24 bpp the pixel is shifted and the least significant bit replicates the msb.

**Bit 8 – DMA** Blender DMA Layer Enable

Value	Description
0	The default color is used on the Overlay 1 Layer.
1	The DMA channel retrieves the pixels stream from the memory.

**Bit 7 – OVR** Blender Overlay Layer Enable

Value	Description
0	Overlay pixel color is set to the default overlay pixel color.
1	Overlay pixel color is set to the DMA channel pixel color.

#### Bit 6 – LAEN Blender Local Alpha Enable

Value	Description
0	Local alpha blending coefficient is disabled.
1	Local alpha blending coefficient is enabled.

#### Bit 5 – GAEN Blender Global Alpha Enable

Value	Description
0	Global alpha blending coefficient is disabled.
1	Global alpha blending coefficient is enabled.

#### Bit 4 – REVALPHA Blender Reverse Alpha

Value	Description
0	Pixel difference is multiplied by alpha.
1	Pixel difference is multiplied by 1 - alpha.

#### Bit 3 – ITER Blender Use Iterated Color

Value	Description
0	Pixel difference is set to 0.
1	Pixel difference is set to the iterated pixel value.

#### Bit 2 – ITER2BL Blender Iterated Color Enable

Value	Description
0	Final adder stage operand is set to 0.
1	Final adder stage operand is set to the iterated pixel value.

#### Bit 1 – INV Blender Inverted Blender Output Enable

Value	Description
0	Iterated pixel is the blended pixel.
1	Iterated pixel is the inverted pixel.

#### Bit 0 – CRKEY Blender Chroma Key Enable

Value	Description
0	Chroma key matching is disabled.
1	Chroma key matching is enabled.

## 45. 2D Graphics Engine (GFX2D)

### 45.1. Description

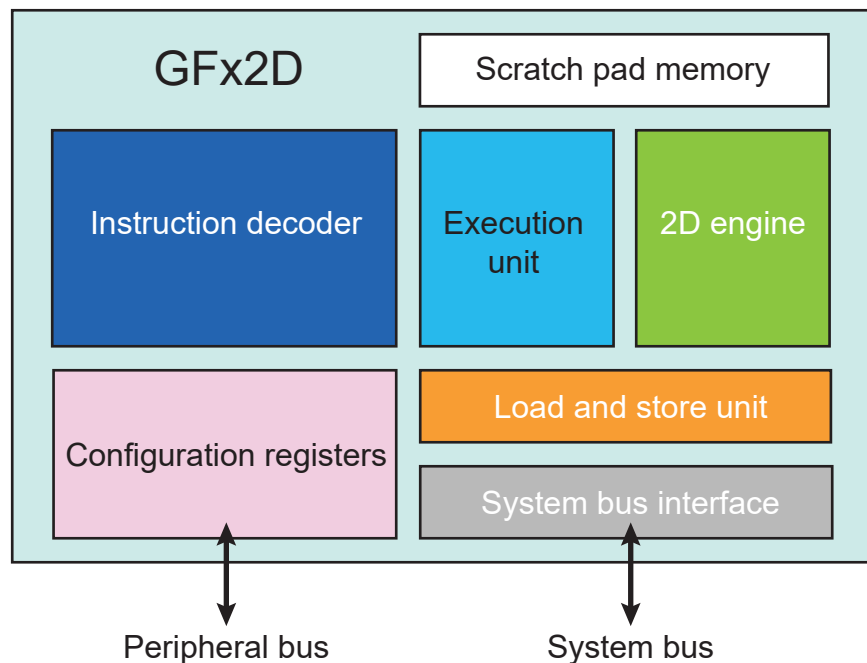

The 2D Graphics Engine (GFX2D) is a drawing engine performing memory data move operations via its system bus host port.

### 45.2. Embedded Characteristics

- 32-bit System Bus Host Interface
- Ring Buffer Command Interface
- FILL, COPY, BLEND and ROP Instructions
- Classic and Special Blending Functions Available
- Alpha Channel, Indexed Color and True Color Supported
- Linear-to-Cartesian Coordinate Transformation
- Automatic Transfer Regulation

### 45.3. Block Diagram

Figure 45.1. GFX2D Block Diagram

### 45.4. Functional Description

The GFX2D controller executes a sequence of instructions stored in a ring buffer located in the system memory. Once the instruction decoding is complete, the graphics engine executes the instruction, performs memory accesses and, optionally, raises an interrupt. A single instruction does not modify the whole set of internal registers. Host software must use a load register instruction to change the graphics context.

## 45.4.1. Ring Buffer Management

### 45.4.1.1. Ring Buffer Model Diagram

Figure 45.2. Ring Buffer Model

### 45.4.1.2. Ring Buffer Allocation

The instruction Ring Buffer (RB) is a contiguous memory area shared between the processor and the graphics engine. The size of the ring buffer is  $24 \times (\text{GFX2D\_LEN.LEN} + 1)$  bytes.

It is an efficient and effective means of passing instructions to the graphics. It is non-blocking and it facilitates batch processing of surfaces. The total RB length is software-programmable, and is a multiple of the RB memory allocation unit. A large RB is recommended to reduce CPU intervention.

Use the following software procedure to allocate a new ring buffer:

1. Wait for command completion by polling the `GFX2D_GS.BUSY` bit.
2. Disable the ring buffer by writing to `GFX2D_GD.DISABLE`.
3. Initialize the tail and head pointers by setting `GFX2D_HEAD.HEAD` and `GFX2D_TAIL.TAIL` to '0'.
4. Program the ring buffer base address by setting `GFX2D_BASE.BASE` to the base address. The address must be 24 bytes aligned.
5. Program the ring buffer length by setting `GFX2D_LEN.LEN` to the length.
6. Enable the ring buffer by writing to `GFX2D_GE.ENABLE`.

### 45.4.1.3. Ring Buffer Push-Pull Model

The Ring Buffer uses the producer/consumer model. The processor pushes the required instructions to render frames into the RB. The graphics consume the instructions and inform the processor that these free slots can be recycled. The RB is full when the number of free slots is equal to one. When the tail pointer is equal to the read pointer, the RB is empty. A new instruction can be pushed only if there is enough space available to store the whole instruction. When the memory is updated with one or more instructions, the head pointer is incremented with the total number of words of the batch of instructions. If the end of the RB is reached, the head pointer wraps around.

Use the following software procedure to add a command to the ring buffer queue:

1. Monitor the Ring Buffer status from the Graphics side by reading the GFX2D\_TAIL register. This register is updated by the hardware when the instruction has been successfully read from the memory.
2. Verify that there is enough space left in the buffer to insert the command. The queue is full when you have inserted N-1 instructions, where N is the number of entries.
3. Write the instruction at the memory location defined by GFX2D\_BASE + GFX2D\_HEAD.HEAD\*4.
4. Increment the local head pointer and the GFX2D\_HEAD.HEAD register to inform the graphics that new instructions have been added to the queue.
5. Wait for command completion by polling the BUSY bit in the GFX2D\_GS register or wait for an interrupt if programmed.

#### 45.4.1.4. Ring Buffer Disable

Use the following software procedure to halt the GFX2D:

1. Wait for command completion by polling the GFX2D\_GS.BUSY bit.
2. Disable the ring buffer by writing '1' to GFX2D\_GD.DISABLE.
3. Reset the tail and head pointers by writing '0' to GFX2D\_HEAD.HEAD and GFX2D\_TAIL.TAIL.

### 45.4.2. GFX2D Surface Memory Format

#### 45.4.2.1. Source Surface Memory Format

Alpha	A3								A2								A1								A0							

**45.4.2.2.3.8-bit Luminance Channel**

The 32-bpp ARGB final pixel is converted into an 8-bit luminance value.

$$Y = 0.299R + 0.587G + 0.114B$$

**Table 45.23.** 8-bit Luminance Memory Mapping, Little Endian Organization

Mem. addr.	0x3								0x2								0x1								0x0							
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Alpha	Y3								Y2								Y1								Y0							

**45.4.2.2.4.8-bit Alpha Channel with 8-bit Luminance**

$$Y = 0.299R + 0.587G + 0.114B$$

The 32-bpp ARGB final pixel is converted into an 8-bit luminance value.

**Table 45.24.** 8-bit Alpha with 8-bit Luminance Memory Mapping, Little Endian Organization

Mem. addr.	0x3								0x2								0x1								0x0							
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Alpha	A1								Y1								A0								Y0							

### 45.4.2.3. Color Look-Up Table (CLUT)

The GFX2D module includes two CLUTs. Each CLUT includes 256 entries containing 32 bits. Each entry contains a 32-bpp ARGB color.

**Table 45.25.** Color Look-Up Table Entry

Mem. addr.	0x3								0x2								0x1								0x0							
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Color entry	A								R								G								B							

The CLUT can be loaded using an LDR instruction with the LDRC bit set. The LDRCID bit indicates the targeted CLUT. The LDRCS bit provides the amount of data to be loaded. Using a reduced CLUT mapping (i.e., 16 entries) reduces the number of accessible colors but improves loading time. The data structure is loaded from a memory location defined by the address in the REG field.

### 45.4.3. GFX2D Visible Registers

#### 45.4.3.1. Register Naming

A set of 15 registers is defined and accessible through the use of the load and store architecture.

**Table 45.26.** Visible Registers

Value	Name	Description
0	GFX2D_PA0	Surface 0 Physical Address Register
1	GFX2D_PITCH0	Surface 0 Pitch Register
2	GFX2D_CFG0	Surface 0 Configuration Register
3	GFX2D_PA1	Surface 1 Physical Address Register
4	GFX2D_PITCH1	Surface 1 Pitch Register
5	GFX2D_CFG1	Surface 1 Configuration Register
6	GFX2D_PA2	Surface 2 Physical Address Register
7	GFX2D_PITCH2	Surface 2 Pitch Register
8	GFX2D_CFG2	Surface 2 Configuration Register
9	GFX2D_PA3	Surface 3 Physical Address Register
10	GPREG0	General-Purpose Register 0
11	GPREG1	General-Purpose Register 1
12	GPREG2	General-Purpose Register 2
13	GPREG3	General-Purpose Register 3
14	GPREG4	General-Purpose Register 4
15	GPREG5	General-Purpose Register 5

General-purpose registers are generic registers. They can hold:

- an address,
- a constant color for a FILL or BLEND operation,
- a constant alpha value for a BLEND, or
- a user-defined 32-bit data for a STORE operation.

**Table 45.27.** General-Purpose Registers

Operation/ Instruction	General-Purpose Register
FILL	The register holds the 32-bit fill color pattern when the FILL arguments are less than 2. In that case, the color is defined by the REG field of the FILL instruction.
BLEND	The register holds the constant 32-bit color (A <sub>c</sub> , R <sub>c</sub> , G <sub>c</sub> , B <sub>c</sub> ). It can be used for CONSTANT_ALPHA, CONSTANT_ALPHA parameters.

.....continued

Operation/ Instruction	General-Purpose Register
STR	The store operation requires a valid address defined by the REGAD field register index, and a data defined by the REG field register index. The general-purpose register can hold a 32-bit address or data.
LDR	The LDR instruction can load a general-purpose register.

### 45.4.3.2. Register Descriptions

Figure 45.3. Surface Registers

### 45.4.4. Traffic Balancing Using Outstanding Regulation

Global system performance is significantly impacted when the LCD controller is reading a frame buffer from memory to refresh the LCD screen. To ensure optimal performance, the LCD forwards its quality of service to other system bus hosts to limit their usage of the bus. The GFX2D frame rate is limited to allow latency-critical LCD operation.

Use the following procedure to activate traffic balancing:

1. Program the GFX2D\_GC.REGQOS1, GFX2D\_GC.REGQOS2 and GFX2D\_GC.REGQOS3 registers and enable the outstanding issuance regulation by setting the GFX2D\_GC.REGEN.
2. Configure the GFX2D\_PCX register, and read the GFX2D\_MCX register to adjust the regulation.

**Figure 45.4.** Traffic Balancing Using Outstanding Regulation

## 45.4.5. Data Flow Instructions

### 45.4.5.1. LDR Instruction

The LDR instruction length is variable and depends on the context.

- When the LDR instruction is used to load a register, the instruction length is 2 words.
- When the LDR instruction is used to load a CLUT, the instruction length is a single word.

**45.4.5.1.1.LDR\_WD0****Name:** LDR\_WD0**Bits 31:28 – OPCODE[3:0]** Instruction Code

This field must be set to '0x8'.

**Bit 24 – IE** Interrupt Enable

Value	Description
0	The End of Instruction interrupt is disabled.
1	The End of Instruction interrupt is enabled.

**Bits 19:16 – REG[3:0]** Register Identifier

This is the target register for a load operation. When the LDR instruction is used to load a Color Look-Up Table, the REG field points to the general-purpose register that holds the physical base address of the table.

**Bit 10 – LDRCS** Color Look-Up Table Size

Value	Description
0	256 entries.
1	16 entries.

**Bit 9 – LDRCID** Color Look-Up Table Selection

Value	Description
0	Table 0 is selected.
1	Table 1 is selected.

**Bit 8 – LDRC** Load Color Look-Up Table

Value	Description
0	Loads the register with the immediate value.
1	Loads the Color Look-Up Table with the content of the memory.

**Bits 2:0 – ARGS[2:0]** Arguments Length  
This field must be set to '0'.

#### 45.4.5.1.2.LDR\_WD1

**Name:** LDR\_WD1

Bit	31	30	29	28	27	26	25	24
	DATA[31:24]							
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8
	DATA[15:8]							
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access								
Reset								

**Bits 31:0 – DATA[31:0]** 32-bit Data

The 32-bit data word loaded into the register.

#### 45.4.5.2.STR Instruction

The instruction length is 1 word.

#### 45.4.5.2.1.STR\_WD0

**Name:** STR\_WD0

**Bits 31:28 – OPCODE[3:0]** Instruction Code  
Must be set to '0x9'.

**Bit 24 – IE** Interrupt Enable

Value	Description
0	The End of Instruction interrupt is disabled.
1	The End of Instruction interrupt is enabled.

**Bits 19:16 – REG[3:0]** Register Identifier  
Points to the general-purpose register that holds the data written to memory.

**Bits 15:12 – REGAD[3:0]** Register Identifier for Stored Address  
Points to the general-purpose register that holds the address of the memory store operation.

**Bits 2:0 – ARGS[2:0]** Arguments Length  
This field must be set to '0'.

#### 45.4.5.3.WFE Instruction

The instruction length is 1 word.

### 45.4.5.3.1.WFE\_WD0

**Name:** WFE\_WD0

**Bits 31:28 – OPCODE[3:0]** Instruction Code  
This field must be set to '0xA'.

**Bits 1:0 – WFEMODE[1:0]** Wait For Event Mode

Value	Description
0	Resume from WFE state when detecting any edge on event signal
1	Resume from WFE state when detecting rising edge on event signal
2	Resume from WFE state when detecting falling edge on event signal

## 45.4.6. Graphics Instructions

### 45.4.6.1.FILL Instruction

The FILL instruction length is 4.

**Figure 45.5.** Fill Operation

**Table 45.28.** FILL Instructions

Word Identifier	Description
FILL_WD0	The instruction header
FILL_WD1	The width and height of the destination-filled area
FILL_WD2	The x and y offsets of the filled area
FILL_WD3	The fill color: a 32-bit ARGB color resized to the area pixel format

#### 45.4.6.1.1.FILL\_WD0

**Name:** FILL\_WD0

**Bits 31:28 – OPCODE[3:0]** Instruction Code  
This field must be set to '0xB'.

**Bit 24 – IE** Interrupt Enable

Value	Description
0	The End of Instruction interrupt is disabled.
1	The End of Instruction interrupt is enabled.

**Bits 19:16 – REG[3:0]** Register Identifier  
This field is relevant when ARGS is less than 2. In that case, the REG value points to a register with a valid 32-bit ARGB color.

**Bits 9:8 – DIR[1:0]** Transfer Direction

Value	Name	Description
0	XY00	Horizontal forward, vertical forward
1	XY01	Horizontal forward, vertical backward
2	XY10	Horizontal backward, vertical forward
3	XY11	Horizontal backward, vertical backward

**Bits 2:0 – ARGS[2:0]** Arguments Length  
Must be less than or equal to 2.

#### 45.4.6.1.2.FILL\_WD1

**Name:** FILL\_WD1

**Bits 28:16 - HEIGHT[12:0]** Destination Surface Height  
The surface height is set to (HEIGHT+1) pixels.

**Bits 12:0 - WIDTH[12:0]** Destination Surface Width  
The surface width is set to (WIDTH+1) pixels.

#### 45.4.6.1.3.FILL\_WD2

**Name:** FILL\_WD2

**Bits 28:16 – DY0[12:0]** Destination Y Position  
This field indicates the vertical position of the window.

**Bits 12:0 – DX0[12:0]** Destination X Position  
This field indicates the horizontal position of the window.

#### 45.4.6.1.4.FILL\_WD3

**Name:** FILL\_WD3

Bit	31	30	29	28	27	26	25	24
	A[7:0]							
Access

Bit	7	6	5	4	3	2	1	0
	B[7:0]							
Access								
Reset								

**Bits 31:24 – A[7:0]** Alpha Color Component Value  
Program this field with the desired Alpha value.

**Bits 23:16 – R[7:0]** Red Color Component Value  
Program this field with the desired Red value.

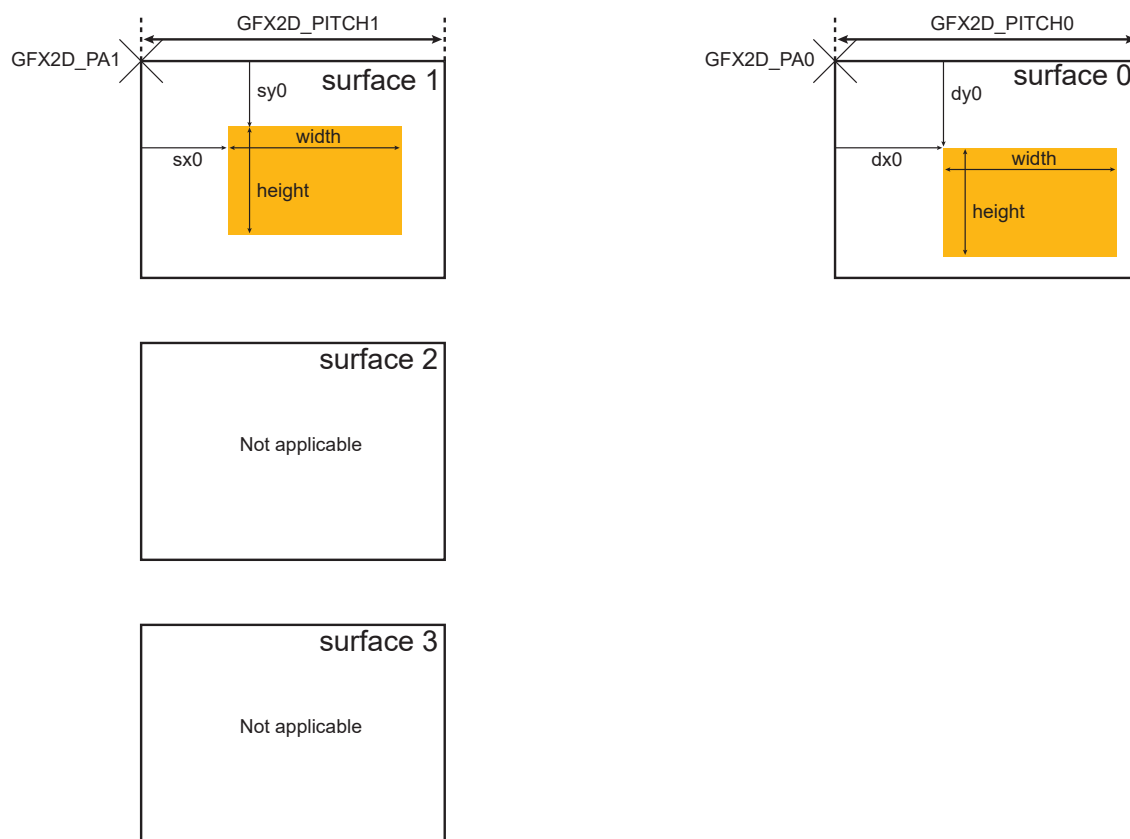

**Bits 15:8 – G[7:0]** Green Color Component Value  
Program this field with the desired Green value.

**Bits 7:0 – B[7:0]** Blue Color Component Value  
Program this field with the desired Blue value.

#### 45.4.6.2.COPY Instruction

The instruction length is 4 words.

**Figure 45.6.** COPY Operation

**Table 45.29.** COPY Instructions

Word Identifier	Description	Surface Register
COPY_WD0	The instruction header	Not applicable
COPY_WD1	The width and height of the destination area	Surface 0 register
COPY_WD2	The x and y offsets of the destination area	Surface 0 register
COPY_WD3	The x and y offsets of the source area	Surface 1 register

#### 45.4.6.2.1.COPY\_WD0

**Name:** COPY\_WD0

**Bits 31:28 – OPCODE[3:0]** Instruction Code  
This field must be set to '0xC'.

**Bit 24 – IE** Interrupt Enable

Value	Description
0	The End of Instruction interrupt is disabled.
1	The End of Instruction interrupt is enabled.

**Bits 19:16 – REG[3:0]** Register Identifier  
When a constant is used, the constant value is located in the register defined by the REG value.

**Bits 9:8 – DIR[1:0]** Transfer Direction

Value	Name	Description
0	XY00	Horizontal forward, vertical forward
1	XY01	Horizontal forward, vertical backward
2	XY10	Horizontal backward, vertical forward
3	XY11	Horizontal backward, vertical backward

**Bits 2:0 – ARGS[2:0]** Arguments Length  
Must be set to '2'.

#### 45.4.6.2.2.COPY\_WD1

**Name:** COPY\_WD1

**Bits 28:16 – HEIGHT[12:0]** Destination Surface Height  
The surface height is set to (HEIGHT+1) pixels.

**Bits 12:0 – WIDTH[12:0]** Destination Surface Width  
The surface width is set to (WIDTH+1) pixels.

### 45.4.6.2.3.COPY\_WD2

**Name:** COPY\_WD2

**Bits 28:16 – DY0[12:0]** Destination Y Position  
This field indicates the vertical position of the window.

**Bits 12:0 – DX0[12:0]** Destination X Position  
This field indicates the horizontal position of the window.

#### 45.4.6.2.4.COPY\_WD3

**Name:** COPY\_WD3

**Bits 28:16 – SY0[12:0]** Source Y Position

This field indicates the vertical position of the window.

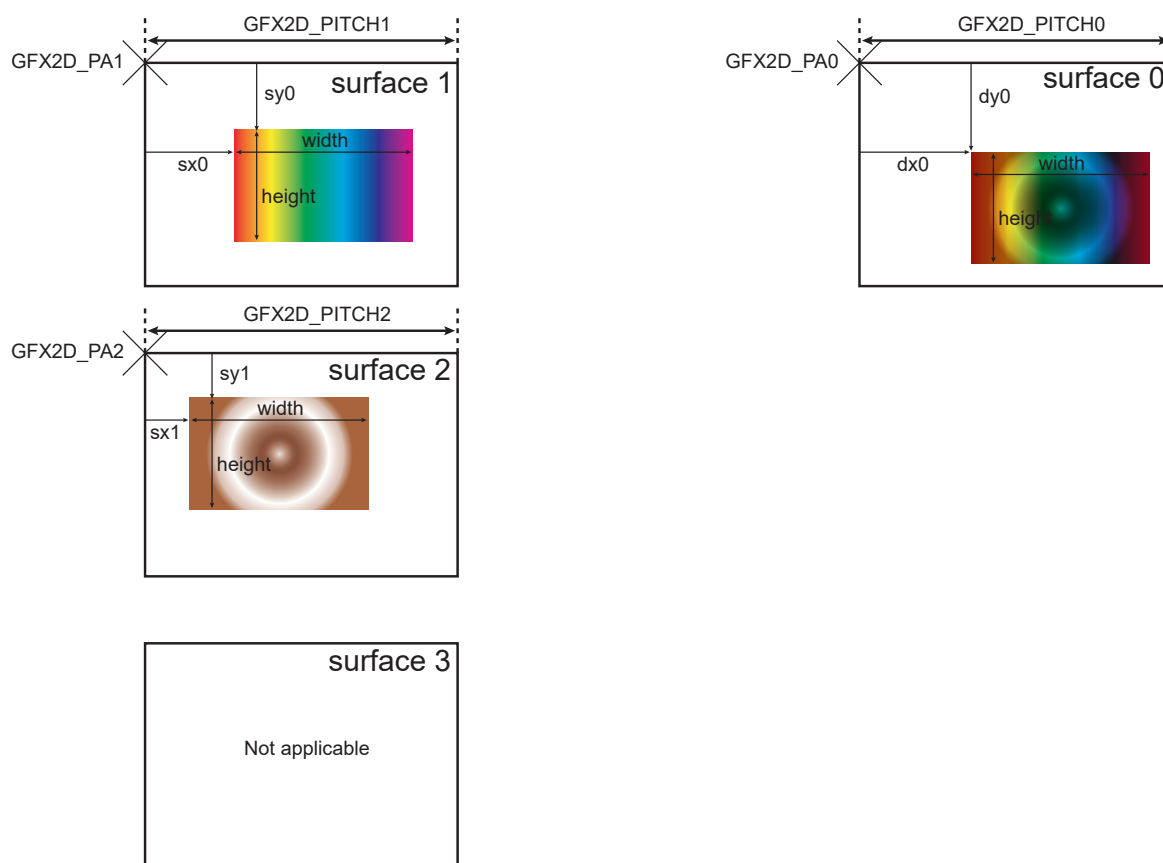

**Bits 12:0 – SX0[12:0]** Source X Position

This field indicates the horizontal position of the window.

#### 45.4.6.3.BLEND Instruction

The instruction length is 6 words.

**Figure 45.7. BLEND Operation**

**Table 45.30. BLEND Instructions**

Word Identifier	Description	Surface Register
BLEND_WD0	The Instruction header	Not applicable
BLEND_WD1	The width and height of the destination area ( $C_f$ )	Surface 0 registers
BLEND_WD2	The x and y offsets of the destination area ( $C_f$ )	Surface 0 registers
BLEND_WD3	The x and y offsets of source 0 ( $C_d$ )	Surface 1 registers
BLEND_WD4	The x and y offsets of source 1 ( $C_s$ )	Surface 2 registers
BLEND_WD5	This register configures the blending functions and factors	Not applicable

### 45.4.6.3.1.BLEND\_WD0

**Name:** BLEND\_WD0

**Bits 31:28 – OPCODE[3:0]** Instruction Code  
This field must be set to '0xD'.

**Bit 24 – IE** Interrupt Enable

Value	Description
0	The End of Instruction interrupt is disabled.
1	The End of Instruction interrupt is enabled.

**Bits 23:20 – DREG[3:0]** Destination Register Identifier  
When a constant is used for the destination surface, the constant value is located in the register defined by the DREG value.

**Bits 19:16 – REG[3:0]** Register Identifier  
When a constant is used, the constant value is located in the register defined by the REG value.

**Bits 9:8 – DIR[1:0]** Transfer Direction

Value	Name	Description
0	XY00	Horizontal forward, vertical forward
1	XY01	Horizontal forward, vertical backward
2	XY10	Horizontal backward, vertical forward
3	XY11	Horizontal backward, vertical backward

**Bits 2:0 – ARGS[2:0]** Arguments Length  
Must be set to '4'.

#### 45.4.6.3.2.BLEND\_WD1

**Name:** BLEND\_WD1

**Bits 28:16 – HEIGHT[12:0]** Destination Surface Height  
The surface height is set to (HEIGHT+1) pixels.

**Bits 12:0 – WIDTH[12:0]** Destination Surface Width  
The surface width is set to (WIDTH+1) pixels.

### 45.4.6.3.3.BLEND\_WD2

**Name:** BLEND\_WD2

**Bits 28:16 – DY0[12:0]** Destination Y Position  
This field indicates the vertical position of the window.

**Bits 12:0 – DX0[12:0]** Destination X Position  
This field indicates the horizontal position of the window.

#### 45.4.6.3.4.BLEND\_WD3

**Name:** BLEND\_WD3

**Bits 28:16 – SY0[12:0]** Source 0 Y Position

This field indicates the vertical position of the window.

**Bits 12:0 – SX0[12:0]** Source 0 X Position

This field indicates the horizontal position of the window.

### 45.4.6.3.5.BLEND\_WD3

**Name:** BLEND\_WD3

**Bits 28:16 – SY1[12:0]** Source 1 Y Position

This field indicates the vertical position of the window.

**Bits 12:0 – SX1[12:0]** Source 1 X Position

This field indicates the horizontal position of the window.

### 45.4.6.3.6.BLEND\_WD5

**Name:** BLEND\_WD5

#### Bit 23 – DPRE Destination Premult

Value	Description
0	Destination pre-multiplication is disabled.
1	Destination pre-multiplication is enabled. Pixels from destination surface are multiplied by constant before blending.

#### Bits 22:20 – DAFACT[2:0] Destination Alpha Factor

Value	Name	Description
0	ZERO	(0, 0, 0, 0)
1	ONE	(1, 1, 1, 1)
2	SRC_ALPHA	(A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> )
3	ONE_MINUS_SRC_ALPHA	(1, 1, 1, 1)-(A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> )
4	DST_ALPHA	(A <sub>D</sub> , A <sub>D</sub> , A <sub>D</sub> , A <sub>D</sub> )
5	ONE_MINUS_DST_ALPHA	(1, 1, 1, 1)-(A <sub>D</sub> , A <sub>D</sub> , A <sub>D</sub> , A <sub>D</sub> )
6	CONSTANT_ALPHA	(A <sub>C</sub> , A <sub>C</sub> , A <sub>C</sub> , A <sub>C</sub> )
7	ONE_MINUS_CONSTANT_ALPHA	(1, 1, 1, 1)-(A <sub>C</sub> , A <sub>C</sub> , A <sub>C</sub> , A <sub>C</sub> )

#### Bit 19 – SPRE Source Premult

Value	Description
0	Source pre-multiplication is disabled.
1	Source pre-multiplication is enabled. Pixels from source surface are multiplied by constant before blending.

#### Bits 18:16 – SAFACT[2:0] Source Alpha Factor

Value	Name	Description
0	ZERO	(0, 0, 0, 0)
1	ONE	(1, 1, 1, 1)
2	SRC_ALPHA	(A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> )
3	ONE_MINUS_SRC_ALPHA	(1, 1, 1, 1)-(A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> , A <sub>S</sub> )

Value	Name	Description
4	DST_ALPHA	$(A_d, A_d, A_d, A_d)$
5	ONE_MINUS_DST_ALPHA	$(1, 1, 1, 1) - (A_d, A_d, A_d, A_d)$
6	CONSTANT_ALPHA	$(A_c, A_c, A_c, A_c)$
7	ONE_MINUS_CONSTANT_ALPHA	$(1, 1, 1, 1) - (A_c, A_c, A_c, A_c)$

**Bits 15:12 – SPE[3:0] Special Blend**

Value	Name	Description
0	LIGHTEN	Based on the color information in each channel, selects the base color or the blend color, whichever is lighter, as the resulting color.
1	DARKEN	Based on the color information in each channel, selects the base color or the blend color, whichever is darker, as the resulting color.
2	MULTIPLY	Based on the color information in each channel, multiplies the base color by the blend color. The result is always a darker color.
3	AVERAGE	Based on the color information in each channel, averages the base color and the blend color to generate the resulting color.
4	ADD	This blend mode adds pixel values.
5	SUBTRACT	Based on the color information in each channel, subtracts the blend color from the base color.
6	DIFFERENCE	Based on the color information in each channel, subtracts either the blend color from the base color or the base color from the blend color, depending on which has the greater brightness value.
7	NEGATION	This mode produces the opposite effect to difference.
8	SCREEN	Based on each channel's color information, multiplies the inverse of the blend and base colors. The resulting color is always a lighter color.
9	OVERLAY	Multiplies or screens the colors, depending on the base color.
10	DODGE	Based on the color information in each channel, brightens the base color to reflect the blend color by decreasing the contrast between the two.
11	BURN	Based on the color information in each channel, darkens the base color to reflect the blend color by increasing the contrast between the two.
12	REFLECT	This blend mode can be used to add shiny objects or area if light. Black pixels in the blend are ignored as if they were transparent.
13	GLOW	The reverse of the REFLECT mode. GLOW effectively brightens the composition by the amount of brightness in the blend layer. Black pixels in the blend layer are rendered as if they were transparent.

**Bits 10:8 – FUNC[2:0] Blending Function**

Value	Name	Description
0	ADD	$C_f = S * C_s + D * C_d$
1	SUBTRACT	$C_f = S * C_s - D * C_d$
2	REVERSE	$C_f = D * C_d + S * C_s$
3	MIN	$C_f = \text{Min}(C_s, C_d)$
4	MAX	$C_f = \text{Max}(C_s, C_d)$
5	SPE	Special blending functions

**Bits 7:4 – DCFAC[3:0] Destination Color Factor**

Value	Name	Description
0	ZERO	$(0, 0, 0, 0)$
1	ONE	$(1, 1, 1, 1)$
2	SRC_COLOR	$(A_s, R_s, G_s, B_s)$
3	ONE_MINUS_SRC_COLOR	$(1, 1, 1, 1) - (A_s, R_s, G_s, B_s)$
4	DST_COLOR	$(A_d, R_d, G_d, B_d)$
5	ONE_MINUS_DST_COLOR	$(1, 1, 1, 1) - (A_d, R_d, G_d, B_d)$
6	SRC_ALPHA	$(A_s, A_s, A_s, A_s)$
7	ONE_MINUS_SRC_ALPHA	$(1, 1, 1, 1) - (A_s, A_s, A_s, A_s)$
8	DST_ALPHA	$(A_d, A_d, A_d, A_d)$
9	ONE_MINUS_DST_ALPHA	$(1, 1, 1, 1) - (A_d, A_d, A_d, A_d)$

Value	Name	Description
10	CONSTANT_COLOR	$(A_c, R_c, G_c, B_c)$
11	ONE_MINUS_CONSTANT_COLOR	$(1, 1, 1, 1) - (A_c, R_c, G_c, B_c)$
12	CONSTANT_ALPHA	$(A_c, A_c, A_c, A_c)$
13	ONE_MINUS_CONSTANT_ALPHA	$(1, 1, 1, 1) - (A_c, A_c, A_c, A_c)$
14	SRC_ALPHA_SATURATE	$(1, i, i, i)$ where $i$ is equal to the minimum between $A_s$ and $1 - A_d$

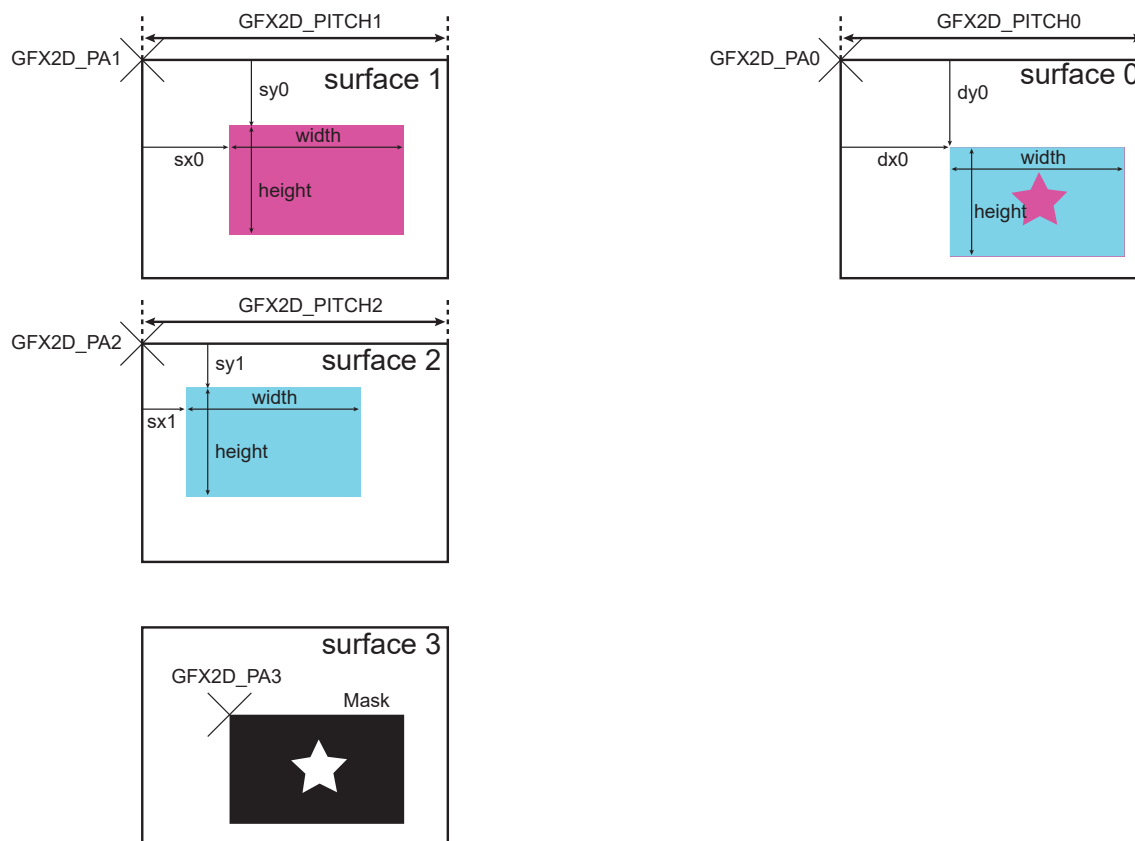

### Bits 3:0 – SCFACT[3:0] Source Color Factor

Value	Name	Description
0	ZERO	$(0, 0, 0, 0)$
1	ONE	$(1, 1, 1, 1)$
2	SRC_COLOR	$(A_s, R_s, G_s, B_s)$
3	ONE_MINUS_SRC_COLOR	$(1, 1, 1, 1) - (A_s, R_s, G_s, B_s)$
4	DST_COLOR	$(A_d, R_d, G_d, B_d)$
5	ONE_MINUS_DST_COLOR	$(1, 1, 1, 1) - (A_d, R_d, G_d, B_d)$
6	SRC_ALPHA	$(A_s, A_s, A_s, A_s)$
7	ONE_MINUS_SRC_ALPHA	$(1, 1, 1, 1) - (A_s, A_s, A_s, A_s)$
8	DST_ALPHA	$(A_d, A_d, A_d, A_d)$
9	ONE_MINUS_DST_ALPHA	$(1, 1, 1, 1) - (A_d, A_d, A_d, A_d)$
10	CONSTANT_COLOR	$(A_c, R_c, G_c, B_c)$
11	ONE_MINUS_CONSTANT_COLOR	$(1, 1, 1, 1) - (A_c, R_c, G_c, B_c)$
12	CONSTANT_ALPHA	$(A_c, A_c, A_c, A_c)$
13	ONE_MINUS_CONSTANT_ALPHA	$(1, 1, 1, 1) - (A_c, A_c, A_c, A_c)$
14	SRC_ALPHA_SATURATE	$(1, i, i, i)$ where $i$ is equal to the minimum between $A_s$ and $1 - A_d$

#### 45.4.6.4.ROP Instruction

The instruction length is 7 words.

**Figure 45.8. ROP Operations**

**Table 45.31. ROP Instruction, Classic Operations**

Word Identifier	Description	Surface Register
ROP_WD0	The instruction header	Not applicable
ROP_WD1	The width and height of the destination area D	Surface 0 registers
ROP_WD2	The x and y offsets of the destination area D	Surface 0 registers
ROP_WD3	The x and y offsets of source S	Surface 1 registers
ROP_WD4	The x and y offsets of pattern P	Surface 2 registers
ROP_WD5	A pointer to raster mask M	Surface 3 registers
ROP_WD6	Indicates the Raster Operation mode	Not applicable

#### 45.4.6.4.1.ROP\_WD0

**Name:** ROP\_WD0

**Bits 31:28 – OPCODE[3:0]** Instruction Code  
This field must be set to '0xE'.

**Bit 24 – IE** Interrupt Enable

Value	Description
0	The End of Instruction interrupt is disabled.
1	The End of Instruction interrupt is enabled.

**Bits 19:16 – REG[3:0]** Register Identifier  
When a constant is used, the constant value is located in the register defined by the REG value.

**Bits 2:0 – ARGS[2:0]** Arguments Length  
Must be set to '5'.

#### 45.4.6.4.2.ROP\_WD1

**Name:** ROP\_WD1

**Bits 28:16 – HEIGHT[12:0]** Destination Surface Height  
The surface height is set to (HEIGHT+1) pixels.

**Bits 12:0 – WIDTH[12:0]** Destination Surface Width  
The surface width is set to (WIDTH+1) pixels.

#### 45.4.6.4.3.ROP\_WD2

**Name:** ROP\_WD2

**Bits 28:16 – DY0[12:0]** Destination Y Position  
This field indicates the vertical position of the window.

**Bits 12:0 – DX0[12:0]** Destination X Position  
This field indicates the horizontal position of the window.

#### 45.4.6.4.4.ROP\_WD3

**Name:** ROP\_WD3

**Bits 28:16 – SY0[12:0]** Source Y Position

This field indicates the vertical position of the window.

**Bits 12:0 – SX0[12:0]** Source X Position

This field indicates the horizontal position of the window.

#### 45.4.6.4.5.ROP\_WD4

**Name:** ROP\_WD4

**Bits 28:16 – PY1[12:0]** Pattern Y Position

This field indicates the pattern Y position of the window.

**Bits 12:0 – PX1[12:0]** Pattern X Position

This field indicates the pattern X position of the window.

#### 45.4.6.4.6.ROP\_WD5

**Name:** ROP\_WD5

Bit	31	30	29	28	27	26	25	24

#### **Bits 31:0 – PMASK[31:0]** Mask Pointer

This field must be set to the 32-bit address of the mask memory location.

## 45.4.6.4.7.ROP\_WD6

Name: ROP\_WD6

## Bits 17:16 – ROPM[1:0] Raster Operation Mode

Value	Name	Description
0	ROP2	<p>Binary raster operation (D, S)</p> <p>Two surfaces are used (required), 16 operations are defined, D and S required.</p> <p>Mask set to 0 internally</p> <p>Pattern set to 0 internally</p> <p>Source read from memory</p> <p>ROPL field value is used to generate the logical expression. ROPL can be any value between 0 and 15 (0x00 to 0x0F).</p> <p>ROPH field is ignored.</p> <p>ROP2_BLACK D = 0 (always 0, black in RGB mode)</p> <p>ROP2_NOTMERGESOURCE D = ~(D   S) Inverse of R2_MERGESOURCE</p> <p>ROP2_MASKNOTSOURCE D = D &amp; ~S Conjunction of destination and inverse of source</p> <p>ROP2_NOTCOPYSOURCE D = ~S Inverse of source color</p> <p>ROP2_MASKSOURCENOT D = S &amp; ~D Conjunction of source and inverse of destination</p> <p>ROP2_NOT D = ~D Inverse of destination</p> <p>ROP2_XORSOURCE D = D ^ S Exclusive OR of destination and source</p> <p>ROP2_NOTMASKSOURCE D = ~(D &amp; S) Inverse of ROP2_MASKSOURCE</p> <p>ROP2_MASKSOURCE D = D &amp; P Conjunction of destination and source</p> <p>ROP2_NOTXORSOURCE D = ~(D ^ S) Inverse of ROP2_XORSOURCE</p> <p>ROP2_NOP D = D No change (copy)</p> <p>ROP2_MERGENOTSOURCE D = D   ~S Disjunction of destination and inverse of source</p> <p>ROP2_COPYSOURCE D = S</p> <p>ROP2_MERGESOURCENOT D = S   ~D Disjunction of source and inverse of destination</p> <p>ROP2_MERGESOURCE D = S   D Conjunction of source and destination</p>

Value	Name	Description
		ROP2_WHITE D = 1
1	ROP3	<p>Ternary raster operation (D, P, S) Three surfaces used, 256 operations</p> <p>Mask value set to 0</p> <p>Source read from memory</p> <p>Pattern read from memory</p> <p>ROPL used to generate the logical expression</p> <p>256 raster operations from 0x00 to 0xFF</p>
2	ROP4	<p>4-operand raster operation (D, P, S, M) Four surfaces used, 256 operations</p> <p>Mask value is read from memory (pointed by PMASK), mask is bit level.</p> <p>Source read from memory</p> <p>Pattern read from memory</p> <p>ROPL used to generate the logical expression when mask bit is cleared</p> <p>ROPH used to generate the logical expression when mask bit is set</p>

**Bits 15:8 – ROPH[7:0]** 8-bit Raster Operation High

**Bits 7:0 – ROPHL[7:0]** 8-bit Raster Operation Low

**Bits 19:16 – REGQOS3[3:0]** Regulation for QoS Level 3

This register indicates the number of clock cycles inserted between outstanding transactions. The number of clock cycles added is calculated as follows.

$$\text{Latency} = 2^{\text{REGQOS3}} - 1$$

The maximum number of clock cycles is 1023.

**Bits 15:12 – REGQOS2[3:0]** Regulation for QoS Level 2

This register indicates the number of clock cycles inserted between outstanding transactions. The number of clock cycles added is calculated as follows.

$$\text{Latency} = 2^{\text{REGQOS2}} - 1$$

The maximum number of clock cycles is 1023.

**Bits 11:8 – REGQOS1[3:0]** Regulation for QoS Level 1

This register indicates the number of clock cycles inserted between outstanding transactions. The number of clock cycles added is calculated as follows.

$$\text{Latency} = 2^{\text{REGQOS1}} - 1$$

The maximum number of clock cycles is 1023.

**Bit 6 – MTY** Memory Tile Access

Value	Description
0	GFX2D uses tile accesses.
1	GFX2D uses linear accesses.

**Bit 4 – REGEN** Outstanding Regulation Enable

Value	Description
0	Outstanding Regulation is disabled.
1	Outstanding Regulation is enabled.

## 45.5.2. GFX2D Global Enable Register

**Name:** GFX2D\_GE  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								ENABLE
Access								W
Reset								0

### Bit 0 – ENABLE GFX2D Enable

Value	Description
0	No effect.
1	Enables the GFX2D controller. This operation is permitted if the global status bit was read as '0'.

### 45.5.3. GFX2D Global Disable Register

**Name:** GFX2D\_GD  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

								WFERES
Access								W
Reset								0

Bit	7	6	5	4	3	2	1	0
								DISABLE
Access								W
Reset								0

#### Bit 8 – WFERES WFE Software Resume bit

Value	Description
0	No effect.
1	Exits the WFE state in software.

#### Bit 0 – DISABLE GFX2D Disable Bit

Value	Description
0	No effect.
1	Disables the graphics engine.

#### 45.5.4. GFX2D Global Status Register

**Name:** GFX2D\_GS  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
				BUSY				STATUS
Access				R				R
Reset				0				0

##### Bit 8 – WFEIP Wait For Event Status bit

Value	Description
0	The graphics core is running.
1	The graphics core is waiting for an event.

##### Bit 4 – BUSY GFX2D Busy Bit

Value	Description
0	The graphics core is in idle state.
1	The graphics core is busy.

##### Bit 0 – STATUS GFX2D Status Bit

Value	Description
0	The graphics engine is disabled.
1	The graphics engine is enabled.

### 45.5.5. GFX2D Interrupt Enable Register

**Name:** GFX2D\_IE  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
				IERR	BERR	RERR	EXEND	RBEMPTY
Access				W	W	W	W	W
Reset				0	0	0	0	0

**Bit 4 – IERR** Illegal Instruction Interrupt Enable Bit

**Bit 3 – BERR** Write Data Bus Error Interrupt Enable Bit

**Bit 2 – RERR** Read Data Bus Error Interrupt Enable Bit

**Bit 1 – EXEND** End of Execution Interrupt Enable Bit

**Bit 0 – RBEMPTY** Ring Buffer Empty Interrupt Enable Bit

## 45.5.6. GFX2D Interrupt Disable Register

**Name:** GFX2D\_ID  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
				IERR	BERR	RERR	EXEND	RBEMPTY
Access				W	W	W	W	W
Reset				0	0	0	0	0

**Bit 4 – IERR** Illegal Instruction Interrupt Disable bit

**Bit 3 – BERR** Write Access Error Interrupt Disable bit

**Bit 2 – RERR** Read Access Error Interrupt Disable Bit

**Bit 1 – EXEND** End of Execution Interrupt Disable Bit

**Bit 0 – RBEMPTY** Ring Buffer Empty Interrupt Disable Bit

## 45.5.7. GFX2D Interrupt Mask Register

**Name:** GFX2D\_IM  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
				IERR	BERR	RERR	EXEND	RBEMPTY
Access				R	R	R	R	R
Reset				0	0	0	0	0

**Bit 4 – IERR** Illegal Instruction Interrupt Mask Bit

**Bit 3 – BERR** Write Error Interrupt Mask Bit

**Bit 2 – RERR** Read Error Interrupt Mask Bit

**Bit 1 – EXEND** Execution Ended Empty Interrupt Mask Bit

**Bit 0 – RBEMPTY** Ring Buffer Empty Interrupt Mask Bit

**45.5.8. GFX2D Interrupt Status Register**

**Name:** GFX2D\_IS  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
				IERR	BERR	RERR	EXEND	RBEMPTY
Access				R	R	R	R	R
Reset				0	0	0	0	0

**Bit 4 – IERR** Illegal Instruction Interrupt Status Bit

Value	Description
0	The interrupt source is masked or no Illegal Instruction interrupt is pending.
1	An Illegal Instruction interrupt is pending.

**Bit 3 – BERR** Write Error Interrupt Status Bit

Value	Description
0	Either the interrupt source is masked or no Write Error interrupt is pending.
1	A Write Error interrupt is pending.

**Bit 2 – RERR** Read Error Interrupt Status Bit

Value	Description
0	Either the interrupt source is masked or no read error interrupt is pending.
1	An interrupt is pending.

**Bit 1 – EXEND** End of Execution Status Bit

Value	Description
0	Either the interrupt source is masked or no End of Execution interrupt is pending.
1	An End of Execution interrupt is pending (i.e. EXEND is '1' when GFX2D_GS.BUSY is set to '0').

**Bit 0 – RBEMPTY** Ring Buffer Empty Interrupt Status Bit

Value	Description
0	The Ring Buffer Empty interrupt has not occurred.
1	The Ring Buffer Empty interrupt has occurred since the last read of the status register.

#### 45.5.9. GFX2D Performance Configuration 0 Register

**Name:** GFX2D\_PC0  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

##### Bits 6:4 – FILT[2:0] Filter Configuration

Value	Name	Description
0	DISABLED	The filter is disabled.
1	QOS0	Events are valid when input QoS is equal to 0.
2	QOS1	Events are valid when input QoS is equal to 1.
3	QOS2	Events are valid when input QoS is equal to 2.
4	QOS3	Events are valid when input QoS is equal to 3.

##### Bits 1:0 – SEL[1:0] Performance Metrics Selection

Value	Name	Description
0	DISABLED	The performance counter is disabled and reset.
1	READ	The performance counter is incremented when a Read access is performed.
2	WRITE	The performance counter is incremented when a Write access is performed
3	CYCLE	Number of clock cycles

## 45.5.10. GFX2D Metrics Counter 0 Register

**Name:** GFX2D\_MC0  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	COUNTER[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	COUNTER[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	COUNTER[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	COUNTER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – COUNTER[31:0]** Metrics Counter

#### 45.5.11. GFX2D Performance Configuration 1 Register

**Name:** GFX2D\_PC1  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

##### Bits 6:4 – FILT[2:0] Filter Configuration

Value	Name	Description
0	DISABLED	The filter is disabled.
1	QOS0	Events are valid when input QoS is equal to 0.
2	QOS1	Events are valid when input QoS is equal to 1.
3	QOS2	Events are valid when input QoS is equal to 2.
4	QOS3	Events are valid when input QoS is equal to 3.

##### Bits 1:0 – SEL[1:0] Performance Metrics Selection

Value	Name	Description
0	DISABLED	The performance counter is disabled and reset.
1	READ	The performance counter is incremented when a Read access is performed.
2	WRITE	The performance counter is incremented when a Write access is performed
3	CYCLE	Number of clock cycles

## 45.5.12. GFX2D Metrics Counter 1

**Name:** GFX2D\_MC1  
**Offset:** 0x2C

Reset	0	0	0	0	0	0	0	0

##### Bits 15:0 – PITCH[15:0] Surface Pitch

This field indicates the surface pitch size in bytes.

## 45.5.19. GFX2D Surface x Configuration Register

**Name:** GFX2D\_CFGx  
**Offset:** 0x48 + x\*0x10 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

### Bit 4 – IDXCX Color Look-Up Table Selection

Value	Description
0	The indexed color is retrieved in Color Look-Up Table 0.
1	The indexed color is retrieved in Color Look-Up Table 1.

### Bits 3:0 – PF[3:0] Pixel Format

Value	Name	Description
0	A4IDX4	4-bit indexed color, with 4-bit alpha value
1	A8	8 bits per pixel alpha, with user-defined constant color
2	IDX8	8-bit indexed color, uses the Color Look-Up Table to expand to true color
3	A8IDX8	8-bit indexed color, with 8-bit alpha value
4	RGB12	12 bits per pixel, 4 bits per color channel
5	ARGB16	16 bits per pixel with 4-bit width alpha value, and 4 bits per color channel
6	RGB15	15 bits per pixel, 5 bits per color channel
7	TRGB16	16 bits per pixel, 5 bits for the red and blue channels and 6 bits for the green channel
8	RGBT16	16 bits per pixel, with 1 bit for transparency and 5 bits for color channels
9	RGB16	16 bits per pixel, 5 bits for the red and blue channels and 6 bits for the green channel
10	RGB24	24 bits per pixel, 8 bits for alpha and color channels
11	ARGB32	32 bits per pixel, 8 bits for alpha and color channels
12	RGBA32	32 bits per pixel, 8 bits for alpha and color channels

## 46. Image Sensor Interface (ISI)

### 46.1. Description

The Image Sensor Interface (ISI) connects a CMOS-type image sensor to the processor and provides image capture in various formats. The ISI performs data conversion, if necessary, before the storage in memory through DMA.

The ISI supports color CMOS image sensor and grayscale image sensors with a reduced set of functionalities.

In Grayscale mode, the data stream is stored in memory without any processing and so is not compatible with the LCD controller.

Internal FIFOs on the preview and codec paths are used to store the incoming data. The RGB output on the preview path is compatible with the LCD controller. This module outputs the data in RGB format (LCD compatible) and has scaling capabilities to make it compliant to the LCD display resolution (see the table [RGB Format in Default Mode, RGB\\_CFG = 00, No Swap](#)).

Several input formats such as preprocessed RGB or YCbCr are supported through the data bus interface.

The ISI supports two synchronization modes:

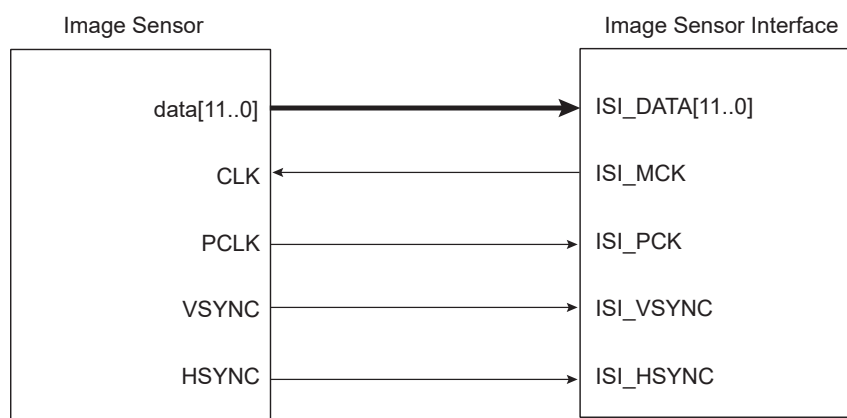

- Hardware with ISI\_VSYNC and ISI\_HSYNC signals
- International Telecommunication Union Recommendation ITU-R BT.656-4 Start-of-Active-Video (SAV) and End-of-Active-Video (EAV) synchronization sequence

Using EAV/SAV for synchronization reduces the pin count (ISI\_VSYNC, ISI\_HSYNC not used). The polarity of the synchronization pulse is programmable to comply with the sensor signals.

**Table 46.1.** I/O Description

Signal	Direction	Description
ISI_VSYNC	In	Vertical synchronization
ISI_HSYNC	In	Horizontal synchronization
ISI_DATA[11..0]	In	Sensor pixel data
ISI_MCK	Out	Main system bus clock provided to the image sensor. See <a href="#">Clocks</a> .
ISI_PCK	In	Pixel clock provided by the image sensor

**Figure 46.1.** ISI Connection Example

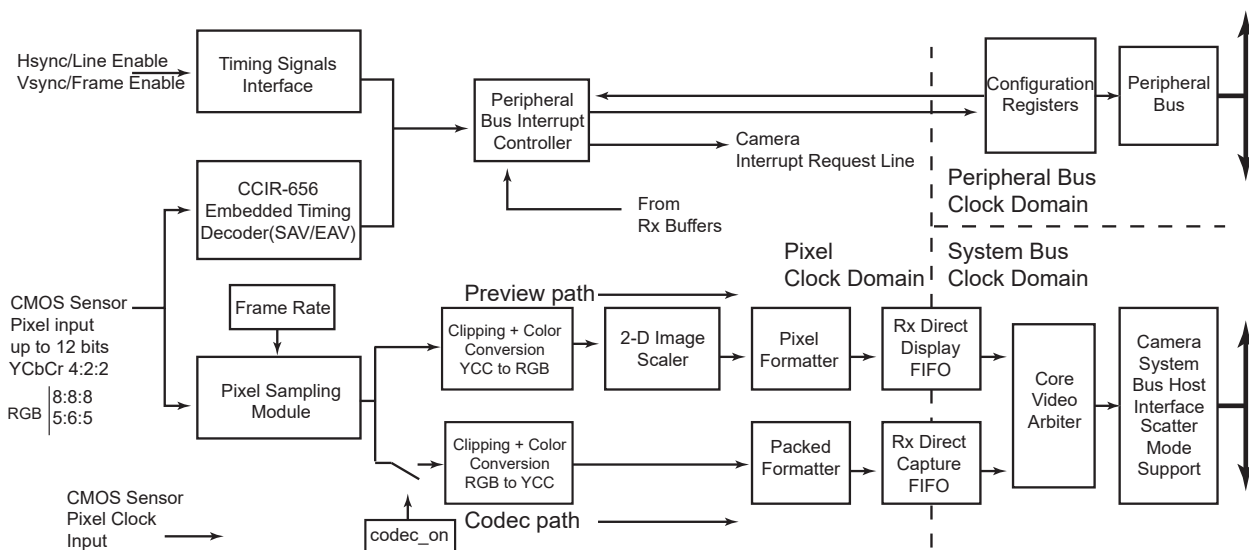

## 46.2. Embedded Characteristics

- ITU-R BT. 601/656 8-bit Mode External Interface Support
- Supports up to 12-bit Grayscale CMOS Sensors
- Support for ITU-R BT.656-4 SAV and EAV Synchronization
- Vertical and Horizontal Resolutions up to 2048 × 2048
- Preview Path up to 640 × 480 in RGB Mode
- Codec Path up to 2048 × 2048
- 256-byte FIFO on Codec Path
- 256-byte FIFO on Preview Path
- Support for Packed Data Formatting for YCbCr 4:2:2 Formats
- Preview Scaler to Generate Smaller Size image
- Programmable Frame Capture Rate
- VGA, QVGA, CIF, QCIF Formats Supported for LCD Preview
- Custom Formats with Horizontal and Vertical Preview Size as Multiples of 16 Also Supported for LCD Preview

## 46.3. Block Diagram

Figure 46.2. ISI Block Diagram

## 46.4. Product Dependencies

### 46.4.1. I/O Lines

The pins used for interfacing the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the ISI pins to their peripheral functions.

### 46.4.2. Power Management

The ISI can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the ISI clock.

**Note:** The pixel clock frequency must be lower than the bus clock frequency (peripheral clock).

#### 46.4.3. Interrupt Sources

The ISI interface has an interrupt line connected to the interrupt controller. Handling the ISI interrupt requires programming the interrupt controller before configuring the ISI.

#### 46.5. Functional Description

The Image Sensor Interface (ISI) supports direct connection to the ITU-R BT. 601/656 8-bit mode compliant sensors and up to 12-bit grayscale sensors. It receives the image data stream from the image sensor on the 12-bit data bus.

This module receives up to 12 bits for data, the horizontal and vertical synchronizations and the pixel clock. The reduced pin count alternative for synchronization is supported for sensors that embed SAV (start of active video) and EAV (end of active video) delimiters in the data stream.

The Image Sensor Interface interrupt line is connected to the Advanced Interrupt Controller and can trigger an interrupt at the beginning of each frame and at the end of a DMA frame transfer. If the SAV/EAV synchronization is used, an interrupt can be triggered on each delimiter event.

For 8-bit color sensors, the data stream received can be in several possible formats: YCbCr 4:2:2, RGB 8:8:8, RGB 5:6:5 and may be processed before the storage in memory. When the preview DMA channel is configured and enabled, the preview path is activated and an 'RGB frame' is moved to memory. The preview path frame rate is configured with the FRATE field of the ISI\_CFG1 register. When the codec DMA channel is configured and enabled, the codec path is activated and a 'YCbCr 4:2:2 frame' is captured as soon as the ISI\_CDC bit of the ISI Control Register (ISI\_CR) is set.

When the FULL bit of the ISI\_CFG1 register is set, both preview DMA channel and codec DMA channel can operate simultaneously. When a zero is written to the FULL bit of the ISI\_CFG1 register, a hardware scheduler checks the FRATE field. If its value is zero, a preview frame is skipped and a codec frame is moved to memory instead. If its value is other than zero, at least one free frame slot is available. The scheduler postpones the codec frame to that free available frame slot.

The data stream may be sent on both preview path and codec path if the value of bit ISI\_CDC in the ISI\_CR is one. To optimize the bandwidth, the codec path should be enabled only when a capture is required.

In Grayscale mode, the input data stream is stored in memory without any processing. The 12-bit data, which represent the grayscale level for the pixel, is stored in memory one or two pixels per word, depending on the GS\_MODE bit in the ISI\_CFG2 register. The codec preview datapath is not available when grayscale image is selected.

A frame rate counter allows users to capture all frames or 1 out of every 2 to 8 frames.

##### 46.5.1. Data Timing

###### 46.5.1.1. VSYNC/HSYNC Data Timing

In the VSYNC/HSYNC synchronization, the valid data is captured with the active edge of the pixel clock (ISI\_PCK), after SFD lines of vertical blanking and SLD pixel clock periods delay programmed in the ISI\_CR.

The data timing using horizontal and vertical synchronization are shown in the following figure, with VSYNC and HSYNC active high and data sampled on the rising edge of the pixel clock.

**Figure 46.3.** HSYNC and VSYNC Synchronization

#### 46.5.1.2.SAV/EAV Data Timing

The ITU-RBT.656-4 standard defines the functional timing for an 8-bit wide interface.

There are two timing reference signals, one at the beginning of each video data block SAV (0xFF000080) and one at the end of each video data block EAV (0xFF00009D). Only data sent between EAV and SAV is captured. Horizontal blanking and vertical blanking are ignored. Use of the SAV and EAV synchronization eliminates the ISI\_VSYNC and ISI\_HSYNC signals from the interface, thereby reducing the pin count. In order to retrieve both frame and line synchronization properly, at least one line of vertical blanking is mandatory.

The data timing using EAV/SAV sequence synchronization are shown in the following figure.

**Figure 46.4.** SAV and EAV Sequence Synchronization

#### 46.5.2. Data Ordering

The RGB color space format is required for viewing images on a display screen preview, and the YCbCr color space format is required for encoding.

All the sensors do not output the YCbCr or RGB components in the same order. The ISI allows the user to program the same component order as the sensor, reducing software treatments to restore the right format.

**Table 46.2.** Data Ordering in YCbCr Mode

Mode	Byte 0	Byte 1	Byte 2	Byte 3
Default	Cb(i)	Y(i)	Cr(i)	Y(i+1)
Mode 1	Cr(i)	Y(i)	Cb(i)	Y(i+1)
Mode 2	Y(i)	Cb(i)	Y(i+1)	Cr(i)
Mode 3	Y(i)	Cr(i)	Y(i+1)	Cb(i)

**Table 46.3.** RGB Format in Default Mode, RGB\_CFG = 00, No Swap

Mode	Byte	D7	D6	D5	D4	D3	D2	D1	D0
RGB 8:8:8	Byte 0	R7(i)	R6(i)	R5(i)	R4(i)	R3(i)	R2(i)	R1(i)	R0(i)

	Byte 3	B4(i+1)	B3(i+1)	B2(i+1)	B1(i+1)	B0(i+1)	G5(i+1)	G4(i+1)	G3(i+1)

**Table 46.5.** RGB Format in Default Mode, RGB\_CFG = 00, Swap Activated

Mode	Byte	D7	D6	D5	D4	D3	D2	D1	D0
RGB 8:8:8	Byte 0	R0(i)	R1(i)	R2(i)	R3(i)	R4(i)	R5(i)	R6(i)	R7(i)
	Byte 1	G0(i)	G1(i)	G2(i)	G3(i)	G4(i)	G5(i)	G6(i)	G7(i)
	Byte 2	B0(i)	B1(i)	B2(i)	B3(i)	B4(i)	B5(i)	B6(i)	B7(i)
	Byte 3	R0(i+1)	R1(i+1)	R2(i+1)	R3(i+1)	R4(i+1)	R5(i+1)	R6(i+1)	R7(i+1)
RGB 5:6:5	Byte 0	G3(i)	G4(i)	G5(i)	R0(i)	R1(i)	R2(i)	R3(i)	R4(i)
	Byte 1	B0(i)	B1(i)	B2(i)	B3(i)	B4(i)	G0(i)	G1(i)	G2(i)
	Byte 2	G3(i+1)	G4(i+1)	G5(i+1)	R0(i+1)	R1(i+1)	R2(i+1)	R3(i+1)	R4(i+1)
	Byte 3	B0(i+1)	B1(i+1)	B2(i+1)	B3(i+1)	B4(i+1)	G0(i+1)	G1(i+1)	G2(i+1)

The RGB 5:6:5 input format is processed to be displayed as RGB 5:6:5 format, compliant with the 16-bit mode of the LCD controller.

### 46.5.3. Clocks

The sensor main system bus clock (ISI\_MCK) can be generated either by the Advanced Power Management Controller (APMC) through a Programmable Clock output or by an external oscillator connected to the sensor.

None of the sensors embed a power management controller, so providing the clock by the APMC is a simple and efficient way to control power consumption of the system.

Care must be taken when programming the system clock. The ISI has two clock domains, the sensor main system bus clock and the pixel clock provided by sensor. The two clock domains are not synchronized, but the sensor main system bus clock must be faster than the pixel clock.

### 46.5.4. Preview Path

#### 46.5.4.1. Scaling, Decimation (Subsampling)

This module resizes captured 8-bit color sensor images to fit the LCD display format. The resize module performs only downscaling. The same ratio is applied for both horizontal and vertical resize, then a fractional decimation algorithm is applied.

The decimation factor is a multiple of 1/16; values 0 to 15 are forbidden.

**Table 46.6.** Decimation Factor

Decimation Value	0-15	16	17	18	19	...	124	125	126	127
Decimation Factor	—	1	1.063	1.125	1.188	...	7.750	7.813	7.875	7.938

**Table 46.7.** Decimation and Scaler Offset Values

OUTPUT	INPUT	352 × 288	640 × 480	800 × 600	1280 × 1024	1600 × 1200	2048 × 1536
VGA 640 × 480	F	—	16	20	32	40	51
QVGA 320 × 240	F	16	32	40	64	80	102
CIF 352 × 288	F	16	26	33	56	66	85
QCIF 176 × 144	F	32	53	66	113	133	170

Example:

- Input 1280 × 1024 Output = 640 × 480
- Hratio = 1280/640 = 2
- Vratio = 1024/480 = 2.1333
- The decimation factor is 2 so 32/16.

**Figure 46.5.** Resize Examples

#### 46.5.4.2. Color Space Conversion

This module converts YCrCb or YUV pixels to RGB color space. Clipping is performed to ensure that the samples value do not exceed the allowable range. The conversion matrix is defined below and is fully programmable:

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} C_0 & 0 & C_1 \\ C_0 & -C_2 & -C_3 \\ C_0 & C_4 & 0 \end{bmatrix} \times \begin{bmatrix} Y - Y_{\text{off}} \\ C_b - C_{\text{boff}} \\ C_r - C_{\text{roff}} \end{bmatrix}$$

Example of programmable value to convert YCrCb to RGB:

$$\begin{cases} R = 1.164 \cdot (Y - 16) + 1.596 \cdot (C_r - 128) \\ G = 1.164 \cdot (Y - 16) - 0.813 \cdot (C_r - 128) - 0.392 \cdot (C_b - 128) \\ B = 1.164 \cdot (Y - 16) + 2.107 \cdot (C_b - 128) \end{cases}$$

An example of programmable value to convert from YUV to RGB:

$$\begin{cases} R = Y + 1.596 \cdot V \\ G = Y - 0.394 \cdot U - 0.436 \cdot V \\ B = Y + 2.032 \cdot U \end{cases}$$

### 46.5.4.3. Memory Interface

#### 46.5.4.3.1. RGB Mode

The preview datapath contains a data formatter that converts 8:8:8 pixel to RGB 5:6:5 format compliant with the 16-bit format of the LCD controller. In general, when converting from a color channel with more bits to one with fewer bits, the formatter module discards the lower-order bits.

For example, converting from RGB 8:8:8 to RGB 5:6:5, the formatter module discards the three LSBs from the red and blue channels, and two LSBs from the green channel.

#### 46.5.4.3.2. 12-bit Grayscale Mode

ISI\_DATA[11:0] is the physical interface to the ISI. These bits are sampled and written to memory.

When 12-bit Grayscale mode is enabled, two memory formats are supported:

ISI\_CFG2.GS\_MODE = 0: two pixels per word

ISI\_CFG2.GS\_MODE = 1: one pixel per word

The following tables illustrate the Grayscale memory mapping configuration for 12-bit data for both formats.

**Table 46.8.** ISI\_CFG2.GS\_MODE = 0 (two pixels per word), with ISI\_CFG1.GRAYLE = 0

Bit	31	30	29	28	27	26	25	24
	Pixel 0 [11:4]							
Bit	23	22	21	20	19	18	17	16
	Pixel 0 [3:0]				-	-	-	-
Bit	15	14	13	12	11	10	9	8
	Pixel 1 [11:4]							
Bit	7	6	5	4	3	2	1	0
	Pixel 1 [3:0]				-	-	-	-

#### 46.5.4.3.3.8-bit Grayscale Mode

For 8-bit Grayscale mode, ISI\_DATA[7:0] on the 12-bit data bus is the physical interface to the ISI. These bits are sampled and written to memory.

To enable 8-bit Grayscale mode, configure ISI\_CFG2 as follows:

- Clear ISI\_CFG2.GRAYSCALE.
- Clear ISI\_CFG2.RGB\_SWAP.
- Clear ISI\_CFG2.COL\_SPACE.
- Configure the field ISI\_CFG2.YCC\_SWAP to value 0.
- Configure the field ISI\_CFG2.IM\_VSIZE with the vertical resolution of the image minus 1.
- Configure the field ISI\_CFG2.IM\_HSIZE with the horizontal resolution of the image divided by 2. The horizontal resolution must be a multiple of 2.

The codec datapath is used to capture the 8-bit grayscale image. Use the following configuration:

- Set ISI\_DMA\_C\_CTRL.C\_FETCH.
- Configure ISI\_DMA\_C\_DSCR.C\_DSCR with the descriptor address.
- Write a one to the bit ISI\_DMA\_CHER.C\_CH\_EN.

**Table 46.11.** Memory Mapping for 8-bit Grayscale Mode

Bit	31	30	29	28	27	26	25	24

	Pixel 1							
Bit	7	6	5	4	3	2	1	0
	Pixel 0							

#### 46.5.4.4.FIFO and DMA Features

Both preview and codec datapaths contain FIFOs. These asynchronous buffers are used to safely transfer formatted pixels from the pixel clock domain to the system bus clock domain. A video arbiter is used to manage FIFO thresholds and triggers a relevant DMA request through the system bus host interface. Thus, depending on the FIFO state, a specified length burst is asserted. Regarding the system bus host interface, it supports Scatter DMA mode through linked list operation. This mode of operation improves flexibility of image buffer location and allows the user to allocate two or more frame buffers. The destination frame buffers are defined by a series of Frame Buffer Descriptors (FBD). Each FBD controls the transfer of one entire frame and then optionally loads a further FBD to switch the DMA operation at another frame buffer address. The FBD is defined by a series of three words. The first word defines the current frame buffer address (named DMA\_X\_ADDR register), the second defines control information (named DMA\_X\_CTRL register) and the third defines the next descriptor address (named DMA\_X\_DSCR). DMA Transfer mode with linked list support is available for both codec and preview datapaths. The data to be transferred described by an FBD requires several burst accesses. In the following example, the use of two ping-pong frame buffers is described.

Example:

The first FBD, stored at address 0x00030000, defines the location of the first frame buffer. This address is programmed in the ISI user interface DMA\_P\_DSCR. To enable the descriptor fetch operation, the value 0x00000001 must be written to the DMA\_P\_CTRL register. LLI\_0 and LLI\_1 are the two descriptors of the linked list.

Destination address: frame buffer ID0 0x02A000 (LLI\_0.DMA\_P\_ADDR)

Transfer 0 Control Information, fetch and writeback: 0x00000003 (LLI\_0.DMA\_P\_CTRL)

Next FBD address: 0x00030010 (LLI\_0.DMA\_P\_DSCR)

The second FBD, stored at address 0x00030010, defines the location of the second frame buffer.

Destination address: frame buffer ID1 0x0003A000 (LLI\_1.DMA\_P\_ADDR)

Transfer 1 Control information fetch and writeback: 0x00000003 (LLI\_1.DMA\_P\_CTRL)

The third FBD address: 0x00030000, wrapping to first FBD (LLI\_1.DMA\_P\_DSCR)

Using this technique, several frame buffers can be configured through the linked list. The following figure illustrates a typical three-frame buffer application. Frame n is mapped to frame buffer 0, frame n+1 is mapped to frame buffer 1, frame n+2 is mapped to frame buffer 2 and further frames wrap. A codec request occurs, and the full-size 4:2:2 encoded frame is stored in a dedicated memory space.

**Figure 46.6.** Three Frame Buffers Application and Memory Mapping

#### 46.5.5. Codec Path

##### 46.5.5.1. Color Space Conversion

Depending on user selection, this module can be bypassed so that input YCrCb stream is directly connected to the format converter module. If the RGB input stream is selected, this module converts RGB to YCrCb color space with the formulas given below:

$$\begin{bmatrix} Y \\ C_r \\ C_b \end{bmatrix} = \begin{bmatrix} C_0 & C_1 & C_2 \\ C_3 & -C_4 & -C_5 \\ -C_6 & -C_7 & C_8 \end{bmatrix} \times \begin{bmatrix} R \\ G \\ B \end{bmatrix} + \begin{bmatrix} Y_{\text{off}} \\ C_{r\text{off}} \\ C_{b\text{off}} \end{bmatrix}$$

An example of coefficients is given below:

$$\begin{cases} Y = 0.257 \cdot R + 0.504 \cdot G + 0.098 \cdot B + 16 \\ C_r = 0.439 \cdot R - 0.368 \cdot G - 0.071 \cdot B + 128 \\ C_b = -0.148 \cdot R - 0.291 \cdot G + 0.439 \cdot B + 128 \end{cases}$$

#### 46.5.5.2.Memory Interface

Dedicated FIFOs are used to support packed memory mapping. YCrCb pixel components are sent in a single 32-bit word in a contiguous space (packed). Data is stored in the order of natural scan lines. Planar mode is not supported.

#### 46.5.5.3.DMA Features

Like preview datapath, codec datapath DMA mode uses linked list operation.

#### 46.5.6. Register Write Protection

To prevent any single software error from corrupting ISI behavior, certain registers in the address space can be write-protected by setting the bits WPEN in [ISI\\_WPMR](#).

The following registers are write-protected when ISI\_WPMR.WPEN is set:

- [ISI\\_CFG1](#)
- [ISI\\_CFG2](#)
- [ISI\\_PSIZE](#)
- [ISI\\_PDECF](#)
- [ISI\\_Y2R\\_SET0](#)
- [ISI\\_Y2R\\_SET1](#)
- [ISI\\_R2Y\\_SET0](#)
- [ISI\\_R2Y\\_SET1](#)
- [ISI\\_R2Y\\_SET2](#)

## 46.6. Register Summary

**Note:** Several parts of the ISI controller use the pixel clock provided by the image sensor (ISI\_PCK). Thus the user must first program the image sensor to provide this clock (ISI\_PCK) before programming the Image Sensor Controller.

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0		

**Bits 31:24 – SFD[7:0]** Start of Frame Delay  
 SFD lines are skipped at the beginning of the frame.

**Bits 23:16 – SLD[7:0]** Start of Line Delay  
 SLD pixel clock periods to wait before the beginning of a line.

**Bits 14:13 – THMASK[1:0]** Threshold Mask

Value	Name	Description
0	BEATS_4	Only 4-beat bursts allowed
1	BEATS_8	Only 4- and 8-beat bursts allowed
2	BEATS_16	4-, 8- and 16-beat bursts allowed

**Bit 12 – FULL** Full Mode is Allowed

Value	Description
0	The codec frame is transferred to memory when an available frame slot is detected.
1	Both preview and codec DMA channels are operating simultaneously.

**Bit 11 – DISCR** Disable Codec Request

Value	Description
0	Codec datapath DMA interface requires a request to restart.
1	Codec datapath DMA automatically restarts.

**Bits 10:8 – FRATE[2:0]** Frame Rate [0..7]

Value	Description
0	All the frames are captured, else one frame every FRATE + 1 is captured.

#### Bit 7 – CRC\_SYNC Embedded Synchronization Correction

Value	Description
0	No CRC correction is performed on embedded synchronization.
1	CRC correction is performed. If the correction is not possible, the current frame is discarded and the CRC_ERR bit is set in the ISI_SR.

#### Bit 6 – EMB\_SYNC Embedded Synchronization

Value	Description
0	Synchronization by HSYNC, VSYNC.
1	Synchronization by embedded synchronization sequence SAV/EAV.

#### Bit 5 – GRAYLE Grayscale Little Endian

See the tables [ISI\\_CFG2.GS\\_MODE = 0 \(two pixels per word\)](#), with [ISI\\_CFG1.GRAYLE = 0](#) and [ISI\\_CFG2.GS\\_MODE = 0 \(two pixels per word\)](#), with [ISI\\_CFG1.GRAYLE = 1](#) for details.

Value	Description
0	The two pixels are represented in big-endian format within a 32-bit register.
1	The two pixels are represented in little-endian format within a 32-bit register.

#### Bit 4 – PIXCLK\_POL Pixel Clock Polarity

Value	Description
0	Data is sampled on rising edge of pixel clock.
1	Data is sampled on falling edge of pixel clock.

#### Bit 3 – VSYNC\_POL Vertical Synchronization Polarity

Value	Description
0	VSYNC active high
1	VSYNC active low

#### Bit 2 – HSYNC\_POL Horizontal Synchronization Polarity

Value	Description
0	HSYNC active high
1	HSYNC active low

## 46.6.2. ISI Configuration 2 Register

**Name:** ISI\_CFG2  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if WPEN is cleared in [ISI\\_WPMR](#).

Bit	31	30	29	28	27	26	25	24
	RGB_CFG[1:0]		YCC_SWAP[1:0]			IM_HSIZE[10:8]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

Reset	0	0	0	0	0	0	0	0

### Bits 31:30 – RGB\_CFG[1:0] RGB Pixel Mapping Configuration

Defines RGB pattern when RGB\_MODE is set to 1.

If RGB\_MODE is set to RGB 8:8:8, then RGB\_CFG = 1 implies the BGR color sequence, else it implies the RGB color sequence.

Value	Name	Description
0	DEFAULT	Byte 0 R/G(MSB) Byte 1 G(LSB)/B Byte 2 R/G(MSB) Byte 3 G(LSB)/B
1	MODE1	Byte 0 B/G(MSB) Byte 1 G(LSB)/R Byte 2 B/G(MSB) Byte 3 G(LSB)/R
2	MODE2	Byte 0 G(LSB)/R Byte 1 B/G(MSB) Byte 2 G(LSB)/R Byte 3 B/G(MSB)
3	MODE3	Byte 0 G(LSB)/B Byte 1 R/G(MSB) Byte 2 G(LSB)/B Byte 3 R/G(MSB)

**Bits 29:28 – YCC\_SWAP[1:0]** YCrCb Format Swap Mode

Defines the YCC image data.

Value	Name	Description
0	DEFAULT	Byte 0 Cb(i) Byte 1 Y(i) Byte 2 Cr(i) Byte 3 Y(i+1)
1	MODE1	Byte 0 Cr(i) Byte 1 Y(i) Byte 2 Cb(i) Byte 3 Y(i+1)
2	MODE2	Byte 0 Y(i) Byte 1 Cb(i) Byte 2 Y(i+1) Byte 3 Cr(i)
3	MODE3	Byte 0 Y(i) Byte 1 Cr(i) Byte 2 Y(i+1) Byte 3 Cb(i)

**Bits 26:16 – IM\_HSIZE[10:0]** Horizontal Size of the Image Sensor [0..2047]

If 8-bit Grayscale mode is enabled, IM\_HSIZE = (Horizontal size/2) - 1.

Else IM\_HSIZE = Horizontal size - 1.

**Bit 15 – COL\_SPACE** Color Space for the Image Data

Value	Description
0	YCbCr.
1	RGB.

**Bit 14 – RGB\_SWAP** RGB Format Swap Mode

When Grayscale mode is enabled (GRAYSCALE=1) or the color space is configured in YCbCr mode (COL\_SPACE=0), the bit RGB\_SWAP must be cleared.

Value	Description
0	No swap.
1	RGB data bus is swapped (D[7:0] is translated into D[0:7]).

**Bit 13 – GRAYSCALE** Grayscale Mode Format Enable

Value	Description
0	Grayscale mode is disabled.
1	Input image is assumed to be grayscale-coded.

**Bit 12 – RGB\_MODE** RGB Input Mode

Value	Description
0	RGB 8:8:8 24 bits.
1	RGB 5:6:5 16 bits.

**Bit 11 – GS\_MODE** Grayscale Pixel Format Mode

Value	Description
0	2 pixels per word.
1	1 pixel per word.

**Bits 10:0 – IM\_VSIZE[10:0]** Vertical Size of the Image Sensor [0..2047]  
IM\_VSIZE = Vertical size - 1

### 46.6.3. ISI Preview Size Register

**Name:** ISI\_PSIZE  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if WPEN is cleared in [ISI\\_WPMR](#).

Bit	31	30	29	28	27	26	25	24
							PREV_HSIZE[9:8]	
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16
	PREV_HSIZE[7:0]

Access							R/W	R/W
Reset							0	0
Bit	7	6	5	4	3	2	1	0
	PREV_VSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 25:16 – PREV\_HSIZE[9:0]** Horizontal Size for the Preview Path  
PREV\_HSIZE = Horizontal Preview size - 1 (640 max only in RGB mode).

**Bits 9:0 – PREV\_VSIZE[9:0]** Vertical Size for the Preview Path  
PREV\_VSIZE = Vertical Preview size - 1 (480 max only in RGB mode).

#### 46.6.4. ISI Preview Decimation Factor Register

**Name:** ISI\_PDECF  
**Offset:** 0x0C  
**Reset:** 0x00000010  
**Property:** Read/Write

This register can only be written if WPEN is cleared in [ISI\\_WPMR](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	DEC_FACTOR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	1	0	0	0	0

##### Bits 7:0 – DEC\_FACTOR[7:0] Decimation Factor

DEC\_FACTOR is 8-bit width, range is from 16 to 255. Values from 0 to 16 do not perform any decimation.

**46.6.5. ISI Color Space Conversion YCrCb to RGB Set 0 Register**

**Name:** ISI\_Y2R\_SET0  
**Offset:** 0x10  
**Reset:** 0x6832CC95  
**Property:** Read/Write

This register can only be written if WPEN is cleared in [ISI\\_WPMR](#).

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
						ISI_SRST	ISI_DIS	ISI_EN
Access						W	W	W
Reset						–	–	–

##### Bit 8 – ISI\_CDC ISI Codec Request

Write a one to this bit to enable the codec datapath and capture a full resolution frame. A new request cannot be taken into account while CDC\_PND bit is active in the ISI\_SR.

##### Bit 2 – ISI\_SRST ISI Software Reset Request

Write a one to this bit to request a software reset of the module. Software must poll the SRST bit in the ISI\_SR to verify that the software request command has terminated.

##### Bit 1 – ISI\_DIS ISI Module Disable Request

Write a one to this bit to disable the module. If both ISI\_EN and ISI\_DIS are asserted at the same time, the disable request is not taken into account. Software must poll the DIS\_DONE bit in the ISI\_SR to verify that the command has successfully completed.

##### Bit 0 – ISI\_EN ISI Module Enable Request

Write a one to this bit to enable the module. Software must poll the ENABLE bit in the ISI\_SR to verify that the command has successfully completed.

**46.6.11. ISI Status Register**

**Name:** ISI\_SR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
					FR_OVR	CRC_ERR	C_OVR	P_OVR
Access					R	R	R	R
Reset					0	0	0	0

Access						R		R
Reset						0		0

Bit	7	6	5	4	3	2	1	0
						SRST	DIS_DONE	ENABLE
Access						R	R	R
Reset						0	0	0

**Bit 27 – FR\_OVR** Frame Rate Overrun (cleared on read)

Value	Description
0	No frame overrun
1	Frame overrun. The current frame is being skipped because a vsync signal has been detected while flushing FIFOs since the last read of ISI_SR.

**Bit 26 – CRC\_ERR** CRC Synchronization Error (cleared on read)

Value	Description
0	No CRC error in the embedded synchronization frame (SAV/EAV)
1	Embedded Synchronization Correction is enabled (CRC_SYNC bit is set) in the ISI_CR and an error has been detected and not corrected since the last read of ISI_SR. The frame is discarded and the ISI waits for a new one.

**Bit 25 – C\_OVR** Codec Datapath Overflow (cleared on read)

Value	Description
0	No overflow
1	An overrun condition has occurred in input FIFO on the codec path. The overrun happens when the FIFO is full and an attempt is made to write a new sample to the FIFO since the last read of ISI_SR.

**Bit 24 – P\_OVR** Preview Datapath Overflow (cleared on read)

Value	Description
0	No overflow
1	An overrun condition has occurred in input FIFO on the preview path. The overrun happens when the FIFO is full and an attempt is made to write a new sample to the FIFO since the last read of ISI_SR.

**Bit 19 – SIP** Synchronization in Progress

When the status of the preview or codec DMA channel is modified, a minimum amount of time is required to perform the clock domain synchronization.

Value	Description
0	The clock domain synchronization process is terminated.
1	This bit is set when the clock domain synchronization operation occurs. No modification of the channel status is allowed when this bit is set, to guarantee data integrity.

**Bit 17 – CXFR\_DONE** Codec DMA Transfer has Terminated (cleared on read)

Value	Description
0	Codec transfer done not detected.
1	Codec transfer done detected. When set, this bit indicates that the data transfer on the codec channel has completed since the last read of ISI_SR.

**Bit 16 – PXFR\_DONE** Preview DMA Transfer has Terminated (cleared on read)

Value	Description
0	Preview transfer done not detected.
1	Preview transfer done detected. When set, this bit indicates that the data transfer on the preview channel has completed since the last read of ISI_SR.

**Bit 10 – VSYNC** Vertical Synchronization (cleared on read)

Value	Description
0	Indicates that the vertical synchronization has not been detected since the last read of the ISI_SR.
1	Indicates that a vertical synchronization has been detected since the last read of the ISI_SR.

**Bit 8 – CDC\_PND** Pending Codec Request

Value	Description
0	Indicates that no codec request is pending
1	Indicates that the request has been taken into account but cannot be serviced within the current frame. The operation is postponed to the next frame.

**Bit 2 – SRST** Module Software Reset Request has Terminated (cleared on read)

Value	Description
0	Indicates that the request is not completed (if a request was issued).
1	Software reset request has completed. This flag is reset after a read operation.

**Bit 1 – DIS\_DONE** Module Disable Request has Terminated (cleared on read)

Value	Description
0	Indicates that the request is not completed (if a request was issued).
1	Disable request has completed. This flag is reset after a read operation.

**Bit 0 – ENABLE** Module Enable

Value	Description
0	Module is disabled.
1	Module is enabled.

## 46.6.12. ISI Interrupt Enable Register

**Name:** ISI\_IER  
**Offset:** 0x2C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
					FR_OVR	CRC_ERR	C_OVR	P_OVR

Access						W	W	
Reset						–	–	

### Bit 27 – FR\_OVR Frame Rate Overflow Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

### Bit 26 – CRC\_ERR Embedded Synchronization CRC Error Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

### Bit 25 – C\_OVR Codec Datapath Overflow Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

### Bit 24 – P\_OVR Preview Datapath Overflow Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

### Bit 17 – CXFR\_DONE Codec DMA Transfer Done Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

**Bit 16 – PXFR\_DONE** Preview DMA Transfer Done Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

**Bit 10 – VSYNC** Vertical Synchronization Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

**Bit 2 – SRST** Software Reset Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

**Bit 1 – DIS\_DONE** Disable Done Interrupt Enable

Value	Description
0	No effect.
1	Enables the corresponding interrupt.

### 46.6.13. ISI Interrupt Disable Register

**Name:** ISI\_IDR  
**Offset:** 0x30  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
					FR_OVR	CRC_ERR	C_OVR	P_OVR
Access					W	W	W	W
Reset					–	–	–	–

Access						W	W	
Reset						–	–	

#### Bit 27 – FR\_OVR Frame Rate Overflow Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

#### Bit 26 – CRC\_ERR Embedded Synchronization CRC Error Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

#### Bit 25 – C\_OVR Codec Datapath Overflow Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

#### Bit 24 – P\_OVR Preview Datapath Overflow Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

#### Bit 17 – CXFR\_DONE Codec DMA Transfer Done Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

**Bit 16 – PXFR\_DONE** Preview DMA Transfer Done Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

**Bit 10 – VSYNC** Vertical Synchronization Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

**Bit 2 – SRST** Software Reset Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

**Bit 1 – DIS\_DONE** Disable Done Interrupt Disable

Value	Description
0	No effect.
1	Disables the corresponding interrupt.

## 46.6.14. ISI Interrupt Mask Register

**Name:** ISI\_IMR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Reset						0	0	

### Bit 27 – FR\_OVR Frame Rate Overrun

Value	Description
0	The Frame Rate Overrun interrupt is disabled.
1	The Frame Rate Overrun is enabled.

### Bit 26 – CRC\_ERR CRC Synchronization Error

Value	Description
0	The CRC Synchronization Error interrupt is disabled.
1	The CRC Synchronization Error interrupt is enabled.

### Bit 25 – C\_OVR Codec FIFO Overflow

Value	Description
0	The Codec FIFO Overflow interrupt is disabled.
1	The Codec FIFO Overflow interrupt is enabled.

### Bit 24 – P\_OVR Preview FIFO Overflow

Value	Description
0	The Preview FIFO Overflow interrupt is disabled.
1	The Preview FIFO Overflow interrupt is enabled.

### Bit 17 – CXFR\_DONE Codec DMA Transfer Completed

Value	Description
0	The Codec DMA Transfer Completed interrupt is disabled.
1	The Codec DMA Transfer Completed interrupt is enabled.

#### Bit 16 – PXFR\_DONE Preview DMA Transfer Completed

Value	Description
0	The Preview DMA Transfer Completed interrupt is disabled.
1	The Preview DMA Transfer Completed interrupt is enabled.

#### Bit 10 – VSYNC Vertical Synchronization

Value	Description
0	The Vertical Synchronization interrupt is disabled.
1	The Vertical Synchronization interrupt is enabled.

#### Bit 2 – SRST Software Reset Completed

Value	Description
0	The Software Reset Completed interrupt is disabled.
1	The Software Reset Completed interrupt is enabled.

#### Bit 1 – DIS\_DONE Module Disable Operation Completed

Value	Description
0	The Module Disable Operation Completed interrupt is disabled.
1	The Module Disable Operation Completed interrupt is enabled.

## 46.6.15. DMA Channel Enable Register

**Name:** ISI\_DMA\_CHER

**Offset:** 0x38

**Reset:** –

**Property:** Write-only

Access							W	W
Reset							–	–

### Bit 1 – C\_CH\_DIS Codec Channel Disable Request

Value	Description
0	No effect.
1	Disables the channel. Poll C_CH_S in DMA_CHSR to verify that the codec channel status has been successfully modified.

### Bit 0 – P\_CH\_DIS Preview Channel Disable Request

Value	Description
0	No effect.
1	Disables the channel. Poll P_CH_S in DMA_CHSR to verify that the preview channel status has been successfully modified.

## 46.6.17. DMA Channel Status Register

**Name:** ISI\_DMA\_CHSR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							C_CH_S	P_CH_S
Access							R	R
Reset							0	0

### Bit 1 – C\_CH\_S Code DMA Channel Status

Value	Description
0	Indicates that the Codec DMA channel is disabled.
1	Indicates that the Codec DMA channel is enabled.

### Bit 0 – P\_CH\_S Preview DMA Channel Status

Value	Description
0	Indicates that the Preview DMA channel is disabled.
1	Indicates that the Preview DMA channel is enabled.

#### 46.6.18. DMA Preview Base Address Register

**Name:** ISI\_DMA\_P\_ADDR  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	P_ADDR[29:22]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	P_ADDR[21:14]

Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

**Bits 31:2 – P\_ADDR[29:0]** Preview Image Base Address  
This address is word-aligned.

#### 46.6.19. DMA Preview Control Register

**Name:** ISI\_DMA\_P\_CTRL  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 3 – P\_DONE** Preview Transfer Done  
This bit is only updated in the memory.

Value	Description
0	The transfer related to this descriptor has not been performed.
1	The transfer related to this descriptor has completed. This bit is updated in memory at the end of the transfer, when writeback operation is enabled.

**Bit 2 – P\_IEN** Transfer Done Flag Control

Value	Description
0	Preview transfer done flag generation is enabled.
1	Preview transfer done flag generation is disabled.

**Bit 1 – P\_WB** Descriptor Writeback Control Bit

Value	Description
0	Preview channel writeback operation is disabled.
1	Preview channel writeback operation is enabled.

**Bit 0 – P\_FETCH** Descriptor Fetch Control Bit

Value	Description
0	Preview channel fetch operation is disabled.
1	Preview channel fetch operation is enabled.

## 46.6.20. DMA Preview Descriptor Address Register

**Name:** ISI\_DMA\_P\_DSCR  
**Offset:** 0x4C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

**Bits 23:8 – WPVSR[15:0] Write Protection Violation Source**

Value	Name
0	No Write Protection Violation occurred since the last read of this register (ISI_WPSR).
1	Write access in ISI_CFG1 while Write Protection was enabled (since the last read).
2	Write access in ISI_CFG2 while Write Protection was enabled (since the last read).
3	Write access in ISI_PSIZE while Write Protection was enabled (since the last read).
4	Write access in ISI_PDECF while Write Protection was enabled (since the last read).
5	Write access in ISI_Y2R_SET0 while Write Protection was enabled (since the last read).
6	Write access in ISI_Y2R_SET1 while Write Protection was enabled (since the last read).
7	Write access in ISI_R2Y_SET0 while Write Protection was enabled (since the last read).
8	Write access in ISI_R2Y_SET1 while Write Protection was enabled (since the last read).
9	Write access in ISI_R2Y_SET2 while Write Protection was enabled (since the last read).

**Bit 0 – WPVS Write Protection Violation Status**

Value	Name
0	No write protection violation occurred since the last read of ISI_WPSR.
1	A write protection violation has occurred since the last read of the ISI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

# Audio Subsystem

## 47. Overview

### 47.1. Components

The audio subsystem is made of the following components. Unless otherwise specified, all except the CLASSD controller are designed to handle audio sample rates up to 192 kHz.

- 1x Synchronous Serial Controller (SSC)
  - The maximum bit clock (TK or RK) speed is 25 MHz in Host or Client mode on both the receiver and the transmitter.
  - As an example, in TDM mode, this corresponds to up to 4x 32-bit channels at 192 kHz, or up to 8x 32-bit channels at 96 kHz.
- 1x Inter-IC Sound Multi Channel Controller (I2SMCC)
  - The maximum bit clock (I2SMCC\_SCK) speed is 25 MHz in both Host and Client modes.
  - In TDM256 mode, this corresponds to 8x 32-bit channels at 96 kHz.
- 1x Stereo Class D Controller (CLASSD)
  - Fixed PWM frequency operation in the 750 to 800 kHz range
  - Targeted to low-end audio applications
  - Embedded interpolation filters to accommodate standard audio sampling rates

### 47.2. Product Dependencies

#### 47.2.1. Clocks

All clocks are controlled by the PMC, which is part of the system controller.

#### 47.2.2. Interrupts

Refer to the table [Peripheral Identifiers](#).

#### 47.2.3. Reset

Audio peripherals are connected to the processor and peripherals reset line.

#### 47.2.4. I/Os

Audio I/Os are multiplexed on GPIOs with various power supplies. For the applicable I/O type and power supply, refer to the [Pin Description](#) table.

### 47.3. Special Functions in SFR

None.

## 48. Audio Class D Amplifier (CLASSD)

### 48.1. Description

The Audio Class D Amplifier (CLASSD) is a digital input, Pulse Width Modulated (PWM) output stereo Class D amplifier. It features a high-quality interpolation filter embedding a digitally-controlled gain, an equalizer and a de-emphasis filter.

On its input side, the CLASSD is compatible with most common audio data rates. On the output side, its PWM output can drive either:

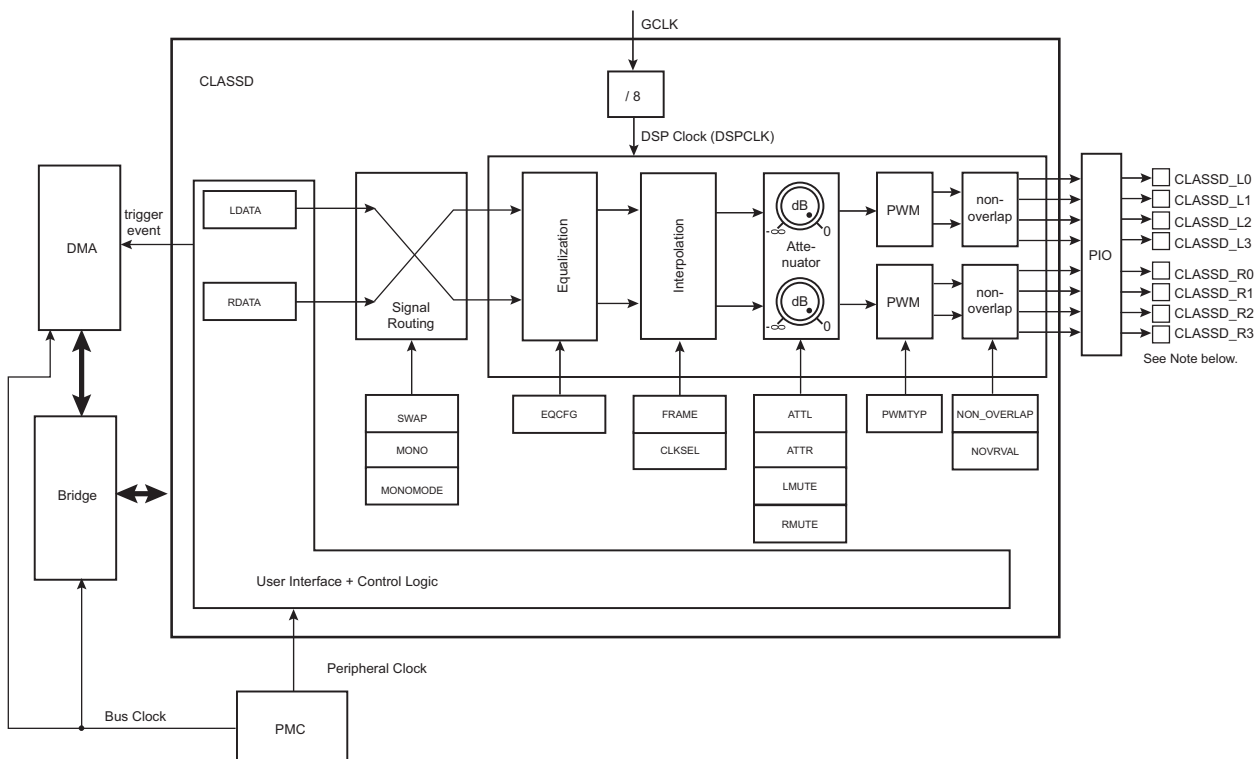

- high-impedance single-ended or differential output loads (Audio DAC application) or,
- external MOSFETs through an integrated non-overlapping circuit (Class D power amplifier application).

### 48.2. Embedded Characteristics

- PWM Class D Amplifier
- 16-bit Audio Data
- DSP Clocks: 12.288 and 11.2896 MHz
- Input Sampling Rates: 8, 16, 32, 48, 96, 22.05, 44.1, 88.2 kHz
- 3-band Equalizer
- De-emphasis Filter
- Digital Volume Control
- Differential or Single-ended Outputs
- Non-overlapping Circuit to Control External MOSFETs
- Supports DMA

## 48.3. Block Diagram

Figure 48.1. CLASSD Block Diagram

Note:  
CLASSD is stereo but depending on the available I/O at the product level, only one (right or left) channel may be accessed.  
Refer to the product pin description table.

## 48.4. Pin Name List

Table 48.1. Output Pins Assignment Versus Application Use Cases

Pin	External MOS Driver (NON_OVERLAP = 1)		Direct Load (NON_OVERLAP = 0)		Type
	Full H-Bridge (PWMTYP = 1)	Half H-Bridge (PWMTYP = 0)	Differential Load (PWMTYP = 1)	Single-Ended Load (PWMTYP = 0)	
	Use Case 1	Use Case 2	Use Cases 3A & 3B	Use Cases 4A & 4B	
CLASSD_L0	gate_pmos_leftp	gate_pmos_left	leftp	left	Output
CLASSD_L1	gate_nmos_leftp	gate_nmos_left	Not used (fixed to 0)	Not used (fixed to 0)	Output
CLASSD_L2	gate_pmos_leftn	Not used (fixed to 1)	leftn	Not used (fixed to 0)	Output
CLASSD_L3	gate_nmos_leftn	Not used (fixed to 1)	Not used (fixed to 0)	Not used (fixed to 0)	Output
CLASSD_R0	gate_pmos_rightp	gate_pmos_right	rightp	right	Output
CLASSD_R1	gate_nmos_rightp	gate_nmos_right	Not used (fixed to 0)	Not used (fixed to 0)	Output
CLASSD_R2	gate_pmos_rightn	Not used (fixed to 1)	rightn	Not used (fixed to 0)	Output
CLASSD_R3	gate_nmos_rightn	Not used (fixed to 1)	Not used (fixed to 0)	Not used (fixed to 0)	Output

## 48.5. Product Dependencies

### 48.5.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CLASSD pins to their peripheral functions.

### 48.5.2. Power Management

The CLASSD is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the CLASSD Peripheral Clock and provide a generic clock (GCLK).

The fields NOVRVAL, NON\_OVERLAP and PWMTYP in CLASSD\_MR, and DSPCLKFREQ and FREQ in CLASSD\_INTPMR, must be configured prior to applying the GCLK.

### 48.5.3. Interrupt

The CLASSD has an interrupt line connected to the interrupt controller. Handling the CLASSD interrupt requires programming the interrupt controller before configuring the CLASSD.

## 48.6. Functional Description

### 48.6.1. Interpolator

#### 48.6.1.1. Clock Configuration

The interpolator accepts input sampling frequencies ( $f_s$ ) and the input DSP clock (DSPCLK) that can be configured in the CLASSD Interpolator Mode Register. GCLK must be configured in the PMC according to the desired DSPCLK so that  $\text{DSPCLK} = \text{GCLK} / 8$ .

The following table provides authorized DSPCLK /  $f_s$  ratios and associated filter types.

**Table 48.2.** Authorized DSPCLK /  $f_s$  Ratios & Filter Types

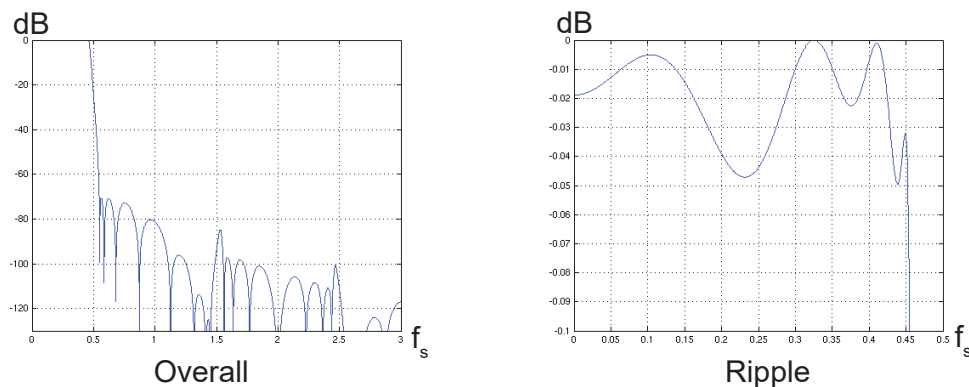

$f_s$	DSPCLK	
	12.288 MHz	11.2896 MHz
8 kHz	2	–
16 kHz	2	–
32 kHz	2	–
48 kHz	1	–
96 kHz	3	–
22.05 kHz	–	1
44.1 kHz	–	1
88.2 kHz	–	3

**Note:** Each dash (–) indicates a configuration that is not authorized and that raises the CFGERR flag in [CLASSD\\_INTSR](#).

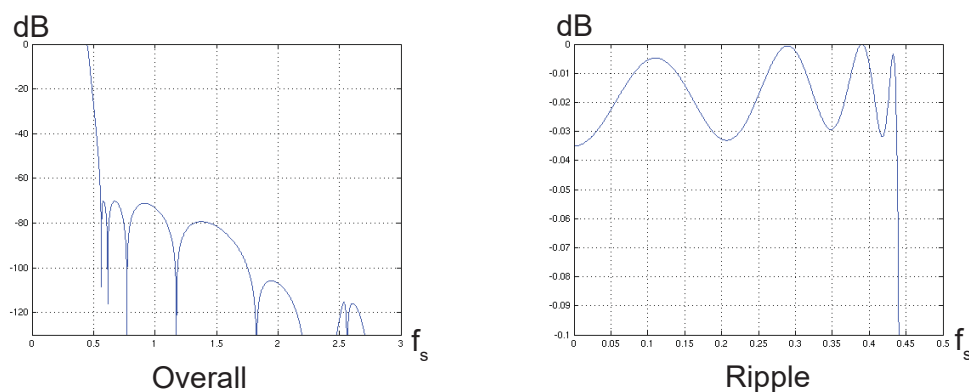

#### 48.6.1.2. CLASSD Frequency Response

Interpolation is performed with a combination of Infinite Impulse Response (IIR) and Cascaded Integrator-Comb (CIC) filters. Given the input configuration, the coefficients of the filters are redefined to optimize their transfer function to optimize the audio bandwidth. The different types of filters are defined in section [Clock Configuration](#).

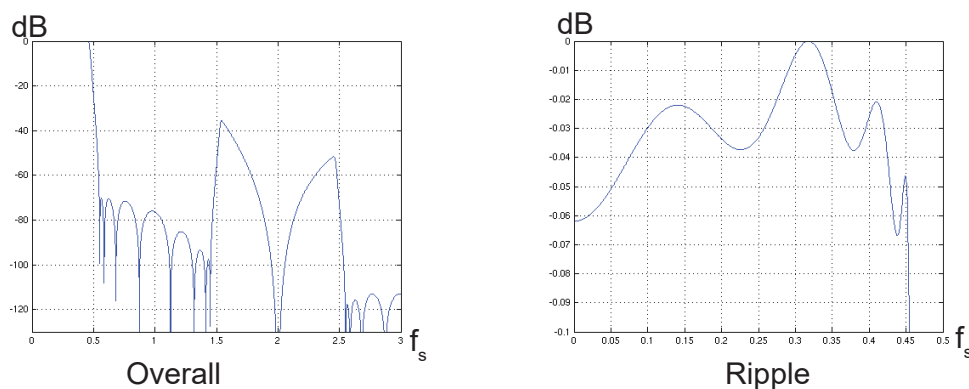

**Figure 48.2. Type 1 Frequency Response**

**Figure 48.3. Type 2 Frequency Response**

**Figure 48.4. Type 3 Frequency Response**

## 48.6.2. Equalizer

The CLASSD offers 12 pre-programmed equalization filters.

A zero-cross detection system is used to modify the equalizer on-the-fly with minimum disturbance on the output signal.

Programming of the equalization filter is detailed in section [CLASSD Interpolator Mode Register](#).

The following figures show the frequency response of the equalizer function implemented in the D/A channels.

**Figure 48.5. Bass Filters Response**

**Figure 48.6. Medium Filters Response**

**Figure 48.7. Treble Filters Response**

### 48.6.3. De-emphasis Filter Frequency Response

The CLASSD includes a de-emphasis filter which can be enabled for 32, 44.1 or 48 kHz sampling frequencies.

The response and the error generated by the digital approximation of the filter are illustrated in the following figures.

**Figure 48.8. De-emphasis Filter: Frequency Response & Error ( $f_s = 32$  kHz)**

**Figure 48.9. De-emphasis Filter: Frequency Response & Error ( $f_s = 44.1$  kHz)**

**Figure 48.10.** De-emphasis Filter: Frequency Response & Error ( $f_s = 48$  kHz)

#### 48.6.4. Attenuator and Recommended Input Levels

The CLASSD features a digital attenuator with an attenuation range of 0–77 dB and a step size of 1 dB. When attenuation greater than 77 dB is programmed, the attenuator mutes the channel.

To avoid saturations in the PWM stage, it is recommended to avoid input levels greater than 1 dB below the digital full scale (-1 dBFS). This can be done by programming a minimum attenuation of 1 dB.

#### 48.6.5. Pulse Width Modulator (PWM)

The CLASSD Pulse Width Modulator generates fixed frequency pulse width modulated output signals. For the 44.1 kS/s and 48 kS/s standard audio sample rates, the PWM output frequency is set to  $16 \times f_s$ : 705.6 kHz and 768 kHz respectively. For 8, 16, 24 and 96 kS/s, the  $16\times$  (interpolation) ratio is adapted to keep the output frequency at 768 kHz. In the same way, the output frequency is 705.6 kHz for the 22.05 and 88.2 kS/s cases.

The CLASSD functions either as a DAC loaded by a medium-to-high resistive load (e.g., 1 k $\Omega$  to 100 k $\Omega$ ) or as a Class D power amplifier controller driving an external power stage. Depending on the value of CLASSD\_MR.NON\_OVERLAP, the CLASSD drives:

- Single-ended or differential resistive loads (NON\_OVERLAP = 0)
- Full or Half MOSFET H-bridges (NON\_OVERLAP = 1)

When driving an external power stage (NON\_OVERLAP = 1), the CLASSD generates the signals to control complementary MOSFET pairs (PMOS and NMOS) with a non-overlapping delay between the NMOS and PMOS controls to avoid short circuit current. The non-overlapping delay can be adjusted in the CLASSD\_MR.NOVRVAL field.

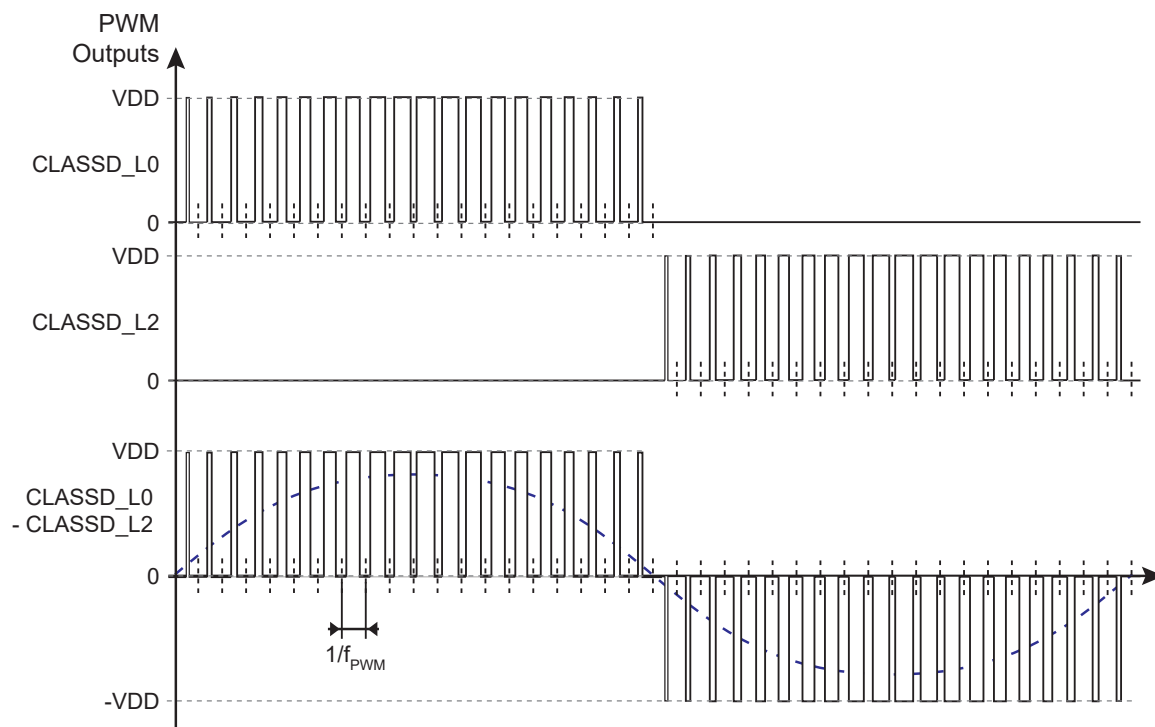

The CLASSD can have a single-ended or a differential output. A specific pulse width modulation type is associated to each case. For single-ended output (CLASSD\_MR.PWMTYP = 0), the PWM acts only on the falling edge of the PWM waveform (trailing edge PWM). For differential output (CLASSD\_MR.PWMTYP = 1), both the rising and the falling edges of the PWM waveform are modulated (symmetric PWM). Modulation principles are illustrated in the following figures for both types of PWM. In particular, when describing a null input, if PWMTYP = 0 (trailing edge PWM), the output waveform is a square wave with 50% duty cycle. With the same input and PWMTYP = 1, the differential output waveform is zero. This difference removes the classical L-C low-pass filter when PWMTYP = 1.

**Figure 48.11.** Output Waveform Modulation Principle for PWMTYP = 0

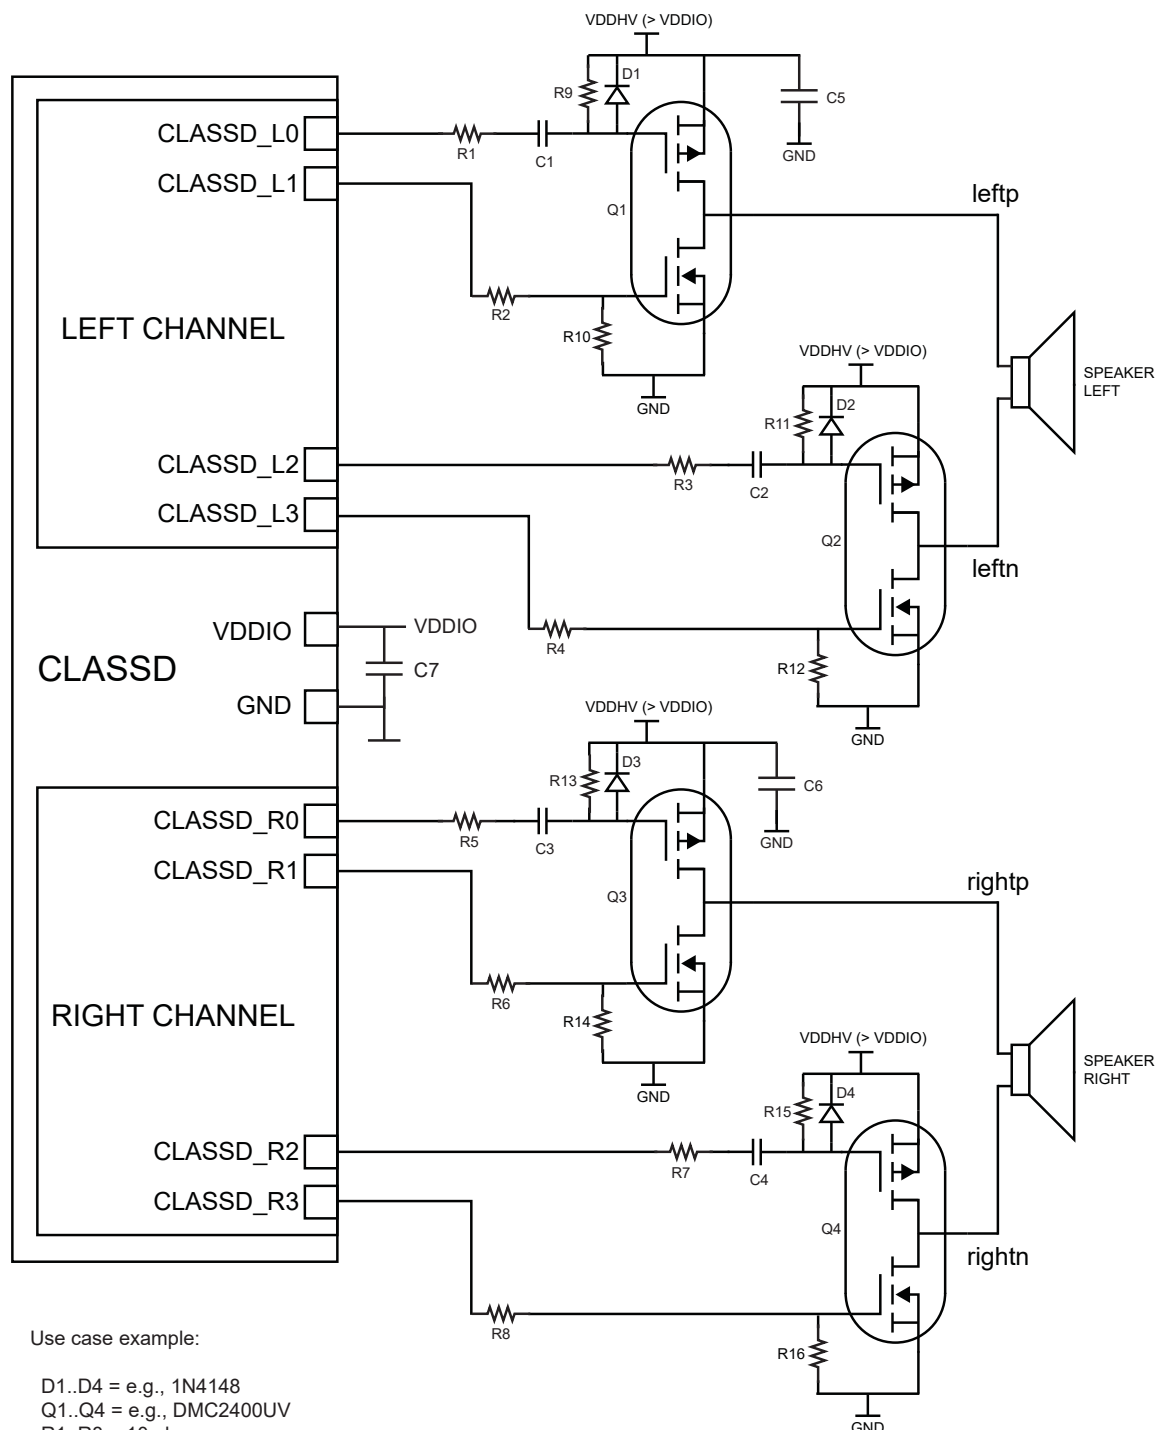

**Figure 48.12.** Output Waveform Modulation Principle for PWMTYP = 1 (Only Left Channel Pins Shown)

## 48.6.6. Application Schematics For Use Case Examples

**Figure 48.13.** Use Case 1: Stereo Class D Amplifier With External Differential Power Stage

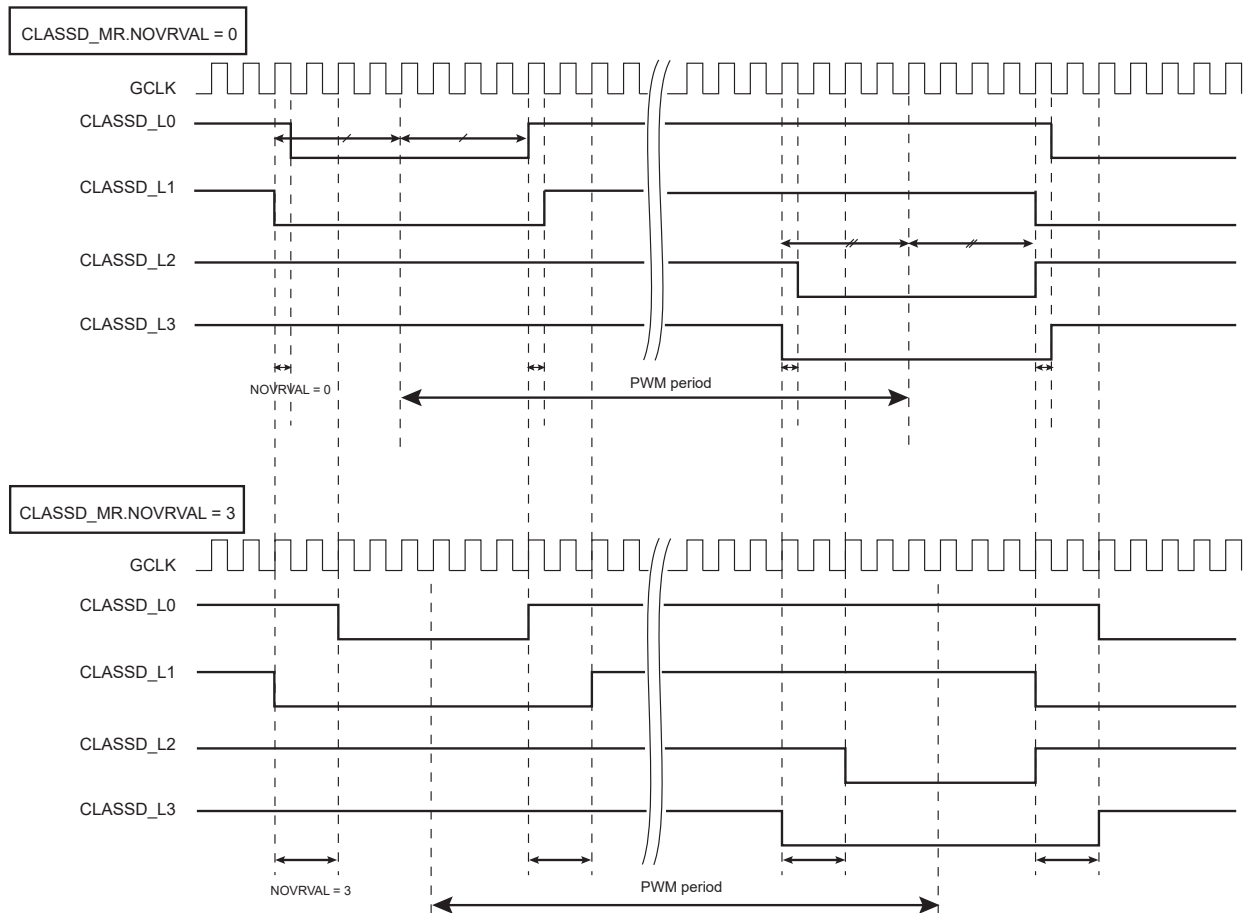

Use case example:

D1..D4 = e.g., 1N4148  
Q1..Q4 = e.g., DMC2400UV  
R1..R8 = 10 ohm  
R9..R16 = 10 kohm  
C1..C4 = 10 nF  
C5..C6 = 10  $\mu$ F  
C7 = 1  $\mu$ F

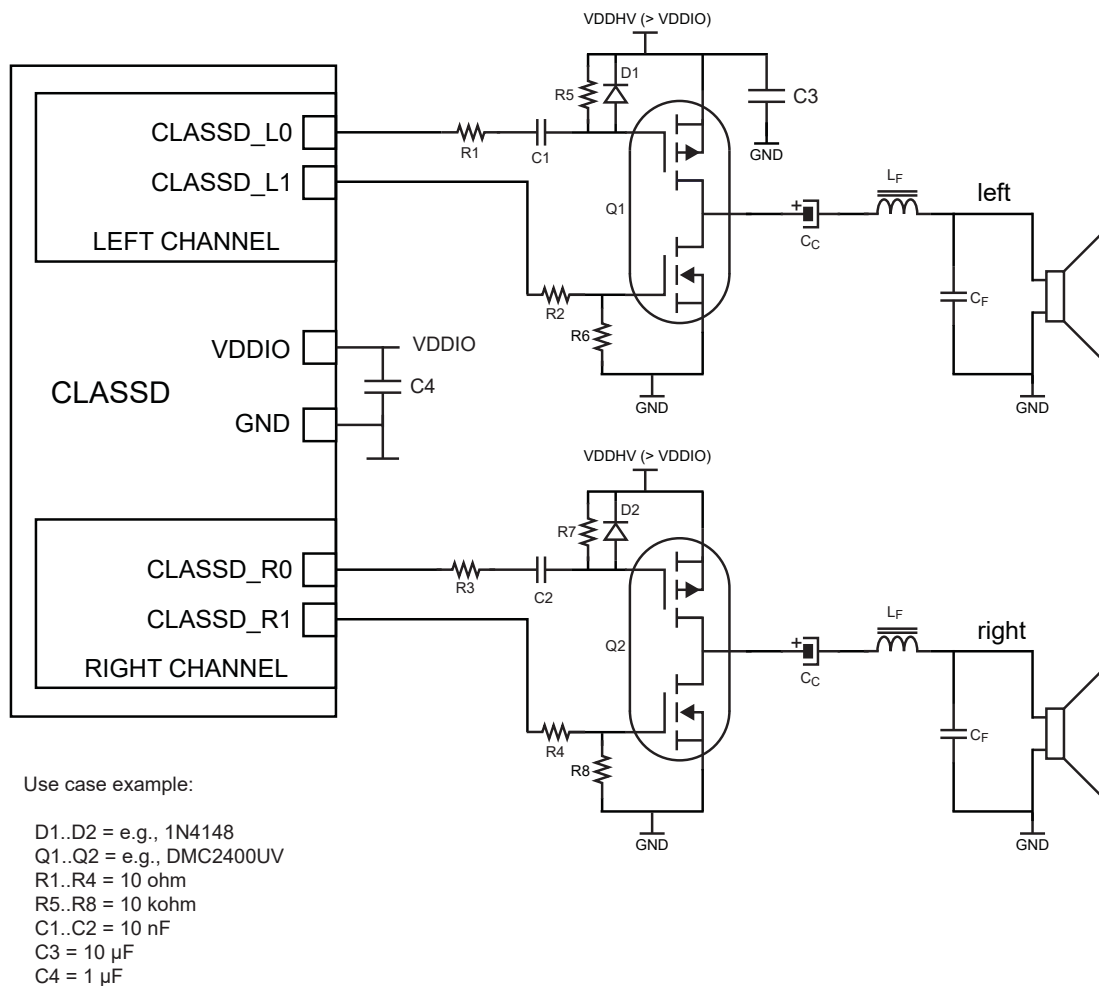

**Figure 48.14. Use Case 1: Waveforms**

CLASSD\_MR.PWMTYP = 1, CLASSD\_MR.NON\_OVERLAP = 1

In Use Case 1, the external power stages are made of complementary low-cost MOSFETs. In addition to the  $R_{DS(on)}$  and drain breakdown voltage characteristics, the choice of these components is driven by a low gate threshold voltage, a low input capacitance, a low total gate charge and a fast turn-on time characteristics. Series resistance ( $10\ \Omega$ ) added to the gates of the MOSFETs are optional and may be adjusted to optimize the gate drive. They help to limit the output current peaks driven by the I/Os into the MOSFET gates in some cases. The  $10\ k\Omega$  resistors ensure an off condition when not driven and the capacitor/diode network (C1..C2/D1..D2) shifts the PMOS drive from the typical  $V_{DDIO}$  level (3.3V) to a higher supply voltage (e.g., a 5V power domain).

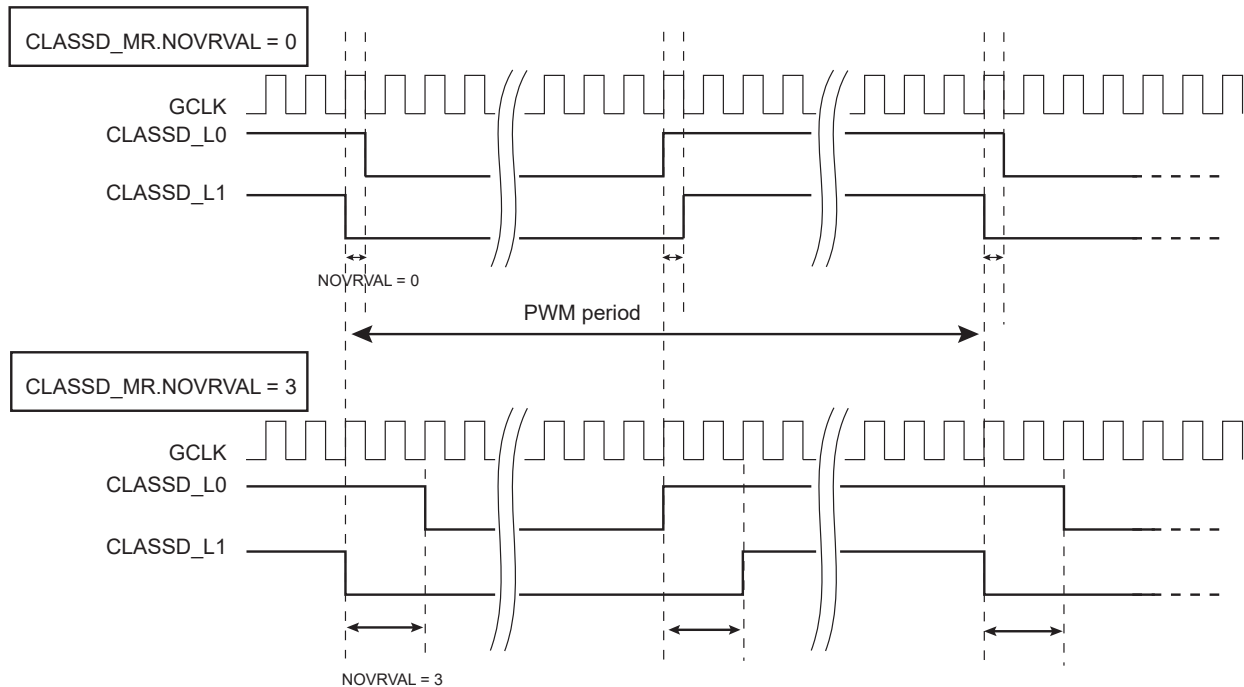

**Figure 48.15.** Use Case 2: Stereo Class D Amplifier With External Single-ended Power Stage

In the Use Case 2 application schematic, the drive network of the MOSFETs gates follows the principles described in Use Case 1.

**Figure 48.16.** Use Case 2: Waveforms

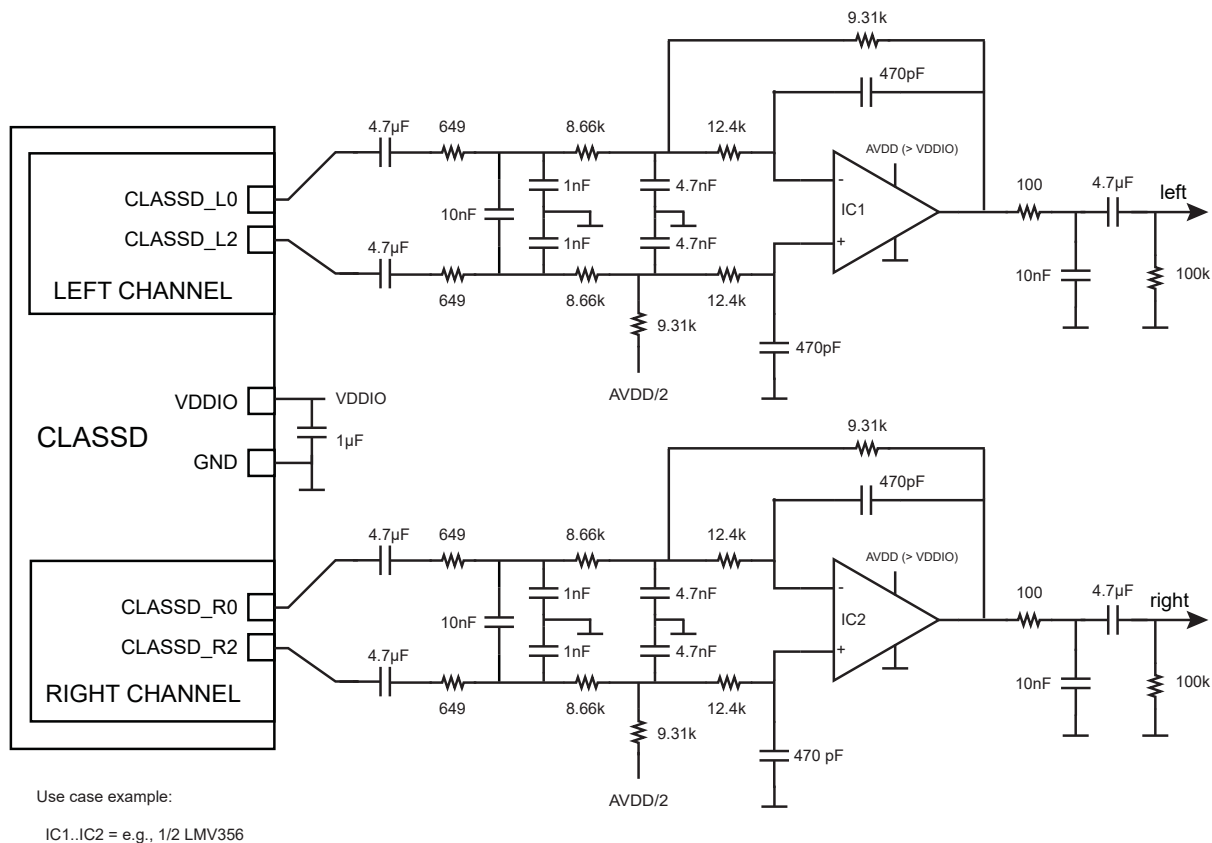

CLASSD\_MR.PWMTYP = 0, CLASSD\_MR.NON\_OVERLAP = 1

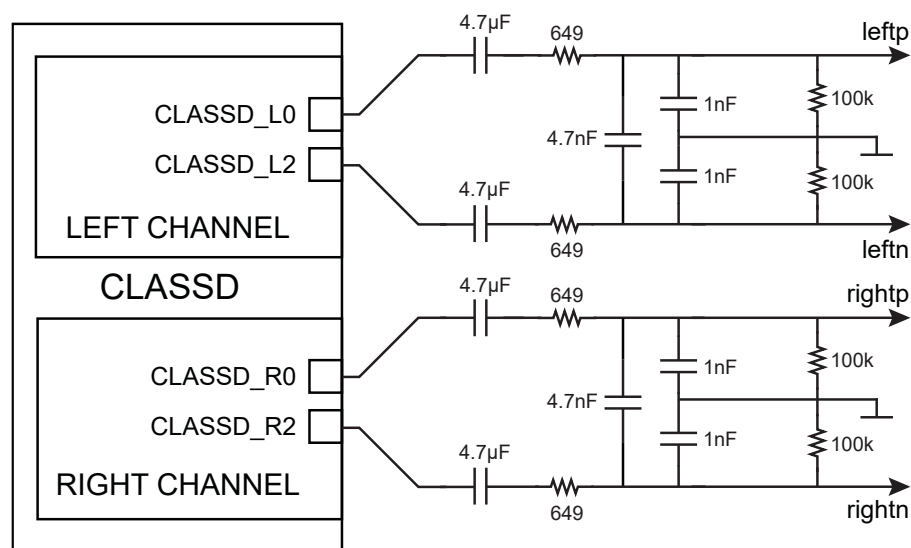

A coupling capacitor ( $C_C$ ) and an L-C low-pass filter ( $L_F$ ,  $C_F$ ) are added to the output of the power stage to remove both the DC and the high frequency components of the PWM signal.  $C_C$  with the resistive part of the speaker ( $R_{SPK}$ ) forms a C-R high pass filter with a corner frequency of  $f_{HP} = 1 / (2 \times \pi \times C_C \times R_{SPK})$ .

$L_F$ ,  $C_F$  and  $R_{SPK}$  form a second-order low-pass filter of corner frequency  $f_C = 1 / (2 \times \pi \times \sqrt{L_F \times C_F})$  and of quality factor  $Q = R_{SPK} \times \sqrt{C_F / L_F}$ . As a numerical example, consider the case  $f_{HP} = 200$  Hz,  $f_C = 30$  kHz,  $Q = 0.707$  (maximum flat response) with  $R_{SPK} = 8 \Omega$ . This leads to  $C_C = 100 \mu F$ ,  $L_F = 60 \mu H$ ,  $C_F = 470$  nF.

**Figure 48.17.** Use Case 3A: Stereo Audio DAC With Active Differential-to-Single Low-Pass Filter

**Figure 48.18.** Use Case 3B: Stereo Audio DAC With Simple Passive Low-Pass Filter and Differential Outputs

**Figure 48.19.** Use Cases 3A and 3B: Waveforms

CLASSD\_MR.PWMTYP = 1, CLASSD\_MR.NON\_OVERLAP = 0

In Use Case 3A, the CLASSD is used as an audio DAC. In this case, the differential outputs of the CLASSD are used. The application schematic suggested in figure "Use Case 3A: Stereo Audio DAC With Active differential to Single Low-Pass Filter" above implements a third-order 10 kHz low-pass Butterworth filter and makes the differential to single-ended conversion. Note that in this schematic, the AVDD/2 point needs to be fed at low impedance (e.g., a buffered voltage). A simpler schematic (Use Case 3B) may also be possible, as shown in figure "Use Case 3B: Stereo Audio DAC With Simple Passive Low-Pass Filter and Differential Outputs" above, at the cost of higher out-of-band noise and differential outputs which may be acceptable in some applications.

**Figure 48.20.** Use Case 4A: Stereo Audio DAC With Active Low-Pass Filter and Single-ended Outputs

**Figure 48.21.** Use Case 4B: Stereo Audio DAC With Passive Low-Pass Filter and Single-ended Outputs

**Figure 48.22.** Use Cases 4A and 4B: Waveforms

CLASSD\_MR.PWMTYP = 0, CLASSD\_MR.NON\_OVERLAP = 0

In Use Case 4A, the CLASSD is used as an audio DAC with active low-pass filter. In this case, the single-ended outputs of the CLASSD are selected (PWMTYP = 0, trailing edge PWM) which leaves more I/Os to the application. A third-order 30 kHz low-pass Butterworth filter is shown in figure "Use Case 4A: Stereo Audio DAC With Active Low-Pass Filter and Single-ended Outputs". The AVDD/2 point can be fed at relatively high impedance as no current is drawn from this point (a simple resistive divider properly decoupled is acceptable). A reduced complexity schematic is presented in figure "Use Case 4B: Stereo Audio DAC With Passive Low-Pass Filter and Single-ended Outputs" above for less constrained applications.

#### 48.6.7. Register Write Protection

To prevent any single software error from corrupting CLASSD behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the CLASSD Write Protection Mode Register (CLASSD\_WPMR).

The following registers can be write-protected:

- CLASSD Mode Register
- CLASSD Interpolator Mode Register

## 48.7. Register Summary

0	No effect.
1	Resets CLASSD, simulating a hardware reset.

## 48.7.2. CLASSD Mode Register

**Name:** CLASSD\_MR  
**Offset:** 0x04  
**Reset:** 0x00010022  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access			NOVRVAL[1:0]					NON_OVERLAP
Reset			R/W	R/W				R/W
			0	0				1
Bit	15	14	13	12	11	10	9	8
Access								PWMTYP
Reset								R/W
								0
Bit	7	6	5	4	3	2	1	0
Access			RMUTE	REN			LMUTE	LEN
Reset			R/W	R/W			R/W	R/W
			1	0			1	0

### Bits 21:20 – NOVRVAL[1:0] Non-Overlapping Value

This field has no effect when NON\_OVERLAP = 0.

Value	Name	Description
0	5NS	Non-overlapping time is 5 ns
1	10NS	Non-overlapping time is 10 ns
2	15NS	Non-overlapping time is 15 ns
3	20NS	Non-overlapping time is 20 ns

### Bit 16 – NON\_OVERLAP Non-Overlapping Enable

Value	Description
0	Non-overlapping circuit is disabled.
1	Non-overlapping circuit is enabled.

### Bit 8 – PWMTYP PWM Modulation Type

0 (TRAILING\_EDGE): The signal is single-ended.

If NON\_OVERLAP is cleared, the signal is sent to CLASSD\_L0 and CLASSD\_R0 (see figure [Use Case 4A](#) or figure [Use Case 4B](#)).

If NON\_OVERLAP is set, the signal is sent to CLASSD\_L0/L1 and CLASSD\_R0/R1 (see figure [Use Case 2](#)).

1 (UNIFORM): The signal is differential.

If NON\_OVERLAP is cleared, the signal is sent to CLASSD\_L0/L2 and CLASSD\_R0/R2 (see figure [Use Case 3A](#) or figure [Use Case 3B](#)).

If NON\_OVERLAP is set, the signal is sent to CLASSD\_L0/L1/L2/L3 and CLASSD\_R0/R1/R2/R3 (see figure [Use Case 1](#)).

#### Bit 5 – RMUTE Right Channel Mute

Value	Description
0	Right channel is unmuted.
1	Right channel is muted.

#### Bit 4 – REN Right Channel Enable

Value	Description
0	Right channel is disabled.
1	Right channel is enabled.

#### Bit 1 – LMUTE Left Channel Mute

Value	Description
0	Left channel is unmuted.
1	Left channel is muted.

#### Bit 0 – LEN Left Channel Enable

Value	Description
0	Left channel is disabled.
1	Left channel is enabled.

**48.7.3. CLASSD Interpolator Mode Register**

**Name:** CLASSD\_INTPMR  
**Offset:** 0x08  
**Reset:** 0x00304E4E  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the CLASSD Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
		MONOMODE[1:0]		MONO	EQCFG[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
		FRAME[2:0]			SWAP	DEEMP		DSPCLKFREQ
Access		R/W	R/W	R/W	R/W	R/W		R/W
Reset		0	1	1	0	0		0
Bit	15	14	13	12	11	10	9	8
		ATTR[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		1	0	0	1	1	1	0
Bit	7	6	5	4	3	2	1	0
		ATTL[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		1	0	0	1	1	1	0

**Bits 30:29 – MONOMODE[1:0] Mono Mode Selection**

Defines which signal is sent to both channels when the MONO bit is set.

Value	Name	Description
0	MONOMIX	(left + right) / 2 is sent to both channels
1	MONOSAT	(left + right) is sent to both channels. If the sum is too high, the result is saturated.
2	MONOLEFT	THR[15:0] is sent to both the left and the right channels
3	MONORIGHT	THR[31:16] is sent to both the left and the right channels

**Bit 28 – MONO Mono Signal**

0 (DISABLED): The signal is sent stereo to the left and right channels.

1 (ENABLED): The same signal is sent to both the left and the right channels. The sent signal is defined by the MONOMODE field value.

**Bits 27:24 – EQCFG[3:0] Equalization Selection**

EQCFG field values 13–15 = flat response

Value	Name	Description
0	FLAT	Flat response
1	BBOOST12	Bass boost +12 dB
2	BBOOST6	Bass boost +6 dB
3	BCUT12	Bass cut -12 dB
4	BCUT6	Bass cut -6 dB
5	MBOOST3	Medium boost +3 dB
6	MBOOST8	Medium boost +8 dB

Value	Name	Description
7	MCUT3	Medium cut -3 dB
8	MCUT8	Medium cut -8 dB
9	TBOOST12	Treble boost +12 dB
10	TBOOST6	Treble boost +6 dB
11	TCUT12	Treble cut -12 dB
12	TCUT6	Treble cut -6 dB

#### Bits 22:20 – FRAME[2:0] CLASSD Incoming Data Sampling Frequency

Value	Name	Description
0	FRAME_8K	8 kHz
1	FRAME_16K	16 kHz
2	FRAME_32K	32 kHz
3	FRAME_48K	48 kHz
4	FRAME_96K	96 kHz
5	FRAME_22K	22.05 kHz
6	FRAME_44K	44.1 kHz
7	FRAME_88K	88.2 kHz

#### Bit 19 – SWAP Swap Left and Right Channels

0 (LEFT\_ON\_LSB): Left channel is on CLASSD\_THR[15:0], right channel is on CLASSD\_THR[31:16].

1 (RIGHT\_ON\_LSB): Right channel is on CLASSD\_THR[15:0], left channel is on CLASSD\_THR[31:16].

#### Bit 18 – DEEMP Enable De-emphasis Filter

0 (DISABLED): De-emphasis filter is disabled.

1 (ENABLED): De-emphasis filter is enabled.

#### Bit 16 – DSPCLKFREQ DSP Clock Frequency

0 (12M288): DSP Clock (DSPCLK) is 12.288 MHz.

1 (11M2896): DSP Clock (DSPCLK) is 11.2896 MHz.

#### Bits 14:8 – ATTR[6:0] Right Channel Attenuation

Right channel attenuation is defined as follows:

- if  $ATTR \leq 77$  the attenuation is -ATTR dB
- else the right signal is muted

#### Bits 6:0 – ATTL[6:0] Left Channel Attenuation

Left channel attenuation is defined as follows:

- if  $ATTL \leq 77$  the attenuation is -ATTL dB
- else the left signal is muted

#### 48.7.4. CLASSD Interpolator Status Register

**Name:** CLASSD\_INTSR  
**Offset:** 0x0C  
**Reset:** 0x00000000

	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x434C44	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x434C44 ("CLD" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x434C44 ("CLD" in ASCII).

## 49. Inter-IC Sound Multi-Channel Controller (I2SMCC)

### 49.1. Description

The Inter-IC Sound Controller (I2SMCC) provides a 5-wire, bidirectional, synchronous, digital audio link to external audio devices: I2SMCC\_DIN, I2SMCC\_DOUT, I2SMCC\_WS, I2SMCC\_CK, and I2SMCC\_MCK pins.

The I2SMCC complies with the Inter-IC Sound (I<sup>2</sup>S) bus specification and supports a Time Division Multiplexed (TDM) interface with external multi-channel audio codecs.

The I2SMCC consists of a receiver, a transmitter and a common clock generator that can be enabled separately to provide Host, Client or Controller modes with receiver and/or transmitter active.

DMA Controller channels, separate for the receiver and for the transmitter, allow a continuous high bit rate data transfer without processor intervention to the following:

- Audio CODECs in Host, Client, or Controller mode
- Stereo DAC or ADC through a dedicated I<sup>2</sup>S serial interface
- Multi-channel or multiple stereo DACs or ADCs, using the TDM format

The I2SMCC uses a single DMA Controller channel for all audio channels.

The 8- and 16-bit compact stereo formats reduce the required DMA Controller bandwidth by transferring the left and right samples within the same data word.

In Host mode, the I2SMCC can produce a  $16 f_s$  to  $1024 f_s$  host clock that provides an over-sampling clock to an external audio codec or digital signal processor (DSP).

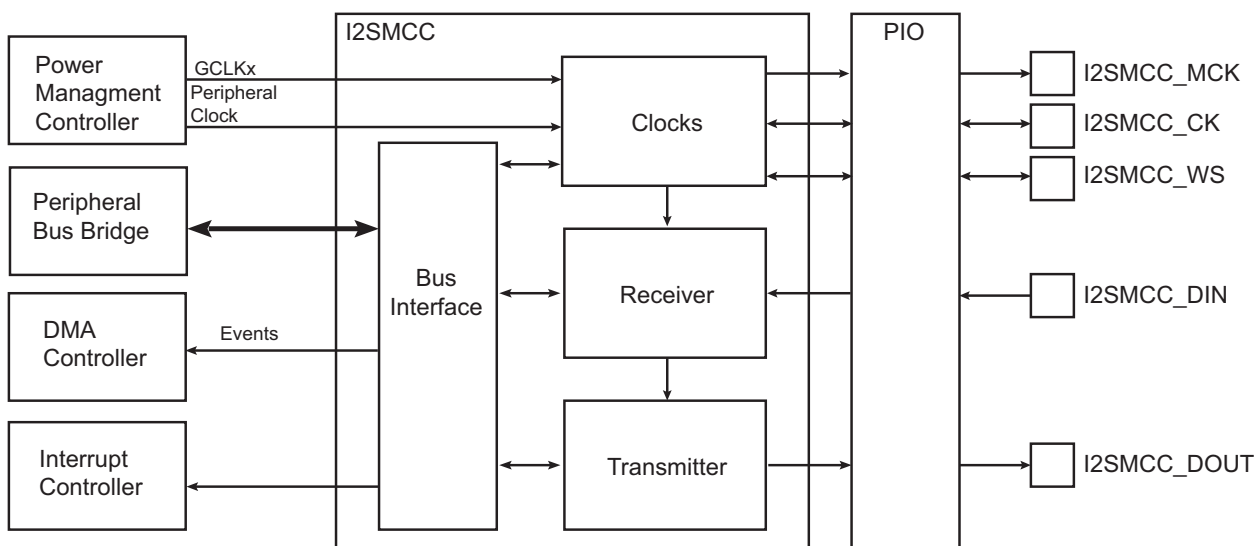

### 49.2. Embedded Characteristics

- Compliant with Inter-IC Sound (I<sup>2</sup>S) Bus Specification
- Host, Client, and Controller Modes
  - Client: Data received/transmitted
  - Host: Data received/transmitted and clocks generated
  - Controller: Clocks generated
- Individual Enable and Disable of Receiver, Transmitter and Clocks
- Configurable Clock Generator Common to Receiver and Transmitter
  - Suitable for a wide range of sample frequencies ( $f_s$ ), including 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, and 192 kHz
  - $16 f_s$  to  $1024 f_s$  host clock generated for external oversampling data converters
- Support for Multiple Data Formats
  - 32-, 24-, 20-, 18-, 16-, and 8-bit mono or stereo format
  - 16- and 8-bit compact stereo format, with left and right samples packed in the same word to reduce data transfers
- Support for Multiple Data Frame Formats
  - 2-channel I<sup>2</sup>S with word select
  - 1- to 8-channel Time Division Multiplexed (TDM) with frame synchronization
- DMA Controller Interfaces the Receiver and Transmitter to Reduce Processor Overhead
- Smart Holding Registers Management to Avoid Audio Channel Mix After Overrun or Underrun
- Functional Safety Monitors and Reports
  - Internal sequencer integrity check reports

- Register write protection

## 49.3. Block Diagram

Figure 49.1. I2SMCC Block Diagram

## 49.4. I/O Lines Description

Table 49.1. I/O Lines Description

Pin Name	Pin Description	Type
I2SMCC_MCK	Host Clock	Output
I2SMCC_CK	Serial Clock	Input/Output
I2SMCC_WS	I <sup>2</sup> S Word Select or TDM Frame Synchronization	Input/Output
I2SMCC_DIN	Serial Data Input	Input
I2SMCC_DOUT	Serial Data Output	Output

## 49.5. Product Dependencies

To use the I2SMCC, other parts of the system must be configured correctly, as described below.

**Note:** In Device mode, the clock provided by the pad I2SMCC\_CK must be free from glitch. It is recommended to enable hysteresis on the pad buffer driving these signals. This also applies to I2SMCC\_WS.

### 49.5.1. I/O Lines

The I2SMCC pins may be multiplexed with I/O Controller lines. The user must first program the PIO Controller to assign the required I2SMCC pins to their peripheral function. If the I2SMCC I/O lines are not used by the application, they can be used for other purposes by the PIO Controller. The user must enable the I2SMCC inputs and outputs that are used.

### 49.5.2. Power Management

If the processor enters a Sleep mode that disables clocks used by the I2SMCC, the I2SMCC stops functioning and resumes operation after the system wakes up from Sleep mode.

### 49.5.3. Clocks

The I2SMCC runs from the peripheral clock and the generic clock (GCLK), both generated by the Power Management Controller (PMC). Prior to using the I2SMCC, the user must first program the

PMC. The I<sup>2</sup>S host and serial clock can be generated either from the peripheral clock or the generic clock.

In a similar way, the I2SMCC must be disabled before removing its clock source to avoid freezing it in an undefined state.

#### 49.5.4. Pad Hysteresis Control

In Client mode, the pad buffer driving I2SMCC\_CK must be configured to manage the input voltage hysteresis.

#### 49.5.5. DMA Controller

The I2SMCC interfaces to the DMA Controller. Using the I2SMCC DMA functionality requires the DMA Controller to be programmed first.

#### 49.5.6. Interrupt Sources

The I2SMCC interrupt line is connected to the Interrupt Controller. Using the I2SMCC interrupt requires the Interrupt Controller to be programmed first.

### 49.6. Functional Description

#### 49.6.1. Initialization

The I2SMCC features a receiver, a transmitter and a clock generator for Host and Controller modes. Receiver and transmitter share the same serial clock and word select.

Before enabling the I2SMCC, the selected configuration must be written to the I2SMCC Mode Register A (I2SMCC\_MRA). If I2SMCC\_MRA.FORMAT is configured in one of the TDM formats, then the I2SMCC\_MRA.NBCHAN and I2SMCC\_MRA.TDMFS fields must also be written.

Once the I2SMCC\_MRA has been written, the I2SMCC clock generator, receiver, and transmitter can be enabled by writing a '1' to the CKEN, RXEN, and TXEN bits in the Control Register (I2SMCC\_CR). The clock generator can be enabled alone in Controller mode to output clocks to the I2SMCC\_MCK, I2SMCC\_CK, and I2SMCC\_WS pins. The clock generator must also be enabled if the receiver or the transmitter is enabled.

The clock generator, receiver, and transmitter can be disabled independently by writing a '1' to I2SMCC\_CR.CXDIS, I2SMCC\_CR.RXDIS and/or I2SMCC\_CR.TXDIS, respectively. Once requested to stop, they stop only when the transmission of the pending frame transmission is completed.

#### 49.6.2. Basic Operation

The receiver can be operated by reading the Receiver Holding register (I2SMCC\_RHR), whenever the Receive Left x Ready (RXLRDYx) bit or the Receive Right Ready (RXRRDYx) bit in the Interrupt Status register A (I2SMCC\_ISRA) is set. Successive values read from I2SMCC\_RHR correspond to the samples from the first left audio channel to the last left audio channel enabled then from the first right audio channel to the last right audio channel enabled, or from channels 0 to I2SMCC\_MRA.NBCHAN in TDM mode for the successive frames.

The transmitter can be operated by writing to the Transmitter Holding register (I2SMCC\_THR), whenever the Transmit Left x Ready (TXLRDYx) bit or the Transmit Right x Ready (TXRRDYx) bit in the I2SMCC\_ISRA is set. Successive values written to I2SMCC\_THR correspond to the samples from the first left audio channel to the last left audio channel enabled, then from the first right audio channel to the last right audio channel enabled, or from channels 0 to I2SMCC\_MRA.NBCHAN in TDM mode for the successive frames.

RXLRDYx, RXRRDYx, TXLRDYx and TXRRDYx can be polled by reading the I2SMCC\_ISRA.

The I2SMCC processor load can be reduced by enabling interrupt-driven operation. The RXLRDYx, RXRRDYx, TXLRDYx and/or TXRRDYx interrupt requests can be enabled by writing a '1' to the corresponding bit in the Interrupt Enable Register A (I2SMCC\_IERA). The interrupt service routine

associated to the I2SMCC interrupt request is executed when at least one of the RXLRDYx, RXRRDYx, TXLRDYx and TXRRDYx status bits is set.

### 49.6.3. Host, Controller and Client Modes

In Host and Controller modes, the I2SMCC provides the host clock, the serial clock and the word select. I2SMCC\_MCK, I2SMCC\_CK, and I2SMCC\_WS pins are outputs.

In Controller mode, the I2SMCC receiver and transmitter are disabled. Only the clocks are enabled and used by an external receiver and/or transmitter.

In Client mode, the I2SMCC receives the serial clock and the word select from an external host. I2SMCC\_CK and I2SMCC\_WS pins are inputs.

The mode is selected by writing I2SMCC\_MRA.MODE. Since the MODE field changes the direction of the I2SMCC\_WS and I2SMCC\_CK pins, the I2SMCC\_MRA must only be written when the I2SMCC is stopped in order to avoid unwanted glitches on the I2SMCC\_WS and I2SMCC\_CK pins.

**Note:** When the Client mode is configured and TDM format is selected, the high level duration of the WS input signal can be one-slot (1 sample duration), half-slot or one-bit. The duration must be configured in I2SMCC\_MRA.TDMFS (See [I2SMCC\\_MRA](#) ).

### 49.6.4. I<sup>2</sup>S Reception and Transmission Sequence

As specified in the I<sup>2</sup>S protocol, data bits are left-justified in the word select time slot, with the MSB transmitted first, starting one clock period after the transition on the word select line.

**Figure 49.2.** I<sup>2</sup>S Reception and Transmission Sequence

Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The word select line indicates the channel in transmission, a low level for the left channel and a high level for the right channel.

The length of words managed in transmit and/or receive holding registers can be chosen among 8, 16, 18, 20, 24, and 32 bits by writing I2SMCC\_MRA.DATALength. The length of the data transmitted or received on the I2S line (Slot length) depends on I2SMCC\_MRA.DATALength/IWS.

The slot length is defined in the following table.

**Table 49.2.** Slot Length (I<sup>2</sup>S format)

I2SMCC_MRA.DATALength	Word Length	Slot Length
0	32 bits	32
1	24 bits	32 if I2SMCC_MRA.IWS = 0 24 if I2SMCC_MRA.IWS = 1
2	20 bits	
3	18 bits	
4	16 bits	16
5	16 bits compact stereo	

.....continued

I2SMCC_MRA.DATALLENGTH	Word Length	Slot Length
6	8 bits	8
7	8 bits compact stereo	

If the time slot allows for more data bits than written in I2SMCC\_MRA.DATALLENGTH, zeroes are appended to the transmitted data word or extra received bits are discarded (see examples in the following figure).

**Figure 49.3.** I<sup>2</sup>S Transfer Format with TX Zero Padding and RX LSB Discarding

I2SMCC\_MRA.DATALLENGTH = 1 (Word Length = 24 bits)  
I2SMCC\_MRA.IWS = 0 (Slot Length = 32 bits)

#### 49.6.5. Left-Justified Reception and Transmission Sequence

As specified in the I<sup>2</sup>S protocol, data bits are left-justified in the word select time slot, with the MSB transmitted first, starting at the same clock period as the transition on the word select line.

**Figure 49.4.** Left-Justified Reception and Transmission Sequence

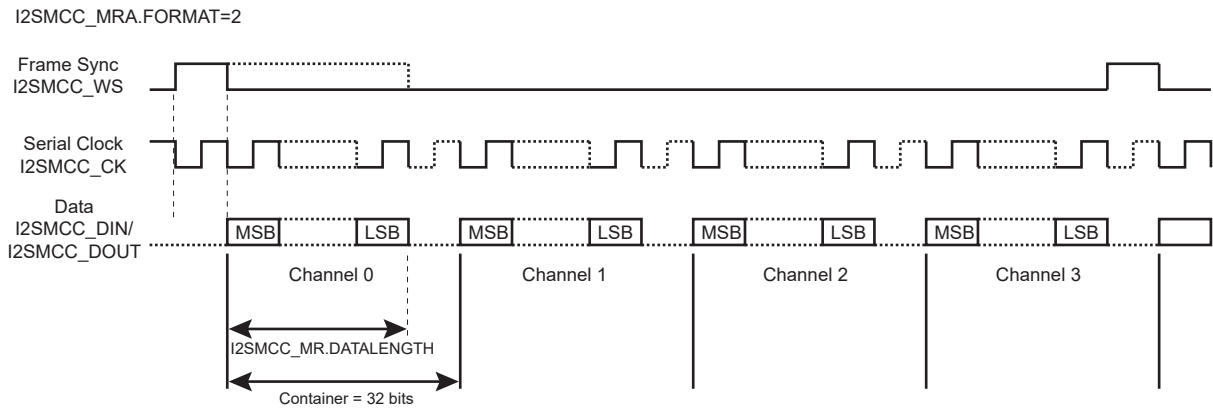

Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The word select line indicates the channel in transmission, with a low level for the right channel and a high level for the left channel.

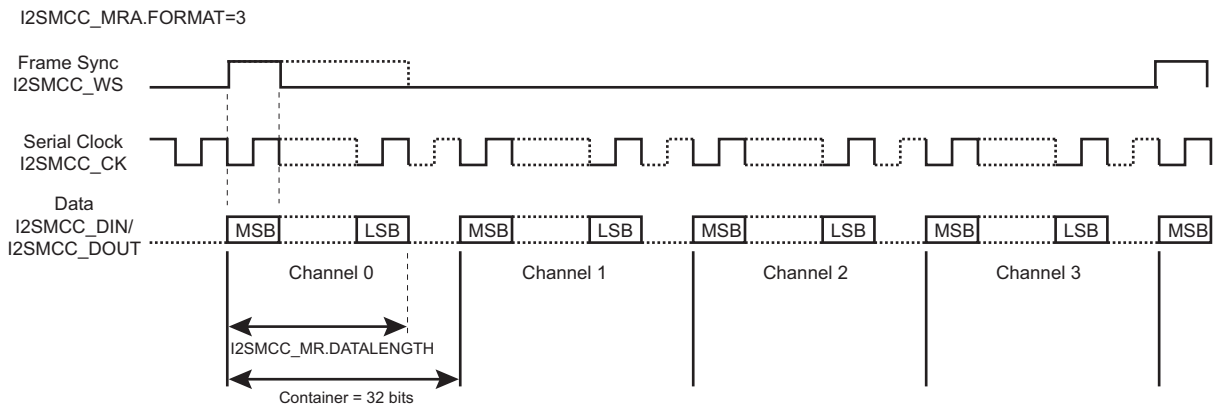

#### 49.6.6. TDM Reception and Transmission Sequence

In Time Division Multiplexed (TDM) format, one to eight data words are sent or received within each frame. As specified in the I<sup>2</sup>S protocol, data bits are left-justified in the channel time slot, with the MSB transmitted first, starting one clock period after the transition on the word select line. Each time slot is 32 bits long.

**Figure 49.5. TDM Reception and Transmission Sequence**

**Figure 49.6. TDM Left-Justified Reception and Transmission Sequence**

Data bits are sent on the falling edge of the serial clock and sampled on the rising edge of the serial clock. The `I2SMCC_WS` pin provides a frame synchronization signal, starting one `I2SMCC_CK` period before the `MSB` of channel 0.

The TDM format is selected when `I2SMCC_MRA.FORMAT=2`.

The TDM Left-Justified format is selected when `I2SMCC_MRA.FORMAT=3`.

The Frame Synchronization pulse can be either one `I2SMCC_CK` period, 16-bit `I2SMCC_CK` period (half time slot) or one 32-bit time slot. This selection is done by writing `I2SMCC_MRA.TDMFS`.

**Note:** In Client mode (`I2SMCC_MRA.MODE = 0`), the `I2SMCC_MRA.TDMFS` configuration must correspond to `I2SMCC_WS` high level period of the audio codec.

The number of channels is selected by writing `I2SMCC_MRA.NBCHAN`.

The Frame Synchronization pulse set to 32-bit time slot with the number of channel set to 1 configuration is not supported.

The length of transmitted words can be chosen among 8, 16, 18, 20, 24, and 32 bits by writing `I2SMCC_MRA.DATALLENGTH`.

If the time slot allows for more data bits than programmed in `I2SMCC_MRA.DATALLENGTH`, zeroes are appended to the transmitted data word or extra received bits are discarded.

#### 49.6.7. Serial Clock and Word Select Generation

The generation of clocks in the `I2SMCC` is described in the following figure.

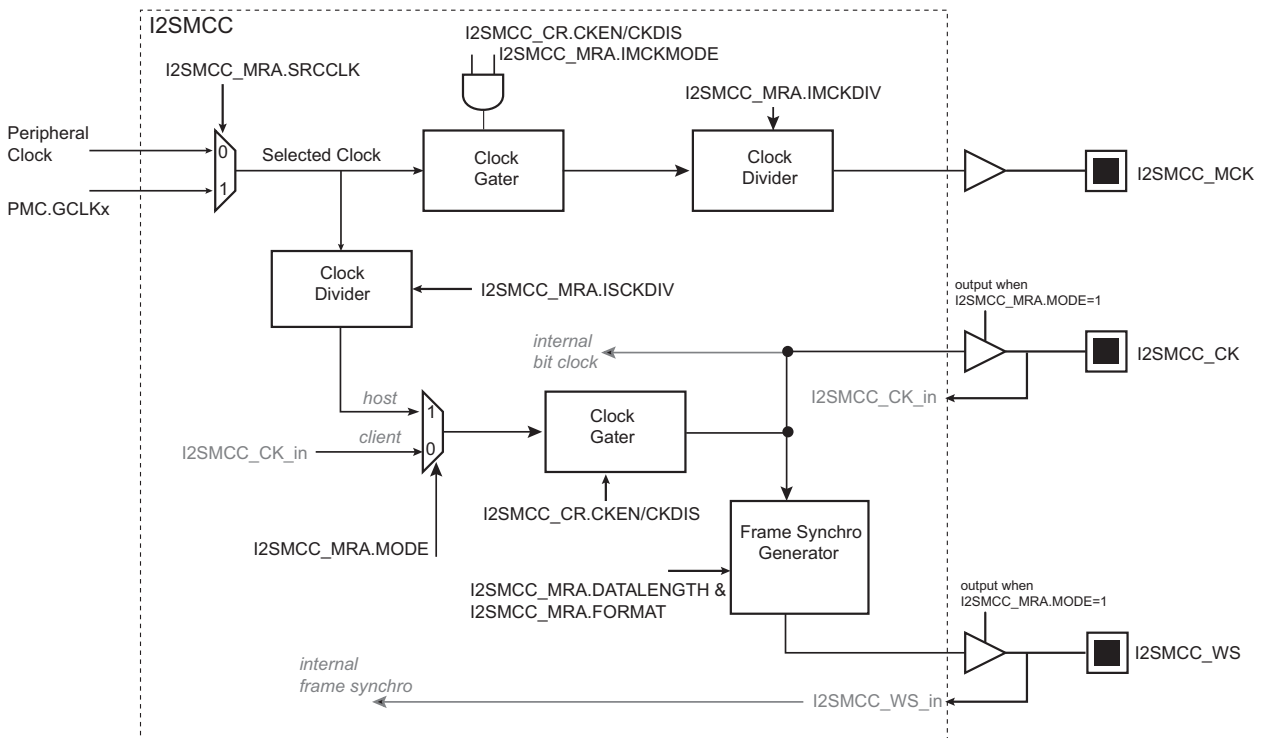

In Client mode, the word select clock is driven by an external host and the serial clock is driven by either an external host or the internal clock circuitry. I2SMCC\_CK and I2SMCC\_WS pins are inputs.

In Host mode, the user configures the host clock, serial clock, and word select clock through the I2SMCC\_MRA. I2SMCC\_MCK, I2SMCC\_CK, and I2SMCC\_WS pins are outputs, MCK and CK frequencies are configured independently using I2SMCC\_MRA.IMCKDIV and I2SMCC\_MRA.ISCKDIV, respectively.

If a host clock output is not required, the MCK clock is used as I2SMCC\_CK by clearing I2SMCC\_MRA.IMCKMODE.

The I2SMCC\_WS pin is used as word select in I<sup>2</sup>S format and as frame synchronization in TDM format, as described in [I<sup>2</sup>S Reception and Transmission Sequence](#) and [TDM Reception and Transmission Sequence](#), respectively.

**Figure 49.7.** I2SMCC Clock Generation

#### 49.6.8. Mono

When the Transmit Mono bit (TXMONO) in I2SMCC\_MRA is set, data written to the left channel is duplicated to the right output channel. In TDM mode, with more than two channels numbered from 0, data written to the even-numbered channels is duplicated to the following odd-numbered channel. When TXMONO is set, I2SMCC\_ISRA.TXRRDYx are always read as '0' and the behavior of TXRUNFx is unchanged.

When the Receive Mono bit (RXMONO) in I2SMCC\_MRA is set, data received from the left channel is duplicated to the right input channel. In TDM mode, with more than two channels numbered from 0, data received from the even-numbered channels is duplicated to the following odd-numbered channel. When RXMONO is set, the behavior of RXRRDYx and RXROVFx is unchanged.

#### 49.6.9. Holding Registers

The I2SMCC user interface includes two common holding registers—the Receive Holding Register (I2SMCC\_RHR) and the Transmit Holding Register (I2SMCC\_THR). The common registers are used to access audio samples for all audio channels.

Each I<sup>2</sup>S or TDM channel has its own register. The register depth depending on the configuration is available in the following table.

**Table 49.3.** Registers Depth

I2SMCC_MRA.FORMAT	I2SMCC_MRA.NBCHAN	Register Depth
0 or 1 (I <sup>2</sup> S or LJ)	NA	4 words
2 or 3 (TDM or TDM LJ)	0 or 1	4 words
	2 or 3	2 words
	4, 5, 6 or 7	1 word

#### 49.6.9.1. Common Registers

The Receiver Holding Register (I2SMCC\_RHR) and the Transmitter Holding Register (I2SMCC\_THR) provide an access to all channels enabled through a single location.

When a new data word is available, the corresponding bit RXLRDYx or RXRRDYx in I2SMCC\_ISRA is set. Reading I2SMCC\_RHR clears this bit. In I<sup>2</sup>S or Left-Justified mode, consecutive access to I2SMCC\_RHR reads first the left channel then the right channel. In TDM or TDM Left-Justified mode, consecutive access to I2SMCC\_RHR reads the TDM channels enabled.

When a receive overrun condition occurs, the corresponding bit RXLOVx or RXROVx in I2SMCC\_ISRA is set. Reading I2SMCC\_ISRA clears this bit.

When data is being received (i.e., stored in the internal shift register), it is stored in internal holding registers. As an example, when 2-wire mode is configured, up to two data for each wire can be stored because four internal holding registers are available.

If nothing is read from I2SMCC\_RHR, or from I2SMCC\_RHLxR and I2SMCC\_RHRxR, the overflow occurs if a new data becomes available for the left channel x or right channel x.

When a data can be written in I2SMCC\_THR, the corresponding bit TXLRDYx bit or TXRRDYx in I2SMCC\_ISRA is set. Writing to I2SMCC\_THR clears this bit. In I<sup>2</sup>S or Left-Justified mode, consecutive access to I2SMCC\_THR writes first the left channel then the right channel. In TDM or TDM Left-Justified mode, consecutive access to I2SMCC\_THR writes the TDM channels enabled.

A transmit underrun condition occurs if a new data word needs to be transmitted before it has been written to I2SMCC\_THR. In this case, the corresponding bit TXLUNx or TXRUNx in I2SMCC\_ISRA is set. Reading I2SMCC\_ISRA clears this bit.

In case of transmit underrun, if the value of I2SMCC\_MRA.TXSAME is '0', then a '0' is transmitted. If the value of I2SMCC\_MRA.TXSAME is '1', then the previous data word for the current transmit channel number is transmitted.

After a transmit underrun, the data written in I2SMCC\_THR is discarded to keep the left and right channels synchronized.

Data words are right-justified in the common registers (I2SMCC\_RHR and I2SMCC\_THR). For the 16-bit compact stereo data format, the left sample uses bits [15:0] and the right sample uses bits [31:16] of the same data word. For the 8-bit compact stereo data format, the left sample uses bits [7:0] and the right sample uses bits [15:8] of the same data word.

#### 49.6.10. DMA Controller Operation

All receiver audio channels and all transmitter audio channels are each assigned to a single DMA Controller channel.

The DMA Controller reads from the I2SMCC\_RHR and writes to the I2SMCC\_THR for all audio channels successively.

The DMA Controller transfers may use 32-bit word, 16-bit halfword, or 8-bit byte depending on the value of the I2SMCC\_MRA.DATALength field.

The DMA chunk size field (DMACHUNK) of the Mode Register B (I2SMCC\_MRB) should correspond to the DMA channel configuration. The supported chunk according to the configuration is available in the two tables below

**Table 49.4. TX DMA Chunk Configurations**

FORMAT	TXMONO	DATALENGTH	NBCHAN	I2SMCC_MRB.DMACHUNK Configuration	Maximum DMA Chunk Size Allowed	
0 or 1 (I <sup>2</sup> S or LJ)	0 (Stereo)	0, 1, 2, 3, 4 or 6 (32, 24, 20, 18, 16 or 8 bits)	No effect	0	1-word chunk	
				1	2-word chunk	
				2	4-word chunk	
				3	8-word chunk	
	1 (Mono)			0	1-word chunk	
				1	2-word chunk	
				2	4-word chunk	
				3	4-word chunk	
	0 or 1 (Stereo or Mono)	5 or 7 (16 bits compact or 8 bits compact)		0	1-word chunk	
				1	2-word chunk	
				2	4-word chunk	
				3	4-word chunk	
2 or 3 (TDM or TDMLJ)	No effect	No effect	0 (1 channel)	0	1-word chunk	
				1	2-word chunk	
				2	4-word chunk	
				3	4-word chunk	
	0 (Stereo)	0, 1, 2, 3, 4 or 6 (32, 24, 20, 18, 16 or 8 bits)	1, 3 or 7 (2, 4 or 8 channels)	0	1-word chunk	
				1	2-word chunk	
				2	4-word chunk	
				3	8-word chunk	
			2, 4, 5 or 6 (3, 5, 6 or 7 channels)	0	1-word chunk	
				1	2-word chunk	
				2	4-word chunk	
				3	4-word chunk	
	1 (Mono)		1, 3 or 7 (2, 4 or 8 channels)	0	1-word chunk	
				1	2-word chunk	
				2	4-word chunk	
				3	4-word chunk	
			2, 4, 5 or 6 (3, 5, 6 or 7 channels)	0	1-word chunk	
				1	2-word chunk	
				2	2-word chunk	
				3	2-word chunk	
	0 or 1		5 or 7 (16 bits compact or 8 bits compact)	1, 3 or 7 (2, 4 or 8 channels)	0	1-word chunk
					1	2-word chunk
					2	4-word chunk
					3	4-word chunk
				2, 4, 5 or 6 (3, 5, 6 or 7 channels)	0	1-word chunk
					1	2-word chunk
					2	2-word chunk
					3	2-word chunk

**Table 49.5. RX DMA Chunk Configurations**

FORMAT	DATALENGTH	NBCHAN	I2SMCC_MR.B.DMACHUNK Configuration	Maximum DMA Chunk Size Allowed
0 or 1 (I <sup>2</sup> S or LJ)	0, 1, 2, 3, 4 or 6 (32, 24, 20, 18, 16 or 8 bits)	No effect	0	1-word chunk
			1	2-word chunk
			2	4-word chunk
			3	8-word chunk
	5 or 7 (16 bits compact or 8 bits compact)		0	1-word chunk
			1	2-word chunk
			2	4-word chunk
			3	
2 or 3 (TDM or TDMLJ)	No effect	0 (1 channel)	0	1-word chunk
			1	2-word chunk
			2	4-word chunk
			3	
	0, 1, 2, 3, 4 or 6 (32, 24, 20, 18, 16 or 8 bits)	1, 3 or 7 (2, 4 or 8 channels)	0	1-word chunk
			1	2-word chunk
			2	4-word chunk
			3	8-word chunk
		2, 4, 5 or 6 (3, 5, 6 or 7 channels)	0	1-word chunk
			1	2-word chunk
			2	4-word chunk
			3	
	5 or 7 (16 bits compact or 8 bits compact)	1, 3 or 7 (2, 4 or 8 channels)	0	1-word chunk
			1	2-word chunk
			2	4-word chunk
			3	
		2, 4, 5 or 6 (3, 5, 6 or 7 channels)	0	1-word chunk
			1	2-word chunk
			2	
			3	

#### 49.6.11. Loop-back Mode

For debug purposes, the I2SMCC can be configured to loop back the transmitter to the receiver. Writing a '1' to I2SMCC\_MRA.RXLOOP internally connects I2SMCC\_DOUTx to I2SMCC\_DINx, so that the transmitted data is also received. Writing a '0' to I2SMCC\_MRA.RXLOOP restores the normal behavior with independent receiver and transmitter. As for other changes to the receiver or transmitter configuration, the I2SMCC receiver and transmitter must be disabled before writing to I2SMCC\_MRA to update I2SMCC\_MRA.RXLOOP.

#### 49.6.12. Interrupts

An I2SMCC interrupt request can be triggered whenever one or several of the following bits are set in I2SMCC\_ISRA and/or I2SMCC\_ISRB:

- Receive Left x Ready (RXLRDYx)
- Receive Right x Ready (RXRRDYx)
- Receive Left x Overrun (RXLOVx)
- Receive Right x Overrun (RXROVx)
- Transmit Left x Ready (TXLRDYx)
- Transmit Right x Ready (TXRRDYx)
- Transmit Left x Underrun (TXLUNx)
- Transmit Right x Underrun (TXRUNx)
- Write Error (WERR)

The interrupt request is generated if the corresponding bit in the Interrupt Mask registers (I2SMCC\_IMRA and I2SMCC\_IMRB) is set. Bits in I2SMCC\_IMRx are set by writing a '1' to the corresponding bit in I2SMCC\_IERx and cleared by writing a '1' to the corresponding bit in I2SMCC\_IDRx. The interrupt request remains active until the corresponding bit in I2SMCC\_ISRx is cleared.

**Figure 49.8.** Interrupt Block Diagram

#### 49.6.13. Register Write Protection

To prevent any single software error from corrupting I2SMCC behavior, certain registers in the address space can be write-protected by setting the Write Protection Configuration Enable (WPCFEN), Write Protection Interrupt Enable (WPITEN) and/or Write Protection Control Enable (WPCTEN) bit(s) in the Write Protection Mode register (I2SMCC\_WPMR).

If a write access to the protected registers is detected, the Write Protection Violation Status (WPVS) flag in the Write Protection Status register (I2SMCC\_WPSR) is set and the field Write Protection Violation Source (WPVSR) indicates the register in which the write access has been attempted. An interrupt can be raised if the Write Error (WERR) interrupt is set in I2SMCC\_IMRB.

The WPVS flag is automatically reset by reading I2SMCC\_WPSR.

The following register can be write-protected with the I2SMCC\_WPMR.WPCFEN bit:

- [Inter-IC Sound Multi Channel Controller Mode Register A](#)
- [Inter-IC Sound Multi Channel Controller Mode Register B](#)

The following registers can be write-protected with the I2SMCC\_WPMR.WPITEN bit:

- [Inter-IC Sound Multi Channel Controller Interrupt Enable Register A](#)
- [Inter-IC Sound Multi Channel Controller Interrupt Disable Register A](#)
- [Inter-IC Sound Multi Channel Controller Interrupt Enable Register B](#)
- [Inter-IC Sound Multi Channel Controller Interrupt Disable Register B](#)

The following register can be write-protected with the I2SMCC\_WPMR.WPCTEN bit:

- [Inter-IC Sound Multi Channel Controller Control Register](#)

## 49.6.14. Functional Safety (Protection, Monitors and Reports)

### 49.6.14.1. Protections

The configuration, interrupt and control registers can be protected against unintentional write accesses resulting from an erroneous software, bad DMA configuration or any abnormal single event upset that would create a spurious access on the bus. See [Register Write Protection](#) for a detailed description.

### 49.6.14.2. Monitors and Reports

When register write protection is enabled, any incorrect access is reported in I2SMCC\_WPSR.WPVS and in I2SMCC\_ISRB.WERR. It is possible to trigger an interrupt by writing a '1' in I2SMCC\_IERB.WERR.

I2SMCC embeds an on-the-fly monitoring of the WS and CK output pads to speed-up detection and report of any error while transmitting a data. The monitor cannot be disabled for safety reason and only reports an error in the user interface (i.e. there is no action on transmission path).

The I2SMCC internal outputs are passed through IO multiplexing logic that may be unintentionally badly configured and leads to absence or bad transmission. Other causes of stuck-at are detected (external cause such as short-circuits or internal cause such as pad buffer transistor failure). As an example, a badly re-assigned I2SMCC\_WS/CK IO pin (software error) is detected as soon as the I2SMCC starts transmitting a data because it is unlikely for another peripheral sharing the same IO pin to drive the same waveform as the I2SMCC on I2SMCC\_WS/CK output.

The monitor is enabled when the I2SMCC is configured in Host mode (I2SMCC\_MRA.MODE=1).

An error is reported in I2SMCC\_WPSR.PADERR and in I2SMCC\_ISR.SECE when there is evidence that the output values on I2SMCC\_WS or I2SMCC\_CK differ from the internal values generated by the I2SMCC.

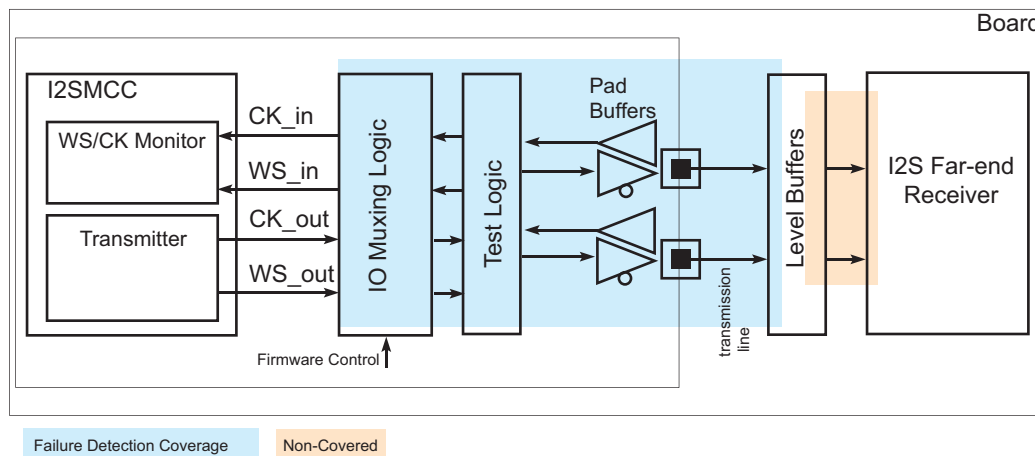

When an I2S format is configured (I2SMCC\_MRA.FORMAT < 2), the I2SMCC\_WS output pad value is oversampled by 2 and, as soon as 2 consecutive samples differ from the internal value generated by the I2SMCC, an error is reported. The rising edges of the I2SMCC\_CK output are counted during a reference period equal to an audio sample period and at the end of each counting period, an error is reported if the counter is below seven at the end of the reference period (the minimum data length of an audio sample being eight bits).

When a TDM format is configured (I2SMCC\_MRA.FORMAT > 1), the I2SMCC\_WS output is monitored in a manner that differs from I2S formats because the waveform of WS can be configured with a minimum high duration pulse of 1 bit time. An error is reported if no falling edge is detected (thus the monitor checks that the output level is not stuck at 1 or 0). The I2SMCC\_CK check is performed in the same way as in I2S format.

The detection method minimizes the likelihood to report a false positive that could result for example from a single upset event.

The monitor covers any failure that would be located in the I2SMCC IO multiplexing downstream circuitry, test logic, output pad buffer and external transmission line from the output pad to any buffering circuitry (if discrete components are placed between the transmitter and far-end receiver).

**Figure 49.9.** Failure Detection Coverage for the I2SMCC Monitor

When an error is reported, it is possible to trigger an interrupt by writing a '1' in I2SMCC\_IER.SECE.

## 49.7. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

### 49.7.1. I2SMCC Control Register

**Name:** I2SMCC\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if WPCTEN is cleared in the [Inter-IC Sound Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	SWRST		TXDIS	TXEN	CKDIS	CKEN	RXDIS	RXEN
Access	W		W	W	W	W	W	W
Reset	–		–	–	–	–	–	–

#### Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets all the registers in the I2SMCC. The I2SMCC is disabled after the reset.

#### Bit 5 – TXDIS Transmitter Disable

Value	Description
0	No effect.
1	Disables the I2SMCC transmitter. I2SMCC_SR.TXEN is cleared when the Transmitter is stopped.

#### Bit 4 – TXEN Transmitter Enable

Value	Description
0	No effect.
1	Enables the I2SMCC transmitter, if TXDIS is not '1'. I2SMCC_SR.TXEN is set when the Transmitter is started.

#### Bit 3 – CKDIS Clocks Disable

Value	Description
0	No effect.
1	Disables the I2SMCC clock generation.

#### Bit 2 – CKEN Clocks Enable

Value	Description
0	No effect.
1	Enables the I2SMCC clock generation, if CKDIS is not '1'.

#### Bit 1 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	Disables the I2SMCC receiver. I2SMCC_SR.RXEN is cleared when the receiver is stopped.

#### Bit 0 – RXEN Receiver Enable

Value	Description
0	No effect.
1	Enables the I2SMCC receiver, if RXDIS is not '1'. I2SMCC_SR.RXEN is set when the receiver is activated.

## 49.7.2. I2SMCC Mode Register A

**Name:** I2SMCC\_MRA  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if WPCFEN is cleared in [Inter-IC Sound Write Protection Mode Register](#).

The I2SMCC\_MRA must only be written when the I2SMCC is stopped in order to avoid unexpected behavior on the I2SMCC\_WS, I2SMCC\_CK and I2SMCC\_DOUT outputs. The proper sequence is to write to I2SMCC\_MRA, then write to I2SMCC\_CR to enable the I2SMCC or to disable the I2SMCC before writing a new value to I2SMCC\_MRA.

Bit	31	30	29	28	27	26	25	24
	IWS	IMCKMODE	ISCKDIV[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TDMFS[1:0]		IMCKDIV[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	NBCHAN[2:0]			SRCCLK	TXSAME	TXMONO	RXLOOP	RXMONO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FORMAT[1:0]		ZERO[1:0]		DATALENGTH[2:0]			MODE
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 31 – IWS** I2SMCC\_WS Slot Length  
See [Slot Length \(I<sup>2</sup>S format\)](#) .

Value	Description
0	I2SMCC_WS slot is 32 bits long for DATALENGTH = 18/20/24 bits.
1	I2SMCC_WS slot is 24 bits long for DATALENGTH = 18/20/24 bits.

**Bit 30 – IMCKMODE** Host Clock Mode

Value	Description
0	No host clock generated.
1	Host clock generated.

**Bits 29:24 – ISCKDIV[5:0]** Selected Clock to I2SMCC Serial Clock Ratio  
I2SMCC\_CK Serial clock output frequency is Selected Clock divided by (2 \* ISCKDIV). If ISCKDIV is 0, the I2SMCC\_CK Serial clock output frequency is equal to the Selected Clock frequency.

**Bits 23:22 – TDMFS[1:0]** TDM Frame Synchronization  
In Client mode (I2SMCC\_MRA.MODE = 0), the I2SMCC\_MRA.TDMFS configuration must correspond to I2SMCC\_WS high level period of the audio codec.

Value	Name	Description
0	SLOT	I2SMCC_WS pulse is high for one time slot at beginning of frame.
1	HALF	I2SMCC_WS pulse is high for half the time slots at beginning of frame.
2	BIT	I2SMCC_WS pulse is high for one bit period at beginning of frame, i.e., one I2SMCC_CK period.

**Bits 21:16 – IMCKDIV[5:0]** Selected Clock to I2SMCC Host Clock Ratio  
I2SMCC\_MCK Host clock output frequency is Selected Clock divided by (2 \* IMCKDIV). If IMCKDIV is 0, the I2SMCC\_MCK Host clock output frequency is equal to the Selected Clock frequency.

**Bits 15:13 – NBCHAN[2:0]** Number of TDM Channels-1  
Must be written with the number of TDM channels minus one.

**Bit 12 – SRCCLK** Source Clock Selection

Value	Description
0	The Peripheral clock is selected as source clock for I2SMCC_MCK/WS/CK pins.
1	The PMC.GCLKx clock is selected as source clock (I2SMCC_MCK/WS/CK rate can be independent of system bus clock).

**Bit 11 – TXSAME** Transmit Data when Underrun

Value	Description
0	'0' is transmitted when underrun.
1	Previous sample transmitted when underrun.

**Bit 10 – TXMONO** Transmit Mono

Value	Description
0	Stereo
1	Mono, with left audio samples duplicated to right audio channel by the I2SMCC.

**Bit 9 – RXLOOP** Loop-back Test Mode

Value	Description
0	Normal mode
1	I2SMCC_DOUT output of I2SMCC are internally connected to I2SMCC_DIN inputs.

**Bit 8 – RXMONO** Receive Mono

Value	Description
0	Stereo
1	Mono, with left audio samples duplicated to right audio channel by the I2SMCC.

**Bits 7:6 – FORMAT[1:0]** Data Format

Value	Name	Description
0	I2S	I2S format, stereo with I2SMCC_WS low for left channel, and MSB of sample starting one I2SMCC_CK period after I2SMCC_WS edge.
1	LJ	Left-justified format, stereo with I2SMCC_WS high for left channel, and MSB of sample starting on I2SMCC_WS edge.
2	TDM	TDM format, with (NBCHAN + 1) channels, I2SMCC_WS high at beginning of first channel, and MSB of sample starting one I2SMCC_CK period after I2SMCC_WS edge.
3	TDMLJ	TDM format, left-justified, with (NBCHAN + 1) channels, I2SMCC_WS high at beginning of first channel, and MSB of sample starting on I2SMCC_WS edge.

**Bits 5:4 – ZERO[1:0]** Must always be written to 0

**Bits 3:1 – DATALENGTH[2:0]** Data Word Length

Value	Name	Description
0	32_BITS	Data length is set to 32 bits.
1	24_BITS	Data length is set to 24 bits.
2	20_BITS	Data length is set to 20 bits.
3	18_BITS	Data length is set to 18 bits.
4	16_BITS	Data length is set to 16 bits.
5	16_BITS_COMPACT	Data length is set to 16-bit compact stereo. Left sample in bits [15:0] and right sample in bits [31:16] of same word.
6	8_BITS	Data length is set to 8 bits.
7	8_BITS_COMPACT	Data length is set to 8-bit compact stereo. Left sample in bits [7:0] and right sample in bits [15:8] of the same word.

**Bit 0 – MODE** I2SMCC Mode

Value	Name	Description
0	SLAVE	Client mode. I2SMCC_CK and I2SMCC_WS pin inputs used as bit clock and word select/frame synchronization.
1	MASTER	Host mode. Bit clock and word select/frame synchronization generated by I2SMCC from Peripheral Clock or GCLK if I2SMCC_MCK/WS/CK rates must be independent of system bus clock (See I2SMCC_MR.SRCCLK) and output to I2SMCC_CK and I2SMCC_WS pins. MCK is output as host clock on I2SMCC_MCK if I2SMCC_MRA.IMCKMODE is set.

### 49.7.3. I2SMCC Mode Register B

**Name:** I2SMCC\_MRB  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if WPCFEN is cleared in the [Inter-IC Sound Write Protection Mode Register](#).

The I2SMCC\_MRB must only be written when the I2SMCC is stopped in order to avoid unexpected behavior on the I2SMCC\_WS, I2SMCC\_CK and I2SMCC\_DOUT outputs. The proper sequence is to write to I2SMCC\_MRB, then write to I2SMCC\_CR to enable the I2SMCC or to disable the I2SMCC before writing a new value to I2SMCC\_MRB.

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

#### Bits 9:8 – DMACHUNK[1:0] DMA Chunk Size

Value	Name	Description
0	1_WORD	A DMA transfer request is issued when at least 1 word is empty in the FIFO.
1	2_WORDS	A DMA transfer request is issued when at least 2 words are empty in the FIFO.
2	4_WORDS	A DMA transfer request is issued when at least 4 words are empty in the FIFO. Limitations exist when operating in Mono or TDM. See <a href="#">TX DMA Chunk Configurations</a> and <a href="#">RX DMA Chunk Configurations</a> .
3	8_WORDS	A DMA transfer request is issued when at least 8 words are empty in the FIFO. Limitations exist when operating in Mono or TDM. See <a href="#">TX DMA Chunk Configurations</a> and <a href="#">RX DMA Chunk Configurations</a> .

#### 49.7.4. I2SMCC Status Register

**Name:** I2SMCC\_SR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
				TXEN				RXEN
Access				R				R
Reset				0				0

##### Bit 4 – TXEN Transmitter Enabled

TXEN=1 if the selected clock (internal bit clock, see the figure [I2SMCC Clock Generation](#)) is active and WS is active.

Value	Description
0	Cleared when the transmitter is disabled, following a I2SMCC_CR.TXDIS or I2SMCC_CR.SWRST request.
1	Set when the transmitter is enabled, following a I2SMCC_CR.TXEN request.

##### Bit 0 – RXEN Receiver Enabled

RXEN=1 if the selected clock (internal bit clock, see the figure [I2SMCC Clock Generation](#)) is active and WS is active.

Value	Description
0	Cleared when the receiver is disabled, following an RXDIS or SWRST request in I2SMCC_CR.
1	Set when the receiver is enabled, following an RXEN request in I2SMCC_CR.

**49.7.5. I2SMCC Interrupt Enable Register A**

**Name:** I2SMCC\_IERA  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if WPITEN is cleared in the [Inter-IC Sound Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	1	1

**Bits 25, 27, 29, 31 – RXROVFx** I<sup>2</sup>S Receive Right x (x=0 only) or TDM Channel [2x]+1 Overrun Flag (Cleared on read)

Value	Description
0	Cleared when I2SMCC_ISRA is read.
1	Set when an overrun error occurs in I2SMCC_RHR.

**Bits 24, 26, 28, 30 – RXLOVFx** I<sup>2</sup>S Receive Left x (x=0 only) or TDM Channel 2x Overrun Flag (Cleared on read)

Value	Description
0	Cleared when I2SMCC_ISRA is read.
1	Set when an overrun error occurs in I2SMCC_RHR.

**Bits 17, 19, 21, 23 – RXRRDYx** I<sup>2</sup>S Receive Right x (x=0 only) or TDM Channel [2x]+1 Ready Flag (Cleared by reading I2SMCC\_RHR)

Value	Description
0	Cleared when a predefined number of read accesses are performed in I2SMCC_RHR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG / FORMAT and varies from 1 to 8.
1	Set when received data is available in I2SMCC_RHR.

**Bits 16, 18, 20, 22 – RXLRDYx** I<sup>2</sup>S Receive Left x (x=0 only) or TDM Channel 2x Ready Flag (Cleared by reading I2SMCC\_RHR)

Value	Description
0	Cleared when a predefined number of read accesses is performed in I2SMCC_RHR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG/FORMAT and varies from 1 to 7.
1	Set when received data is available in I2SMCC_RHR.

**Bits 9, 11, 13, 15 – TXRUNFx** I<sup>2</sup>S Transmit Right x (x=0 only) or TDM Channel [2x]+1 Underrun Flag (Cleared on read)

Value	Description
0	Cleared when the I2SMCC_ISRA is read.
1	Set when an underrun error occurs in I2SMCC_THR.

**Bits 8, 10, 12, 14 – TXLUNFx** I<sup>2</sup>S Transmit Left x (x=0 only) or TDM Channel 2x Underrun (Cleared on read)

Value	Description
0	Cleared when I2SMCC_ISRA is read.
1	Set when an underrun error occurs in I2SMCC_THR.

**Bits 1, 3, 5, 7 – TXRRDYx** I<sup>2</sup>S Transmit Right x (x=0 only) or TDM Channel [2x]+1 Ready Flag (Cleared by writing I2SMCC\_THR)

Value	Description
0	Cleared when a predefined number of write accesses is performed in I2SMCC_THR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG/FORMAT and varies from 1 to 8.
1	Set when I2SMCC_THR is empty.

**Bits 0, 2, 4, 6 – TXLRDYx** I<sup>2</sup>S Transmit Left x (x=0 only) or TDM Channel 2x Ready Flag (Cleared by writing I2SMCC\_THR)

Value	Description
0	Cleared when a predefined number of write accesses is performed in I2SMCC_THR. The predefined number depends on the configuration of I2SMCC_MRA.WIRECFG/FORMAT and varies from 1 to 7.
1	Set when I2SMCC_THR is empty.

#### 49.7.9. I2SMCC Interrupt Enable Register B

**Name:** I2SMCC\_IERB

**Offset:** 0x20

**Reset:** –

**Property:** Write-only

This register can only be written if WPITEN is cleared in the [Inter-IC Sound Write Protection Mode Register](#).

The following configuration values are valid for the listed bit of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

Bit	7	6	5	4	3	2	1	0
	THR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – THR[31:0] Transmitter Holding Register

Next data word to be transmitted after the current word if TXLRDYx or TXRRDYx is not set. If I2SMCC\_MRA.DATALength specifies fewer than 32 bits, data is right-justified in the THR field.

## 49.7.15. I2SMCC Write Protection Mode Register

**Name:** I2SMCC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCTEN	WPITEN	WPCFEN
Access						R/W	R/W	R/W
Reset						0	0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x493253	PASSWD	Writing any other value in this field aborts the write operation. Always reads as 0.

### Bit 2 – WPCTEN Write Protection Control Enable

Value	Description
0	Disables the write protection of the control if WPKEY matches to 0x493253 (I2S in ASCII).
1	Enables the write protection of the control if WPKEY matches to 0x493253 (I2S in ASCII).

### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection of the interruption if WPKEY matches to 0x493253 (I2S in ASCII).
1	Enables the write protection of the interruption if WPKEY matches to 0x493253 (I2S in ASCII).

### Bit 0 – WPCFEN Write Protection Configuration Enable

Value	Description
0	Disables the write protection of the configuration if WPKEY matches to 0x493253 (I2S in ASCII).
1	Enables the write protection of the configuration if WPKEY matches to 0x493253 (I2S in ASCII).

## 49.7.16. I2SMCC Write Protection Status Register

**Name:** I2SMCC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	WPVSR[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 31:8 – WPVSR[23:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the I2SMCC_WPSR.
1	A write protection violation has occurred since the last read of the I2SMCC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 50. Synchronous Serial Controller (SSC)

### 50.1. Description

The Synchronous Serial Controller (SSC) provides a synchronous communication link with external devices. It supports many serial synchronous communication protocols generally used in audio and telecom applications such as I2S, Short Frame Sync, Long Frame Sync, etc.

The SSC contains an independent receiver and transmitter and a common clock divider. The receiver and the transmitter each interface with three signals: the TD/RD signal for data, the TK/RK signal for the clock and the TF/RF signal for the Frame Sync. The transfers can be programmed to start automatically or on different events detected on the Frame Sync signal.

The SSC high-level of programmability and its use of DMA enable a continuous high bit rate data transfer without processor intervention.

Featuring connection to the DMA, the SSC enables interfacing with low processor overhead to:

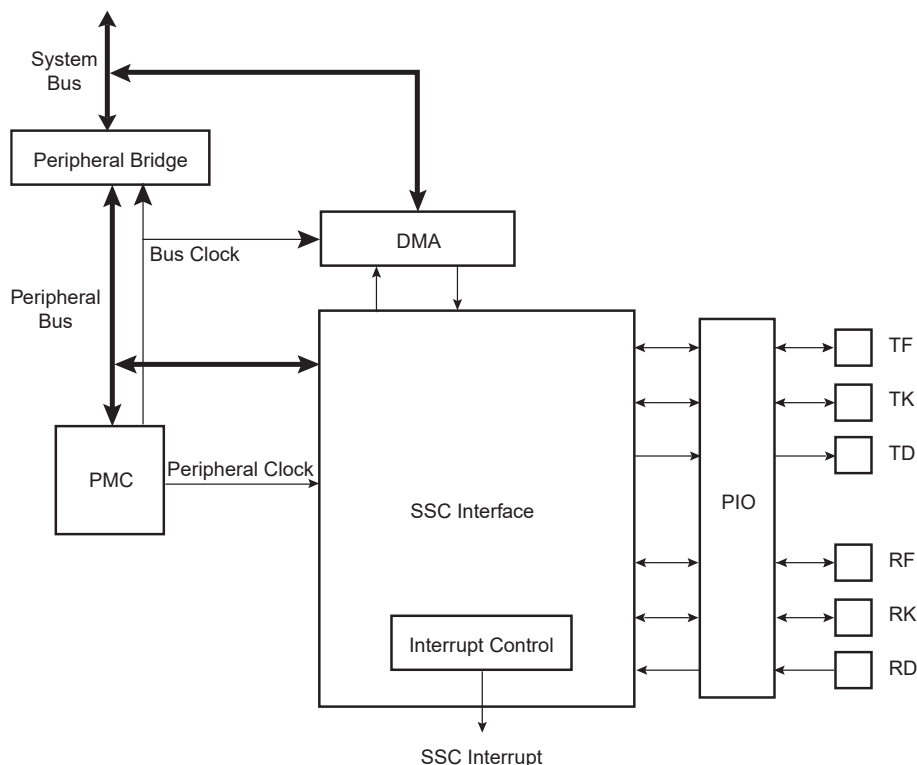

- Codecs in Host or Client mode
- DAC through dedicated serial interface, particularly I2S
- Magnetic card reader

### 50.2. Embedded Characteristics

- Provides Serial Synchronous Communication Links Used in Audio and Telecom Applications
- Contains an Independent Receiver and Transmitter and a Common Clock Divider
- Interfaced with the DMA Controller (DMAC) to Reduce Processor Overhead
- Offers a Configurable Frame Sync and Data Length
- Receiver and Transmitter can be Programmed to Start Automatically or on Detection of Different Events on the Frame Sync Signal
- Receiver and Transmitter Include a Data Signal, a Clock Signal and a Frame Sync Signal
- Up to 16 Channels in TDM Mode

## 50.3. Block Diagram

Figure 50.1. SSC Block Diagram

## 50.4. Application Block Diagram

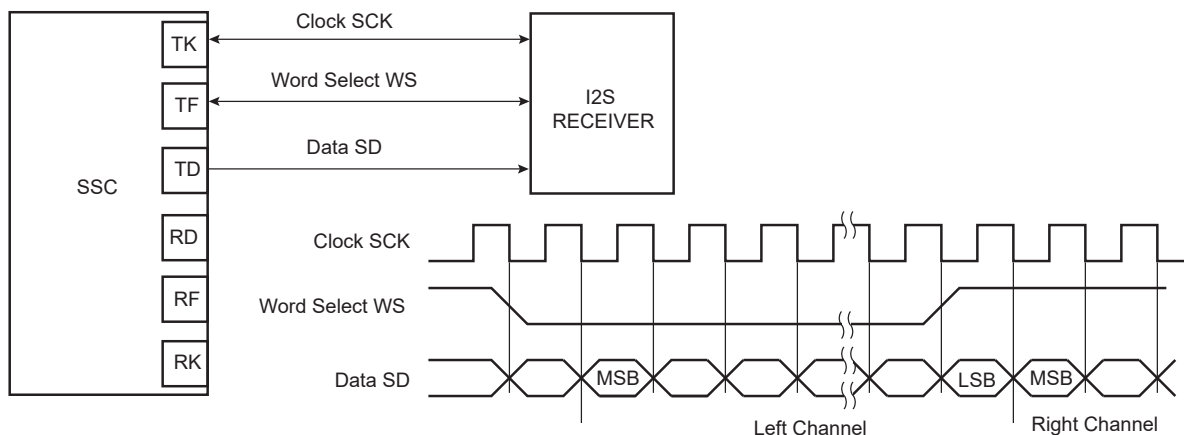

Figure 50.2. SSC Application Block Diagram

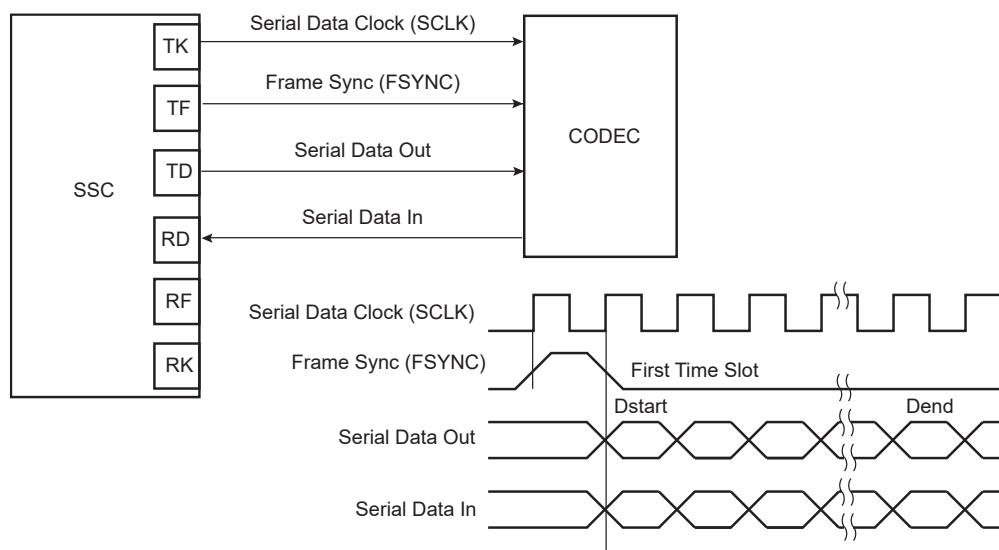

## 50.5. SSC Application Examples

The SSC can support several serial communication modes used in audio or high speed serial links. Some standard applications are shown in the following figures. All serial link applications supported by the SSC are not listed here.

**Figure 50.3. Audio Application Block Diagram**

**Figure 50.4. Codec Application Block Diagram**

**Figure 50.5.** Time Slot Application Block Diagram

## 50.6. Pin Name List

**Table 50.1.** I/O Lines Description

Pin Name	Pin Description	Type
RF	Receive Frame Synchronization	Input/Output
RK	Receive Clock	Input/Output
RD	Receive Data	Input
TF	Transmit Frame Synchronization	Input/Output
TK	Transmit Clock	Input/Output
TD	Transmit Data	Output

## 50.7. Product Dependencies

### 50.7.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines.

Before using the SSC receiver, the PIO controller must be configured to dedicate the SSC receiver I/O lines to the SSC Peripheral mode.

Before using the SSC transmitter, the PIO controller must be configured to dedicate the SSC transmitter I/O lines to the SSC Peripheral mode.

### 50.7.2. Power Management

The SSC is not continuously clocked. The SSC interface may be clocked through the Power Management Controller (PMC), therefore the programmer must first configure the PMC to enable the SSC clock.

### 50.7.3. Interrupt

The SSC interface has an interrupt line connected to the interrupt controller. Handling interrupts requires programming the interrupt controller before configuring the SSC.

All SSC interrupts can be enabled/disabled configuring the SSC Interrupt Mask Register. Each pending and unmasked SSC interrupt asserts the SSC interrupt line. The SSC interrupt service routine can get the interrupt origin by reading the SSC Interrupt Status Register.

### 50.7.4. Audio Sampling Rate Limitations

The maximum audio sampling rate that can be processed depends on the peripheral clock frequency and number of audio channels.

When operating in I2S mode (2 channels) the maximum rate in kilo samples per second (ksps) is the peripheral clock frequency given in kHz divided by 448 (i.e.,  $224 \times 2$ ).

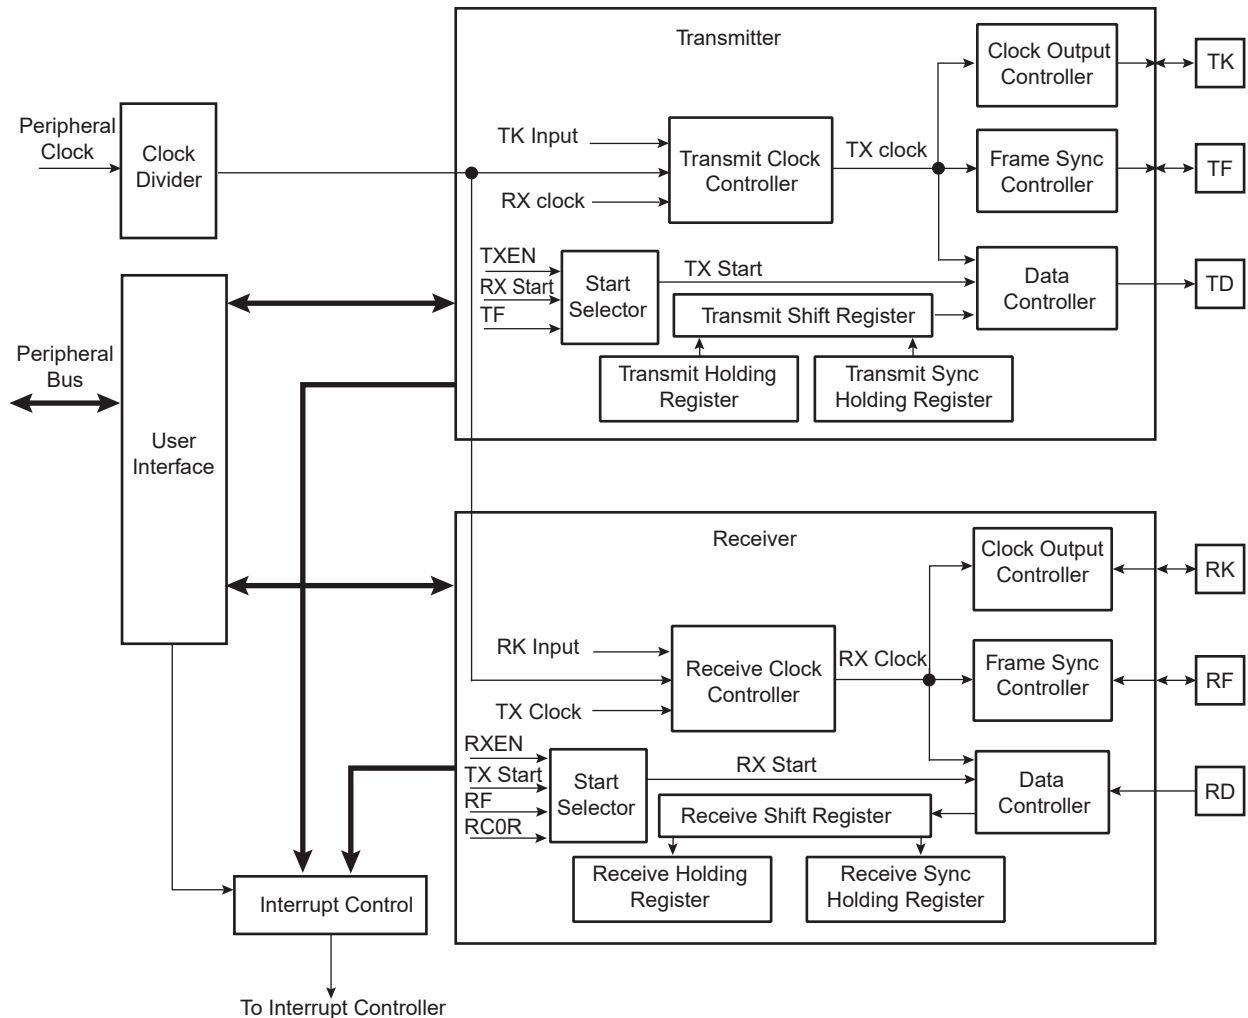

When operating in TDM mode (2 to 8 channels), the maximum rate in ksps is the peripheral clock frequency given in kHz divided by  $224 \times$  number of channels.

## 50.8. Functional Description

This section contains the functional description of the following: SSC Functional Block, Clock Management, Data Format, Start, Transmit, Receive and Frame Synchronization.

The receiver and transmitter operate separately. However, they can work synchronously by programming the receiver to use the transmit clock and/or to start a data transfer when transmission starts. Alternatively, this can be done by programming the transmitter to use the receive clock and/or to start a data transfer when reception starts. The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Client mode data transfers. The maximum clock speed allowed on the TK and RK pins is the peripheral clock divided by 2.

**Figure 50.6.** SSC Functional Block Diagram

### 50.8.1. Clock Management

The transmit clock can be generated by:

- an external clock received on the TK I/O pad
- the receive clock
- the internal clock divider

The receive clock can be generated by:

- an external clock received on the RK I/O pad
- the transmit clock
- the internal clock divider

Furthermore, the transmitter block can generate an external clock on the TK I/O pad, and the receive block can generate an external clock on the RK I/O pad.

This allows the SSC to support many Host and Client mode data transfers.

### 50.8.1.1.Clock Divider

**Figure 50.7.** Divided Clock Block Diagram

The peripheral clock divider is determined by the 12-bit field DIV counter and comparator (so its maximal value is 4095) in the Clock Mode Register (SSC\_CMCR), allowing a peripheral clock division by up to 8190. The Divided Clock is provided to both the receiver and the transmitter. When this field is programmed to 0, the Clock Divider is not used and remains inactive.

When DIV is set to a value equal to or greater than 1, the Divided Clock has a frequency of peripheral clock divided by 2 times DIV. Each level of the Divided Clock has a duration of the peripheral clock multiplied by DIV. This ensures a 50% duty cycle for the Divided Clock regardless of whether the DIV value is even or odd.

**Figure 50.8.** Divided Clock Generation

### 50.8.1.2.Transmit Clock Management

The transmit clock is generated from the receive clock or the divider clock or an external clock scanned on the TK I/O pad. The transmit clock is selected by the CKS field in the Transmit Clock Mode Register (SSC\_TCMR). Transmit Clock can be inverted independently by the CKI bits in the SSC\_TCMR.

The transmitter can also drive the TK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC\_TCMR. The Transmit Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC\_TCMR to select TK pin (CKS field) and at the same time Continuous Transmit Clock (CKO field) can lead to unpredictable results.

**Figure 50.9. Transmit Clock Management**

### 50.8.1.3. Receive Clock Management

The receive clock is generated from the transmit clock or the divider clock or an external clock scanned on the RK I/O pad. The Receive Clock is selected by the CKS field in SSC\_RCMR (Receive Clock Mode Register). Receive Clocks can be inverted independently by the CKI bits in SSC\_RCMR.

The receiver can also drive the RK I/O pad continuously or be limited to the current data transfer. The clock output is configured by the SSC\_RCMR. The Receive Clock Inversion (CKI) bits have no effect on the clock outputs. Programming the SSC\_RCMR to select RK pin (CKS field) and at the same time Continuous Receive Clock (CKO field) can lead to unpredictable results.

**Figure 50.10. Receive Clock Management**

#### 50.8.1.4. Serial Clock Ratio Considerations

The transmitter and the receiver can be programmed to operate with the clock signals provided on either the TK or RK pins. This allows the SSC to support many Client mode data transfers. In this case, the maximum clock speed allowed on the RK pin is:

- Peripheral clock divided by 2 if Receive Frame Synchronization is input
- Peripheral clock divided by 3 if Receive Frame Synchronization is output

In addition, the maximum clock speed allowed on the TK pin is:

- Peripheral clock divided by 7 if Transmit Frame Synchronization is input
- Peripheral clock divided by 2 if Transmit Frame Synchronization is output

These are only theoretical speed limits for first order calculations. Refer to the section "Electrical Characteristics" for exact speed limits on TK and RK.

#### 50.8.2. Transmit Operations

A transmit frame is triggered by a start event and can be followed by synchronization data before data transmission.

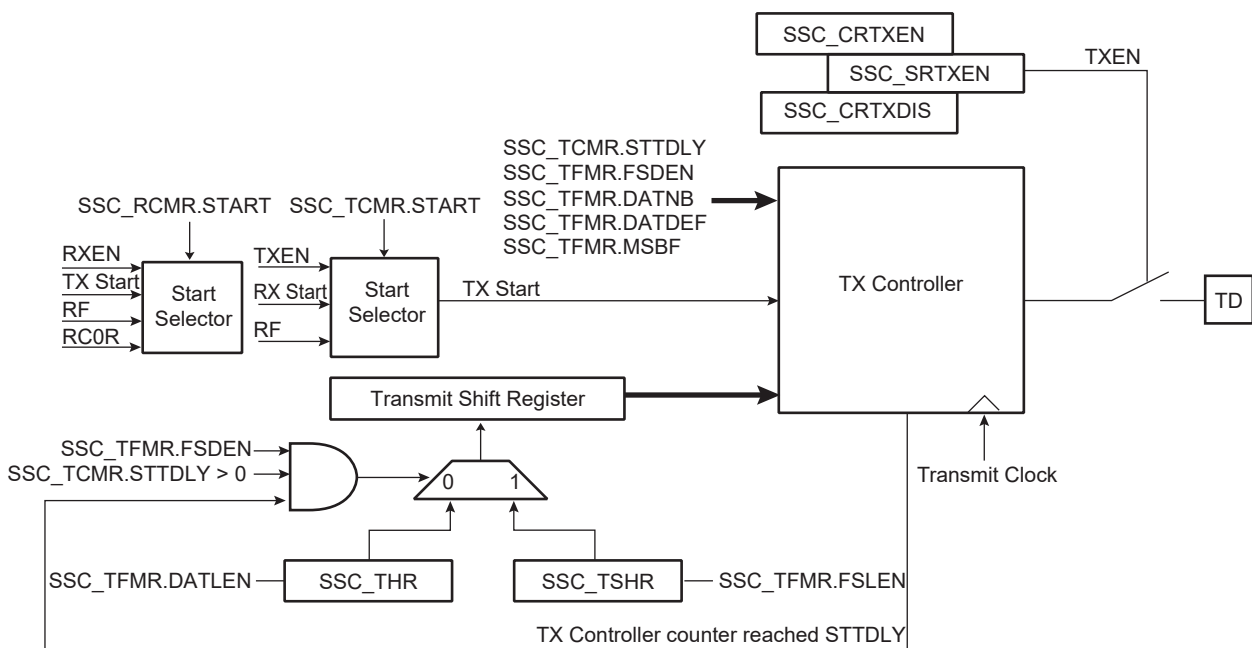

The start event is configured by setting the SSC\_TCMR. See [Start](#).

The frame synchronization is configured setting the Transmit Frame Mode Register (SSC\_TFMR). See [Frame Synchronization](#).

To transmit data, the transmitter uses a shift register clocked by the transmit clock signal and the start mode selected in the SSC\_TCMR. Data is written by the application to the Transmit Holding register (SSC\_THR) then transferred to the transmit shift register according to the data format selected.

When both the SSC\_THR and the transmit shift register are empty, the status flag TXEMPTY is set in the Status register (SSC\_SR). When the Transmit Holding register is transferred to the transmit shift register, the status flag TXRDY is set in the SSC\_SR and additional data can be loaded in the Transmit Holding register.

**Figure 50.11.** Transmit Block Diagram

### 50.8.3. Receive Operations

A receive frame is triggered by a start event and can be followed by synchronization data before data transmission.

The start event is configured by setting the Receive Clock Mode Register (SSC\_RCMR). See [Start](#).

The frame synchronization is configured by setting the Receive Frame Mode Register (SSC\_RFMR). See [Frame Synchronization](#).

The receiver uses a shift register clocked by the receive clock signal and the start mode selected in the SSC\_RCMR. The data is transferred from the shift register depending on the data format selected.

When the receive shift register is full, the SSC transfers the data into the Receive Holding register (SSC\_RHR), the status flag RXRDY is set in the SSC\_SR and the data can be read in the Receive Holding register. If another transfer occurs before read of the Receive Holding register, the status flag OVRUN is set in the SSC\_SR and the receive shift register is transferred in the SSC\_RHR. The old unread data is then lost.

**Figure 50.12.** Receive Block Diagram

### 50.8.4. Start

The transmitter and receiver can both be programmed to start their operations when an event occurs, respectively in the Transmit Start Selection (START) field of SSC\_TCMR and in the Receive Start Selection (START) field of SSC\_RCMR.

Under the following conditions the start event is independently programmable:

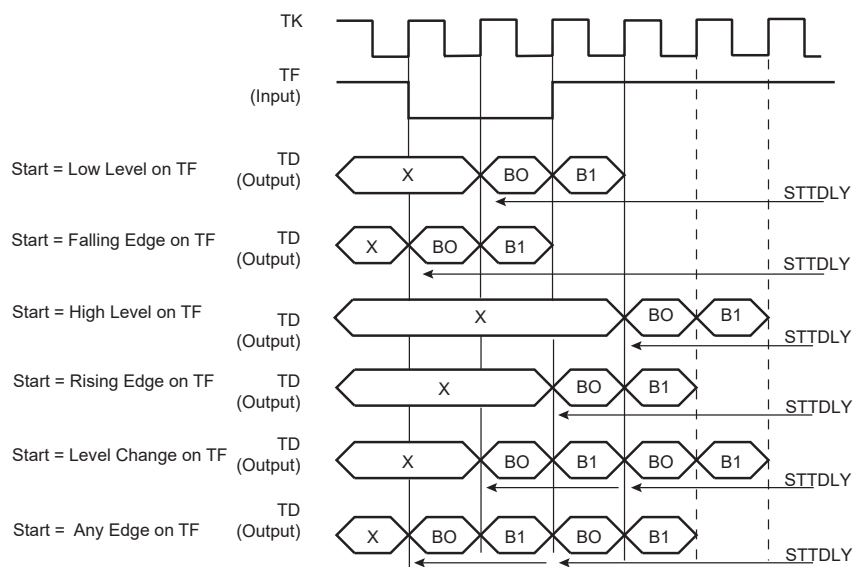

- Continuous. In this case, the transmission starts as soon as a word is written in SSC\_THR and the reception starts as soon as the receiver is enabled.
- Synchronously with the transmitter/receiver
- On detection of a falling/rising edge on TF/RF
- On detection of a low level/high level on TF/RF
- On detection of a level change or an edge on TF/RF

A start can be programmed in the same manner on either side of the Transmit/Receive Clock Register (SSC\_RCMR/SSC\_TCMR). Thus, the start could be on TF (Transmit) or RF (Receive).

Moreover, the receiver can start when data is detected in the bit stream with the Compare Functions.

Detection on TF/RF input/output is done by the field FSOS of the Transmit/Receive Frame Mode Register (SSC\_TFMR/SSC\_RFMR).

**Figure 50.13. Transmit Start Mode**

**Figure 50.14. Receive Pulse/Edge Start Modes**

### 50.8.5. Frame Synchronization

The Transmit and Receive Frame Sync pins, TF and RF, can be programmed to generate different kinds of Frame Sync signals. The Frame Sync Output Selection (FSOS) field in the Receive Frame Mode Register (SSC\_RFMR) and in the Transmit Frame Mode Register (SSC\_TFMR) are used to select the required waveform.

- Programmable low or high levels during data transfer are supported.
- Programmable high levels before the start of data transfers or toggling are also supported.

If a pulse waveform is selected, the Frame Sync Length (FSLEN) field in SSC\_RFMR and SSC\_TFMR programs the length of the pulse, from 1 bit time up to 256 bit times.

The periodicity of the Receive and Transmit Frame Sync pulse output can be programmed through the Period Divider Selection (PERIOD) field in SSC\_RCMR and SSC\_TCMR.

#### 50.8.5.1. Frame Sync Data

Frame Sync Data transmits or receives a specific tag during the Frame Sync signal.

During the Frame Sync signal, the receiver can sample the RD line and store the data in the Receive Sync Holding Register and the transmitter can transfer Transmit Sync Holding Register in the shift register. The data length to be sampled/shifted out during the Frame Sync signal is programmed by the FSLEN field in SSC\_RFMR/SSC\_TFMR and has a maximum value of 256.

Concerning the Receive Frame Sync Data operation, if the Frame Sync Length is equal to or lower than the delay between the start event and the current data reception, the data sampling operation is performed in the Receive Sync Holding Register through the receive shift register.

The Transmit Frame Sync Operation is performed by the transmitter only if the bit Frame Sync Data Enable (FSDEN) in SSC\_TFMR is set. If the Frame Sync length is equal to or lower than the delay between the start event and the current data transmission, the normal transmission has priority and the data contained in the Transmit Sync Holding Register is transferred in the Transmit Register, then shifted out.

#### 50.8.5.2. Frame Sync Edge Detection

The Frame Sync Edge detection is programmed by the FSEDGE field in SSC\_RFMR/SSC\_TFMR. This sets the corresponding flags RXSYN/TXSYN in the SSC Status Register (SSC\_SR) on Frame Sync Edge detection (signals RF/TF).

### 50.8.6. Receive Compare Modes

Figure 50.15. Receive Compare Modes

#### 50.8.6.1. Compare Functions

The length of the comparison patterns (Compare 0, Compare 1) and thus the number of bits they are compared to is defined by FSLEN, but with a maximum value of 256 bits. Comparison is always done by comparing the last bits received with the comparison pattern. Compare 0 can be one start event of the receiver. In this case, the receiver compares at each new sample the last bits received at the Compare 0 pattern contained in the Compare 0 Register (SSC\_RC0R). When this start event is selected, the user can program the receiver to start a new data transfer either by writing a new Compare 0, or by receiving continuously until Compare 1 occurs. This selection is done with the STOP bit in the SSC\_RCMR.

#### 50.8.7. Data Format

The data framing format of both the transmitter and the receiver are programmable through the Transmitter Frame Mode Register (SSC\_TFMR) and the Receive Frame Mode Register (SSC\_RFMR). In either case, the user can independently select the following parameters:

- Event that starts the data transfer (START)
- Delay in number of bit periods between the start event and the first data bit (STTDLY)
- Length of the data (DATLEN)

- Number of data to be transferred for each start event (DATNB)
- Length of synchronization transferred for each start event (FSLEN)
- Bit sense: most or least significant bit first (MSBF)

Additionally, the transmitter can be used to transfer synchronization and select the level driven on the TD pin while not in data transfer operation. This is done respectively by the Frame Sync Data Enable (FSDEN) and by the Data Default Value (DATDEF) bits in SSC\_TFMR.

**Table 50.2.** Data Frame Registers

Transmitter	Receiver	Field	Length	Comment
SSC_TFMR	SSC_RFMR	DATLEN	Up to 32	Size of word
SSC_TFMR	SSC_RFMR	DATNB	Up to 16	Number of words transmitted in frame
SSC_TFMR	SSC_RFMR	MSBF	-	Most significant bit first
SSC_TFMR	SSC_RFMR	FSLEN	Up to 256	Size of Synchro data register
SSC_TFMR	-	DATDEF	0 or 1	Data default value ended
SSC_TFMR	-	FSDEN	-	Enable send SSC_TSHR
SSC_TCMR	SSC_RCMR	PERIOD	Up to 512	Frame size
SSC_TCMR	SSC_RCMR	STTDLY	Up to 255	Size of transmit start delay

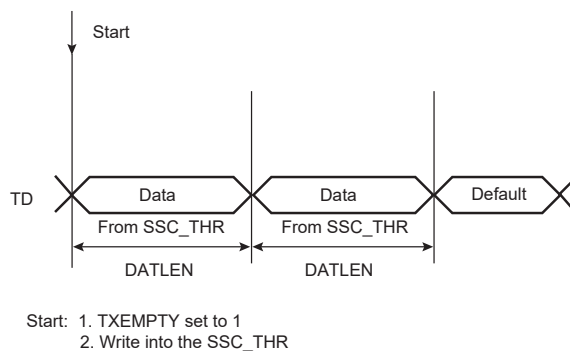

**Figure 50.16.** Transmit and Receive Frame Format in Edge/Pulse Start Modes

Note: 1. Example of input on falling edge of TF/RF.

In the example illustrated above, the SSC\_THR is loaded twice. The FSDEN value has no effect on the transmission. SyncData cannot be output in Continuous mode.

**Figure 50.17.** Transmit Frame Format in Continuous Mode (STTDLY = 0)

**Figure 50.18.** Receive Frame Format in Continuous Mode (STTDLY = 0)

#### 50.8.8. Loop Mode

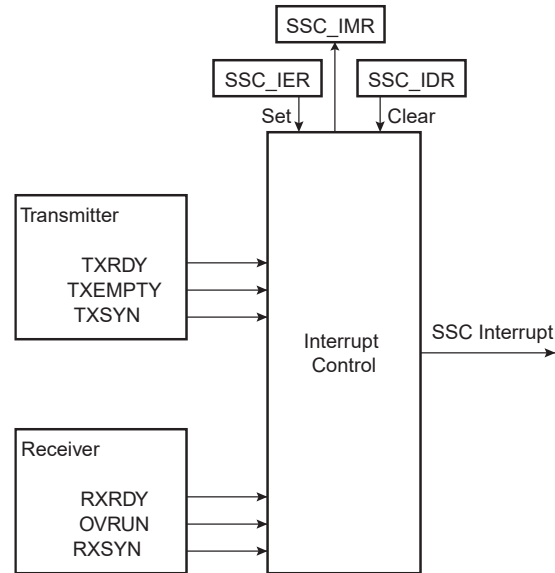

The receiver can be programmed to receive transmissions from the transmitter. This is done by setting the Loop Mode (LOOP) bit in the SSC\_RFMR. In this case, RD is connected to TD, RF is connected to TF and RK is connected to TK.

#### 50.8.9. Interrupt

Most bits in the SSC\_SR have a corresponding bit in interrupt management registers.

The SSC can be programmed to generate an interrupt when it detects an event. The interrupt is controlled by writing the Interrupt Enable Register (SSC\_IER) and Interrupt Disable Register (SSC\_IDR). These registers enable and disable, respectively, the corresponding interrupt by setting and clearing the corresponding bit in the Interrupt Mask Register (SSC\_IMR), which controls the generation of interrupts by asserting the SSC interrupt line connected to the interrupt controller.

**Figure 50.19.** Interrupt Block Diagram

#### 50.8.10. Register Write Protection

To prevent any single software error from corrupting SSC behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the [SSC Write Protection Mode Register](#) (SSC\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the [SSC Write Protection Status Register](#) (SSC\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the SSC\_WPSR.

The following registers can be write-protected:

- [SSC Clock Mode Register](#)
- [SSC Receive Clock Mode Register](#)
- [SSC Receive Frame Mode Register](#)
- [SSC Transmit Clock Mode Register](#)
- [SSC Transmit Frame Mode Register](#)
- [SSC Receive Compare 0 Register](#)
- [SSC Receive Compare 1 Register](#)

## 50.9. Register Summary

**Note:** Offsets 0x100–0x128 are reserved for PDC registers.

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	SSC_CR	31:24

### 50.9.1. SSC Control Register

**Name:** SSC\_CR  
**Offset:** 0x0  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	SWRST						TXDIS	TXEN
Access	W						W	W
Reset	–						–	–

Bit	7	6	5	4	3	2	1	0
							RXDIS	RXEN
Access							W	W
Reset							–	–

#### Bit 15 – SWRST Software Reset

Value	Description
0	No effect.
1	Performs a software reset. Has priority on any other bit in SSC_CR.

#### Bit 9 – TXDIS Transmit Disable

Value	Description
0	No effect.
1	Disables Transmit. If a character is currently being transmitted, disables at end of current character transmission.

#### Bit 8 – TXEN Transmit Enable

Value	Description
0	No effect.
1	Enables Transmit if TXDIS is not set.

#### Bit 1 – RXDIS Receive Disable

Value	Description
0	No effect.
1	Disables Receive. If a character is currently being received, disables at end of current character reception.

#### Bit 0 – RXEN Receive Enable

Value	Description
0	No effect.

Value	Description
1	Enables Receive if RXDIS is not set.

## 50.9.2. SSC Clock Mode Register

**Name:** SSC\_CMCR  
**Offset:** 0x4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					DIV[11:8]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 11:0 – DIV[11:0] Clock Divider

Value	Description
0	The Clock Divider is not active.
Any other value	The divided clock equals the peripheral clock divided by 2 times DIV. The maximum bit rate is $f_{\text{peripheral clock}}/2$ . The minimum bit rate is $f_{\text{peripheral clock}}/2 \times 4095 = f_{\text{peripheral clock}}/8190$ .

### 50.9.3. SSC Receive Clock Mode Register

**Name:** SSC\_RCMR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	PERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Reset	0	0	0	0	0	0	0	0

#### Bits 31:24 – PERIOD[7:0] Receive Period Divider Selection

This field selects the divider to apply to the selected Receive Clock in order to generate a new Frame Sync signal. If 0, no PERIOD signal is generated. If not 0, a PERIOD signal is generated each 2 x (PERIOD + 1) Receive Clock.

#### Bits 23:16 – STTDLY[7:0] Receive Start Delay

If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of reception. When the receiver is programmed to start synchronously with the transmitter, the delay is also applied.

**Note:** STTDLY must be configured in relation to the receive synchronization data to be stored in SSC\_RSHR.

#### Bit 12 – STOP Receive Stop Selection

Value	Description
0	After completion of a data transfer when starting with a Compare 0, the receiver stops the data transfer and waits for a new compare 0.
1	After starting a receive with a Compare 0, the receiver operates in a continuous mode until a Compare 1 is detected.

#### Bits 11:8 – START[3:0] Receive Start Selection

Value	Name	Description
0	CONTINUOUS	Continuous, as soon as the receiver is enabled, and immediately after the end of transfer of the previous data.
1	TRANSMIT	Transmit start

Value	Name	Description
2	RF_LOW	Detection of a low level on RF signal
3	RF_HIGH	Detection of a high level on RF signal
4	RF_FALLING	Detection of a falling edge on RF signal
5	RF_RISING	Detection of a rising edge on RF signal
6	RF_LEVEL	Detection of any level change on RF signal
7	RF_EDGE	Detection of any edge on RF signal
8	CMP_0	Compare 0

#### Bits 7:6 – CKG[1:0] Receive Clock Gating Selection

Value	Name	Description
0	CONTINUOUS	None
1	EN_RF_LOW	Receive Clock enabled only if RF Low
2	EN_RF_HIGH	Receive Clock enabled only if RF High

#### Bit 5 – CKI Receive Clock Inversion

CKI affects only the Receive Clock and not the output clock signal.

Value	Description
0	The data inputs (Data and Frame Sync signals) are sampled on Receive Clock falling edge. The Frame Sync signal output is shifted out on Receive Clock rising edge.
1	The data inputs (Data and Frame Sync signals) are sampled on Receive Clock rising edge. The Frame Sync signal output is shifted out on Receive Clock falling edge.

#### Bits 4:2 – CKO[2:0] Receive Clock Output Mode Selection

Value	Name	Description
0	NONE	None, RK pin is an input
1	CONTINUOUS	Continuous Receive Clock, RK pin is an output
2	TRANSFER	Receive Clock only during data transfers, RK pin is an output

#### Bits 1:0 – CKS[1:0] Receive Clock Selection

Value	Name	Description
0	MCK	Divided Clock
1	TK	TK Clock signal
2	RK	RK pin

**50.9.4. SSC Receive Frame Mode Register**

**Name:** SSC\_RFMR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	FSLEN_EXT[3:0]							FSEDGE
Access	R/W	R/W	R/W	R/W				R/W

		FSOS[2:0]			FSLEN[3:0]			
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					DATNB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MSBF		LOOP	DATLEN[4:0]				
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

**Bits 31:28 – FSLEN\_EXT[3:0]** FSLEN Field Extension

Extends FSLEN field. For details, see [FSLEN: Receive Frame Sync Length](#).

**Bit 24 – FSEDGE** Frame Sync Edge Detection

Determines which edge on Frame Sync will generate the interrupt RXSYN in the SSC Status Register.

Value	Name	Description
0	POSITIVE	Positive Edge Detection
1	NEGATIVE	Negative Edge Detection

**Bits 22:20 – FSOS[2:0]** Receive Frame Sync Output Selection

Value	Name	Description
0	NONE	None, RF pin is an input
1	NEGATIVE	Negative Pulse, RF pin is an output
2	POSITIVE	Positive Pulse, RF pin is an output
3	LOW	Driven Low during data transfer, RF pin is an output
4	HIGH	Driven High during data transfer, RF pin is an output
5	TOGGLING	Toggling at each start of data transfer, RF pin is an output

**Bits 19:16 – FSLEN[3:0]** Receive Frame Sync Length

This field defines the number of bits sampled and stored in the Receive Sync Data Register. When this mode is selected by the START field in the Receive Clock Mode Register, it also determines the length of the sampled data to be compared to the Compare 0 or Compare 1 register.

This field is used with FSLEN\_EXT to determine the pulse length of the Receive Frame Sync signal.

Pulse length is equal to  $FSLEN + (FSLEN\_EXT \times 16) + 1$  Receive Clock periods.

**Bits 11:8 – DATNB[3:0]** Data Number per Frame

This field defines the number of data words to be received after each transfer start, which is equal to  $(DATNB + 1)$ .

**Bit 7 – MSBF** Most Significant Bit First

Value	Description
0	The lowest significant bit of the data register is sampled first in the bit stream.
1	The most significant bit of the data register is sampled first in the bit stream.

**Bit 5 – LOOP** Loop Mode

Value	Description
0	Normal operating mode.
1	RD is driven by TD, RF is driven by TF and TK drives RK.

**Bits 4:0 – DATLEN[4:0]** Data Length

Value	Description
0	Forbidden value (1-bit data length not supported).
Any other value	The bit stream contains $DATLEN + 1$ data bit.

### 50.9.5. SSC Transmit Clock Mode Register

**Name:** SSC\_TCMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	PERIOD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	STTDLY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	START[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CKG[1:0]		CKI	CKO[2:0]			CKS[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:24 – PERIOD[7:0] Transmit Period Divider Selection

This field selects the divider to apply to the selected Transmit Clock to generate a new Frame Sync signal. If 0, no period signal is generated. If not 0, a period signal is generated at each  $2 \times (\text{PERIOD} + 1)$  Transmit Clock.

#### Bits 23:16 – STTDLY[7:0] Transmit Start Delay

If STTDLY is not 0, a delay of STTDLY clock cycles is inserted between the start event and the current start of transmission of data. When the transmitter is programmed to start synchronously with the receiver, the delay is also applied.

**Note:** STTDLY must be set carefully. If STTDLY is too short in respect to TAG (Transmit Sync Data) transmission, data is transmitted instead of the end of TAG.

#### Bits 11:8 – START[3:0] Transmit Start Selection

Value	Name	Description
0	CONTINUOUS	Continuous, as soon as a word is written in the SSC_THR (if Transmit is enabled), and immediately after the end of transfer of the previous data
1	RECEIVE	Receive start
2	TF_LOW	Detection of a low level on TF signal
3	TF_HIGH	Detection of a high level on TF signal
4	TF_FALLING	Detection of a falling edge on TF signal
5	TF_RISING	Detection of a rising edge on TF signal
6	TF_LEVEL	Detection of any level change on TF signal
7	TF_EDGE	Detection of any edge on TF signal

### Bits 7:6 – CKG[1:0] Transmit Clock Gating Selection

Value	Name	Description
0	CONTINUOUS	None
1	EN_TF_LOW	Transmit Clock enabled only if TF Low
2	EN_TF_HIGH	Transmit Clock enabled only if TF High

### Bit 5 – CKI Transmit Clock Inversion

CKI affects only the Transmit Clock and not the Output Clock signal.

Value	Description
0	The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock falling edge. The Frame Sync signal input is sampled on Transmit Clock rising edge.
1	The data outputs (Data and Frame Sync signals) are shifted out on Transmit Clock rising edge. The Frame Sync signal input is sampled on Transmit Clock falling edge.

### Bits 4:2 – CKO[2:0] Transmit Clock Output Mode Selection

Value	Name	Description
0	NONE	None, TK pin is an input
1	CONTINUOUS	Continuous Transmit Clock, TK pin is an output
2	TRANSFER	Transmit Clock only during data transfers, TK pin is an output

### Bits 1:0 – CKS[1:0] Transmit Clock Selection

Value	Name	Description
0	MCK	Divided Clock
1	RK	RK Clock signal
2	TK	TK pin

**50.9.6. SSC Transmit Frame Mode Register**

**Name:** SSC\_TFMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SSC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	FSLEN_EXT[3:0]							FSEDGE
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0

Bit	23	22	21	20	19	18	17	16
	FSDEN	FSOS[2:0]			FSLEN[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
					DATNB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MSBF		DATDEF	DATLEN[4:0]				
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

**Bits 31:28 – FSLEN\_EXT[3:0]** FSLEN Field Extension

Extends FSLEN field. For details, see the description of [FSLEN](#).

**Bit 24 – FSEDGE** Frame Sync Edge Detection

Determines which edge on frame synchronization will generate the interrupt TXSYN (Status Register).

Value	Name	Description
0	POSITIVE	Positive Edge Detection
1	NEGATIVE	Negative Edge Detection

**Bit 23 – FSDEN** Frame Sync Data Enable

Value	Description
0	The TD line is driven with the default value during the Transmit Frame Sync signal.
1	SSC_TSHR value is shifted out during the transmission of the Transmit Frame Sync signal.

**Bits 22:20 – FSOS[2:0]** Transmit Frame Sync Output Selection

Value	Name	Description
0	NONE	None, TF pin is an input
1	NEGATIVE	Negative Pulse, TF pin is an output
2	POSITIVE	Positive Pulse, TF pin is an output
3	LOW	Driven Low during data transfer
4	HIGH	Driven High during data transfer
5	TOGGLING	Toggling at each start of data transfer

**Bits 19:16 – FSLEN[3:0]** Transmit Frame Sync Length

This field defines the length of the Transmit Frame Sync signal and the number of bits shifted out from SSC\_TSHR if FSDEN is 1.

This field is used with FSLEN\_EXT to determine the pulse length of the Transmit Frame Sync signal. Pulse length is equal to  $FSLEN + (FSLEN\_EXT \times 16) + 1$  Transmit Clock period.

**Bits 11:8 – DATNB[3:0]** Data Number per Frame

This field defines the number of data words to be transferred after each transfer start, which is equal to  $(DATNB + 1)$ .

**Bit 7 – MSBF** Most Significant Bit First

Value	Description
0	The lowest significant bit of the data register is shifted out first in the bit stream.
1	The most significant bit of the data register is shifted out first in the bit stream.

**Bit 5 – DATDEF** Data Default Value

This bit defines the level driven on the TD pin while out of transmission. Note that if the pin is defined as multi-drive by the PIO Controller, the pin is enabled only if the SCC TD output is 1.

When the TD pin is configured in Multi-drive (Open-drain) mode by the PIO controller, a 0 is driven if SSC data output equals 0 and the pin is in high-impedance when SSC data output is 1.

**Bits 4:0 – DATLEN[4:0]** Data Length

Value	Description
0	Forbidden value (1-bit data length not supported).
Any other value	The bit stream contains $DATLEN + 1$ data bit.

## 50.9.7. SSC Receive Holding Register

**Name:** SSC\_RHR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

### 50.9.13. SSC Status Register

**Name:** SSC\_SR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
							RXEN	TXEN
Access							R	R
Reset							0	0

Bit	15	14	13	12	11	10	9	8
					RXSYN	TXSYN	CP1	CP0
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
			OVRUN	RXRDY			TXEMPTY	TXRDY
Access			R	R			R	R
Reset			0	0			0	0

#### Bit 17 – RXEN Receive Enable

Value	Description
0	Receive is disabled.
1	Receive is enabled.

#### Bit 16 – TXEN Transmit Enable

Value	Description
0	Transmit is disabled.
1	Transmit is enabled.

#### Bit 11 – RXSYN Receive Sync

Value	Description
0	No Rx Sync has occurred since the last read of the Status register.
1	An Rx Sync has occurred since the last read of the Status register.

#### Bit 10 – TXSYN Transmit Sync

Value	Description
0	No Tx Sync has occurred since the last read of the Status register.
1	A Tx Sync has occurred since the last read of the Status register.

#### Bit 9 – CP1 Compare 1

Value	Description
0	No compare 1 has occurred since the last read of the Status register.
1	A compare 1 has occurred since the last read of the Status register.

### Bit 8 – CP0 Compare 0

Value	Description
0	No compare 0 has occurred since the last read of the Status register.
1	A compare 0 has occurred since the last read of the Status register.

### Bit 5 – OVRUN Receive Overrun

Value	Description
0	No data has been loaded in SSC_RHR while previous data has not been read since the last read of the Status Register.
1	Data has been loaded in SSC_RHR while previous data has not yet been read since the last read of the Status Register.

### Bit 4 – RXRDY Receive Ready

Value	Description
0	SSC_RHR is empty.
1	Data has been received and loaded in SSC_RHR.

### Bit 1 – TXEMPTY Transmit Empty

Value	Description
0	Data remains in SSC_THR or is currently transmitted from TSR.
1	Last data written in SSC_THR has been loaded in TSR and last data loaded in TSR has been transmitted.

### Bit 0 – TXRDY Transmit Ready

Value	Description
0	Data has been loaded in SSC_THR and is waiting to be loaded in the Transmit Shift register (TSR).
1	SSC_THR is empty.

## 50.9.14. SSC Interrupt Enable Register

**Name:** SSC\_IER  
**Offset:** 0x44  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					RXSYN	TXSYN	CP1	CP0
Access					W	W	W	W
Reset					–	–	–	–

Bit	7	6	5	4	3	2	1	0
			OVRUN	RXRDY			TXEMPTY	TXRDY
Access			W	W			W	W
Reset			–	–			–	–

### Bit 11 – RXSYN Rx Sync Interrupt Enable

Value	Description
0	No effect.
1	Enables the Rx Sync Interrupt.

### Bit 10 – TXSYN Tx Sync Interrupt Enable

Value	Description
0	No effect.
1	Enables the Tx Sync Interrupt.

### Bit 9 – CP1 Compare 1 Interrupt Enable

Value	Description
0	No effect.
1	Enables the Compare 1 Interrupt.

### Bit 8 – CP0 Compare 0 Interrupt Enable

Value	Description
0	No effect.
1	Enables the Compare 0 Interrupt.

### Bit 5 – OVRUN Receive Overrun Interrupt Enable

Value	Description
0	No effect.
1	Enables the Receive Overrun Interrupt.

#### Bit 4 – RXRDY Receive Ready Interrupt Enable

Value	Description
0	No effect.
1	Enables the Receive Ready Interrupt.

#### Bit 1 – TXEMPTY Transmit Empty Interrupt Enable

Value	Description
0	No effect.
1	Enables the Transmit Empty Interrupt.

#### Bit 0 – TXRDY Transmit Ready Interrupt Enable

Value	Description
0	No effect.
1	Enables the Transmit Ready Interrupt.

## 50.9.15. SSC Interrupt Disable Register

**Name:** SSC\_IDR  
**Offset:** 0x48  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					RXSYN	TXSYN	CP1	CP0
Access					W	W	W	W
Reset					–	–	–	–

Bit	7	6	5	4	3	2	1	0
			OVRUN	RXRDY			TXEMPTY	TXRDY
Access			W	W			W	W
Reset			–	–			–	–

### Bit 11 – RXSYN Rx Sync Interrupt Disable

Value	Description
0	No effect.
1	Disables the Rx Sync Interrupt.

### Bit 10 – TXSYN Tx Sync Interrupt Disable

Value	Description
0	No effect.
1	Disables the Tx Sync Interrupt.

### Bit 9 – CP1 Compare 1 Interrupt Disable

Value	Description
0	No effect.
1	Disables the Compare 1 Interrupt.

### Bit 8 – CP0 Compare 0 Interrupt Disable

Value	Description
0	No effect.
1	Disables the Compare 0 Interrupt.

### Bit 5 – OVRUN Receive Overrun Interrupt Disable

Value	Description
0	No effect.
1	Disables the Receive Overrun Interrupt.

#### Bit 4 – RXRDY Receive Ready Interrupt Disable

Value	Description
0	No effect.
1	Disables the Receive Ready Interrupt.

#### Bit 1 – TXEMPTY Transmit Empty Interrupt Disable

Value	Description
0	No effect.
1	Disables the Transmit Empty Interrupt.

#### Bit 0 – TXRDY Transmit Ready Interrupt Disable

Value	Description
0	No effect.
1	Disables the Transmit Ready Interrupt.

## 50.9.16. SSC Interrupt Mask Register

**Name:** SSC\_IMR  
**Offset:** 0x4C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
					RXSYN	TXSYN	CP1	CP0
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
			OVRUN	RXRDY			TXEMPTY	TXRDY
Access			R	R			R	R
Reset			0	0			0	0

### Bit 11 – RXSYN Rx Sync Interrupt Mask

Value	Description
0	The Rx Sync Interrupt is disabled.
1	The Rx Sync Interrupt is enabled.

### Bit 10 – TXSYN Tx Sync Interrupt Mask

Value	Description
0	The Tx Sync Interrupt is disabled.
1	The Tx Sync Interrupt is enabled.

### Bit 9 – CP1 Compare 1 Interrupt Mask

Value	Description
0	The Compare 1 Interrupt is disabled.
1	The Compare 1 Interrupt is enabled.

### Bit 8 – CP0 Compare 0 Interrupt Mask

Value	Description
0	The Compare 0 Interrupt is disabled.
1	The Compare 0 Interrupt is enabled.

### Bit 5 – OVRUN Receive Overrun Interrupt Mask

Value	Description
0	The Receive Overrun Interrupt is disabled.
1	The Receive Overrun Interrupt is enabled.

#### Bit 4 – RXRDY Receive Ready Interrupt Mask

Value	Description
0	The Receive Ready Interrupt is disabled.
1	The Receive Ready Interrupt is enabled.

#### Bit 1 – TXEMPTY Transmit Empty Interrupt Mask

Value	Description
0	The Transmit Empty Interrupt is disabled.
1	The Transmit Empty Interrupt is enabled.

#### Bit 0 – TXRDY Transmit Ready Interrupt Mask

Value	Description
0	The Transmit Ready Interrupt is disabled.
1	The Transmit Ready Interrupt is enabled.

**50.9.17. SSC Write Protection Mode Register**

**Name:** SSC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

See [Register Write Protection](#) for the list of registers that can be protected.

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x535343	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

**Bit 0 – WPEN Write Protection Enable**

Value	Description
0	Disables the write protection of the configuration registers if WPKEY corresponds to 0x535343 ("SSC" in ASCII).
1	Enables the write protection of the configuration registers if WPKEY corresponds to 0x535343 ("SSC" in ASCII).

## 50.9.18. SSC Write Protection Status Register

**Name:** SSC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 23:8 – WPVSR[15:0] Write Protect Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the SSC_WPSR.
1	A write protection violation has occurred since the last read of the SSC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

# Security and Cryptography Subsystem

## 51. Overview

### 51.1. Components

- Advanced Encryption Standard (AES) engine
- Triple Data Encryption Standard (TDES) engine
- Secure Hash Algorithm (SHA)
- True Random Number Generator (TRNG)
- One-Time-Programming Memory Controller (OTPC)

Data is moved into and out of the different blocks using a Direct Memory Access (DMA) engine.

#### 51.1.1. Cryptography Subsystem Keybus

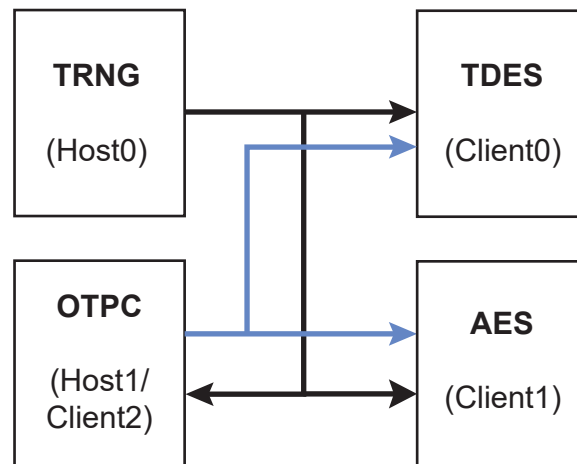

The keybus is a private bus transferring keys from hosts (TRNG, OTPC) to clients (AES, TDES, OTPC) with no possibility for the processor or software to read the keys.

The key used by the crypto IPs is provided either by the keybus internal register or by the IPs internal key register (KEYWR). To select the keybus as a source for AES and TDES, the PKRS bit must be set in the MR/EMR register.

At host level, the client destination and the key length must be defined before starting the transfer.

The device features a keybus system with two hosts and three clients, connected as shown in the following figure.

**Figure 51.1.** Cryptography Keybus

## 51.2. Product Dependencies

### 51.2.1. Clocks

All clocks are controlled by the PMC, which is part of the system controller.

### 51.2.2. Interrupts

Refer to the table [Peripheral Identifiers](#).

#### **51.2.3. Reset**

Cryptography peripherals are connected to the processor and peripherals reset line.

#### **51.2.4. I/Os**

None.

#### **51.3. Special Functions in SFR**

None.

## 52. Advanced Encryption Standard (AES)

### 52.1. Description

The Advanced Encryption Standard (AES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 197 specification.

The AES supports the following confidentiality modes of operation for symmetrical key block cipher algorithms: ECB, CBC, OFB, CFB, CTR and XTS, as specified in the NIST Special Publication 800-38A Recommendation and NIST Special Publication 800-38E Recommendation, as well as Galois/Counter Mode (GCM) as specified in the NIST Special Publication 800-38D Recommendation. It is compatible with all these modes via DMA Controller channels, minimizing processor intervention for large buffer transfers.

The AES key can be either loaded by the software or loaded in an invisible manner from the software.

The 128-bit/192-bit/256-bit AES key is stored in the AES Key register made of four/six/eight 32-bit write-only AES Key Word registers (AES\_KEYWR0–7). For a software-invisible key transfer, the Private Key Bus accesses the Private Key Internal Register from the TRNG or OTPC. The bit PKRS in the Extended Mode register (AES\_EMR) selects either AES\_KEYWRx or the Private Key Internal Register.

The 128-bit input data and initialization vector (for some modes) are each stored in four 32-bit write-only AES Input Data registers (AES\_IDATAR0–3) and AES Initialization Vector registers (AES\_IVR0–3).

As soon as the initialization vector, the input data and the key are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data are ready to be read out on the four 32-bit AES Output Data registers (AES\_ODATAR0–3) or through the DMA channels.

### 52.2. Embedded Characteristics

- Compliant with FIPS Publication 197, Advanced Encryption Standard (AES)
- 128-bit/192-bit/256-bit Cryptographic Key
- 10/12/14 Clock Cycles Encryption/Decryption Inherent Processing Time with a 128-bit/192-bit/256-bit Cryptographic Key
- Double Input Buffer Optimizes Runtime
- Automatic Padding supported for IPSec and SSL standards
- IPSec and SSL Protocol Layers Improved Performances (Tightly coupled with SHA)
- Support of the Modes of Operation Specified in the NIST Special Publication 800-38A and NIST Special Publication 800-38D and NIST Special Publication 800-38E:
  - Electronic Codebook (ECB)
  - Cipher Block Chaining (CBC) including CBC-MAC
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
  - Counter (CTR)
  - Galois/Counter Mode (GCM)
  - XEX-Based Tweaked-Codebook Mode (XTS)
- 8, 16, 32, 64 and 128-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allows Optimized Message Authentication Code (MAC) Generation
- Abnormal Software Access and Internal Sequencer Integrity Check Reports
- Register Write Protection

- Temporary Secure Storage for Keys
- Private Key Bus Access to the Private Key Internal Register Not Readable from any Peripheral or Software
- Connection to DMA Optimizes Data Transfers for all Operating Modes

## 52.3. Product Dependencies

### 52.3.1. Power Management

The AES is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the AES clock.

### 52.3.2. Interrupt Sources

The AES interface has an interrupt line connected to the Interrupt Controller.

Handling the AES interrupt requires programming the Interrupt Controller before configuring the AES.

## 52.4. Functional Description

The Advanced Encryption Standard (AES) specifies a FIPS-approved cryptographic algorithm that can be used to protect electronic data. The AES algorithm is a symmetric block cipher that can encrypt (encipher) and decrypt (decipher) information.

Encryption converts data to an unintelligible form called ciphertext. Decrypting the ciphertext converts the data back into its original form, called plaintext. The CIPHER bit in the AES Mode register (AES\_MR) allows selection between the encryption and the decryption processes.

The AES is capable of using cryptographic keys of 128/192/256 bits to encrypt and decrypt data in blocks of 128 bits. This 128-bit/192-bit/256-bit key is defined in the user interface AES\_KEYWRx register or in the Private Key Internal Register that is only writable from the Private Key Bus.

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 128-bit data block called the initialization vector (IV), which must be set in AES\_IVRx. The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message. AES\_IVRx are also used by the CTR mode to set the counter value.

### 52.4.1. AES Register Endianness

In Arm processor-based products, the system bus and processors manipulate data in little-endian form. The AES interface requires little-endian format words. However, in accordance with the protocol of the FIPS 197 specification, data is collected, processed and stored by the AES algorithm in big-endian form.

The following example illustrates how to configure the AES:

If the first 64 bits of a message (according to FIPS 197, i.e., big-endian format) to be processed is 0xcafedeca\_01234567, then AES\_IDATAR0 and AES\_IDATAR1 registers must be written with the following pattern:

- AES\_IDATAR0 = 0xcadefeca
- AES\_IDATAR1 = 0x67452301

### 52.4.2. Operating Modes

The AES supports the following modes of operation:

- ECB: Electronic Codebook
- CBC: Cipher Block Chaining
  - CBC-MAC: Useful for CMAC hardware acceleration

- OFB: Output Feedback
- CFB: Cipher Feedback
  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)
  - CFB128 (CFB where the length of the data segment is 128 bits)
- CTR: Counter
- GCM: Galois/Counter Mode
- XTS: XEX-based Tweaked-codebook Mode

Data pre-processing, data post-processing and data chaining for the concerned modes are performed automatically. Refer to the *NIST Special Publication 800-38A* and *NIST Special Publication 800-38D* for more complete information.

Mode selection is done by configuring AES\_MR.OPMOD.

When switching from an operating mode requiring the initialization vectors (e.g. CBC, GCM) to another operating mode that does not require initialization vectors (e.g. ECB) and a message of one block has been processed, initialization vector registers (AES\_IVRx) must be cleared before switching to the new mode.

In CFB mode, five data sizes are possible (8, 16, 32, 64 or 128 bits), configurable by means of AES\_MR.CFBS.

In CTR mode, the size of the block counter embedded in the module is 16 bits. Therefore, there is a rollover after processing 1 Mbyte of data. If the file to be processed is greater than 1 Mbyte, this file must be split into fragments of 1 Mbyte or less for the first fragment if the initial value of the counter is greater than 0. Prior to loading the first fragment into AES\_IDATARx, AES\_IVRx must be fully programmed with the initial counter value. For any fragment, after the transfer is completed and prior to transferring the next fragment, AES\_IVRx must be programmed with the appropriate counter value.

If the initial value of the counter is greater than 0 and the data buffer size to be processed is greater than 1 Mbyte, the size of the first fragment to be processed must be 1 Mbyte minus  $16 \times$  (initial value) to prevent a rollover of the internal 16-bit counter.

To have a sequential increment, the counter value must be programmed with the value programmed for the previous fragment +  $2^{16}$  (or less for the first fragment).

All AES\_IVRx fields must be programmed to take into account the possible carry propagation.

#### 52.4.3. Last Output Data Mode (CBC-MAC)

This mode is used to generate cryptographic checksums on data (MAC) by means of cipher block chaining encryption algorithm (CBC-MAC algorithm for example).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data are available either on AES\_ODATARx for Manual and Auto mode, or at the address specified in the receive buffer pointer for DMA mode (see the table [Last Output Data Mode Behavior versus Start Modes](#)).

AES\_MR.LOD allows retrieval of only the last data of several encryption/decryption processes.

Therefore, there is no need to define a read buffer in DMA mode.

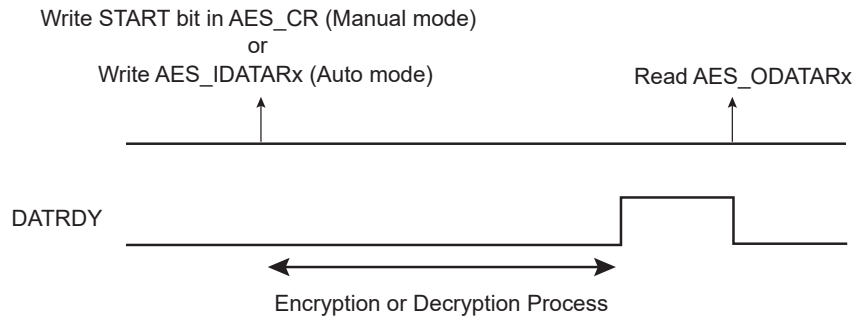

This data are only available in AES\_ODATARx.

### 52.4.3.1. Manual and Auto Modes

#### 52.4.3.1.1. If AES\_MR.LOD = 0

The DATRDY flag is cleared when at least one AES\_ODATARx is read (see the following figure).

**Figure 52.1.** Manual and Auto Modes with AES\_MR.LOD = 0

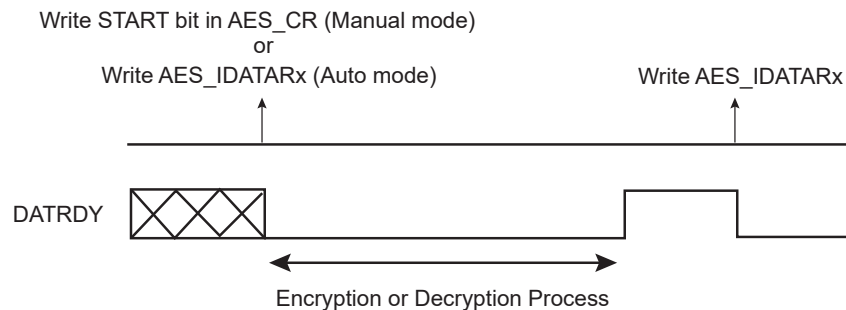

If the user does not want to read AES\_ODATARx between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user cannot know the end of the following encryptions/decryptions.

#### 52.4.3.1.2. If AES\_MR.LOD = 1

This mode is optimized to process AES CBC-MAC operating mode.

The DATRDY flag is cleared when at least one AES\_IDATAR is written (see the following figure). No additional AES\_ODATAR reads are necessary between consecutive encryptions/decryptions.

**Figure 52.2.** Manual and Auto Modes with AES\_MR.LOD = 1

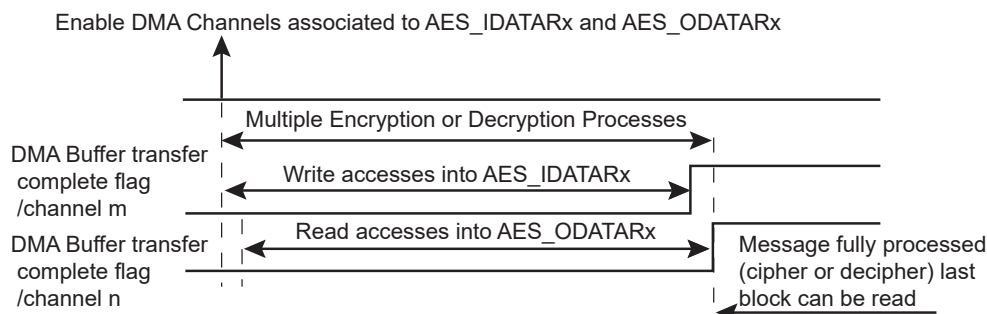

### 52.4.3.2. DMA Mode

#### 52.4.3.2.1. If AES\_MR.LOD = 0

This mode may be used for all AES operating modes except CBC-MAC where AES\_MR.LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to AES\_ODATARx (see the following figure). Two DMA channels are required: one for writing message blocks to AES\_IDATARx and one to obtain the result from AES\_ODATARx.

**Figure 52.3.** DMA Transfer with AES\_MR.LOD = 0

#### 52.4.3.2.2.If AES\_MR.LOD = 1

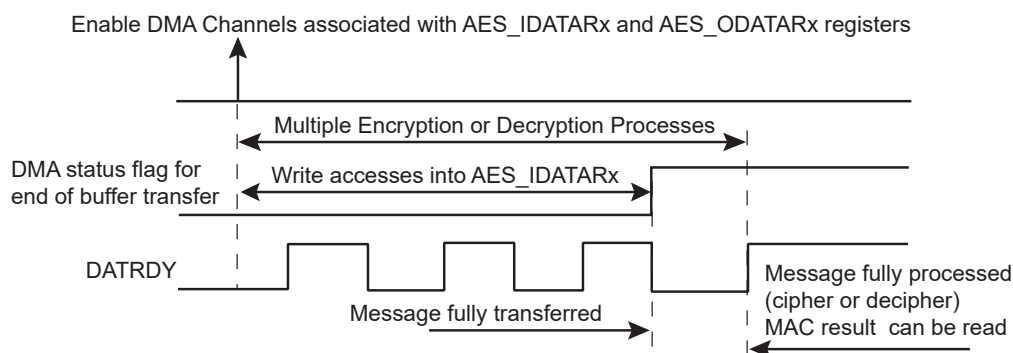

This mode is optimized to process AES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the following figure).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, AES\_MR.SMOD must be written to '0'. To restart a CBC-MAC on a new buffer, AES\_MR.SMOD must be written to '2'.

The output data are only available on AES\_ODATARx.

**Figure 52.4.** DMA Transfer with AES\_MR.LOD = 1

The following table summarizes the different cases.

**Table 52.1.** Last Output Data Mode Behavior versus Start Modes

Sequence	Manual and Auto Modes		DMA Transfer	
	AES_MR.LOD = 0	AES_MR.LOD = 1	AES_MR.LOD = 0	AES_MR.LOD = 1
DATRDY Flag Clearing Condition <sup>(1)</sup>	At least one AES_ODATAR must be read	At least one AES_IDATAR must be written	Not used	Managed by the DMA
End of Encryption/Decryption Notification	DATRDY	DATRDY	2 DMA Buffer transfer complete flags (channel m and channel n)	DMA buffer transfer complete flag, then AES DATRDY flag
Encrypted/Decrypted Data Result Location	In AES_ODATARx	In AES_ODATARx	At the address specified in the Channel Buffer Transfer Descriptor	In AES_ODATARx

**Note:**

- Depending on the mode, there are other ways of clearing the DATRDY flag. See [AES\\_ISR](#).

**WARNING**

In DMA mode, reading AES\_ODATARx before the last data transfer may lead to unpredictable results.

## 52.4.4. Galois/Counter Mode (GCM)

### 52.4.4.1. Description

GCM comprises the AES engine in CTR mode along with a universal hash function (GHASH engine) that is defined over a binary Galois field to produce a message authentication tag (the AES CTR engine and the GHASH engine are depicted in the following figure).

The GHASH engine processes data packets after the AES operation. GCM assures the confidentiality of data through the AES Counter mode of operation for encryption. Authenticity of the confidential data is assured through the GHASH engine. GCM can also provide assurance of data that is not encrypted. Refer to *NIST Special Publication 800-38D* for more complete information.

GCM can be used with or without the DMA host. Messages may be processed as a single complete packet of data or they may be broken into multiple packets of data over time.

GCM processing is computed on 128-bit input data fields. There is no support for unaligned data. The AES key length can be whatever length is supported by the AES module.

The recommended programming procedure when using DMA is described in the section [GCM Processing](#).

Figure 52.5. GCM Block Diagram

Note: 1. Optional

#### 52.4.4.2. Key Writing and Automatic Hash Subkey Calculation

Whenever a new key is written to the hardware, two automatic actions are processed:

- GCM Hash Subkey  $H$  generation—The GCM hash subkey ( $H$ ) is automatically generated. The GCM hash subkey generation must be complete before doing any other action. AES\_ISR.DATRDY indicates when the subkey generation is complete (with interrupt if configured). The GCM hash subkey calculation is processed with the formula  $H = \text{CIPHER}(\text{Key}, <128 \text{ bits to zero}>)$ . The generated GCM  $H$  value is then available in AES\_GCMHRx. If the application software requires a specific hash subkey, the automatically generated  $H$  value can be overwritten in AES\_GCMHRx. AES\_GCMHRx can be written after the end of the hash subkey generation (see AES\_ISR.DATRDY) and prior to starting the input data feed.
- AES\_GHASHRx Clear—AES\_GHASHRx are automatically cleared. If a hash initial value is needed for the GHASH, it must be written to AES\_GHASHRx
  - after writing AES\_KEYWRx, if any
  - before starting the input data feed

#### 52.4.4.3. GCM Processing

GCM processing is made up of three phases:

1. Processing the Additional Authenticated Data (AAD), hash computation only.
2. Processing the Ciphertext (C), hash computation + ciphering/deciphering.
3. Generating the Tag using length of AAD, length of C and  $J_0$  (refer to NIST documentation for details).

The Tag generation can be done either automatically, after the end of AAD/C processing if AES\_MR.GTAGEN is set, or manually using AES\_GHASHRx.GHASH (see subsections [Processing a Complete Message with Tag Generation](#) and [Manual GCM Tag Generation](#) for details).

#### 52.4.4.3.1. Processing a Complete Message with Tag Generation

Use this procedure only if  $J_0$  four LSB bytes  $\neq$  0xFFFFFFFF.

**Note:** If  $J_0$  four LSB bytes = 0xFFFFFFFF or if the value is unknown, use the procedure described in [Processing a Complete Message without Tag Generation](#) followed by the procedure in [Manual GCM Tag Generation](#).

Figure 52.6. Full Message Alignment

To process a complete message with Tag generation, the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '1'.
2. Write the key and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = IV \parallel 0^{31} \parallel 1$  when  $\text{len}(IV) = 96$  and  $J_0 = \text{GHASH}_H(IV \parallel 0^{5+64} \parallel [\text{len}(IV)]64)$  if  $\text{len}(IV) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation.
4. Set AES\_IVRx.IV with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
5. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Wait for TAGRDY to be set (use interrupt if needed), then read AES\_TAGRx.TAG to obtain the authentication tag of the message.

#### 52.4.4.3.2. Processing a Complete Message without Tag Generation

Processing a message without generating the Tag can be used to customize the Tag generation, or to process a fragmented message. To manually generate the GCM Tag, see [Manual GCM Tag Generation](#).

To process a complete message without Tag generation, the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
2. Write the key and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).

3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = IV \parallel 0^{31} \parallel 1$  when  $\text{len}(IV) = 96$  and  $J_0 = \text{GHASH}_H(IV \parallel 0^{5+64} \parallel [\text{len}(IV)]64)$  if  $\text{len}(IV) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation example when  $\text{len}(IV) \neq 96$ .
4. Set  $\text{AES\_IVRx.IV}$  with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
5. Configure  $\text{AES\_AADLENR.AADLEN}$  and  $\text{AES\_CLENR.CLEN}$ .
6. Fill  $\text{AES\_IDATARx.IDATA}$  with the message to process according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Make sure the last output data have been read if  $\text{AES\_CLENR.CLEN} \neq 0$  (or wait for DATRDY), then read  $\text{AES\_GHASHRx.GHASH}$  to obtain the hash value after the last processed data.

#### 52.4.4.3.3. Processing a Fragmented Message without Tag Generation

If needed, a message can be processed by fragments, in such case automatic GCM Tag generation is not supported.

To process a message by fragments, the sequence is as follows:

- First fragment:

1. Set  $\text{AES\_MR.OPMOD}$  to GCM and  $\text{AES\_MR.GTAGEN}$  to '0'.
2. Write the key and wait for  $\text{AES\_ISR.DATRDY}$  to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in  $\text{AES\_GCMHRx}$ . See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Calculate the  $J_0$  value as described in NIST documentation  $J_0 = IV \parallel 0^{31} \parallel 1$  when  $\text{len}(IV) = 96$  and  $J_0 = \text{GHASH}_H(IV \parallel 0^{5+64} \parallel [\text{len}(IV)]64)$  if  $\text{len}(IV) \neq 96$ . See [Processing a Message with only AAD \(GHASHH\)](#) for  $J_0$  generation example when  $\text{len}(IV) \neq 96$ .
4. Set  $\text{AES\_IVRx.IV}$  with  $\text{inc32}(J_0)$  ( $J_0 + 1$  on 32 bits).
5. Configure  $\text{AES\_AADLENR.AADLEN}$  and  $\text{AES\_CLENR.CLEN}$  according to the length of the first fragment, or set the fields with the full message length (both configurations work).
6. Fill  $\text{AES\_IDATARx.IDATA}$  with the first fragment of the message to process (aligned on 16-byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read  $\text{AES\_GHASHRx.GHASH}$  to obtain the value of the hash after the last processed data and finally read  $\text{AES\_CTR.CTR}$  to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).

- Next fragment (or last fragment):

1. Set  $\text{AES\_MR.OPMOD}$  to GCM and  $\text{AES\_MR.GTAGEN}$  to '0'.
2. Write the key and wait until  $\text{AES\_ISR.DATRDY}$  is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in  $\text{AES\_GCMHRx}$ . See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Set  $\text{AES\_IVRx.IV}$  as follows:
  - If the first block of the fragment is a block of Additional Authenticated data, set  $\text{AES\_IVRx.IV}$  with the  $J_0$  initial value
  - If the first block of the fragment is a block of Plaintext data, set  $\text{AES\_IVRx.IV}$  with a value constructed as follows: 'LSB96( $J_0$ )  $\parallel$  CTR' value, (96 bit LSB of  $J_0$  concatenated with saved CTR value from previous fragment).

4. Configure AES\_AADLENR.AADLEN and AES\_CLENR.CLEN according to the length of the current fragment, or set the fields with the remaining message length, both configurations work.
5. Fill AES\_GHASHRx.GHASH with the value stored after the previous fragment.
6. Fill AES\_IDATARx.IDATA with the current fragment of the message to process (aligned on 16 byte boundary) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when the data have been processed (however, no output data are generated when processing AAD).
7. Make sure the last output data have been read if the fragment ends in C phase (or wait for DATRDY if the fragment ends in AAD phase), then read AES\_GHASHRx.GHASH to obtain the value of the hash after the last processed data and finally read AES\_CTR.CTR to obtain the value of the CTR encryption counter (not needed when the fragment ends in AAD phase).

**Note:** Step 1 and 2 are required only if the value of the concerned registers has been modified.

Once the last fragment has been processed, the GHASH value will allow manual generation of the GCM tag. See [Manual GCM Tag Generation](#).

#### 52.4.4.3.4. Manual GCM Tag Generation

This section describes the last steps of the GCM Tag generation.

The Manual GCM Tag Generation is used to complete the GCM Tag Generation when the message has been processed without Tag Generation.

**Note:** The Message Processing without Tag Generation must be finished before processing the Manual GCM Tag Generation.

To generate a GCM Tag manually, the sequence is as follows:

Processing  $S = \text{GHASH}_H(\text{AAD} || 0v || C || 0u || [\text{len}(\text{AAD})]64 || [\text{len}(C)]64)$ :

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
2. Write the key and wait for AES\_ISR.DATRDY to be set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Configure AES\_AADLENR.AADLEN to 0x10 (16 bytes) and AES\_CLENR.CLEN to '0'. This will allow running a single  $\text{GHASH}_H$  on a 16-byte input data (see the following figure).
4. Fill AES\_GHASHRx.GHASH with the state of the GHASH field stored at the end of the message processing.
5. Fill AES\_IDATARx.IDATA according to the SMOD configuration used with ' $\text{len}(\text{AAD})64 || \text{len}(C)64$ ' value as described in the NIST documentation and wait for DATRDY to be set; use interrupt if needed.
6. Read AES\_GHASHRx.GHASH to obtain the current value of the hash.

Processing  $T = \text{GCTRK}(J_0, S)$ :

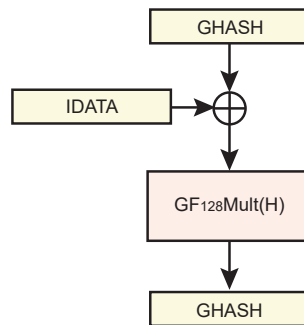

1. Set AES\_MR.OPMOD to CTR.
2. Set AES\_IVRx.IV with ' $J_0$ ' value.
3. Fill AES\_IDATARx.IDATA with the GHASH value read at step 6 and wait for DATRDY to be set (use interrupt if needed).
4. Read AES\_ODATARx.ODATA to obtain the GCM Tag value.

**Note:** Step 4 is optional if the GHASH field is to be filled with value '0' (0 length packet for instance).

#### 52.4.4.3.5.Processing a Message with only AAD (GHASHH)

**Figure 52.7.** Single GHASH<sub>H</sub> Block Diagram (AADLEN ≤ 0x10 and CLEN = 0)

It is possible to process a message with only AAD setting the CLEN field to '0' in AES\_CLENR, this can be used for J<sub>0</sub> generation when len(IV) ≠ 96 for instance.

Example: Processing J<sub>0</sub> when len(IV) ≠ 96

To process J<sub>0</sub> = GHASH<sub>H</sub>(IV || 0<sup>s+64</sup> || [len(IV)]64), the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
2. Write AES\_KEYWRx and wait until AES\_ISR.DATRDY is set (GCM hash subkey generation complete); use interrupt if needed. After the GCM hash subkey generation is complete the GCM hash subkey can be read or overwritten with specific value in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#).
3. Configure AES\_AADLENR.AADLEN with 'len(IV) || 0<sup>s+64</sup> || [len(IV)]64' in and AES\_CLENR.CLEN to '0'. This will allow running a GHASH<sub>H</sub> only.
4. Fill AES\_IDATARx.IDATA with the message to process (IV || 0<sup>s+64</sup> || [len(IV)]64) according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a GHASH<sub>H</sub> step is over (use interrupt if needed).
5. Read AES\_GHASHRx.GHASH to obtain the J<sub>0</sub> value.  
Note: The GHASH value can be overwritten at any time by writing the value of AES\_GHASHRx.GHASH, used to perform a GHASH<sub>H</sub> with an initial value for GHASH (write GHASH field between step 3 and step 4 in this case).

#### 52.4.4.3.6.Processing a Single GF128 Multiplication

The AES can also be used to process a single multiplication in the Galois field on 128 bits (GF<sub>128</sub>) using a single GHASH<sub>H</sub> with custom H value (see the figure above).

To run a GF<sub>128</sub> multiplication (A x B), the sequence is as follows:

1. Set AES\_MR.OPMOD to GCM and AES\_MR.GTAGEN to '0'.
1. Configure AES\_AADLENR.AADLEN with 0x10 (16 bytes) and AES\_CLENR.CLEN to '0'. This will allow running a single GHASH<sub>H</sub>.
2. Fill AES\_GCMHRx.H with B value.
3. Fill AES\_IDATARx.IDATA with the A value according to the SMOD configuration used. If Manual Mode or Auto Mode is used, the DATRDY bit indicates when a GHASHH computation is over (use interrupt if needed).
4. Read AES\_GHASHRx.GHASH to obtain the result.

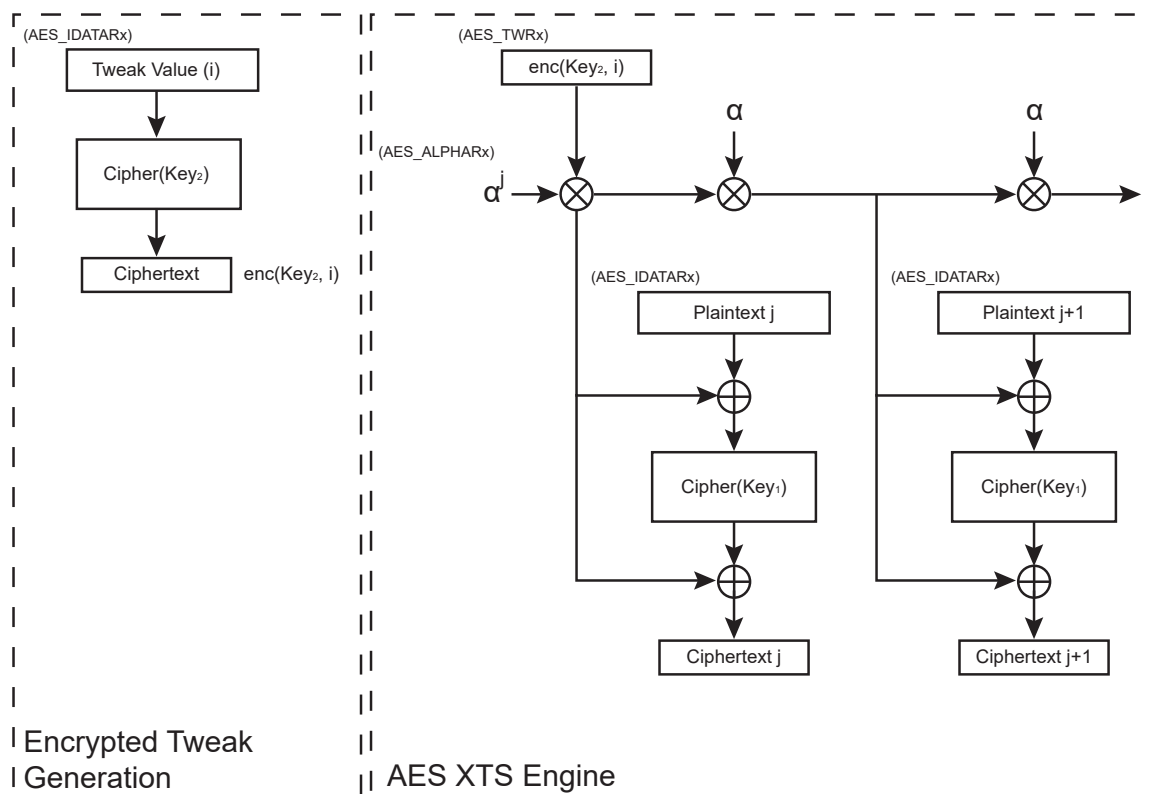

**Note:** AES\_GHASHRx.GHASH can be initialized with a value C between step 3 and step 4 to run a ((A XOR C) x B) GF<sub>128</sub> multiplication.

#### 52.4.5. XEX-based Tweaked-codebook Mode (XTS)

XTS mode comprises the AES engine with XOR on inputs and outputs. After each encryption/decryption, the value used for the XOR is multiplied by the first GF( $2^{128}$ ) alpha primitive (0x2) and then used for the next encryption/decryption. The XTS mode uses two different keys and defines a Tweak Value (i) as additional input.

XTS processing is computed on 128-bit input data fields. There is no support for unaligned data (padding must be done manually if needed). The AES key length can be any length supported by the AES module.

**Figure 52.8.** XTS Block Diagram

##### 52.4.5.1.XTS Processing Procedure

XTS processing comprises two phases:

1. Generate encrypted tweak with Key2 (this step is only required for the first processing, further consecutive processing does not require this step).
2. Process the data giving encrypted tweak and first alpha primitive for the first encryption/decryption.

##### 52.4.5.1.1.Encrypted Tweak Generation

In the case of a new encryption/decryption, it is necessary to first encrypt the Tweak Value (i) with Key2. Here are the steps to follow to perform this step:

1. Set AES\_MR.OPMODE to ECB and AES\_MR.CIPHER to '1'.
2. Write the Key2.
3. Fill AES\_IDATARx.IDATA with the Tweak value (i) according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES\_ODATARx.

#### 52.4.5.1.2. Data Processing

To process data using XTS mode, follow the steps below:

1. Set AES\_MR.OPMODE to XTS.
2. Write the Key1.
3. Only if the data to process is the first to be processed in the data unit, or if the data block to process is not consecutive to the previous processed data block in the same data unit, then two additional mandatory steps are required:
  - a. AES\_TWRx must be written with the encrypted Tweak Value (see [Encrypted Tweak Generation](#) for details) with bytes swapped as described in [AES Register Endianness](#).
  - b. Write AES\_ALPHARx with the alpha primitive corresponding to the block number in the data unit.
4. Fill AES\_IDATARx.IDATA with the data to process according to the SMOD configuration used. If Manual mode or Auto mode is used, the DATRDY bit indicates when the data have been processed and can be read in AES\_ODATARx. Repeat Step 4 as long as consecutive data blocks are processed in the same data unit.

#### 52.4.6. Double Input Buffer

AES\_IDATARx can be double-buffered to reduce the runtime of large files.

This mode allows a new message block to be written when the previous message block is being processed. This is only possible when DMA accesses are performed (AES\_MR.SMOD = 2).

AES\_MR.DUALBUFF must be set to '1' to access the double buffer.

#### 52.4.7. Temporary Secured Storage for Keys

The AES provides secure storage for up to 2x 256-bit keys. The storage is available while VDDCORE voltage is supplied.

The keys can be only written in AES internal registers and are not readable. Moreover, the internal registers holding the keys are buried in the overall product logic area during the physical implementation.

One key can be loaded by software by writing the Key Word registers (AES\_KEYWRx).

One key can be loaded by Private Key bus only.

**Figure 52.9.** Temporary Secured Storage for Keys

#### 52.4.8. Start Modes

AES\_MR.SMOD allows selection of the encryption (or decryption) Start mode.

##### 52.4.8.1. Manual Mode

The sequence of actions is as follows:

1. Write AES\_MR with all required fields, including but not limited to SMOD and OPMOD. (Write AES\_EMR.PKRS according to the type of key to be loaded).
2. Write the 128-bit/192-bit/256-bit AES key in AES\_KEYWRx or in the Private Key internal registers.
3. Write the initialization vector (or counter) in AES\_IVRx.  
**Note:** AES\_IVRx concerns all modes except ECB.
4. Set the bit DATRDY (Data Ready) in the AES Interrupt Enable register (AES\_IER), depending on whether an interrupt is required or not at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized AES\_IDATARx (see the following table).
6. Set the START bit in the AES Control register (AES\_CR) to begin the encryption or the decryption process.
7. When processing completes, the DATRDY flag in the AES Interrupt Status register (AES\_ISR) is raised. If an interrupt has been enabled by setting AES\_IER.DATRDY, the interrupt line of the AES is activated.
8. When software reads one of AES\_ODATARx, AES\_IER.DATRDY is automatically cleared.

**Table 52.2.** Authorized Input Data Registers

Operating Mode	Input Data Registers to Write
ECB	All
CBC	All
OFB	All
128-bit CFB	All
64-bit CFB	AES_IDATAR0 and AES_IDATAR1
32-bit CFB	AES_IDATAR0
16-bit CFB	AES_IDATAR0
8-bit CFB	AES_IDATAR0
CTR	All
GCM	All
XTS	All

**Notes:**

1. In 64-bit CFB mode, writing to AES\_IDATAR2 and AES\_IDATAR3 is not allowed and may lead to errors in processing.
2. In 32, 16, and 8-bit CFB modes, writing to AES\_IDATAR1, AES\_IDATAR2 and AES\_IDATAR3 is not allowed and may lead to errors in processing.

#### 52.4.8.2.Auto Mode

The Auto Mode is similar to the manual one, except that in this mode, as soon as the correct number of AES\_IDATARx is written, processing is automatically started without any action in AES\_CR.

#### 52.4.8.3.DMA Mode

The DMA Controller can be used in association with the AES to perform an encryption/decryption of a buffer without any action by software during processing.

AES\_MR.SMOD must be configured to 2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (AES\_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be configured with the address of AES\_IDATAR0.

The DMA chunk size configuration depends on the AES mode of operation and is summarized in the following table.

When writing data to AES with a first DMA channel, data are first fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the AES with the second DMA channel, the source data is the data read from AES and data destination is the memory buffer. In this case, the source data size depends on the AES mode of operation, as shown in the following table.

**Table 52.3.** DMA Data Transfer Type for the Different Operating Modes

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
ECB	4	Word
CBC	4	Word
OFB	4	Word
CFB 128-bit	4	Word
CFB 64-bit	1	Word
CFB 32-bit	1	Word
CFB 16-bit	1	Half-word
CFB 8-bit	1	Byte
CTR	4	Word
GCM	4	Word
XTS	4	Word

#### 52.4.9. Automatic Padding Mode

When Automatic Padding mode is configured, the message is automatically padded after the last block is written. Depending on the size of the message, either a padding is performed after the last part of the message and padding blocks are added, or only padding blocks are added.

IPSec and SSL padding standards are both supported.

The auto padding feature only supports CBC and CTR modes.

**Note:** When automatic padding is enabled and AES\_MR.SMOD=2, AES\_MR.DUALBUFF must be cleared.

##### 52.4.9.1. IPSec Padding

Automatic Padding is enabled by writing a ‘1’ to AES\_EMR.APEN. IPSEC padding mode is selected by writing a ‘0’ to AES\_EMR.APM.

**Figure 52.10.** IPSec Padding

Each byte of the padding area contains incremental integer values.

The “Pad Length” in bytes is configured in AES\_EMR.PADLEN and the “Next Header” value is configured in AES\_EMR.NHEAD. AES\_EMR.PADLEN must be configured with the length of the padding section, not including the length of the “Pad Length” and “Next Header” sections.

The BCNT field in the AES Byte Counter register (AES\_BCNT) defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES\_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES\_IDATARx access).

AES\_BCNT.BCNT and AES\_EMR.PADLEN must be configured so that the sum of the length of the message (Payload Data) and of the length of the Padding, Pad Length (1 byte) and Next Header (1 byte) sections is a multiple of the AES block size (128 bits).

To process an IPsec message using auto-padding, the sequence is as follows:

1. Set AES\_MR.OPMOD to either CBC or CTR mode.
2. Set AES\_EMR.APEN to ‘1’, AES\_EMR.APM to ‘0’, AES\_EMR.PADLEN to the desired padding length in byte and AES\_EMR.NHEAD to the desired Next Header field value.
3. Configure AES\_BCNT.BCNT with the whole message length, without padding, in byte.
4. Write the key.
5. Set AES\_IVRx.IV if needed.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block, write only what is necessary (e.g., write only AES\_IDATAR0 if last block size is  $\leq 32$  bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 52.4.9.2.SSL Padding

Auto Padding is enabled by writing a ‘1’ to AES\_EMR.APEN and SSL padding mode is selected by writing a ‘1’ to AES\_EMR.APM.

**Figure 52.11.** SSL Padding

Each byte of the padding area contains the padding length.

The padding length is configured in AES\_EMR.PADLEN.

AES\_BCNT.BCNT defines the length, in bytes, of the message to process. It must be configured before writing the first data in AES\_IDATARx and the remaining bytes to process can be read at anytime (BCNT value is decremented after each AES\_IDATARx access).

AES\_BCNT.BCNT and AES\_EMR.PADLEN must be configured so that the length of the message plus the length of the padding section is a multiple of the AES block size (128 bits).

To process a complete SSL message, the sequence is as follows:

1. Set AES\_MR.OPMOD to either CBC or CTR mode.

2. Set AES\_EMR.APEN to '1', AES\_EMR.APM to '1', AES\_EMR.PADLEN to the desired padding length in bytes.
3. Set AES\_BCNT.BCNT with the whole message length, without padding, in bytes.
4. Write the key.
5. Set AES\_IVRx.IV if needed.
6. Fill AES\_IDATARx.IDATA with the message to process according to the SMOD configuration used. On the last data block write only what is necessary (e.g., write only AES\_IDATAR0 if last block size is  $\leq 32$  bits).
7. Wait for the DATRDY flag to be raised, meaning auto-padding completion and last block processing.

#### 52.4.9.3. Flags

AES\_ISR.EOPAD rises as soon as the automatic padding phase is over, meaning that all the extra padding blocks have been processed. Reading AES\_ISR clears this flag.

AES\_ISR.PLENERR indicates an error in the frame configuration, meaning that the whole message length including padding does not respect the standard selected. AES\_ISR.PLENERR rises at the end of the frame in case of wrong message length and is cleared reading AES\_ISR.

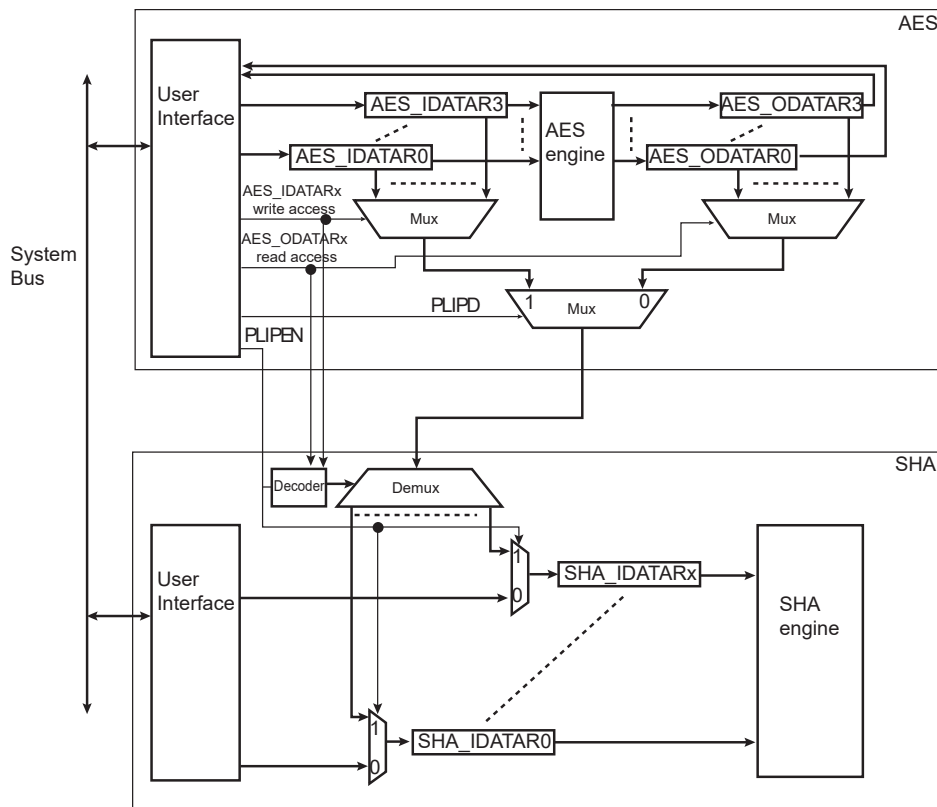

In IPSec/SSL standard message length including padding must be a multiple of the AES block size when CBC mode is used and multiple of 32-bit if CTR mode is used.

#### 52.4.10. Secure Protocol Layers Improved Performances

Secure protocol layers such as IPSec require encryption and authentication. For IPSec, the authentication is based on HMAC, thus SHA is required. To optimize performance, the AES embeds a mode of operation, used with DMA only, that enables the SHA module to process the input or output data of the AES module. If this mode is enabled, write access is required only into AES\_IDATARx registers, since SHA input data registers are automatically written by AES without software intervention. When the DMA is configured to transfer a buffer of data (input frame), only one transfer descriptor is required for both authentication and encryption/decryption processes and only one buffer is transferred through the system bus (reducing the load of the system bus).

Improved performance for secure protocol layers requires AES\_EMR.PLIPEN to be set.

**Figure 52.12.** Secure Protocol Layers Improved Performances Block Diagram

#### 52.4.10.1.Cipher Mode

When AES\_EMR.PLIPD is cleared and AES\_EMR.PLIPEN=1, the message written into AES\_IDATARx is first encrypted with the AES module and the encrypted message is authenticated with the SHA module. Therefore, when AES\_EMR.PLIPD is cleared, AES\_ODATARx are selected and sent to SHA\_IDATARx as soon as AES\_ODATARx are read. A read access in AES corresponds to a write access to the corresponding SHA\_IDATARx. The number of SHA\_IDATARx is greater than the number of AES\_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES\_ODATARx values into the corresponding SHA\_IDATARx without software intervention.

#### 52.4.10.2.Decipher Mode

When AES\_EMR.PLIPD is written to '1' and AES\_EMR.PLIPEN=1, the message written into AES\_IDATARx is decrypted with the AES module and also sent to SHA for authentication. Therefore, when AES\_EMR.PLIPD=1, AES\_IDATARx are selected and sent to SHA\_IDATARx as soon as AES\_IDATARx are written. A write access in AES corresponds to a write access to the corresponding SHA\_IDATARx. The number of SHA\_IDATARx is greater than the number of AES\_ODATARx, but the SHA module embeds the decoding logic to automatically dispatch AES\_IDATARx values into the corresponding SHA\_IDATARx without software intervention.

#### 52.4.10.3.Encapsulating Security Payload (ESP) IPsec Examples

The following examples describe how to configure AES and SHA to optimize processing an ESP IPsec frame for maximum performance.

The cipher (or decipher) of an ESP IPsec frame requires both encryption (or decryption) and authentication.

For cipher, the input frame located in the system memory must first be padded and the resulting buffer encrypted. The encrypted frame must be written back to the system memory and sent to the authentication module.

When the AES module is configured to improve the performance of the secure protocol layers (AES\_EMR.PLIPEN = 1), the data transfers are simplified, limiting the bandwidth requirements on the system bus.

Before configuring the DMA to start the transfer of the data buffer (input frame) to the AES, the following actions must be taken in registers:

- AES\_BCNT.BCNT must be configured with the length of the message (Input Frame).
- The padding length of the AES must be configured in AES\_EMR.PADLEN. See [Automatic Padding Mode](#) to configure Automatic Padding mode.
- The next header value must be configured in AES\_EMR.NHEAD.
- AES\_MR.SMOD and SHA\_MR.SMOD must be configured to 2.  
**Note:** When automatic padding is enabled and AES\_MR.SMOD = 2, AES\_MR.DUALBUFF must be cleared.
- The SHA\_MSR.MSGSIZE must be configured with the length of the authentication message including the optional extended sequence number (ESN) and header and trailer information required by the authentication algorithm used (HMAC, etc.). Refer to the section “Secure Hash Algorithm (SHA)” for more details on configuration for optimized processing of header information.
- The Security Parameter Index (SPI, sequence number (SEQ#)) and the optional Initialization Vector (IV) must be configured sequentially in SHA\_IDATAR0.
- A first DMA transfer descriptor must be configured to transfer the input frame from the system memory to the AES input data registers (AES\_IDATARx), and a second DMA descriptor must be configured to transfer the encrypted frame from AES to the system memory.  
**Note:** If AES\_EMR.PLIPEN = 1, there is no need to define a transfer descriptor to load the encrypted frame into the SHA input data registers because the transfer is automatically performed while the second descriptor transfer is in progress.

See the following figures.

**Figure 52.13.** Generation of an ESP IPsec Frame without ESN

If the optional extended sequence number is required for authentication, wait for the AES-to-system memory DMA buffer transfer to complete before configuring the ESN value. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA\_IDATAR0 register. Wait for SHA\_ISR.WRDY=1 before each write in the SHA\_IDATAR0 register. See the following figure.

**Figure 52.14.** Generation of an ESP IPsec Frame with ESN

To decipher an ESP IPsec frame without the optional ESN trailer information, two DMA channels are required and the SHA must be configured in Automatic padding mode.

**Note:** AES automatic padding must be disabled when deciphering a frame.

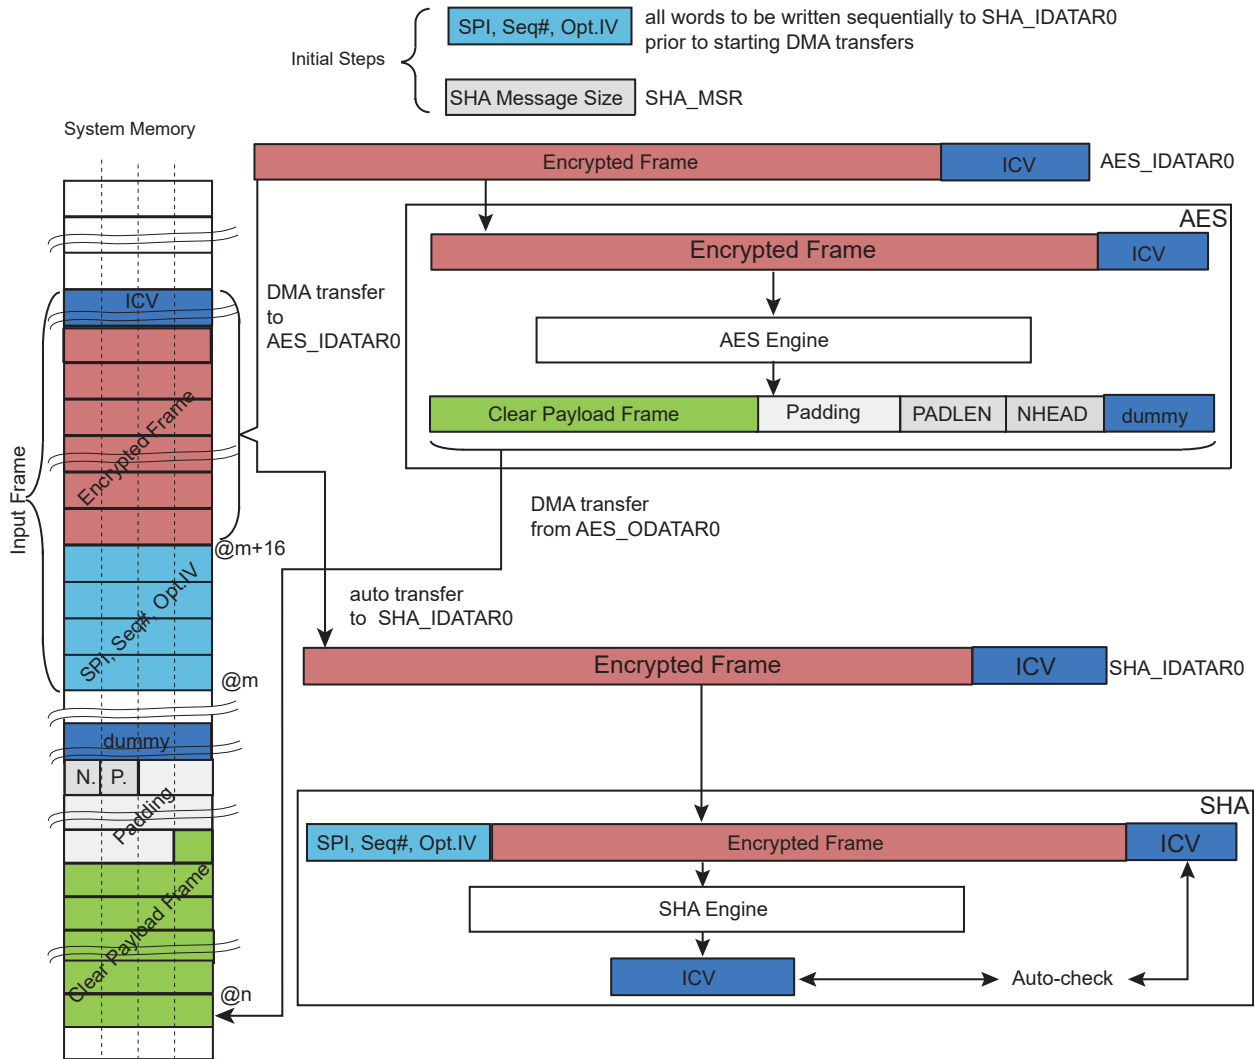

- A first DMA transfer descriptor must be configured to load the received encrypted frame from the system memory to AES\_IDATARx for decryption. The start address of the first transfer descriptor must be defined after the SPI, SEQ#, and optional IV (see the following figure).
- A second DMA descriptor must be configured to transfer the decrypted frame from AES\_ODATARx to the system memory.
- AES\_EMR.PLIPEN and AES\_EMR.PLIPD must be written to '1' so that the data buffer is written in AES\_IDATARx and in SHA\_IDATARx.

The SHA has the capability to perform an automatic check with an expected integrity check value if this value is appended at the end of the frame buffer (SHA\_MR.CHECK=2). Thus, if the first transfer descriptor includes the ICV for SHA, the first DMA transfer allows the decryption and authentication

processes including the automatic check. The decrypted part resulting from ICV is not required for downstream processing and must be considered as dummy data.

The end of the decryption and authentication processes occur when flag SHA\_ISR.CHECKF=1. The authentication status is provided by SHA\_ISR.CHKST.

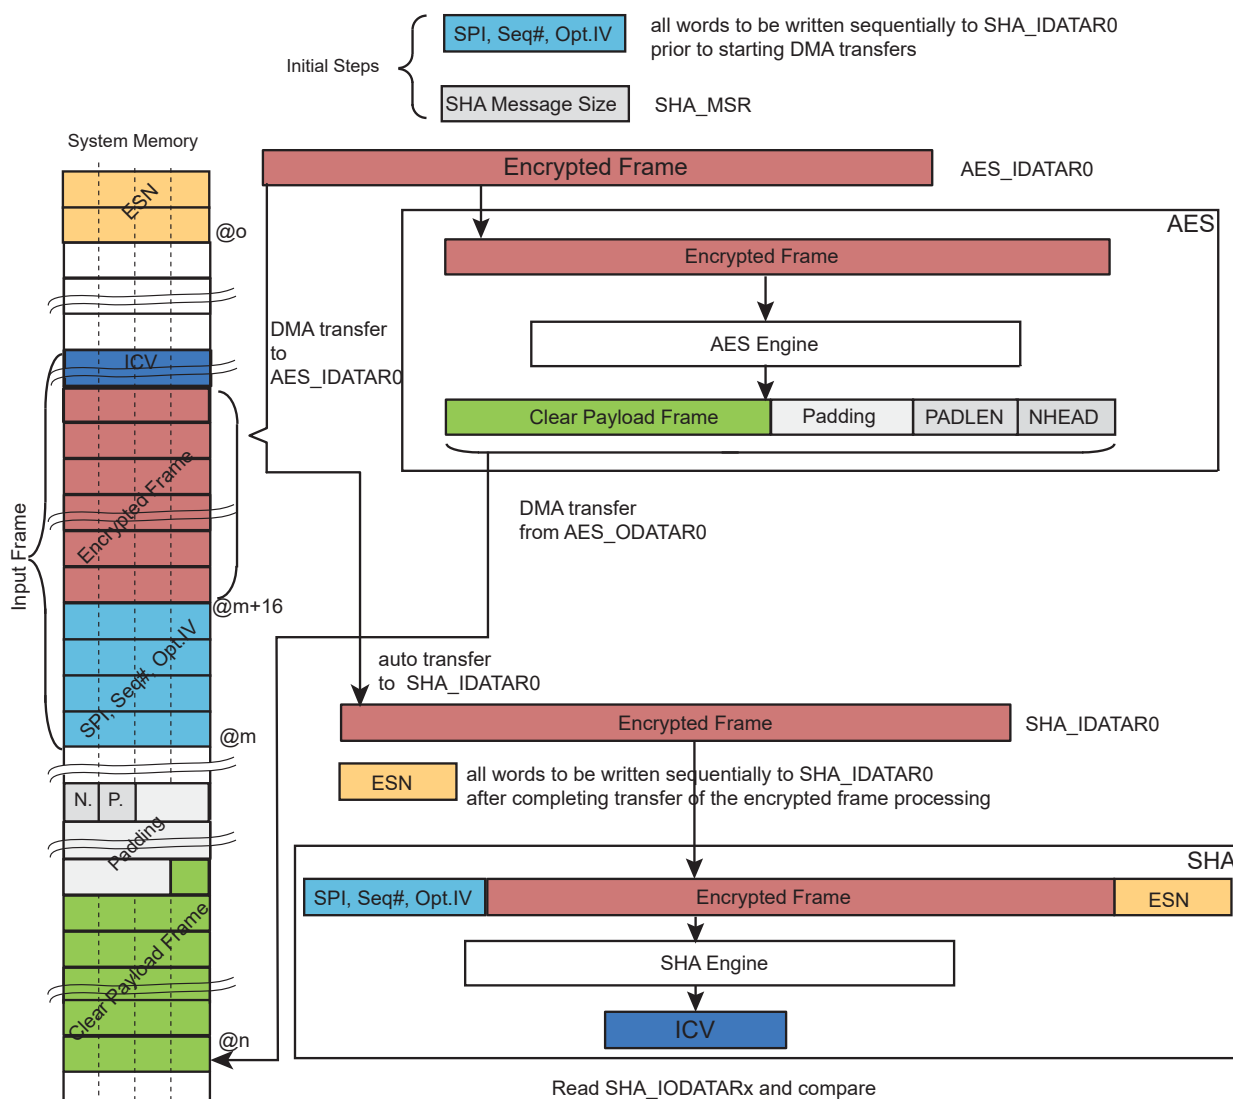

**Figure 52.15.** Decryption of an ESP IP Sec Frame without ESN

If the optional ESN trailer information is part of the ICV (see the following figure), the ESN must be manually written into SHA\_IDATAR0. The ESN value must be written after completion of the system memory-to-AES DMA buffer transfer. The ESN value must be configured in the SHA by writing sequentially each 32-bit word of the ESN into the SHA\_IDATAR0 register. Wait for SHA\_ISR.WRDY=1 before each write in the SHA\_IDATAR0 register.

When the optional ESN trailer information is part of the ICV, it is not possible to include the ICV received in the input frame to the first transfer descriptor. Moreover, if the HMAC algorithm is used for authentication, no automatic check can be performed when optimizing the processing performances of the SHA module. For more details, refer to the section "Secure Hash Algorithm (SHA)". The result of the HMAC read in the SHA\_IDATARx must be manually compared with the ICV value of the input frame. The comparison must be performed after the end of the authentication process. The authentication process is completed when the SHA\_ISR.DATRDY flag is set.

**Figure 52.16.** Decryption of an ESP IPsec Frame with ESN

## 52.4.11. Security Features

### 52.4.11.1. Private Key Bus

The AES provides secure key transfer that requires a transfer command only, thus avoiding any manipulation of the key by software.

The AES features a set of Private Key internal registers that can be accessed only through the dedicated Private Key bus from the TRNG or OTPC.

The Private Key internal registers cannot be read from any peripheral or from software.

The AES key used by the encryption/decryption engine is either the Private Key internal registers content or the AES\_KEYWRx registers loaded via the AES\_KEYWRx.

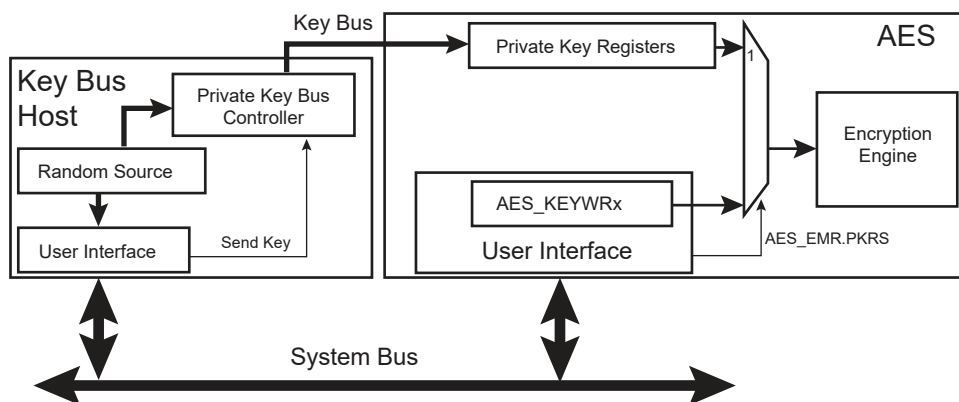

To select the Private Key internal registers as the source of the AES key, AES\_EMR.PKRS must be written to '1'.

When AES\_EMR.PKRS is modified, it is mandatory to load the corresponding key value even if the key has been previously written with same value.

To write the Private Key internal registers, the software must:

1. Write a '1' in AES\_EMR.PKRS.
2. Trigger the key transfer over the Private Key bus from the TRNG or OTPC key bus host.
3. Wait for completion of the transfer signaled in the TRNG or OTPC Status register.
4. Check for any access violation in AES\_WPSR.PKRPVS.

**Figure 52.17.** Key Selection

#### 52.4.11.2. Unspecified Register Access Detection

When an unspecified register access occurs, AES\_ISR.URAD is raised. Its source is then reported in AES\_ISR.URAT. Only the last unspecified register access is available through the AES\_ISR.URAT.

Several kinds of unspecified register accesses can occur:

- Input Data register written during the data processing when SMOD = IDATAR0\_START
- Output Data register read during data processing
- Mode register written during data processing
- Output Data register read during sub-keys generation
- Mode register written during sub-keys generation
- Write-only register read access

AES\_ISR.URAD and AES\_ISR.URAT can only be reset by AES\_CR.SWRST.

#### 52.4.11.3. Clearing Key on Tamper Event

On a tamper detection event on WKUP[8:1] pins, an immediate clear of the key (internal registers) can be performed if AES\_MR.TAMPCLR=1. For configuration details, refer to the section "Real-Time Clock (RTC)".

#### 52.4.11.4. Register Write Protection

To prevent any single software error from corrupting AES behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the AES Write Protection Mode Register (AES\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the AES Write Protection Status Register (AES\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading AES\_WPSR.

The following register(s) can be write-protected when WPEN is set in AES\_WPMR:

- [AES Mode Register](#)
- [AES Key Word Register x](#)
- [AES Initialization Vector Register x](#)
- [AES Additional Authenticated Data Length Register](#)
- [AES Plaintext/Ciphertext Length Register](#)
- [AES GCM Intermediate Hash Word Register x](#)
- [AES GCM H Word Register x](#)
- [AES Extended Mode Register](#)
- [AES Byte Counter Register](#)
- [AES Tweak Word Register x](#)
- [AES Alpha Word Register x](#)

The following register(s) can be write-protected when WPITEN is set:

- [AES Interrupt Enable Register](#)
- [AES Interrupt Disable Register](#)

The following register(s) can be write-protected when WPCREN is set:

- [AES Control Register](#)

#### 52.4.11.5. Security and Safety Analysis and Reports

Several types of checks are performed when the AES is enabled.

The peripheral clock of the AES is monitored by specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the AES. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag AES\_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the AES is also monitored and if an abnormal state is detected, the flag AES\_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the AES are monitored and if an incorrect access is performed, the flag AES\_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in AES\_WPSR.SWETYP (see [AES\\_WPSR](#) for details). For example, writing the AES\_ODATARx is an error, as well as reading the AES\_IDATARx, when the AES\_ISR.DATRDY flag is cleared. AES\_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when AES\_WPSR is read.

If one of these flags is set, the flag AES\_ISR.SECE is set and can trigger an interrupt if the AES\_IMR.SECE bit is '1'. SECE is cleared by reading AES\_ISR.

It is possible to configure an action to be performed by AES as soon as an abnormal event detection occurs. If AES\_WPMR.ACTION > 0, either a lock is performed or a lock and immediate clear of the AES\_KEYWRx key. If a lock is performed, the current processing is ended normally but any new processing is not performed whatever the start mode of operation (see [AES\\_MR.SMOD](#)).

A locked state of the AES is unlocked as follows:

1. Read AES\_WPSR.
2. Disable the source of tamper if the tamper is enabled to perform a clear of the key.
3. Write a '1' to AES\_CR.UNLOCK.

It is possible to select the type of event that will lock the AES in case of abnormal event detection. See [AES\\_WPMR.ACTION](#) for details.

If the AES\_MR.TMPCLR=1 and the tamper pin is active, the AES is locked.

## 52.5. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0	
0x00	AES_CR	31:24								UNLOCK	
		23:16									
		15:8								SWRST	
		7:0								START	
0x04	AES_MR	31:24	TAMPCLR								
		23:16		CKEY[3:0]					CFBS[2:0]		
		15:8	LOD	OPMOD[2:0]				KEYSIZE[1:0]		SMOD[1:0]	
		7:0	PROCDLY[3:0]				DUALBUFF		GTAGEN	CIPHER	
0x08 ... 0x0F	Reserved

### 52.5.1. AES Control Register

**Name:** AES\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
								UNLOCK
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								SWRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								START
Access								W
Reset								–

#### Bit 24 – UNLOCK Unlock Processing

AES\_WPSR must be cleared before performing the unlock command.

Value	Description
0	No effect.
1	Unlocks the processing in case of abnormal event detection if AES_WPMR.ACTION > 0.

#### Bit 8 – SWRST Software Reset

Value	Description
0	No effect.
1	Resets the AES. A software-triggered reset of the AES interface is performed.

#### Bit 0 – START Start Processing

Value	Description
0	No effect.
1	Starts manual encryption/decryption process.

## 52.5.2. AES Mode Register

**Name:** AES\_MR  
**Offset:** 0x04  
**Reset:** 0x00080000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TAMPCLR							
Access	R/W							
Reset	-							

Bit	23	22	21	20	19	18	17	16
	CKEY[3:0]					CFBS[2:0]		
Access	W	W	W	W		R/W	R/W	R/W
Reset	0	0	0	-		0	0	0

Bit	15	14	13	12	11	10	9	8
	LOD	OPMOD[2:0]			KEYSIZE[1:0]		SMOD[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PROCDLY[3:0]				DUALBUFF		GTAGEN	CIPHER
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

### Bit 31 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on the AES_KEYWRx key.
1	A tamper detection event immediately clears the AES_KEYWRx key.

### Bits 23:20 – CKEY[3:0] Key

Value	Name	Description
0xE	PASSWD	This field must be written with 0xE the first time AES_MR is programmed. For subsequent programming of AES_MR, any value can be written, including that of 0xE. Always reads as 0.

### Bits 18:16 – CFBS[2:0] Cipher Feedback Data Size

Value	Name	Description
0	SIZE_128BIT	128-bit
1	SIZE_64BIT	64-bit
2	SIZE_32BIT	32-bit
3	SIZE_16BIT	16-bit
4	SIZE_8BIT	8-bit

## Bit 15 – LOD Last Output Data Mode

**WARNING**

In DMA mode, reading to the Output Data registers before the last data encryption/decryption process may lead to unpredictable results.

Value	Description
0	No effect.  After each end of encryption/decryption, the output data are available either on the output data registers (Manual and Auto modes) or at the address specified in the Channel Buffer Transfer Descriptor for DMA mode. In Manual and Auto modes, the DATRDY flag is cleared when at least one of the Output Data registers is read.
1	The DATRDY flag is cleared when at least one of the Input Data Registers is written.  No more Output Data Register reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a> ).

## Bits 14:12 – OPMOD[2:0] Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

When switching from an operating mode requiring the initialization vectors (e.g. CBC, GCM) to another operating mode that does not require initialization vectors (e.g. ECB) and a message of one block has been processed, initialization vector registers (AES\_IVRx) must be cleared before switching to the new mode.

Value	Name	Description
0	ECB	ECB: Electronic Codebook mode
1	CBC	CBC: Cipher Block Chaining mode
2	OFB	OFB: Output Feedback mode
3	CFB	CFB: Cipher Feedback mode
4	CTR	CTR: Counter mode (16-bit internal counter)
5	GCM	GCM: Galois/Counter mode
6	XTS	XTS: XEX-based tweaked-codebook mode

## Bits 11:10 – KEYSIZE[1:0] Key Size

Value	Name	Description
0	AES128	AES Key Size is 128 bits
1	AES192	AES Key Size is 192 bits
2	AES256	AES Key Size is 256 bits

## Bits 9:8 – SMOD[1:0] Start Mode

If a DMA transfer is used, configure SMOD to 2. See [DMA Mode](#) for more details.

Value	Name	Description
0	MANUAL_START	Manual Mode
1	AUTO_START	Auto Mode
2	IDATAR0_START	AES_IDATAR0 access only Auto Mode (DMA)

## Bits 7:4 – PROCDLY[3:0] Processing Delay

Processing Time =  $N \times (\text{PROCDLY} + 1)$   
where

- $N = 10$  when KEYSIZE = 0
- $N = 12$  when KEYSIZE = 1
- $N = 14$  when KEYSIZE = 2

The processing time represents the number of clock cycles that the AES needs in order to perform one encryption/decryption.

**Note:** The best performance is achieved with PROCDLY equal to 0.

**Bit 3 – DUALBUFF** Dual Input Buffer

Value	Name	Description
0	INACTIVE	AES_IDATARx cannot be written during processing of previous block.
1	ACTIVE	AES_IDATARx can be written during processing of previous block when SMOD = 2. It speeds up the overall runtime of large files.

**Bit 1 – GTAGEN** GCM Automatic Tag Generation Enable

Value	Description
0	Automatic GCM Tag generation disabled.
1	Automatic GCM Tag generation enabled.

**Bit 0 – CIPHER** Processing Mode

Value	Description
0	Decrypts data.
1	Encrypts data.

### 52.5.3. AES Interrupt Enable Register

**Name:** AES\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [AES Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					SECE	PLENERR	EOPAD	TAGRDY
Access					W	W	W	W
Reset					–	–	–	–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 19 – SECE** Security and/or Safety Event Interrupt Enable

**Bit 18 – PLENERR** Padding Length Error Interrupt Enable

**Bit 17 – EOPAD** End of Padding Interrupt Enable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

## 52.5.4. AES Interrupt Disable Register

**Name:** AES\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [AES Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					SECE	PLENERR	EOPAD	TAGRDY
Access					W	W	W	W
Reset					–	–	–	–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 19 – SECE** Security and/or Safety Event Interrupt Disable

**Bit 18 – PLENERR** Padding Length Error Interrupt Disable

**Bit 17 – EOPAD** End of Padding Interrupt Disable

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 52.5.5. AES Interrupt Mask Register

**Name:** AES\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					SECE	PLENERR	EOPAD	TAGRDY
Access					R	R	R	R
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
								URAD
Access								R
Reset								0
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

**Bit 19 – SECE** Security and/or Safety Event Interrupt Mask

**Bit 18 – PLENERR** Padding Length Error Interrupt Mask

**Bit 17 – EOPAD** End of Padding Interrupt Mask

**Bit 16 – TAGRDY** GCM Tag Ready Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

## 52.5.6. AES Interrupt Status Register

**Name:** AES\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access					SECE	PLENERR	EOPAD	TAGRDY
Reset					R	R	R	R
					0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	URAT[3:0]							URAD
Reset	R	R	R	R				R
	0	0	0	0				0
Bit	7	6	5	4	3	2	1	0
Access								DATRDY
Reset								R
								0

### Bit 19 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	There is no security report in AES_WPSR.
1	One security flag is set in AES_WPSR.

### Bit 18 – PLENERR Padding Length Error

Value	Description
0	No Padding Length Error occurred.
1	Padding Length Error detected.

### Bit 17 – EOPAD End of Padding

Value	Description
0	Padding is not over.
1	Padding phase is over.

### Bit 16 – TAGRDY GCM Tag Ready

Value	Description
0	GCM Tag is not valid.
1	GCM Tag generation is complete (cleared by reading GCM Tag, starting another processing or when writing a new key).

### Bits 15:12 – URAT[3:0] Unspecified Register Access (cleared by writing SWRST in AES\_CR) Only the last Unspecified Register Access Type is available through the URAT field.

Value	Name	Description
0	IDR_WR_PROCESSING	Input Data register written during the data processing when SMOD = 2 mode.
1	ODR_RD_PROCESSING	Output Data register read during the data processing.
2	MR_WR_PROCESSING	Mode register written during the data processing.
3	ODR_RD_SUBKGEN	Output Data register read during the sub-keys generation.
4	MR_WR_SUBKGEN	Mode register written during the sub-keys generation.
5	WOR_RD_ACCESS	Write-only register read access.

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing SWRST in AES\_CR)

Value	Description
0	No unspecified register access has been detected since the last SWRST.
1	At least one unspecified register access has been detected since the last SWRST.

**Bit 0 – DATRDY** Data Ready (cleared by setting bit START or bit SWRST in AES\_CR or by reading AES\_ODATARx)

Value	Description
0	Output data not valid.
1	Encryption or decryption process is completed.

**Note:** If AES\_MR.LOD = 1: In Manual and Auto mode, the DATRDY flag can also be cleared by writing at least one AES\_IDATARx.

## 52.5.7. AES Key Word Register x

**Name:** AES\_KEYWRx  
**Offset:** 0x20 + x\*0x04 [x=0..7]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

These registers are write-only to prevent the key from being read by another application.

**Note:** AES\_KEYWRx registers are not used if the Private Key internal registers are selected (AES\_EMR.PKRS=1).

Bit	31	30	29	28	27	26	25	24
	KEYW[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEYW[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	KEYW[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEYW[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bits 31:0 – KEYW[31:0] Key Word

The four/six/eight 32-bit Key Word registers set the 128-bit/192-bit/256-bit cryptographic key used for AES encryption/decryption.

AES\_KEYWR0 corresponds to the first word of the key and respectively AES\_KEYWR3/AES\_KEYWR5/AES\_KEYWR7 to the last one.

Whenever a new key (AES\_KEYWRx) is written to the hardware, two automatic actions are processed:

- GCM hash subkey generation
- AES\_GHASHRx Clear

See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

These registers are write-only to prevent the key from being read by another application.

**Note:** To write AES\_KEYWRx and start using the key immediately, AES\_EMR.PKRS must be written to 0 prior to writing AES\_KEYWRx.

## 52.5.8. AES Input Data Register x

**Name:** AES\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	IDATA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	IDATA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bits 31:0 – IDATA[31:0] Input Data Word

The four 32-bit Input Data registers set the 128-bit data block used for encryption/decryption. AES\_IDATAR0 corresponds to the first word of the data to be encrypted/decrypted, and AES\_IDATAR3 to the last one.

These registers are write-only to prevent the input data from being read by another application.

## 52.5.9. AES Output Data Register x

**Name:** AES\_ODATARx  
**Offset:** 0x50 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ODATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ODATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ODATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – ODATA[31:0] Output Data

The four 32-bit Output Data registers contain the 128-bit data block that has been encrypted/decrypted.

AES\_ODATAR0 corresponds to the first word, AES\_ODATAR3 to the last one.

**52.5.10. AES Initialization Vector Register x**

**Name:** AES\_IVRx  
**Offset:** 0x60 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

The four 32-bit Initialization Vector registers set the 128-bit Initialization Vector data block that is used by some modes of operation as an additional initial input.

AES\_IVR0 corresponds to the first word of the Initialization Vector, AES\_IVR3 to the last one.

These registers are write-only to prevent the Initialization Vector from being read by another application.

For CBC, OFB and CFB modes, the IV input value corresponds to the initialization vector.

For CTR mode, the IV input value corresponds to the initial counter value.

These registers are not used in ECB mode and must not be written.

When switching from an operating mode requiring the initialization vectors (e.g. CBC, GCM) to another operating mode that does not require initialization vectors (e.g. ECB) and a message of one block has been processed, AES\_IVRx must be cleared before switching to the new mode

Bit	31	30	29	28	27	26	25	24
	IV[31:24]							
Access	W	W	W	W	W	W	W	W

	IV[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – IV[31:0] Initialization Vector**

## 52.5.11. AES Additional Authenticated Data Length Register

**Name:** AES\_AADLENR  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	AADLEN[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	AADLEN[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	AADLEN[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	AADLEN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – AADLEN[31:0] Additional Authenticated Data Length

Length in bytes of the Additional Authenticated Data (AAD) that is to be processed.

**Note:** The maximum byte length of the AAD portion of a message is limited to the 32-bit counter length.

## 52.5.12. AES Plaintext/Ciphertext Length Register

**Name:** AES\_CLENR  
**Offset:** 0x74  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	CLEN[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CLEN[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CLEN[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CLEN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – CLEN[31:0] Plaintext/Ciphertext Length

Length in bytes of the plaintext/ciphertext (C) data that is to be processed.

**Note:** The maximum byte length of the C portion of a message is limited to the 32-bit counter length.

### 52.5.13. AES GCM Intermediate Hash Word Register x

**Name:** AES\_GHASHRx  
**Offset:** 0x78 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	GHASH[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	GHASH[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	GHASH[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	GHASH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – GHASH[31:0] Intermediate GCM Hash Word x

The four 32-bit Intermediate Hash Word registers expose the intermediate GHASH value. May be read to save the current GHASH value so processing can later be resumed, presumably on a later message fragment. Whenever a new key is written in AES\_KEYWRx, two automatic actions are processed:

- GCM hash subkey generation
- AES\_GHASHRx Clear

See [Key Writing and Automatic Hash Subkey Calculation](#) for details.

If an application software-specific hash initial value is needed for the GHASH, it must be written to AES\_GHASHRx:

- after writing AES\_KEYWRx, if any
- before starting the input data feed.

## 52.5.14. AES GCM Authentication Tag Word Register x

**Name:** AES\_TAGRx  
**Offset:** 0x88 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	TAG[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TAG[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TAG[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TAG[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – TAG[31:0] GCM Authentication Tag x

The four 32-bit Tag registers contain the final 128-bit GCM Authentication tag ( $T$ ) when GCM processing is complete. TAG0 corresponds to the first word, TAG3 to the last word.

## 52.5.15. AES GCM Encryption Counter Value Register

**Name:** AES\_CTRR  
**Offset:** 0x98  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	CTR[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CTR[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CTR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CTR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – CTR[31:0]** GCM Encryption Counter  
Reports the current value of the 32-bit GCM counter.

## 52.5.16. AES GCM H Word Register x

**Name:** AES\_GCMHRx  
**Offset:** 0x9C + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	H[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	H[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	H[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	H[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – H[31:0] GCM H Word x

The four 32-bit H Word registers contain the 128-bit GCM hash subkey *H* value.

Whenever a new key is written in AES\_KEYWRx, two automatic actions are processed:

- GCM hash subkey *H* generation
- AES\_GHASHRx Clear

If the application software requires a specific hash subkey, the automatically-generated *H* value can be overwritten in AES\_GCMHRx. See [Key Writing and Automatic Hash Subkey Calculation](#) for details. Generating a GCM hash subkey *H* by a write in AES\_GCMHRx enables to:

- select the GCM hash subkey *H* for GHASH operations,
- select one operand to process a single GF128 multiply.

## 52.5.17. AES Extended Mode Register

**Name:** AES\_EMR  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	BPE							
Access	R/W							
Reset	0							

Bit	23	22	21	20	19	18	17	16
	NHEAD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	PADLEN[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	PKRS		PLIPD	PLIPEN			APM	APEN
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0

### Bit 31 – BPE Block Processing End

Value	Description
0	AES_ISR.DATRDY flag reports only the end message encryption processing. No intermediate block processing is reported when SMOD=2. When a DMA is used to transfer data, BPE must be cleared.
1	AES_ISR.DATRDY flag reports each end of block processing when SMOD=2. When AES_IDATARx are not loaded by a DMA and SMOD=2, this bit can be written to 1 to rise the AES_ISR.DATRDY flag when a new data block can be written.

### Bits 23:16 – NHEAD[7:0] IPsec Next Header

Value	Description
0–255	IPsec Next Header field

### Bits 15:8 – PADLEN[7:0] Auto Padding Length

Value	Description
0–255	Padding length in bytes

### Bit 7 – PKRS Private Key Internal Register Select

Value	Description
0	The key used by the AES is in the AES_KEYWRx registers.
1	The key used by the AES is in the Private Key internal registers written through the Private Key bus.

### Bit 5 – PLIPD Protocol Layer Improved Performance Decipher

Value	Description
0	Protocol layer improved performance is in ciphering mode.
1	Protocol layer improved performance is in deciphering mode.

**Bit 4 – PLIPEN** Protocol Layer Improved Performance Enable

Value	Description
0	Protocol layer improved performance is disabled.
1	Protocol layer improved performance is enabled.

**Bit 1 – APM** Auto Padding Mode

Value	Description
0	Auto Padding performed according to IPSec standard.
1	Auto Padding performed according to SSL standard.

**Bit 0 – APEN** Auto Padding Enable

Value	Description
0	Auto Padding feature is disabled.
1	Auto Padding feature is enabled.

## 52.5.18. AES Byte Counter Register

**Name:** AES\_BCNT  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	BCNT[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BCNT[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	BCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	BCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – BCNT[31:0] Auto Padding Byte Counter

Auto padding byte counter value. BCNT must be greater than 0.

## 52.5.19. AES Tweak Word Register x

**Name:** AES\_TWRx  
**Offset:** 0xC0 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TWEAK[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TWEAK[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TWEAK[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TWEAK[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – TWEAK[31:0] Tweak Word x

The four 32-bit Tweak Word registers contain the 128-bit Tweak value.

## 52.5.20. AES Alpha Word Register x

**Name:** AES\_ALPHARx  
**Offset:** 0xD0 + x\*0x04 [x=0..3]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [AES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	ALPHA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	ALPHA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	ALPHA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	ALPHA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bits 31:0 – ALPHA[31:0] Alpha Word x

The four 32-bit Alpha Word registers contain the 128-bit primitive of  $GF(2^{128})$  to use for the first processing.

## 52.5.21. AES Write Protection Mode Register

**Name:** AES\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ACTION[2:0]			FIRSTE		WPCREN	WPITEN	WPEN
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x414553	PASSWD	Writing any other value in this field aborts the write operation of the WPEN,WPITEN,WPCREN bits. Always reads as 0.

### Bits 7:5 – ACTION[2:0] Action on Abnormal Event Detection

When the field AES\_WPMR.ACTION differs from 0 and an abnormal event or internal state is detected, the AES is locked until the unlock command is issued (AES\_CR.UNLOCK=1). The lock source must be cleared before performing the unlock command. If AES\_WPSR.SEQE=1, the following two actions must be performed:

1/ Read AES\_WPSR.

2/ Issue software reset by writing a 1 in AES\_CR.SWRST.

A specific configuration applies where the sequence does not clear the lock source (AES\_WPSR=0). If AES\_WPSR.SEQE remains high after the clearing sequence, then only a hardware reset will unlock the AES. A hardware reset can be performed by issuing a reset controller software reset (refer to the section “Reset Controller (RSTC)”). This condition can be met when AES\_EMR.PKWL=1 and a key has been loaded through the Private Key bus. The key loaded through the key bus is corrupted, but it is impossible to reload a new key unless a hardware reset is issued.

Value	Name	Description
0	REPORT_ONLY	No action (stop or clear key) is performed when one of PKRPVS, WPVS, CGD, SEQE, or SWE flags is set.
1	LOCK_PKRPVS_WPVS_SWE	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/SWE event detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.

Value	Name	Description
2	LOCK_CGD_SEQE	If a processing is in progress when the AES_WPSR.CGD/SEQE event detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.
3	LOCK_ANY_EV	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.
4	CLEAR_PKRPVS_WPVS_SWE	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/SWE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.  Moreover, the AES_KEYWRx key is immediately cleared.
5	CLEAR_CGD_SEQE	If a processing is in progress when the AES_WPSR.CGD/SEQE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.  Moreover, the AES_KEYWRx key is immediately cleared.
6	CLEAR_ANY_EV	If a processing is in progress when the AES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a AES_CR.UNLOCK command is issued.  Moreover, the AES_KEYWRx key is immediately cleared.

#### Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in AES_WPSR.WPVSR and the last software control error type is reported in AES_WPSR.SWETYP. The AES_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in AES_WPSR.WPVSR and only the first software control error type is reported in AES_WPSR.SWETYP. The AES_ISR.SECE flag is set at the first error occurrence within a series.

#### Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x414553 (“AES” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x414553 (“AES” in ASCII).

#### Bit 1 – WPITEN Write Protection Interruption Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).

#### Bit 0 – WPEN Write Protection Configuration Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x414553 (“AES” in ASCII).

## 52.5.22. AES Write Protection Status Register

**Name:** AES\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				PKRPVS	SWE	SEQE	CGD	WPVS
Access				R	R	R	R	R
Reset				0	0	0	0	0

### Bit 31 – ECLASS Software Error Class (cleared on read)

0 (WARNING): An abnormal access that does not affect system functionality

1 (ERROR): An access is performed into key, input data, control registers while the AES is performing an encryption/decryption or a start is request by software or DMA while the key is not fully configured.

### Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (Warning).
1	WRITE_RO	AES is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address (Warning).
3	CTRL_START	Abnormal use of AES_CR.START command when DMA access is configured.
4	WEIRD_ACTION	A key write, init value write, output data read, AES_MR and AES_EMR write, GCM configuration registers write, AES_TWRx and AES_ALPHARx registers write, AES_BCNT write, Private Key Bus access has been performed while a current processing is in progress (abnormal).
5	INCOMPLETE_KEY	A tentative of start is required while the key is not fully loaded into the AES_KEYWRx registers.

### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS=1, WPVSR indicates the register address offset at which a write access has been attempted.

When WPVS=0 and SWE=1, WPVSR reports the address of the incorrect software access. As soon as WPVS=1, WPVSR returns the address of the write-protected violation.

### Bit 4 – PKRPVS Private Key Internal Register Protection Violation Status (cleared on read)

Value	Description
0	No Private Key Internal Register access violation has occurred since the last read of AES_WPSR.
1	A Private Key Internal Register access violation has occurred since the last read of AES_WPSR.

**Bit 3 – SWE** Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of AES_WPSR.
1	A software error has occurred since the last read of AES_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of AES_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of AES_WPSR. This flag can only be set under abnormal operating conditions.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of AES_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of AES_WPSR. This flag can only be set in case of abnormal clock signal waveform (glitch).

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

Value	Description
0	No write protect violation has occurred since the last read of AES_WPSR.
1	A write protect violation has occurred since the last read of AES_WPSR. The address offset of the violated register is reported into field WPVSR.

## 53. Secure Hash Algorithm (SHA)

### 53.1. Description

The Secure Hash Algorithm (SHA) is compliant with the American *FIPS (Federal Information Processing Standard) Publication 180-4* specification.

The 512/1024-bit block of message is respectively stored in 16/32 x 32-bit registers, (SHA\_IDATARx/SHA\_IODATARx) which are write-only.

As soon as the input data is written, hash processing can be started. The registers comprising the block of a message must be entered consecutively. Then, after the processing period, the message digest is ready to be read out on the 5 up to 8/16 x 32-bit output data registers (SHA\_IODATARx) or through the DMA channels.

### 53.2. Embedded Characteristics

- Supports Secure Hash Algorithm (SHA1, SHA224, SHA256, SHA384, SHA512)
- Supports Hash-based Message Authentication Code (HMAC) Algorithm (HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512)
- Compliant with FIPS Publication 180-4
- Supports Automatic Padding of Messages
- Supports Up to 2 Sets of Initial Hash Values Registers (HMAC Acceleration or other)
- Supports Automatic Check of the Hash (HMAC Acceleration or other)
- Tightly Coupled to AES for Protocol Layers Improved Performances
- Configurable Processing Period:
  - 85 clock cycles to obtain a fast SHA1 runtime, 88 clock cycles for SHA384, SHA512 or 209 Clock Cycles for Maximizing Bandwidth of Other Applications
  - 72 clock cycles to obtain a fast SHA224, SHA256 runtime or 194 clock cycles for maximizing bandwidth of other applications
- Connection to DMA Channel Capabilities Optimizes Data Transfers
- Double Input Buffer Optimizes Runtime
- Register Write Protection

### 53.3. Product Dependencies

#### 53.3.1. Power Management

The SHA may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SHA clock.

#### 53.3.2. Interrupt Sources

The SHA interface has an interrupt line connected to the Interrupt Controller.

Handling the SHA interrupt requires programming the Interrupt Controller before configuring the SHA.

### 53.4. Functional Description

The Secure Hash Algorithm (SHA) module requires a padded message according to the FIPS 180 specification. This message can be provided with the padding to the SHA module, or the padding can be automatically computed by the SHA module if the size of the message is provided. The first block of the message must be indicated to the module by a specific command. The SHA module produces an N-bit message digest each time a block is written and processing period ends, where N

is 160 for SHA1, 224 for SHA224, 256 for SHA256, 384 for SHA384, 512 for SHA512. The SHA module is also capable of computing a Hash-based Message Authentication Code (HMAC) algorithm.

#### 53.4.1. SHA Algorithm

The SHA can process SHA1, SHA224, SHA256, SHA384, SHA512 by configuring the ALGO field in the Mode register (SHA\_MR).

#### 53.4.2. HMAC Algorithm

The HMAC algorithm is as follows:

$$\text{HMAC}_K(m) = h((K_0 \oplus \text{opad}) || h((K_0 \oplus \text{ipad}) || m))$$

where:

- $h$  = SHA function
- $K_0$  = the key  $K$  after any necessary pre-processing to form a block size key
- $m$  = message to authenticate
- $||$  = concatenation operator
- $\oplus$  = XOR operator
- $\text{ipad}$  = predefined constant (0x3636...3636)
- $\text{opad}$  = predefined constant (0x5C5C...5C5C)

The SHA provides a fully optimized processing of the HMAC algorithm by executing the following operations:

- starting the SHA algorithm from any user predefined hash value, thus ' $h(K_0 \oplus \text{ipad})$ ' for first HMAC hash and ' $h(K_0 \oplus \text{opad})$ ' for second HMAC hash
- performing automatic padding
- routing automatically the first hash result ' $h((K_0 \oplus \text{ipad}) || m)$ ' to the source of the second hash processing ' $h((K_0 \oplus \text{opad}) || (\text{first hash result}))$ ' including the concatenation of the first hash result to ' $K_0 \oplus \text{opad}$ '.

To perform the HMAC operation, the ALGO field value must be greater than 7, the automatic padding feature must be enabled (MSGSIZE and BYTCNT fields differ from 0) and the SHA internal initial hash value registers 0 and 1 must be configured, respectively, with the hash results of input blocks " $K_0 \oplus \text{ipad}$ " and " $K_0 \oplus \text{opad}$ " (see [Internal Registers for Initial Hash Value or Expected Hash Result](#)).

The size of the message (' $m$ ') must be written in the MSGSIZE and BYTCNT fields.

The FIRST bit in the SHA Control register (SHA\_CR) should be set before writing the first block of the message.

The SHA can process HMAC-SHA1, HMAC-SHA224, HMAC-SHA256, HMAC-SHA384, HMAC-SHA512 by configuring the SHA\_MR.ALGO field.

#### 53.4.3. Processing Period

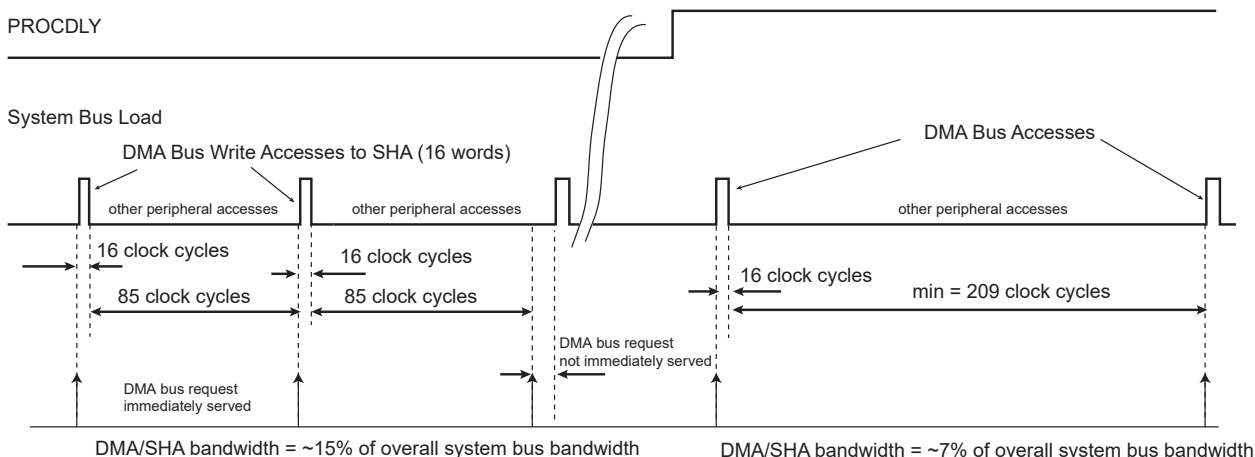

When SHA is enabled and DMA is used to write the messages, the inherent processing period may result, depending on the application, in a significant bandwidth usage at system bus level. In some applications, it may be important to keep as much bandwidth as possible for the other peripherals (e.g. CPU, other DMA channels). The SHA engine inherent processing period can be configured to reduce the bandwidth required by writing SHA\_MR.PROCDLY=1.

In SHA1 mode, the shortest processing period is 85 clock cycles + 2 clock cycles for start command synchronization (SHA\_MR.PROCDLY=0). The longest period is 209 clock cycles + 2 clock cycles when SHA\_MR.PROCDLY=1 (see the figure below).

In SHA256 mode, the shortest processing period is 72 clock cycles + 2 clock cycles for start command synchronization (SHA\_MR.PROCDLY=0). The longest period is 194 clock cycles + 2 clock cycles when SHA\_MR.PROCDLY=1.

In SHA384 or SHA512 mode, the shortest processing period is 88 clock cycles + 2 clock cycles for start command synchronization. The longest period is 209 clock cycles + 2 clock cycles.

**Figure 53.1.** Bandwidth Usage in SHA-1 Mode

#### 53.4.4. Double Input Buffer

The SHA Input Data registers (SHA\_IDATARx) can be double-buffered to reduce the runtime of large messages.

Double-buffering allows a new message block to be written while the previous message block is being processed. This is only possible when DMA accesses are performed (SMOD = 2).

The DUALBUFF bit in the SHA\_MR must be set to have double input buffer access.

#### 53.4.5. Internal Registers for Initial Hash Value or Expected Hash Result

The SHA module embeds two sets of internal registers (IR0, IR1) to store different data used by the SHA or HMAC algorithms (see the figure [User Initial Hash Value and Expected Hash Internal Register Access](#)). These internal registers are accessed through SHA Input Data registers (SHA\_IDATARx).

When the ALGO field selects SHA algorithms, IR0 can be configured with a user initial hash value. This initial hash value can be used to compute a custom hash algorithm with two sets of different initial constants, or to continue a hash computation by providing the intermediate hash value previously returned by the SHA module.

When the ALGO field selects SHA algorithms, IR1 can be configured with either a user initial hash value or an expected hash result. The expected hash result must be configured in the IR1 if the field CHECK = 1 (see [Automatic Check](#)). If the field CHECK = 0 or 2, IR1 can be configured with a user initial hash value that differs from IR0 value.

When the ALGO field selects HMAC algorithms, IR0 must be configured with the hash result of  $K_0 \oplus \text{ipad}$  and IR1 must be configured with the hash result of  $K_0 \oplus \text{opad}$ . These pre-computed first blocks speed up the HMAC computation by saving the time to compute the intermediate hash values of the first block which is constant while the secret key is constant (see [HMAC Algorithm](#)).

**Table 53.1.** Configuration Values of Internal Registers

Register	SHA Modes (ALGO < 8)			HMAC Modes (ALGO > 7)
	CHECK = 0	CHECK = 1	CHECK = 2	
IR0	User Initial Hash	User Initial Hash	User Initial Hash	hash( $K_0 \oplus \text{ipad}$ )

.....continued

Register	SHA Modes (ALGO < 8)			HMAC Modes (ALGO > 7)
	CHECK = 0	CHECK = 1	CHECK = 2	
IR1	User Initial Hash	Expected Hash Result	User Initial Hash	hash( $K_0 \oplus opad$ )

To calculate the initial HMAC values, follow this sequence:

1. Calculate  $K_0$ .
2. Calculate  $K_0 \oplus ipad$  and  $K_0 \oplus opad$ .
3. Perform a hash of the result of  $K_0 \oplus ipad$  and  $K_0 \oplus opad$  (auto-padding must be disabled for that type of hash).
4. Write  $h(K_0 \oplus ipad)$  and  $h(K_0 \oplus opad)$  in IR0 and IR1 respectively.

To write IR0 or IR1, follow this sequence:

1. Set SHA\_CR.WUIHV (IR0) or SHA\_CR.WUIEHV (IR1).
2. Write the data in SHA\_IDATARx. The number of registers to write depends on the type of data (user initial hash values or expected hash result) and on the type of algorithm selected:
  - For user initial hash values:
    - SHA\_IDATAR0 to SHA\_IDATAR4 for SHA1
    - SHA\_IDATAR0 to SHA\_IDATAR7 for SHA224 or SHA256
    - SHA\_IDATAR0 to SHA\_IDATAR15 for SHA384, SHA512
  - For expected hash result:
    - SHA\_IDATAR0 to SHA\_IDATAR4 for SHA1
    - SHA\_IDATAR0 to SHA\_IDATAR6 for SHA224
    - SHA\_IDATAR0 to SHA\_IDATAR7 for SHA256
    - SHA\_IDATAR0 to SHA\_IDATAR11 for SHA384
    - SHA\_IDATAR0 to SHA\_IDATAR16 for SHA512
3. Clear SHA\_CR.WUIHV or SHA\_CR.WUIEHV.

IR0 and IR1 are automatically selected for HMAC processing if the field ALGO selects HMAC algorithms. If SHA algorithms are selected, the internal registers are selected if the corresponding UIHV or UIEHV bits are set.

**Figure 53.2.** User Initial Hash Value and Expected Hash Internal Register Access

#### 53.4.6. Automatic Padding

The SHA module features an automatic padding computation to speed up the execution of the algorithm.

The automatic padding function requires the following information:

- Complete message size in bytes to be written in the MSGSIZE field of the SHA Message Size register (SHA\_MSR).  
The size of the message is written at the end of the last block, as required by the FIPS 180 specification (the size is automatically converted into a bit-size).  
**Note:** SHA\_MSR is a 32-bit register, thus the automatic padding capability is limited to messages of less than 4 gigabytes. For messages greater than 4 gigabytes, padding must be performed by the software.
- Number of remaining bytes (to write in the SHA\_IDATARx) to be written in the BYTCNT field of the SHA Bytes Count register (SHA\_BCR).  
Automatic padding occurs when the BYTCNT field reaches 0. At each write in the SHA Input registers, the BYTCNT field value is decreased by the number of bytes written.

The BYTCNT field value must be written with the same value as the MSGSIZE field value if the full message is processed. If the message is partially preprocessed and an initial hash value is used, BYTCNT must be written with the remaining bytes to hash while MSGSIZE holds the message size.

To disable the automatic padding feature, the MSGSIZE and BYTCNT fields must be configured with 0.

### 53.4.7. Automatic Check

The SHA module features an automatic check of the hash result with the expected hash. A check failure can generate an interrupt if configured in the SHA Interrupt Enable register (SHA\_IER).

Automatic check requires the automatic padding feature to be enabled (MSGSIZE and BYTCNT fields must be greater than 0).

There are two methods to configure the expected hash result:

- if SHA\_MR.CHECK = 1, the expected hash result is read from the internal register (IR1). This method cannot be used when HMAC algorithms is selected because this register is already used to store user initial hash values for the second hash processing. IR1 cannot be read by software.
- If SHA\_MR.CHECK = 2, the expected hash result is written in the SHA\_IDATARx after the message.

When SHA\_MR.CHECK = 2, the method can provide more flexibility of use if a message is stored in system memory together with its expected hash result. A DMA with linked list can be used to ease the transfer of the message and its expected hash result.

**Figure 53.3.** Message and Expected Hash Result Memory Mapping

The number of 32-bit words of the hash result to check with the expected hash can be selected with SHA\_MR.CHCNT. The status of the check is available in the CHKST field in the SHA Interrupt Status register (SHA\_ISR).

An interrupt can be generated (if enabled) when the check is completed. The check occurs several clock cycles after the computation of the requested hash, so the interrupt and the CHECKF bit are set several clock cycles after the DATRDY flag of the SHA\_ISR.

### 53.4.8. Protocol Layers Improved Performances

The SHA can be tightly coupled to the AES module to improve performances when processing protocol layers such as IPsec or OpenSSL.

When the AES is configured to be tightly coupled to SHA (AES\_MR), SHA must be always configured in Double Buffer mode (SHA\_MR.DUALBUFF = 1).

Refer to the section “Advanced Encryption Standard (AES)” for details.

### 53.4.9. Start Modes

SHA\_MR.SMOD is used to select the Hash Processing Start mode.

#### 53.4.9.1.Manual Mode

In Manual mode, the sequence is as follows:

1. Set SHA\_IER.DATRDY (Data Ready) , depending on whether an interrupt is required at the end of processing.
2. If the initial hash values differ from the FIPS standard, set SHA\_MR.UIHV and/or SHA\_MR.UIEHV. If the initial hash values comply with the FIPS180 specification, clear SHA\_MR.UIHV and/or SHA\_MR.UIEHV.
3. If automatic padding is required, configure SHA\_MSR.MSGSIZE with the number of bytes of the message, and configure SHA\_BCR.BYTCNT with the remaining number of bytes to write. The BYTCNT field must be written with a value different from MSGSIZE field value if the message is preprocessed and completed by using user initial hash values. If automatic padding is not required, configure SHA\_MSR.MSGSIZE and SHA\_BCR.BYTCNT to 0.
4. The FIRST command must be set by writing a 1 into the corresponding bit of the Control register (SHA\_CR) to start a hash computation with initial constants (first block of a message) or to resume after message processing was interrupted. When a first message processing is interrupted to process another message, the intermediate hash results must be stored in the system memory and they must be reloaded in user initial values registers (IR0 accessed via SHA\_IDATAR when SHA\_CR.WUIHV=1) prior to resume and continue the processing of the first message. For the other blocks, there is nothing to write.
5. Write the block to process in SHA\_IDATARx.
6. To begin processing, set SHA\_CR.START.
7. When processing is completed, the bit DATRDY in the Interrupt Status register (SHA\_ISR) rises. If an interrupt has been enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated.
8. Repeat the write procedure for each block (step 5), start procedure (step 6) and wait for the interrupt procedure (step 7) up to the last block of the entire message. Each time the start procedure is complete, the DATRDY flag is cleared.
9. After the last block is processed (the DATRDY flag is set, if an interrupt was enabled by setting SHA\_IER.DATRDY, the interrupt line of the SHA is activated), read the message digest in the Output Data registers. The DATRDY flag is automatically cleared when reading the SHA\_IODATARx registers.

#### 53.4.9.2.Auto Mode

In Auto mode, processing starts as soon as the correct number of SHA\_IDATARx is written. No action is required in SHA\_CR.

#### 53.4.9.3.DMA Mode

The DMA can be used in association with the SHA to perform the algorithm on a complete message without any action by the software during processing.

SHA\_MR.SMOD must be configured to 2.

The DMA must be configured with non-incremental addresses.

The start address of any transfer descriptor must be set to point to the SHA\_IDATAR0.

The DMA chunk size must be set to transfer, for each trigger request, 16 words of 32 bits.

The FIRST bit of SHA\_CR must be set before starting the DMA when the first block is transferred.

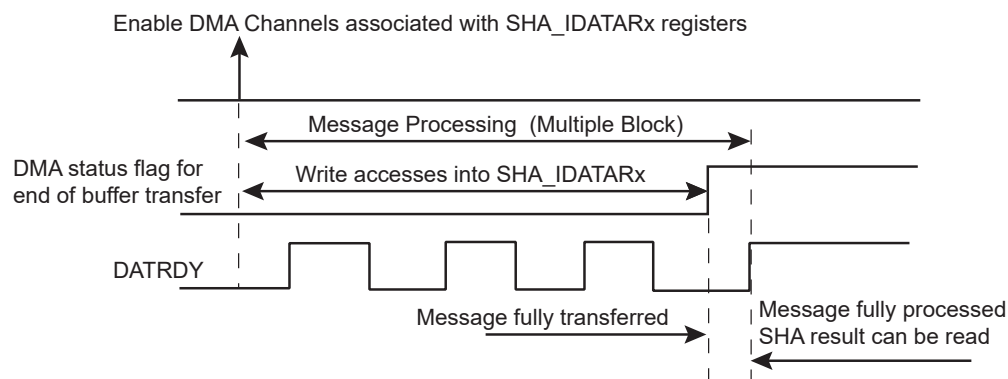

**Note:** The FIRST bit command is also used to resume after message processing was interrupted. When a first message processing is interrupted to process another message, the intermediate hash results must be stored in the system memory and they must be reloaded in user initial values registers (IR0 accessed via SHA\_IDATAR when SHA\_CR.WUIHV=1) prior to resume and continue the processing of first message.. Thus, the DMA data buffers and SHA\_CR.FIRST command must be managed accordingly.

The DMA generates an interrupt when the end of buffer transfer is completed but the SHA processing is still in progress. The end of SHA processing is indicated by the flag DATRDY in the SHA\_ISR.

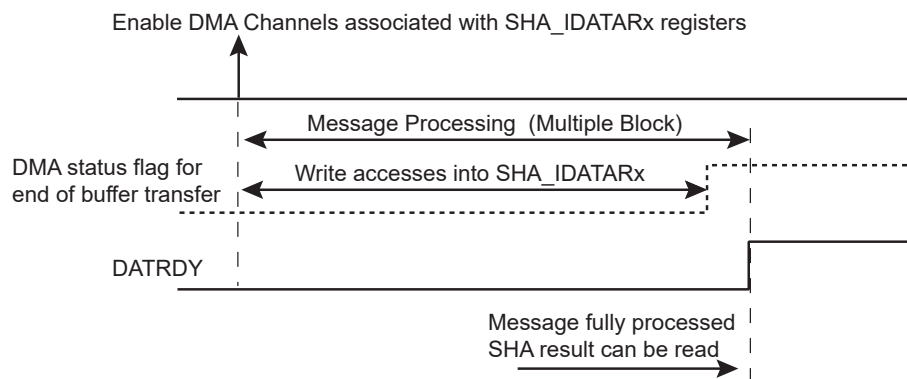

If automatic padding is disabled, the end of SHA processing requires two interrupts to be verified. The DMA end of transfer interrupt must be verified first, then the SHA DATRDY interrupt must be enabled and verified (see the figure [Interrupts Processing with DMA](#)).

If automatic padding is enabled, the end of SHA processing requires only one interrupt to be verified. The DMA end of transfer is not required, so the SHA DATRDY interrupt must be enabled prior to start the DMA and DATRDY interrupt is the only one to be verified (see the figure [Interrupts Processing with DMA and Automatic Padding](#)).

**Figure 53.4.** Interrupts Processing with DMA

**Figure 53.5.** Interrupts Processing with DMA and Automatic Padding

#### 53.4.9.4.SHA Register Endianness

In Arm processor-based products, the system bus and processors manipulate data in little-endian form. The SHA interface requires little-endian format words. However, in accordance with the protocol of the FIPS 180 specification, data is collected, processed and stored by the SHA algorithm in big-endian form.

The following example illustrates how to configure the SHA:

If the first 64 bits of a message (according to FIPS 180, i.e., big-endian format) to be processed is 0xcafedeca\_01234567, then the SHA\_IDATAR0 and SHA\_IDATAR1 registers must be written with the following pattern:

- SHA\_IDATAR0 = 0xcadefeca
- SHA\_IDATAR1 = 0x67452301

In a little-endian system, the message (according to FIPS 180) starting with pattern 0xcafedeca 01234567 is stored into memory as follows:

- 0xca stored at initial offset (for example 0x00),
- then 0xfe stored at initial offset + 1 (i.e., 0x01),
- 0xde stored at initial offset + 2 (i.e., 0x02),
- 0xca stored at initial offset + 3 (i.e., 0x03).

If the message is received through a serial-to-parallel communication channel, the first received character is 0xca and it is stored at the first memory location (initial offset). The second byte, 0xfe, is stored at initial offset + 1.

When reading on a 32-bit little-endian system bus, the first word read back from system memory is 0xcadefeca.

When the SHA\_IODATARx registers are read, the hash result is organized in little-endian format, allowing system memory storage in the same format as the message.

Taking an example from the FIPS 180 specification Appendix B.1, the endian conversion can be observed.

For this example, the 512-bit message is:

[illegible]

and the expected SHA-256 result is:

0xba7816bf 8f01cfea 414140de 5dae2223 b00361a3 96177a9c b410ff61 f20015ad

If the message has not already been stored in the system memory, the first step is to convert the input message to little-endian before writing to the SHA\_IDATARx registers. This would result in a write of:

SHA IDATAR0 = 0x80636261..... SHA IDATAR15 = 0x18000000

The data in the output message digest registers, SHA\_IODATARx, contain SHA\_IODATAR0 = 0xbf1678ba... SHA\_IODATAR7 = 0xad1500f2 which is the little-endian format of 0xba7816bf,..., 0xf20015ad.

Reading SHA\_IODATAR0 to SHA\_IODATAR1 and storing into a little-endian memory system forces hash results to be stored in the same format as the message.

When the output message is read, the user can convert back to big-endian for a resulting message value of:

0xba7816bf\_8f01cfea\_414140de\_5dae2223\_b00361a3\_96177a9c\_b410ff61\_f20015ad

### 53.4.10. Security Features

#### 53.4.10.1.Unspecified Register Access Detection

When an unspecified register access occurs, the URAD bit in the SHA\_ISR is set. Its source is then reported in the Unspecified Register Access Type field (URAT). Only the last unspecified register access is available through the URAT field.

Several kinds of unspecified register accesses can occur:

- SHA\_IDATARx written during data processing in DMA mode
- SHA\_IODATARx read during data processing
- SHA\_MR written during data processing
- Write-only register read access

The URAD bit and the URAT field can only be reset by the SWRST bit in the SHA\_CR.

#### 53.4.10.2. Register Write Protection

To prevent any single software error from corrupting SHA behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SHA Write Protection Mode register (SHA\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SHA Write Protection Status register (SHA\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading SHA\_WPSR.

The following register(s) can be write-protected when SHA\_WPMR.WPEN is set:

- [SHA Mode Register](#)
- [SHA Message Size Register](#)
- [SHA Bytes Count Register](#)

The following register(s) can be write-protected when WPITEN is set:

- [SHA Interrupt Enable Register](#)
- [SHA Interrupt Disable Register](#)

The following register(s) can be write-protected when WPCREN is set:

- [SHA Control Register](#)

#### 53.4.10.3. Security and Safety Analysis and Reports

Several types of checks are performed when the SHA is enabled.

The peripheral clock of the SHA is monitored by a specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the SHA. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the SHA\_WPSR.CGD flag is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the SHA is also monitored, and if an abnormal state is detected, the SHA\_WPSR.SEQE flag is set. This flag is not set under normal operating conditions.

Software accesses to the SHA are monitored and if an incorrect access is performed, the SHA\_WPSR.SWE flag is set. The type of incorrect/abnormal software access is reported in the SHA\_WPSR.SWETYP field (see [SHA Write Protection Status Register](#) for details), e.g., reading the SHA\_ODATARx when the SHA\_ISR.DATRDY flag is cleared is an error. SHA\_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The CGD, SEQE, SWE and WPVS flags are automatically cleared when SHA\_WPSR is read.

If one of these flags is set, the SHA\_ISR.SECE flag is set and can trigger an interrupt if SHA\_IMR.SECE is '1'. SECE is cleared by reading SHA\_ISR.

It is possible to configure an action to be performed by SHA as soon as an abnormal event detection occurs. If SHA\_WPMR.ACTION > 0, a lock is performed. When a lock occurs, the current processing is ended normally but any new processing is not performed whatever the start mode of operation (see SHA\_MR.SMOD).

A locked state of the SHA is unlocked as follows:

1. Read SHA\_WPSR.
2. Disable the source of tamper if the tamper is enabled.
3. Write a '1' to SHA\_CR.UNLOCK.

It is possible to select the type of event that will lock the SHA in case of abnormal event detection. See SHA\_WPMR.ACTION for details.

If SHA\_MR.TMPLCK=1 and the tamper pin is active, the SHA is locked whatever the value of the field SHA\_WPMR.ACTION.

## 53.5. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	SHA_CR	31:24								UNLOCK
		23:16								
		15:8			WUIEHV	WUIHV				SWRST

### 53.5.1. SHA Control Register

**Name:** SHA\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
								UNLOCK
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			WUIEHV	WUIHV				SWRST
Access			W	W				W
Reset			–	–				–

Bit	7	6	5	4	3	2	1	0
				FIRST				START
Access				W				W
Reset				–				–

**Bit 24 – UNLOCK** Unlock Processing  
SHA\_WPSR must be cleared before performing the unlock command.

Value	Description
0	No effect.
1	Unlocks the processing in case of abnormal event detection if SHA_WPMR.ACTION > 0.

**Bit 13 – WUIEHV** Write User Initial or Expected Hash Values

Value	Description
0	SHA_IDATARx accesses are routed to the data registers.
1	SHA_IDATARx accesses are routed to the internal registers (IR1).

**Bit 12 – WUIHV** Write User Initial Hash Values

Value	Description
0	SHA_IDATARx accesses are routed to the data registers.
1	SHA_IDATARx accesses are routed to the internal registers (IR0).

**Bit 8 – SWRST** Software Reset

Value	Description
0	No effect.
1	Resets the SHA. A software-triggered hardware reset of the SHA interface is performed.

**Bit 4 – FIRST** First Block of a Message

Value	Description
0	No effect.

Value	Description
1	Indicates that the next block to process is the first one of a message or the first block of a fragment of a message.

#### Bit 0 – START Start Processing

Value	Description
0	No effect.
1	Starts manual hash algorithm process.

### 53.5.2. SHA Mode Register

**Name:** SHA\_MR  
**Offset:** 0x04  
**Reset:** 0x0000100  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	CHKCNT[3:0]						CHECK[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0
Bit	23	22	21	20	19	18	17	16
								DUALBUFF
Access								R/W
Reset								0
Bit	15	14	13	12	11	10	9	8
	TMPLCK				ALGO[3:0]			
Access	R/W				R/W	R/W	R/W	R/W
Reset	0				0	0	0	1
Bit	7	6	5	4	3	2	1	0
	BPE	UIEHV	UIHV	PROCDLY	AOE		SMOD[1:0]	
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

**Bits 31:28 – CHKCNT[3:0]** Check Counter

Number of 32-bit words to check. The value 0 indicates that the number of words to compare will be based on the algorithm selected (5 words for SHA1, 7 words for SHA224, 8 words for SHA256, 12 words for SHA384, 16 words for SHA512).

**Bits 25:24 – CHECK[1:0]** Hash Check

Values not listed in table must be considered as “reserved”.

Value	Name	Description
0	NO_CHECK	No check is performed.
1	CHECK_EHV	Check is performed with expected hash stored in internal expected hash value registers.
2	CHECK_MESSAGE	Check is performed with expected hash provided after the message.

**Bit 16 – DUALBUFF** Dual Input Buffer

Value	Name	Description
0	INACTIVE	SHA_IDATARx and SHA_IODATARx cannot be written during processing of previous block.
1	ACTIVE	SHA_IDATARx and SHA_IODATARx can be written during processing of previous block when SMOD value = 2. It speeds up the overall runtime of large files.

**Bit 15 – TMPLCK** Tamper Lock Enable

Value	Description
0	A tamper event has no effect.
1	A tamper event locks the SHA until the tamper root cause is cleared and SHA_CR.UNLOCK is written to 1.

**Bits 11:8 – ALGO[3:0]** SHA Algorithm

Values not listed in the table must be considered as “reserved”.

Value	Name	Description
0	SHA1	SHA1 algorithm processed
1	SHA256	SHA256 algorithm processed
2	SHA384	SHA384 algorithm processed
3	SHA512	SHA512 algorithm processed
4	SHA224	SHA224 algorithm processed
8	HMAC_SHA1	HMAC algorithm with SHA1 Hash processed
9	HMAC_SHA256	HMAC algorithm with SHA256 Hash processed
10	HMAC_SHA384	HMAC algorithm with SHA384 Hash processed
11	HMAC_SHA512	HMAC algorithm with SHA512 Hash processed
12	HMAC_SHA224	HMAC algorithm with SHA224 Hash processed
13	Reserved	–
14	Reserved	–

#### Bit 7 – BPE Block Processing End

When SMOD=2 and ALGO<5, the SHA\_ISR.DATRDY flag rises when each block has been processed. When SMOD=2 and ALGO>7, the SHA\_ISR.DATRDY rises when all blocks except the last one have been processed.

Value	Description
0	BPE must be cleared when a DMA transfers data. When SMOD=2, SHA_ISR.DATRDY flag rises only when the SHA or HMAC processing cycle has completed. No intermediate block processing is reported.
1	When processing small messages, data transfer by software can improve performance compared to DMA. In this case, BPE can be written to 1, forcing the SHA_ISR.DATRDY to rise when a data must be loaded into SHA_IDATARx.

#### Bit 6 – UIEHV User Initial or Expected Hash Value Registers

Value	Description
0	The SHA algorithm is started with the standard initial values as defined in the FIPS 180 specification.
1	The SHA algorithm is started with the user initial hash values stored in the internal register 1 (IR1). If HMAC is configured, UIEHV has no effect (i.e. IR1 is always selected).

#### Bit 5 – UIHV User Initial Hash Values

Value	Description
0	The SHA algorithm is started with the standard initial values as defined in the FIPS 180 specification.
1	The SHA algorithm is started with the user initial hash values stored in the internal register 0 (IR0). If HMAC is configured, UIHV has no effect (i.e. IR0 is selected).

#### Bit 4 – PROCDLY Processing Delay

When SHA1 algorithm is processed, runtime period is either 85 or 209 clock cycles.  
When SHA256 or SHA224 algorithm is processed, runtime period is either 72 or 194 clock cycles.  
When SHA384 or SHA512 algorithm is processed, runtime period is either 88 or 209 clock cycles.

Value	Name	Description
0	SHORTEST	SHA processing runtime is the shortest one
1	LONGEST	SHA processing runtime is the longest one (reduces the SHA bandwidth requirement, reduces the system bus overload)

#### Bit 3 – AOE Always On Enable

Value	Description
0	The SHA operates in functional operating modes.
1	As soon as a START command is written, the SHA processes dummy calculations until AOE=0, without software intervention. This can be used to create an additional current consumption when AES is used to encrypt/decrypt.

**Bits 1:0 – SMOD[1:0] Start Mode**

Values not listed in the table must be considered as “reserved”.

If a DMA transfer is used, configure the SMOD value to 2. See [DMA Mode](#) for details.

Value	Name	Description
0	MANUAL_START	Manual mode
1	AUTO_START	Auto mode
2	IDATAR0_START	SHA_IDATAR0 access only mode (mandatory when DMA is used)

### 53.5.3. SHA Interrupt Enable Register

**Name:** SHA\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								SECE
Access								W
Reset								–
Bit	23	22	21	20	19	18	17	16
								CHECKF
Access								W
Reset								–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 24 – SECE** Security and/or Safety Event Interrupt Enable

**Bit 16 – CHECKF** Check Done Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 53.5.4. SHA Interrupt Disable Register

**Name:** SHA\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								SECE
Access								W
Reset								–
Bit	23	22	21	20	19	18	17	16
								CHECKF
Access								W
Reset								–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 24 – SECE** Security and/or Safety Event Interrupt Disable

**Bit 16 – CHECKF** Check Done Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 53.5.5. SHA Interrupt Mask Register

**Name:** SHA\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
								SECE
Access								R
Reset								0

Bit	23	22	21	20	19	18	17	16
								CHECKF
Access								R
Reset								0

Bit	15	14	13	12	11	10	9	8
								URAD
Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

**Bit 24 – SECE** Security and/or Safety Event Interrupt Mask

**Bit 16 – CHECKF** Check Done Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 53.5.6. SHA Interrupt Status Register

**Name:** SHA\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								SECE
Access								R
Reset								0

Bit	23	22	21	20	19	18	17	16
								CHECKF
Access	R	R	R	R				R
Reset	0	0	0	0				0

Bit	15	14	13	12	11	10	9	8
								URAD
Access		R	R	R				R
Reset		0	0	0				0

Bit	7	6	5	4	3	2	1	0
				WRDY				DATRDY
Access				R				R
Reset				0				0

#### Bit 24 – SECE Security and/or Safety Event

Value	Description
0	There is no report in SHA_WPSR.
1	There is a Security and/or Safety Event reported in SHA_WPSR.

#### Bits 23:20 – CHKST[3:0] Check Status (cleared by writing SHA\_CR.START or SHA\_CR.SWRST or by reading SHA\_IODATARx)

Value 5 indicates identical hash values (expected hash = hash result). Any other value indicates different hash values.

#### Bit 16 – CHECKF Check Done Status (cleared by writing SHA\_CR.START or SHA\_CR.SWRST or by reading SHA\_IODATARx)

Value	Description
0	Hash check has not been computed.
1	Hash check has been computed, status is available in the CHKST bits.

#### Bits 14:12 – URAT[2:0] Unspecified Register Access Type (cleared by writing a 1 to SWRST bit in SHA\_CR) Only the last Unspecified Register Access Type is available through the URAT field.

Value	Name
0	SHA_IDATAR0 to SHA_IDATAR15 written during data processing in DMA mode (URAD = 1 and URAT = 0 can occur only if DUALBUFF is cleared in SHA_MR)
1	Output Data Register read during data processing
2	SHA_MR written during data processing
3	Write-only register read access

**Bit 8 – URAD** Unspecified Register Access Detection Status (cleared by writing a 1 to SHA\_CR.SWRST)

Value	Description
0	No unspecified register access has been detected since the last SWRST.
1	At least one unspecified register access has been detected since the last SWRST.

**Bit 4 – WRDY** Input Data Register Write Ready

Value	Description
0	SHA_IDATAR0 cannot be written
1	SHA_IDATAR0 can be written

**Bit 0 – DATRDY** Data Ready (cleared by writing a 1 to bit SWRST or START in SHA\_CR, or by reading SHA\_IODATARx)

Value	Description
0	Output data is not valid.
1	512/1024-bit block process is completed. DATRDY is cleared when one of the following conditions is met: <ul style="list-style-type: none"> <li>• Bit START in SHA_CR is set.</li> <li>• Bit SWRST in SHA_CR is set.</li> <li>• The hash result is read.</li> </ul>

### 53.5.7. SHA Message Size Register

**Name:** SHA\_MSR  
**Offset:** 0x20  
**Reset:** 0x0  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	MSGSIZE[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	MSGSIZE[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MSGSIZE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MSGSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – MSGSIZE[31:0] Message Size

The size in bytes of the message. When MSGSIZE differs from 0, the SHA appends the corresponding value converted in bits after the padding section, as described in the FIPS180 specification.

To disable automatic padding, MSGSIZE field must be written to 0.

**Note:** SHA\_MSR is a 32-bit register, thus the automatic padding capability is limited to messages of less than 4 gigabytes. For messages greater than 4 gigabytes, padding must be performed by the software.

### 53.5.8. SHA Bytes Count Register

**Name:** SHA\_BCR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	BYTCNT[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BYTCNT[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	BYTCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	BYTCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – BYTCNT[31:0] Remaining Byte Count Before Auto Padding

When the hash processing starts from the beginning of a message (without preprocessed hash part), BYTCNT must be written with the same value as MSGSIZE. If a part of the message has been already hashed and the hash does not start from the beginning, BYTCNT must be configured with the number of bytes remaining to process before the padding section.

When read, provides the size in bytes of the message remaining to be written before the automatic padding starts.

BYTCNT is automatically updated each time a write occurs in SHA\_IDATARx and SHA\_IODATARx.

When BYTCNT reaches 0, the MSGSIZE is converted into a bit count and appended at the end of the message after the padding, as described in the FIPS 180 specification.

To disable automatic padding, the MSGSIZE and BYTCNT fields must be written to 0.

### 53.5.9. SHA Input Data Register x

**Name:** SHA\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..15]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	IDATA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	IDATA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – IDATA[31:0] Input Data

32-bit Input Data registers load the data block used for hash processing.

These registers are write-only to prevent reading of input data by another application.

SHA\_IDATAR0 corresponds to the first word of the block, SHA\_IDATAR15 to the last word of the last block in case SHA algorithm is set to SHA1, SHA224, SHA256, or SHA\_IDATAR15 to the last word of the block if SHA algorithm is SHA384 or SHA512 (see [SHA Input/Output Data Register x](#)).

SHA\_IDATARx can be also written to configure the hash result of the previous fragment of a message when starting the processing of the next fragment when the SHA has processed another message in between fragments.

### 53.5.10. SHA Input/Output Data Register x

**Name:** SHA\_IODATARx  
**Offset:** 0x80 + x\*0x04 [x=0..15]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	IODATA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	IODATA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	IODATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IODATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – IODATA[31:0] Input/Output Data

These registers can be used to read the resulting message digest and to write the second part of the message block when the SHA algorithm is SHA-384 or SHA-512.

SHA\_IODATAR0 to SHA\_IODATAR15 can be written or read but reading these offsets does not return the content of corresponding parts (words) of the message block. Only results from SHA calculation can be read through these registers.

When SHA processing is in progress, these registers return 0x0000.

SHA\_IODATAR0 corresponds to the first word of the message digest; SHA\_IODATAR4 to the last one in SHA1 mode, SHA\_IODATAR6 in SHA224, SHA\_IODATAR7 in SHA256, SHA\_IODATAR11 in SHA384 or SHA\_IODATAR15 in SHA512.

When SHA224 is selected, the content of SHA\_IODATAR7 must be ignored.

When SHA384 is selected, the content of SHA\_IODATAR12 to SHA\_IODATAR15 must be ignored.

### 53.5.11. SHA Write Protection Mode Register

**Name:** SHA\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		ACTION[1:0]		FIRSTE		WPCREN	WPITEN	WPEN
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x534841	PASSWD	Writing any other value in this field aborts the write operation of the WPEN,WPITEN,WPCREN bits. Always reads as 0.

#### Bits 6:5 – ACTION[1:0] Action on Abnormal Event Detection

Value	Name	Description
0	REPORT_ONLY	No action (stop or clear key) is performed when one of WPVS,CGD,SEQE, or SWE flag is set.
1	LOCK_WPVS_SWE	If a processing is in progress when the SHA_WPSR.WPVS/SWE event detection occurs, the current processing is ended normally but no other processing is started while a SHA_CR.UNLOCK command is issued.
2	LOCK_CGD_SEQE	If a processing is in progress when the SHA_WPSR.CGD/SEQE event detection occurs, the current processing is ended normally but no other processing is started while a SHA_CR.UNLOCK command is issued.
3	LOCK_ANY_EV	If a processing is in progress when the SHA_WPSR.WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a SHA_CR.UNLOCK command is issued.

#### Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in SHA_WPSR.WPVSRC and the last software control error type is reported in SHA_WPSR.SWETYP. The SHA_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in SHA_WPSR.WPVSRC and only the first software control error type is reported in SHA_WPSR.SWETYP. The SHA_ISR.SECE flag is set at the first error occurrence within a series.

## Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x534841 (“SHA” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x534841 (“SHA” in ASCII).

## Bit 1 – WPITEN Write Protection Interruption Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).

## Bit 0 – WPEN Write Protection Configuration Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x534841 (“SHA” in ASCII).

### 53.5.12. SHA Write Protection Status Register

**Name:** SHA\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS					SWETYP[3:0]		
Access	R				R	R	R	R
Reset	0				0	0	0	0
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

#### Bit 31 – ECLASS Software Error Class (cleared on read)

0 (WARNING): An abnormal access that does not affect system functionality

1 (ERROR): An access is performed into key, input data, control registers while the SHA is performing an encryption/decryption or a start is request by software or DMA while the key is not fully configured.

#### Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (Warning).
1	WRITE_RO	SHA is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address (Warning).
3	CTRL_START	SHA is locked and a start command with SHA_CR.START has been performed.
4	AUTO_START	SHA is locked and a tentative automatic start has been performed by writing input data registers (SHA_MR.SMOD>0).
5	BAD_START	SHA is not locked and a start command with SHA_CR.START has been performed whereas Start mode is automatic (SHA_MR.SMOD>0)

#### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS=1, WPVSR indicates the register address offset at which a write access has been attempted.

When WPVS=0 and SWE=1, WPVSR reports the address of the incorrect software access. As soon as WPVS=1, WPVSR returns the address of the write-protected violation.

#### Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of SHA_WPSR.

Value	Description
1	A software error has occurred since the last read of SHA_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of SHA_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of SHA_WPSR. This flag can only be set under abnormal operating conditions.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of SHA_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of SHA_WPSR. This flag can only be set in case of an abnormal clock signal waveform (glitch).

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

Value	Description
0	No write protect violation has occurred since the last read of SHA_WPSR.
1	A write protect violation has occurred since the last read of SHA_WPSR. The address offset of the violated register is reported into field WPVSR.

## 54. Triple Data Encryption Standard (TDES)

### 54.1. Description

The Triple Data Encryption Standard (TDES) is compliant with the American FIPS (Federal Information Processing Standard) Publication 46-3 specification.

The TDES supports the four different confidentiality modes of operation (ECB, CBC, OFB and CFB), specified in the FIPS (Federal Information Processing Standard) Publication 81 and is compatible with the Peripheral Data Controller channels for all of these modes, minimizing processor intervention for large buffer transfers.

The TDES key can be either loaded by the software or loaded in an invisible manner from the software.

The software can write up to three 64-bit keys, each stored in two 32-bit write-only registers, i.e., Key x Word registers, TDES\_KEYxWR0 and TDES\_KEYxWR1. For a software-invisible key transfer, the Private Key bus accesses the Private Key internal registers from the TRNG. The PKRS bit in the Mode register selects either TDES\_KEYxWR0/TDES\_KEYxWR1 or the Private Key internal registers.

The input data (and initialization vector for some modes) are stored in two corresponding 32-bit write-only registers:

- Input Data registers, TDES\_IDATAR0 and TDES\_IDATAR1
- Initialization Vector registers, TDES\_IVR0 and TDES\_IVR1

As soon as the initialization vector, the input data and the keys are configured, the encryption/decryption process may be started. Then the encrypted/decrypted data is ready to be read out on the two 32-bit Output Data registers (TDES\_ODATARx) or through the DMA channels.

### 54.2. Embedded Characteristics

- Supports Single Data Encryption Standard (DES) and Triple Data Encryption Standard (TDES)
- Compliant with FIPS Publication 46-3, Data Encryption Standard (DES)
- 64-bit Cryptographic Key for TDES
- Two-key or Three-key Algorithms for TDES
- 18 Clock Cycles Encryption/Decryption Processing Time for DES
- 50 Clock Cycles Encryption/Decryption Processing Time for TDES
- Supports eXtended Tiny Encryption Algorithm (XTEA)
- 128-bit key for XTEA and Programmable Round Number up to 64
- Supports the Four Standard Modes of Operation specified in the FIPS Publication 81, DES Modes of Operation
  - Electronic Code Book (ECB)
  - Cipher Block Chaining (CBC)
  - Cipher Feedback (CFB)
  - Output Feedback (OFB)
- 8-, 16-, 32- and 64-bit Data Sizes Possible in CFB Mode
- Last Output Data Mode Allowing Optimized Message (Data) Authentication Code (MAC) Generation
- Abnormal Software Access Reports and Automatic Lock
- Abnormal Internal Sequence Detection and Automatic Lock
- Register Write Protection

- Temporary Secured Storage for Keys
- Private Key Bus Access to the Private Key Internal Register Not Readable from any Peripheral or Software
- Connection to DMA Optimizes Data Transfers for all Operating Modes

### 54.3. Product Dependencies

#### 54.3.1. Power Management

The TDES may be clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the TDES clock.

#### 54.3.2. Interrupt Sources

The TDES interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TDES.

### 54.4. Functional Description

The Data Encryption Standard (DES) and the Triple Data Encryption Algorithm (TDES) specify FIPS-approved cryptographic algorithms that can be used to protect electronic data. TDES\_MR.TDES is used to select either the single DES or the Triple DES mode.

Encryption (enciphering) converts data to an unintelligible form called ciphertext. Decrypting (deciphering) the ciphertext converts the data back into its original form, called plaintext. TDES\_MR.CIPHER is used to choose between encryption and decryption.

A DES is capable of using cryptographic keys of 64 bits to encrypt and decrypt data in blocks of 64 bits. This 64-bit key is defined in the Key 1 registers (TDES\_KEY1WRx or Private Key internal registers, only writable from the Private Key bus).

A TDES key consists of three DES keys, which is also referred to as a key bundle. These three 64-bit keys are defined, respectively, in the Key 1, 2 and 3 Registers (TDES\_KEY1WRy, TDES\_KEY2WRy and TDES\_KEY3WRy or the Private Key internal registers). In Triple DES mode (TDESMOD = 1 in TDES\_MR), TDES\_MR.KEYMOD is used to choose between a two- and a three-key algorithm, as summarized in the table below.

**Table 54.1.** TDES Algorithms Summary

Algorithm	Mode	Data Processing Sequence Steps		
		First	Second	Third
Three-key	Encryption	Encryption with Key 1	Decryption with Key 2	Encryption with Key 3
	Decryption	Decryption with Key 3	Encryption with Key 2	Decryption with Key 1
Two-key	Encryption	Encryption with Key 1	Decryption with Key 2	Encryption with Key 1
	Decryption	Decryption with Key 1	Encryption with Key 2	Decryption with Key 1

The input to the encryption processes of the CBC, CFB, and OFB modes includes, in addition to the plaintext, a 64-bit data block called the initialization vector (IV), which must be set in TDES\_IVRx. The initialization vector is used in an initial step in the encryption of a message and in the corresponding decryption of the message.

The XTEA algorithm can be used instead of DES/TDES by configuring TDES\_MR.TDESMOD with the appropriate value 0x2. An XTEA key consists of a 128-bit key. They are defined in the Key 1 and 2 Registers.

The number of rounds of XTEA is defined in TDES\_XTEA\_RNDR and can be programmed up to 64 (1 round = 2 Feistel network rounds).

All the start and operating modes of the TDES algorithm can be applied to the XTEA algorithm.

### 54.4.1. Operating Modes

The TDES supports the following operating modes:

- ECB—Electronic Code Book
- CBC—Cipher Block Chaining
- OFB—Output Feedback
- CFB—Cipher Feedback
  - CFB8 (CFB where the length of the data segment is 8 bits)
  - CFB16 (CFB where the length of the data segment is 16 bits)
  - CFB32 (CFB where the length of the data segment is 32 bits)
  - CFB64 (CFB where the length of the data segment is 64 bits)

The data pre-processing, post-processing and data chaining for each mode are automatically performed. Refer to the FIPS Publication 81 for more complete information.

These modes are selected by setting TDES\_MR.OPMOD.

In CFB mode, four data sizes are possible (8, 16, 32 and 64 bits), configurable in TDES\_MR.CFBS (see [TDES Mode Register](#)).

### 54.4.2. Temporary Secured Storage for Keys

The TDES provides secure storage for two sets of three 64-bit keys. The storage is available while VDDCORE voltage is supplied.

The keys can be only written in TDES internal registers and are not readable. Moreover, the internal registers holding the keys are buried in the overall product logic area during the physical implementation.

One set of keys can be loaded by software by writing the Key Word registers (TDES\_KEYxWRy).

One key can be loaded by Private Key bus only.

**Figure 54.1.** Temporary Secured Storage for Keys

### 54.4.3. Start Modes

TDES\_MR.SMODO selects the Encryption (or Decryption) start mode.

#### 54.4.3.1. Manual Mode

The sequence is as follows:

1. Write TDES\_MR with all required fields, including but not limited to SMODO and OPMODO.
2. Write the 64-bit key(s) in TDES\_KEYxWRy or the Private Key internal register, depending on whether one, two or three keys are required.

3. Write the initialization vector (or counter) in TDES\_IVRx.  
**Note:** TDES\_IVRx concern all modes except ECB.
4. Set DATRDY (Data Ready) in the TDES Interrupt Enable register (TDES\_IER), depending on whether an interrupt is required or not at the end of processing.
5. Write the data to be encrypted/decrypted in the authorized TDES\_IDATARx (see the table below).  
**Note:** In 32-, 16- and 8-bit CFB modes, writing to TDES\_IDATAR1 is not allowed and may lead to processing errors.
6. Set the START bit in the TDES Control Register (TDES\_CR) to begin the encryption or decryption process.
7. When the processing completes, DATRDY in the TDES Interrupt Status register (TDES\_ISR) rises. If an interrupt has been enabled by setting TDES\_IER.DATRDY, the interrupt line of the TDES is activated.
8. When the software reads a TDES\_ODATARx, TDES\_IER.DATRDY is automatically cleared.

**Table 54.2.** Authorized Input Data Registers

Operating Mode	Input Data Registers to Write
ECB	All
CBC	All
OFB	All
CFB 64-bit	All
CFB 32-bit	TDES_IDATAR0
CFB 16-bit	TDES_IDATAR0
CFB 8-bit	TDES_IDATAR0

#### 54.4.3.2.Auto Mode

The Auto Mode is similar to the Manual Mode, except that as soon as the correct number of TDES\_IDATARx is written, processing is automatically started without any action in TDES\_CR.

#### 54.4.3.3.DMA Mode

The DMA Controller can be used in association with the TDES to perform an encryption/decryption of a buffer without any action by the software during processing.

TDES\_MR.SMOD must be set to 2 and the DMA must be configured with non-incremental addresses.

For all operating modes except CBC-MAC (TDES\_MR.LOD=1), 2 DMA channels must be programmed (transmit and receive). In CBC-MAC, only 1 transmit channel must be programmed.

The start address of any transfer descriptor must be set in TDES\_IDATAR0.

The DMA chunk size configuration depends on the TDES mode of operation and is listed in the table below.

When writing data to TDES with the first DMA channel, data will be fetched from a memory buffer (source data). It is recommended to configure the size of source data to “words” even for CFB modes. On the contrary, the destination data size depends on the mode of operation. When reading data from the TDES with the second DMA channel, the source data is the data read from TDES and data destination is the memory buffer. In this case, source data size depends on the TDES mode of operation and is listed in the table below.

**Table 54.3.** DMA Data Transfer Type for the Different Operating Modes

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
ECB	1	Word
CBC	1	Word
OFB	1	Word

.....continued

Operating Mode	Chunk Size	Destination/Source Data Transfer Type
CFB 64-bit	1	Word
CFB 32-bit	1	Word
CFB 16-bit	1	Half-word
CFB 8-bit	1	Byte

#### 54.4.4. Last Output Data Mode (CBC-MAC)

This mode is used to generate cryptographic checksums on data (MAC) using a CBC-MAC or a CFB encryption algorithm (refer to *FIPS Publication 81 Appendix F*).

The CMAC algorithm is a variant of CBC-MAC with post-processing requiring one-block encryption in ECB mode. Thus CBC-MAC is useful to accelerate CMAC.

After each end of encryption/decryption, the output data is available either on the output data registers for Manual and Auto modes or at the address specified in the receive buffer pointer for DMA mode (see [Table 54.4](#)).

TDES\_MR.LOD can be used to retrieve only the last data of several encryption/decryption processes.

This data is only available in TDES\_ODATARx.

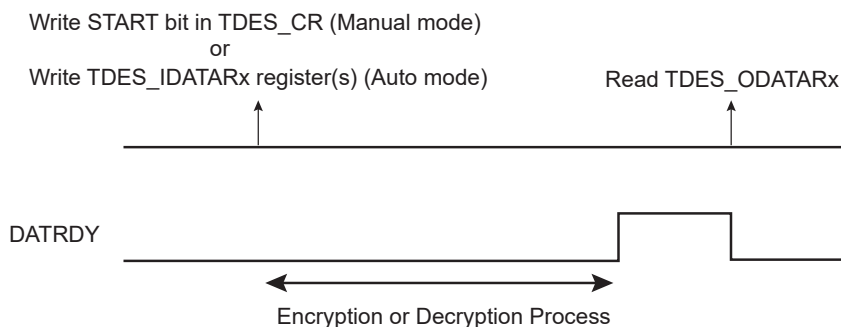

Therefore, there is no need to define a read buffer in DMA mode.

#### 54.4.4.1. Manual and Auto Modes

##### 54.4.4.1.1. TDES\_MR.LOD = 0

The DATRDY flag is cleared when at least one TDES\_ODATARx is read. See the figure below.

**Figure 54.2.** Manual and Auto Modes with LOD = 0

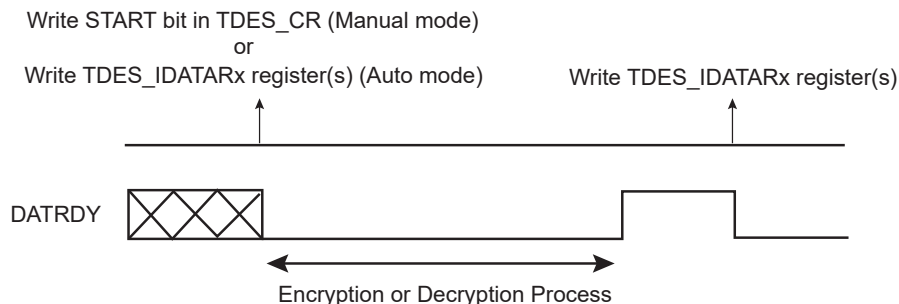

If the user does not want to read TDES\_ODATARx between each encryption/decryption, the DATRDY flag will not be cleared. If the DATRDY flag is not cleared, the user will not be informed of the end of the encryptions/decryptions that follow.

##### 54.4.4.1.2. TDES\_MR.LOD = 1

The DATRDY flag is cleared when at least one TDES\_IDATARx is written, before the start of a new transfer. See the figure below. No further TDES\_ODATARx reads are necessary between consecutive encryptions/decryptions.

**Figure 54.3.** Manual and Auto Modes with LOD = 1

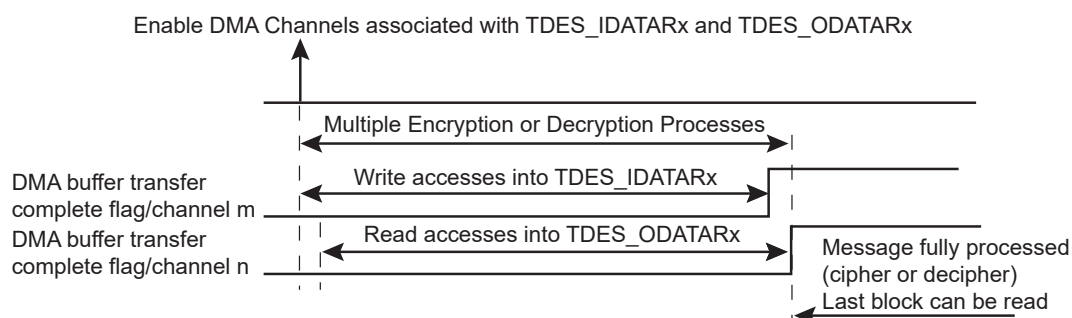

#### 54.4.4.2.DMA Mode

##### 54.4.4.2.1.TDES\_MR.LOD = 0

This mode may be used for all TDES operating modes except CBC-MAC where LOD = 1 mode is recommended.

The end of the encryption/decryption is indicated by the end of DMA transfer associated to TDES\_ODATARx (see the figure below). Two DMA channels are required: one for writing message blocks to TDES\_IDATARx and one to obtain the result from TDES\_ODATARx.

**Figure 54.4.** DMA Transfer with LOD = 0

##### 54.4.4.2.2.TDES\_MR.LOD = 1

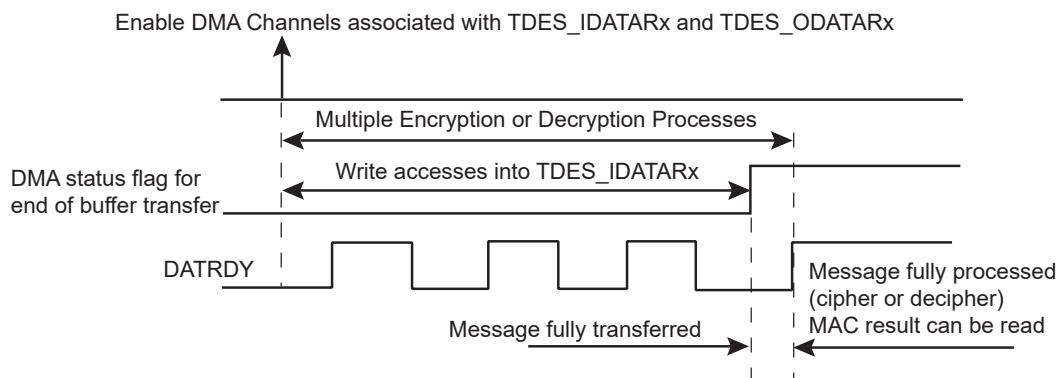

This mode is optimized to process the TDES CBC-MAC operating mode.

The user must first wait for the DMA buffer transfer complete flag, then for the flag DATRDY to rise to ensure that the encryption/decryption is completed (see the figure below).

The DMA receive channel must not be used. Prior to reading the CBC-MAC result, TDES\_MR.SMOD must be written to 0. To restart a CBC-MAC on a new buffer, TDES\_MR.SMOD must be written to 2.

The output data is only available on TDES\_ODATARx.

**Figure 54.5.** DMA Transfer with LOD = 1

The table below summarizes the different cases.

**Table 54.4.** Last Output Data Mode Behavior versus Start Modes

Sequence	Manual and Auto Modes		DMA Transfer	
	LOD = 0	LOD = 1	LOD = 0	LOD = 1
DATRDY Flag Clearing Condition <sup>(1)</sup>	At least one TDES_ODATARx must be read	At least one TDES_IDATARx must be written	Not used	Managed by the DMA
End of Encryption/Decryption	DATRDY	DATRDY	2 DMA buffer transfer complete flags (channel m and channel n)	DMA buffer transfer complete flag, then TDES DATRDY flag
Encrypted/Decrypted Data Result Location	In TDES_ODATARx	In TDES_ODATARx	Not available	In TDES_ODATARx

**Note:** Depending on the mode, there are other ways of clearing the DATRDY flag. See [TDES Interrupt Status Register](#).

**WARNING** In DMA mode, reading to TDES\_ODATARx before the last data transfer may lead to unpredictable results.

## 54.4.5. Security Features

### 54.4.5.1. Private Key Bus

The TDES provides secure key transfer that requires a transfer command only, thus avoiding any manipulation of the key by software.

The TDES features a set of Private Key internal registers that can be accessed only through the dedicated Private Key bus from the TRNG.

The Private Key internal registers cannot be read from any peripheral or from software.

The TDES key used by the encryption/decryption engine is either the Private Key internal registers content or the internal key registers loaded via the TDES\_KEYxWRy.

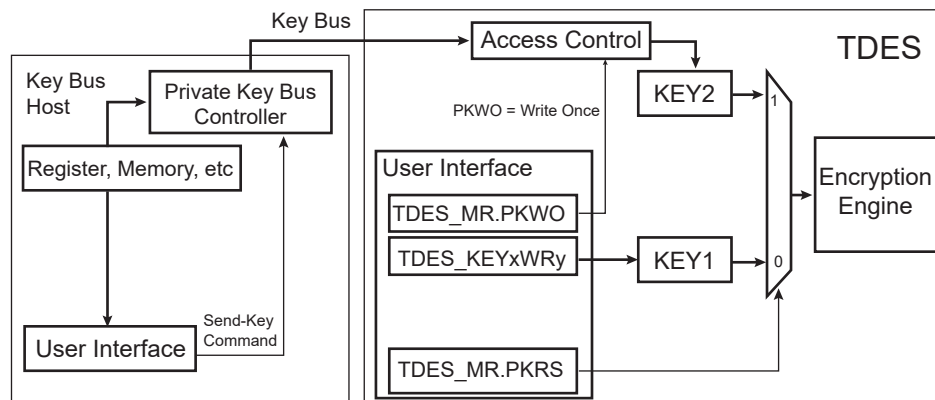

To select the Private Key internal registers as the source of the TDES key, TDES\_MR.PKRS must be written to '1'.

To write the Private Key internal registers, the software must:

1. Write a '1' in TDES\_MR.PKRS.

2. Trigger the key transfer over the Private Key bus from the KEY\_BUS\_MASTERS key bus host.
3. Wait for completion of the transfer signaled in the KEY\_BUS\_MASTERS status register.
4. Check for any access violation in TDES\_WPSR.PKRPVS.

**Figure 54.6.** Key Selection

While TDES\_MR.PKWO=0, it is possible to write the Private Key internal registers as many times as required.

As soon as the bit TDES\_MR.PKWO=1, the next write sequence on Private Key internal registers is the last one. Any additional write sequence in the Private Key internal registers has no effect, thus providing write-protection of these registers. A hardware reset is the only way to exit from the write-protected state.

#### 54.4.5.2. Unspecified Register Access Detection

When an unspecified register access occurs, TDES\_ISR.URAD is set. Its source is then reported in TDES\_ISR.URAT. Only the last unspecified register access is available through TDES\_ISR.URAT.

Several kinds of unspecified register accesses can occur:

- TDES\_IDATARx written during the data processing in DMA mode
- TDES\_ODATARx read during the data processing
- TDES\_MR written during the data processing
- Write-only register read access

URAD and URAT can only be reset by TDES\_CR.SWRST.

#### 54.4.5.3. Clearing Key on Tamper Event

On a tamper detection event on WKUP[8:1] pins, an immediate clear of the key (internal registers) can be performed if TDES\_MR.TAMPCLR=1. For configuration details, refer to section Real-Time Clock (RTC).

#### 54.4.5.4. Register Write Protection

To prevent any single software error from corrupting TDES behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the [TDES Write Protection Mode Register](#) (TDES\_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the [TDES Write Protection Status Register](#) (TDES\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS flag is automatically cleared by reading TDES\_WPSR.

The following register can be write-protected when WPEN is set:

- [TDES Mode Register](#)
- [TDES Key 1 Word Register x](#)
- [TDES Key 2 Word Register x](#)
- [TDES Key 3 Word Register x](#)
- [TDES Initialization Vector Register x](#)
- [TDES XTEA Rounds Register](#)

The following registers can be write-protected when WPITEN is set:

- [TDES Interrupt Enable Register](#)
- [TDES Interrupt Disable Register](#)

The following register can be write-protected when WPCREN is set:

- [TDES Control Register](#)

#### 54.4.5.5. Security and Safety Analysis and Reports

Several types of checks are performed when the TDES is enabled.

The peripheral clock of the TDES is monitored by specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the TDES. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag TDES\_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the TDES is also monitored and if an abnormal state is detected, the flag TDES\_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the TDES are monitored and if an incorrect access is performed, the flag TDES\_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the TDES\_WPSR.SWETYP field (see [TDES Write Protection Status Register](#) for details). For example, writing the TDES\_ODATARx is an error, as well as reading the TDES\_IDATARx, when the TDES\_ISR.DATRDY flag is cleared. TDES\_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when TDES\_WPSR is read.

If one of these flags is set, the flag TDES\_ISR.SECE is set and can trigger an interrupt if the TDES\_IMR.SECE bit is '1'. SECE is cleared by reading TDES\_ISR.

It is possible to configure an action to be performed by the TDES as soon as an abnormal event detection occurs. If the field TDES\_WPMR.ACTION is greater than 0, either a lock is performed or a lock and immediate clear of TDES\_KEYxWRY. If a lock is performed, the current processing is ended normally but any new processing is not performed regardless of the start mode of operation (see TDES\_MR.SMOD).

A locked state of the TDES is unlocked as follows:

1. Read the TDES\_WPSR.
2. Disable the source of tamper if the tamper is enabled to perform a clear of the key.
3. Write a '1' to TDES\_CR.UNLOCK.

It is possible to select the type of event that will lock the TDES in case of abnormal event detection. See TDES\_WPMR.ACTION for details.

If the TDES\_MR.TMPCLR=1 and the tamper pin is active, the TDES is locked.

## 54.5. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	TDES_CR	31:24								UNLOCK
		23:16								
		15:8								SWRST
		7:0								START

### 54.5.1. TDES Control Register

**Name:** TDES\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [TDES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
								UNLOCK
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								SWRST
Access								W
Reset								–

Bit	7	6	5	4	3	2	1	0
								START
Access								W
Reset								–

#### Bit 24 – UNLOCK Unlock Processing

Value	Description
0	No effect.
1	Unlocks the processing in case of abnormal event detection if TDES_WPMR.ACTION > 0.

#### Bit 8 – SWRST Software Reset

Value	Description
0	No effect
1	Resets the TDES. A software-triggered reset of the TDES interface is performed.

#### Bit 0 – START Start Processing

Value	Description
0	No effect
1	Starts Manual encryption/decryption process.

## 54.5.2. TDES Mode Register

**Name:** TDES\_MR  
**Offset:** 0x04  
**Reset:** 0x00000002  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TDES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TAMPCLR							
Access	R/W							
Reset	0							
Bit	23	22	21	20	19	18	17	16
							CFBS[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
	LOD		OPMOD[1:0]				SMOD[1:0]	
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0
Bit	7	6	5	4	3	2	1	0
	PKRS	PKWO		KEYMOD		TDESMOD[1:0]		CIPHER
Access	R/W	R/W		R/W		R/W	R/W	R/W
Reset	0	0		0		0	1	0

### Bit 31 – TAMPCLR Tamper Pin Clear Key Enable

Value	Description
0	A tamper detection event has no effect on TDES_KEYxWRy.
1	A tamper detection event immediately clears TDES_KEYxWRy.

### Bits 17:16 – CFBS[1:0] Cipher Feedback Data Size

Value	Name	Description
0	SIZE_64BIT	64 bits
1	SIZE_32BIT	32 bits
2	SIZE_16BIT	16 bits
3	SIZE_8BIT	8 bits

### Bit 15 – LOD Last Output Data Mode

**WARNING** In DMA mode, reading to TDES\_ODATARx before the last data encryption/decryption process may lead to unpredictable result.

Value	Description
0	No effect.  After each end of encryption/decryption, the output data is available either on TDES_ODATARx (Manual and Auto modes) .  In Manual and Auto modes, the DATRDY flag is cleared when at least one of the TDES_ODATARx is read.
1	The DATRDY flag is cleared when at least one of the Input Data Registers is written.  No further TDES_ODATARx reads are necessary between consecutive encryptions/decryptions (see <a href="#">Last Output Data Mode</a> ).

### Bits 13:12 – OPMOD[1:0] Operating Mode

For CBC-MAC operating mode, set OPMOD to CBC and LOD to 1.

Value	Name	Description
0	ECB	Electronic Code Book mode
1	CBC	Cipher Block Chaining mode
2	OFB	Output Feedback mode
3	CFB	Cipher Feedback mode

### Bits 9:8 – SMOD[1:0] Start Mode

If a DMA transfer is used, 0x2 must be configured. See [DMA Mode](#) for more details.

Value	Name	Description
0	MANUAL_START	Manual mode
1	AUTO_START	Auto mode
2	IDATAR0_START	TDES_IDATAR0 accesses only Auto mode

### Bit 7 – PKRS Private Key Internal Register Select

Value	Description
0	The keys used by the TDES are in the TDES_KEY1WRx, TDES_KEY2WRx and TDES_KEY3WRx registers.
1	The keys used by the TDES are the in the Private Key internal registers written through the Private Key bus.

### Bit 6 – PKWO Private Key Write Once

Once PKWO is set to '1', only a hardware reset sets this bit to '0' internally. Writing it to '0' with a register access has no impact (although the field will be read to value '0').

Value	Description
0	The Private Key internal register can be written multiple times through the Private Key bus.
1	The Private Key internal register can be written only once through the Private Key bus until hardware reset.

### Bit 4 – KEYMOD Key Mode

Value	Description
0	Three-key algorithm is selected.
1	Two-key algorithm is selected. There is no need to write TDES_KEY3WRy (or Private Pey internal registers with more than 128 bits).

### Bits 2:1 – TDESMOD[1:0] ALGORITHM Mode

Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	SINGLE_DES	Single DES processing using TDES_KEY1WRy.
1	TRIPLE_DES	Triple DES processing using TDES_KEY1WRy, TDES_KEY2WRy and TDES_KEY3WRy .
2	XTEA	XTEA processing using TDES_KEY1WRy and TDES_KEY2WRy.

### Bit 0 – CIPHER Processing Mode

Value	Name	Description
0	DECRYPT	Decrypts data.
1	ENCRYPT	Encrypts data.

### 54.5.3. TDES Interrupt Enable Register

**Name:** TDES\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TDES Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
								SECE
Access								W
Reset								–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 16 – SECE** Security and/or Safety Event Interrupt Enable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

#### 54.5.4. TDES Interrupt Disable Register

**Name:** TDES\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TDES Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
								SECE
Access								W
Reset								–
Bit	15	14	13	12	11	10	9	8
								URAD
Access								W
Reset								–
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								W
Reset								–

**Bit 16 – SECE** Security and/or Safety Event Interrupt Disable

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 54.5.5. TDES Interrupt Mask Register

**Name:** TDES\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
								SECE
Access								R
Reset								0
Bit	15	14	13	12	11	10	9	8
								URAD
Access								R
Reset								0
Bit	7	6	5	4	3	2	1	0
								DATRDY
Access								R
Reset								0

**Bit 16 – SECE** Security and/or Safety Event Interrupt Mask

**Bit 8 – URAD** Unspecified Register Access Detection Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

## 54.5.6. TDES Interrupt Status Register

**Name:** TDES\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								SECE
Reset								R 0
Bit	15	14	13	12	11	10	9	8
Access			URAT[1:0]					URAD
Reset			R 0	R 0				R 0
Bit	7	6	5	4	3	2	1	0
Access								DATRDY
Reset								R 0

### Bit 16 – SECE Security and/or Safety Event Interrupt Mask

Value	Description
0	There is no security report in TDES_WPSR.
1	One security flag is set in TDES_WPSR.

### Bits 13:12 – URAT[1:0] Unspecified Register Access (cleared by setting bit TDES\_CR.SWRST) Only the last Unspecified Register Access Type is available through the URAT field.

Value	Name	Description
0	IDR_WR_PROCESSING	TDES_IDATAR written during data processing when SMOD = 0x2 mode.
1	ODR_RD_PROCESSING	TDES_ODATAR read during data processing.
2	MR_WR_PROCESSING	TDES_MR written during data processing.
3	WOR_RD_ACCESS	Write-only register read access.

### Bit 8 – URAD Unspecified Register Access Detection Status (cleared by setting TDES\_CR.SWRST)

Value	Description
0	No unspecified register access has been detected since the last write of TDES_CR.SWRST.
1	At least one unspecified register access has been detected since the last write of TDES_CR.SWRST.

### Bit 0 – DATRDY Data Ready (cleared by setting TDES\_CR.START or TDES\_CR.SWRST, or by reading TDES\_ODATARx)

If TDES\_MR.LOD = 1: In Manual and Auto modes, the DATRDY flag can also be cleared by writing at least one TDES\_IDATARx.

Value	Description
0	Output data is not valid.

Value	Description
1	Encryption or decryption process is completed.

### 54.5.7. TDES Key 1 Word Register y

**Name:** TDES\_KEY1WRy  
**Offset:** 0x20 + y\*0x04 [y=0..1]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [TDES Write Protection Mode Register](#).

Immediately cleared on tamper detection event if TDES\_MR.TAMPCLR=1.

Bit	31	30	29	28	27	26	25	24
	KEY1W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY1W[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	KEY1W[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEY1W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – KEY1W[31:0] Key 1 Word

The two 32-bit Key 1 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

TDES\_KEY1WR0.KEY1W refers to the first word of the key and TDES\_KEY1WR1.KEY1W to the last one.

These registers are write-only to prevent the key from being read by another application.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 LSB bits of the encryption/decryption key.

TDES\_KEY1WRy registers are not used if the Private Key internal register is selected instead by writing a 1 to TDES\_MR.PKRS.

### 54.5.8. TDES Key 2 Word Register y

**Name:** TDES\_KEY2WRy  
**Offset:** 0x28 + y\*0x04 [y=0..1]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [TDES Write Protection Mode Register](#).

Immediately cleared on tamper detection event if TDES\_MR.TAMPCLR=1.

Bit	31	30	29	28	27	26	25	24
	KEY2W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY2W[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	KEY2W[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEY2W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – KEY2W[31:0] Key 2 Word

The two 32-bit Key 2 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

TDES\_KEY2WR0.KEY2W refers to the first word of the key and TDES\_KEY2W1.KEY2W to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES\_KEY2WRx registers are not used in DES mode.

In XTEA mode, the key is defined on 128 bits. These registers contain the 64 MSB bits of the encryption/decryption key.

TDES\_KEY2WRy registers are not used if the Private Key internal register is selected instead by writing a 1 to TDES\_MR.PKRS.

### 54.5.9. TDES Key 3 Word Register y

**Name:** TDES\_KEY3WRy  
**Offset:** 0x30 + y\*0x04 [y=0..1]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [TDES Write Protection Mode Register](#).

Immediately cleared on tamper detection event if TDES\_MR.TAMPCLR=1.

Bit	31	30	29	28	27	26	25	24
	KEY3W[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	KEY3W[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	KEY3W[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	KEY3W[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – KEY3W[31:0] Key 3 Word

The two 32-bit Key 3 Word registers are used to set the 64-bit cryptographic key used for encryption/decryption.

TDES\_KEY3WR0.KEY3W refers to the first word of the key and TDES\_KEY3WR1.KEY3W to the last one.

These registers are write-only to prevent the key from being read by another application.

TDES\_KEY3WRx registers are not used in DES mode, TDES with two-key algorithm selected and XTEA mode.

TDES\_KEY3WRy registers are not used if the Private Key internal register is selected by writing a 1 to TDES\_MR.PKRS.

### 54.5.10. TDES Input Data Register x

**Name:** TDES\_IDATARx  
**Offset:** 0x40 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	IDATA[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	IDATA[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	IDATA[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	IDATA[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – IDATA[31:0] Input Data

The two 32-bit TDES\_IDATARx are used to set the 64-bit data block used for encryption/decryption. TDES\_IDATAR0.IDATA refers to the first word of the data to be encrypted/decrypted, and TDES\_IDATAR1.IDATA to the last one. These registers are write-only to prevent the input data from being read by another application.

### 54.5.11. TDES Output Data Register x

**Name:** TDES\_ODATARx  
**Offset:** 0x50 + x\*0x04 [x=0..1]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ODATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8

#### Bits 31:0 – ODATA[31:0] Output Data

The two 32-bit TDES\_ODATARx contain the 64-bit data block which has been encrypted/decrypted. TDES\_ODATAR0.ODATA refers to the first word, TDES\_ODATAR1.ODATA to the last one.

## 54.5.12. TDES Initialization Vector Register x

**Name:** TDES\_IVRx  
**Offset:** 0x60 + x\*0x04 [x=0..1]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [TDES Write Protection Mode Register](#).

These registers are write-only to prevent the Initialization Vector from being read by another application.

These registers are not used for the ECB mode and must not be written.

Bit	31	30	29	28	27	26	25	24
	IV[31:24]							
Access	W	W	W	W	W	W	W	W

Reset	–	–	–	–	–	–	–	–

### Bits 31:0 – IV[31:0] Initialization Vector

The two 32-bit TDES\_IVRx are used to set the 64-bit initialization vector data block, which is used by some modes of operation as an additional initial input.

TDES\_IVR1.IV refers to the first word of the Initialization Vector, TDES\_IVR2.IV to the last one.

### 54.5.13. TDES XTEA Rounds Register

**Name:** TDES\_XTEA\_RNDR  
**Offset:** 0x70  
**Reset:** 0x000000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TDES Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

			XTEA_RNDS[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bits 5:0 – XTEA\_RNDS[5:0] Number of Rounds

This 6-bit field is used to define the number of complete rounds (1 complete round = 2 Feistel rounds) processed in XTEA algorithm.

The value of XTEA\_RNDS has no effect if TDES\_MR.TDESMOD is set to 0x0 or 0x1.

0x00 corresponds to 1 complete round, 0x01 corresponds to 2 complete rounds, etc.

## 54.5.14. TDES Write Protection Mode Register

**Name:** TDES\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

See [Register Write Protection](#) for the list of registers that can be write-protected.

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W

Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

## Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x444553	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

## Bits 7:5 – ACTION[2:0] Action on Abnormal Event Detection

Value	Name	Description
0	REPORT_ONLY	No action (stop or clear key) is performed when one of PKRPVS, WPVS, CGD, SEQE, or SWE flags are set.
1	LOCK_PKRPVS_WPVS_SWE	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/SWE event detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued.
2	LOCK_CGD_SEQE	If a processing is in progress when the TDES_WPSR.CGD/SEQE event detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued.
3	LOCK_ANY_EV	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued.
4	CLEAR_PKRPVS_WPVS_SWE	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/SWE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued. Moreover, TDES_KEYxWRy are immediately cleared.
5	CLEAR_CGD_SEQE	If a processing is in progress when the TDES_WPSR.CGD/SEQE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued. Moreover, TDES_KEYxWRy are immediately cleared.

Value	Name	Description
6	CLEAR_ANY_EV	If a processing is in progress when the TDES_WPSR.PKRPVS/WPVS/CGD/SEQE/SWE events detection occurs, the current processing is ended normally but no other processing is started while a TDES_CR.UNLOCK command is issued.  Moreover, TDES_KEYxWRy are immediately cleared.

#### Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in TDES_WPSR.WPVSRC and the last software control error type is reported in TDES_WPSR.SWETYP. The TDES_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in TDES_WPSR.WPVSRC and only the first software control error type is reported in TDES_WPSR.SWETYP. The TDES_ISR.SECE flag is set at the first error occurrence within a series.

#### Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x444553 (“DES” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x444553 (“DES” in ASCII).

#### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x444553 (“DES” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x444553 (“DES” in ASCII).

#### Bit 0 – WPEN Write Protection Enable

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x444553 (“DES” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x444553 (“DES” in ASCII).

**54.5.15. TDES Write Protection Status Register**

**Name:** TDES\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				PKRPVS	SWE	SEQE	CGD	WPVS
Access				R	R	R	R	R
Reset				0	0	0	0	0

**Bit 31 – ECLASS** Software Error Class (cleared on read)

Value	Name	Description
0	WARNING	An abnormal access that does not affect system functionality.
1	ERROR	An access is performed into key, input data, control registers while the TDES is performing an encryption/decryption or a start is request by software or DMA while the key is not fully configured.

**Bits 27:24 – SWETYP[3:0]** Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	A write-only register has been read (Warning).
1	WRITE_RO	TDES is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address (Warning).
3	CTRL_START	Abnormal use of TDES_CR.START command when DMA access is configured.
4	WEIRD_ACTION	A key write, init value write, output data read, Mode register write, Private Key bus access or XTEA round register has been performed while a current processing is in progress (abnormal).
5	INCOMPLETE_KEY	A tentative of start is required while the keys are not fully loaded into TDES_KEYxWRy.

**Bits 23:8 – WPVSR[15:0]** Write Protection Violation Source (cleared on read)

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

When WPVS=0 and SWE=1, WPVSR reports the address of the incorrect software access. As soon as WPVS=1, WPVSR returns the address of the write-protected violation.

**Bit 4 – PKRPVS** Private Key Register Protection Violation Status (cleared on read)

Value	Description
0	No Private Key internal register access violation has occurred since the last read of TDES_WPSR.
1	A Private Key internal register access violation has occurred since the last read of TDES_WPSR.

**Bit 3 – SWE** Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of TDES_WPSR.
1	A software error has occurred since the last read of TDES_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of TDES_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of TDES_WPSR. This flag is set under abnormal operating conditions.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring circuitry has not been corrupted since the last read of TDES_WPSR. Under normal operating conditions, this bit is always cleared.
1	The clock monitoring circuitry has been corrupted since the last read of TDES_WPSR. This flag is set in case of abnormal clock signal waveform (glitch).

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of TDES_WPSR.
1	A write protection violation has occurred since the last read of TDES_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 55. Random Number Generator (TRNG)

### 55.1. Description

The Random Number Generator (TRNG) passes the American *NIST Special Publication 800-22 (A Statistical Test Suite for Random and Pseudorandom Number Generators for Cryptographic Applications)* and the *Diehard Suite of Tests*.

The TRNG may be used as an entropy source for seeding an NIST approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3.

The TRNG is fully designed with digital cells, and under the specified operating conditions, external factors such as temperature, humidity, etc. affect TRNG ageing in the same manner as all other digital peripherals (CPU core, bus matrix, etc.) of the product.

### 55.2. Embedded Characteristics

- Passes *NIST Special Publication 800-22 Test Suite*
- Passes *Diehard Suite of Tests*
- Usable as Entropy Source for Seeding a NIST-approved DRNG (Deterministic RNG) as required by FIPS PUB 140-2 and 140-3
- Provides a 32-bit Random Number at Maximum 84 Clock Cycles
- Functional Safety Monitors and Reports:
  - Monitoring of internal sequencer abnormal states
  - Abnormal software access reports
  - Register write protection
- Private Key Bus Interface to Transfer Cryptographic Keys Not Readable From Any Peripheral Nor From Software

### 55.3. Block Diagram

Figure 55.1. TRNG Block Diagram

## 55.4. Product Dependencies

### 55.4.1. Power Management

The TRNG interface may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the TRNG user interface clock. The user interface clock is independent from any clock that may be used in the entropy source logic circuitry. The source of entropy can be enabled before enabling the user interface clock.

### 55.4.2. Interrupt Sources

The TRNG interface has an interrupt line connected to the Interrupt Controller. In order to handle interrupts, the Interrupt Controller must be programmed before configuring the TRNG.

## 55.5. Functional Description

As soon as the TRNG is enabled in the Control register (TRNG\_CR), the generator provides one 32-bit random value at a maximum streaming rate of 84 clock cycles. Entropy rate increases at a lower frequency. It is possible to divide by 2 the streaming rate by configuring the Mode register (TRNG\_MR) to achieve better entropy if the streaming rate does not require new data every 84 clock cycles. For a lower streaming rate, the software intervention is required to skip, on a regular basis, the data ready information reported in the Status register (TRNG\_ISR).

A sequence of random values can be generated by the TRNG and a random value can be directly loaded through the private key bus into specific private key internal registers of the private key bus clients (for example, AES or other encryption unit). There is no possibility of reading these keys from the processor and software from system bus. This is done by writing the Private Key Bus Control register (TRNG\_PKBCR) with the appropriate destination (KSLAVE) and length of the key to be generated (KLENGTH).

This random value transferred through the private key bus cannot be used for encrypted communications with remote equipment, but is useful while the system remains in Active mode to reinforce the security of data processed by the application running on the system and stored temporarily in external memories. The cryptography keys are never known to application software, thus they cannot be exchanged or provided to the external world in any case.

**Note:** Putting the system into Backup mode causes the key stored in the encryption engine to be lost. Local encryption and decryption of data can still be performed by using a key unknown to the software if the key is stored in a non-volatile area, for example in the OTP memory. The TRNG can transfer a random value to the non-volatile memory of the system to store the key for further decryption. When the key is required for decryption, it can be transferred by the private key bus from the OTP memory to the encryption module.

By writing a '1' to the HALFR bit in the Mode register (TRNG\_MR), the random values are provided every 168 cycles instead of every 84 cycles. HALFR must be written to '1' when the TRNG peripheral clock frequency is above 100 MHz.

The TRNG interrupt line can be enabled in the Interrupt Enable register (TRNG\_IER), and disabled in the Interrupt Disable register (TRNG\_IDR). This interrupt is set when a new random value is available or when a transfer over the private key bus is complete and is cleared when the Status register (TRNG\_ISR) is read. The flag TRNG\_ISR.DATRDY is set when the random data is ready to be read out on the 32-bit Output Data register (TRNG\_ODATA). The flag TRNG\_ISR.EOTPKB is set when the transfer through the private key bus is complete.

### Normal Operating Mode

The normal operating mode checks that the TRNG\_ISR.DATRDY flag equals '1' before reading TRNG\_ODATA when a 32-bit random value is required by the software application.

**Figure 55.2.** TRNG Data Generation Sequence

### Key Bus Operating Mode

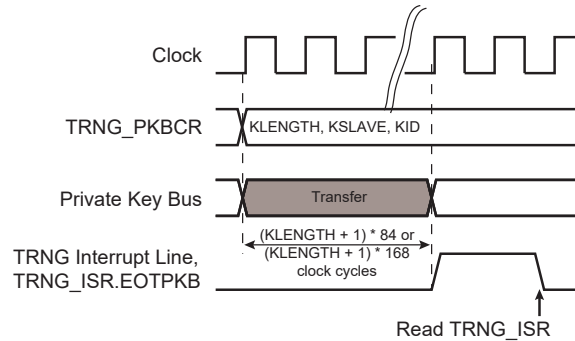

After a write to KSLAVE and KLENGTH in TRNG\_PKBCR, the software:

- waits for the end of transfer of the key indicated by the TRNG\_ISR.EOTPKB flag being read at '1', optionally after a TRNG interrupt,
- checks for any key bus access violation in the selected private key bus destination client status register,
- uses the private key bus destination client or launches any other private key bus transfer.

**Figure 55.3.** TRNG Private Key Bus

**Figure 55.4.** TRNG Private Key Bus Transfer

#### 55.5.1. First Value Read after Power-up

After a power-up and the first configuration to enable the TRNG, the first data can be read as soon as the flag DATRDY is set in the Interrupt Status register (TRNG\_ISR). However, randomness (entropy) of a sequence of first value read after a power-up sequence is correct only if the TRNG has been enabled for a significant period of time.

When the first value after power-up is a key factor for the application, it is recommended to wait for 5 ms before reading the first value and after the power-up followed by the initial enable of the TRNG.

#### 55.5.2. Entropy

The TRNG provides a new random data at a maximum rate of peripheral clock divided by 84. However, entropy increases as the reading rate decreases.

#### 55.5.3. Register Write Protection

To prevent any single software error from corrupting TRNG behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the [TRNG Write Protection Mode Register](#) (TRNG\_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the [TRNG Write Protection Status Register](#) (TRNG\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS flag is automatically cleared by reading TRNG\_WPSR.

The following register can be write-protected when WPEN is set:

- [TRNG\\_MR](#)

The following registers can be write-protected when WPITEN is set:

- [TRNG\\_IER](#)
- [TRNG\\_IDR](#)

The following registers can be write-protected when WPCREN is set:

- [TRNG\\_CR](#)
- [TRNG\\_PKBCR](#)

#### 55.5.4. Security and Functional Analysis and Reports

Several type of checks are performed when the TRNG is enabled.

The peripheral clock of the TRNG is monitored by specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the TRNG. Corruption on the triggering edge of

the clock or a pulse with a minimum duration may be identified. If the flag TRNG\_WPSR.CGD is set, an abnormal condition occurred on the peripheral clock. This flag is not set under normal operating conditions.

The internal sequencer of the TRNG is also monitored and if an abnormal state is detected, the flag TRNG\_WPSR.SEQE is set. This flag is not set under normal operating conditions.

The software accesses to the TRNG are monitored and if an incorrect access is performed, the flag TRNG\_WPSR.SWE is set. The type of incorrect/abnormal software access is reported in the TRNG\_WPSR.SWETYP field (see [TRNG Write Protection Status Register](#) for details). For example, reading the TRNG\_ODATA when the TRNG is disabled is an error, as well as reading the TRNG\_ODATA, when the TRNG\_ISR.DATRDY flag is cleared. TRNG\_WPSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE and WPVS are automatically cleared when TRNG\_WPSR is read.

If one of these flags is set, the flag TRNG\_ISR.SECE is set and can trigger an interrupt if the TRNG\_IMR.SECE bit is '1'. SECE is cleared by reading TRNG\_ISR.

## 55.6. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	TRNG_CR	31:24	WAKEY[23:16]

### 55.6.1. TRNG Control Register

**Name:** TRNG\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TRNG Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	WAKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	WAKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	WAKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
								ENABLE
Access								W
Reset								–

#### Bits 31:8 – WAKEY[23:0] Register Write Access Key

Value	Name	Description
0x524E47	PASSWD	Writing any other value in this field aborts the write operation.

#### Bit 0 – ENABLE Enable TRNG to Provide Random Values

Value	Description
0	Disables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.
1	Enables the TRNG if 0x524E47 (“RNG” in ASCII) is written in WAKEY field at the same time.

## 55.6.2. TRNG Mode Register

**Name:** TRNG\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TRNG Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								HALFR
Access								R/W
Reset								0

### Bit 0 – HALFR Half Rate Enable

Value	Name	Description
0	DISABLED	Maximum stream rate provided (1 sample every 84 MCK clock cycles).
1	ENABLED	Half maximum stream rate provided if the peripheral clock frequency is above 100 MHz (1 sample every 168 MCK clock cycles).

### 55.6.3. TRNG Private Key Bus Control Register

**Name:** TRNG\_PKBCR  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TRNG Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	WAKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	WAKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	KLENGTH[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
			KSLAVE[1:0]				KID	
Access			W	W				W
Reset			–	–				–

#### Bits 31:16 – WAKEY[15:0] Register Write Access Key

Value	Name	Description
0x524B	PASSWD	Writing any other value in this field aborts the write operation.

#### Bits 15:8 – KLENGTH[7:0] Key Length

Length-1 in 32-bit words of the key(s) to be directly loaded from the TRNG into the private key internal registers of the private key bus client KSLAVE.

Example: for one 64-bit key to be loaded, KLENGTH must be written to 1. For 128-bit keys, KLENGTH must be written to 3.

#### Bits 5:4 – KSLAVE[1:0] Key Bus Client

Private key bus client identifier for the destination encryption unit to be loaded from the TRNG.

Value	Name	Description
0	TDES_ID	TDES
1	AES_ID	AES
2	OTPC_ID	OTPC
3	Reserved_ID	Reserved

#### Bit 0 – KID Key ID (Must always be written to 0)

#### 55.6.4. TRNG Interrupt Enable Register

**Name:** TRNG\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TRNG Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						EOTPKB	SECE	DATRDY
Access						W	W	W
Reset						–	–	–

**Bit 2 – EOTPKB** End Of Transfer on Private Key Bus Interrupt Enable

**Bit 1 – SECE** Security and/or Safety Event Interrupt Enable

**Bit 0 – DATRDY** Data Ready Interrupt Enable

### 55.6.5. TRNG Interrupt Disable Register

**Name:** TRNG\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TRNG Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						EOTPKB	SECE	DATRDY
Access						W	W	W
Reset						–	–	–

**Bit 2 – EOTPKB** End Of Transfer on Private Key Bus Interrupt Disable

**Bit 1 – SECE** Security and/or Safety Event Interrupt Disable

**Bit 0 – DATRDY** Data Ready Interrupt Disable

### 55.6.6. TRNG Interrupt Mask Register

**Name:** TRNG\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						EOTPKB	SECE	DATRDY
Access						R	R	R
Reset						0	0	0

**Bit 2 – EOTPKB** End Of Transfer on Private Key Bus Interrupt Mask

**Bit 1 – SECE** Security and/or Safety Event Interrupt Mask

**Bit 0 – DATRDY** Data Ready Interrupt Mask

### 55.6.7. TRNG Interrupt Status Register

**Name:** TRNG\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						EOTPKB	SECE	DATRDY
Access						R	R	R
Reset						0	0	0

#### Bit 2 – EOTPKB End Of Transfer on Private Key Bus (cleared on read)

Value	Description
0	No private key bus transfer has ended since the last read of the Interrupt Status Register.
1	The private key bus transfer has ended.

#### Bit 1 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	No safety or security event occurred since the last read of the Interrupt Status Register.
1	One or more safety or security event occurred since the last read of TRNG_ISR. For details on the event, see <a href="#">TRNG Write Protection Status Register</a> .

#### Bit 0 – DATRDY Data Ready (cleared on read)

Value	Description
0	Output data is not valid or TRNG is disabled.
1	New random value has been completed since the last read of TRNG_ISR.

## 55.6.8. TRNG Output Data Register

**Name:** TRNG\_ODATA  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ODATA[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ODATA[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ODATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ODATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – ODATA[31:0] Output Data

The 32-bit Output Data register contains the 32-bit random data.

## 55.6.9. TRNG Write Protection Mode Register

**Name:** TRNG\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				FIRSTE		WPCREN	WPITEN	WPEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x524E47	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

### Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in TRNG_WPSR.WPVSRC and the last software control error type is reported in TRNG_WPSR.SWETYP. The TRNG_ISR.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in TRNG_WPSR.WPVSRC and only the first software control error type is reported in TRNG_WPSR.SWETYP. The TRNG_ISR.SECE flag is set at the first error occurrence within a series.

### Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x524E47 ("RNG" in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x524E47 ("RNG" in ASCII).

### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x524E47 ("RNG" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x524E47 ("RNG" in ASCII).

**Bit 0 – WPEN** Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x524E47 (“RNG” in ASCII).

## 55.6.10. TRNG Write Protection Status Register

**Name:** TRNG\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS					SWETYP[3:0]		
Access	R				R	R	R	R
Reset	0				0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

### Bit 31 – ECLASS Software Error Class (cleared on read)

Value	Name	Description
0	WARNING	An abnormal access that does not affect system functionality.
1	ERROR	Reading TRNG_ODATA when TRNG is disabled or used for private key bus transfer does not provide a random value. Writing to the PKB_CTRL register while a private key bus transfer is ongoing does not launch a new private key bus transfer.

### Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	TRNG is enabled and a write-only register has been read (Warning).
1	WRITE_RO	TRNG is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address.
3	TRNG_DIS	The TRNG_ODATA register has been read when TRNG is disabled or used for private key bus transfer (Error).
4	PKB_BUSY	A write access to the PKB_CTRL register has been attempted during a private key bus transfer (Error).
5	LOCK_ERR	A write access to TRNG_WPMR has been attempted when one of the write protection bits is already locked, its corresponding lock control bit is set and the corresponding write protection bit is cleared, which looks like an unlock tentative (Warning).

### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source (cleared on read)

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

When WPVS=0 and SWE=1, WPVSR reports the address of the incorrect software access. As soon as WPVS=1, WPVSR returns the address of the write-protected violation.

**Bit 3 – SWE** Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of TRNG_WPSR.
1	A software error has occurred since the last read of TRNG_WPSR. The field SWETYP details the type of software error; the associated incorrect software access is reported in the field WPVSR (if WPVS=0).

**Bit 2 – SEQE** Internal Sequencer Error (cleared on read)

Value	Description
0	No peripheral internal sequencer error has occurred since the last read of TRNG_WPSR.
1	A peripheral internal sequencer error has occurred since the last read of TRNG_WPSR. This flag is set under abnormal operating conditions.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	No clock glitch has occurred since the last read of TRNG_WPSR. Under normal operating conditions, this bit is always cleared.
1	A clock glitch has occurred since the last read of TRNG_WPSR. This flag is set in case of abnormal clock signal waveform (glitch).

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of TRNG_WPSR.
1	A write protection violation has occurred since the last read of TRNG_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

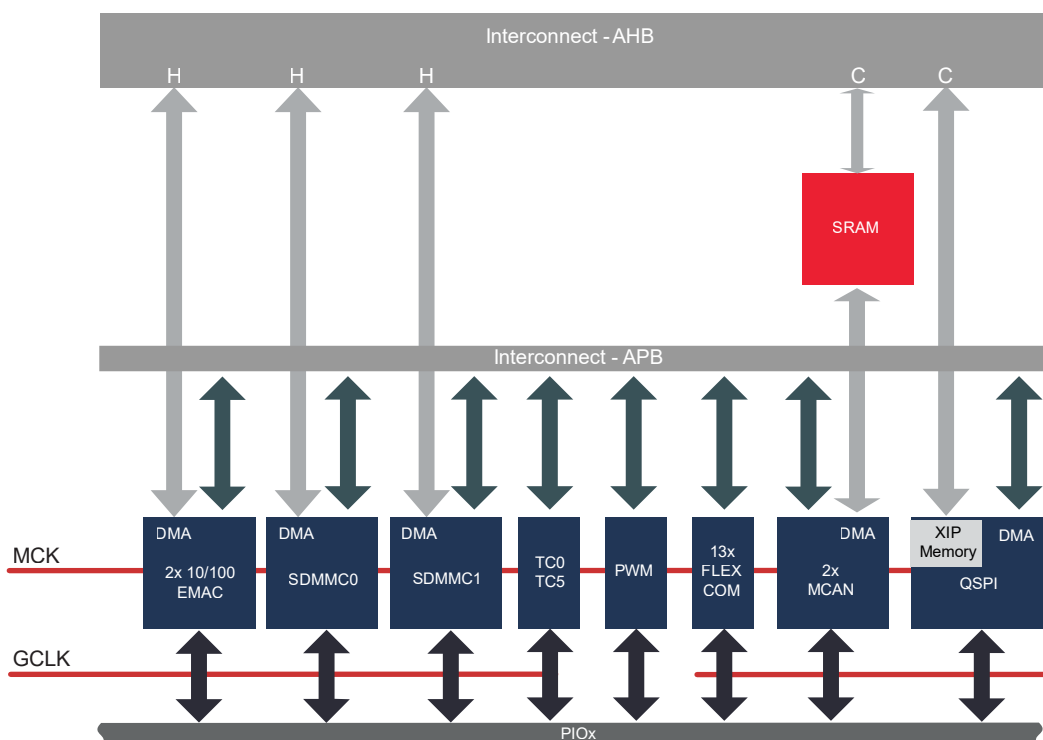

# Connectivity Subsystem

## 56. Overview

### 56.1. Block Diagram

Figure 56.1. Connectivity Subsystem Block Diagram

### 56.2. Components

- 2x 10/100 Ethernet MAC (EMAC)
- 2x Secure Digital MultiMedia Card Controller (SDMMC0, 1)
- 6x Timer Counter
- Pulse Width Modulation Controller (PWM)
- 13x Flexible Serial Communication Controller (FLEXCOM)
- 2x Controller Area Network (MCAN)
- 1x Quad Serial Peripheral Interface (QSPI)

### 56.3. FLEXCOM Features

Table 56.1. FLEXCOM Features

Functions and Features	FLEXCOM Instance

## 56.4. Product Dependencies

### 56.4.1. Clocks

All the components of this subsystem have their clocks controlled by the PMC, which is part of the system controller.

All connectivity peripherals, except the PWM and the QSPI controllers, have a GLCK input to generate fixed baud rates, independent from the CPU frequency.

#### 56.4.1.1.QSPI

The QSPI peripheral is fed with the peripheral clock and the QSPI 2x clock. The first one is enabled/disabled as any peripheral clock in the PMC\_PCR register, and the second one is controlled by QSPICLK bits in the PMC\_SCER and PMC\_SCDR registers.

### 56.4.2. Interrupts

Refer to the table [Peripheral Identifiers](#).

### 56.4.3. Reset

Connectivity peripherals are connected to the processor and peripherals reset line.

### 56.4.4. I/Os

I/Os are multiplexed on PIOs.

For the applicable I/O type (General Purpose (GPIO) or DDR (DDRIO)) and power supply, refer to the [Pin Description](#) table. I/O drive and slew rate configuration differ depending on the I/O type. Refer to I/O characteristics in the section [Electrical Characteristics](#).

#### 56.4.4.1.EMAC

- EMAC0 supports MII & RMII; EMAC1 supports RMII only.

- The media interface is configured using the EMAC\_USRIO.RMII bit.

#### 56.4.4.2.QSPI I/Os

QSPI\_IO2 and QSPI\_IO3 have dual functions and are used as HOLD and WP in Dual and Serial I/O modes. As Quad mode is not the default mode, they need to be pulled up until Quad mode is enabled in the Configuration register. Pull-up resistors are not required for QSPI\_IO0 and QSPI\_IO1.

#### 56.5. Special Functions in SFR

None.

## 57. Ethernet MAC 10/100 (EMAC)

### 57.1. Description

The EMAC module implements a 10/100 Ethernet MAC compatible with the IEEE 802.3 standard using an address checker, statistics and control registers, receive and transmit blocks, and a DMA interface.

The address checker recognizes four specific 48-bit addresses and contains a 64-bit hash register for matching multicast and unicast addresses. It can recognize the broadcast address of all ones, copy all frames, and act on an external address match signal.

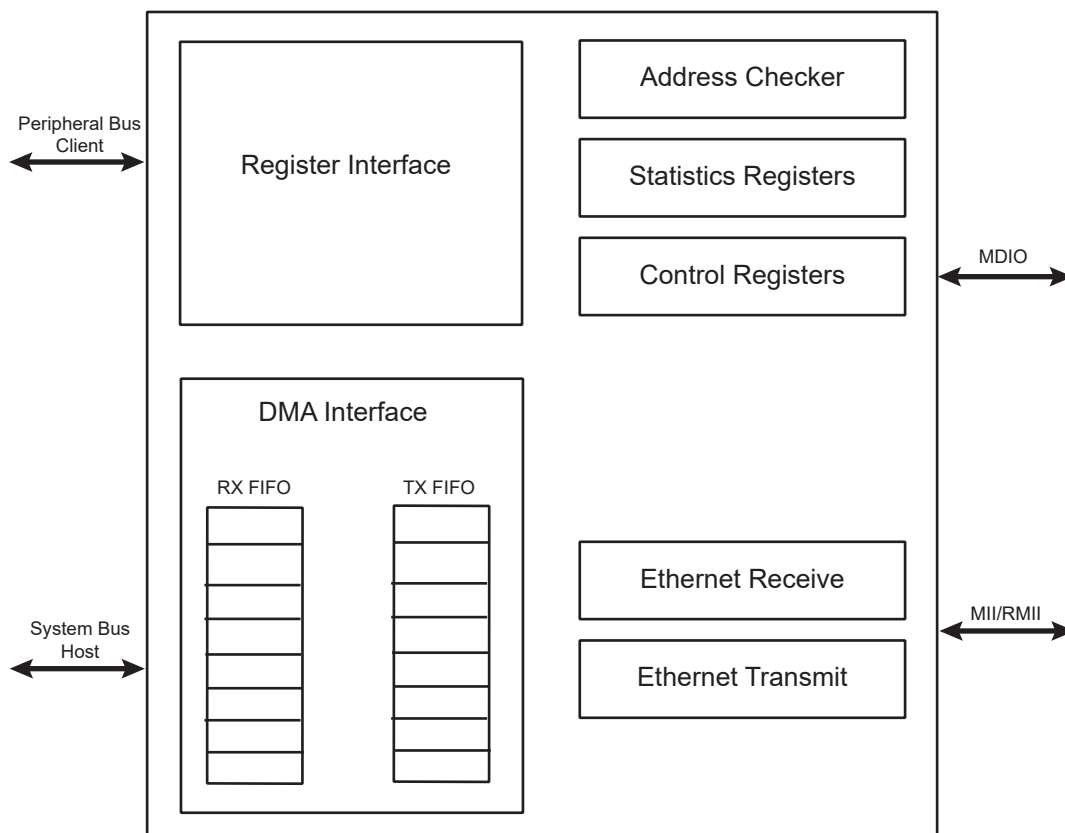

The statistics register block contains registers for counting various types of event associated with transmit and receive operations. These registers, along with the status words stored in the receive buffer list, enable software to generate network management statistics compatible with IEEE 802.3.

### 57.2. Embedded Characteristics

- EMAC0 supports MII and RMII Interfaces to the Physical Layer (EMAC1 supports RMII only)
- Compatible with IEEE Standard 802.3
- 10 and 100 Mbit/s Operation
- Full- and Half-duplex Operation
- Statistics Counter Registers
- Interrupt Generation to Signal Receive and Transmit Completion
- DMA Host on Receive and Transmit Channels
- Transmit and Receive FIFOs
- Automatic Pad and CRC Generation on Transmitted Frames
- Automatic Discard of Frames Received with Errors
- Address Checking Logic Supports Up to Four Specific 48-bit Addresses
- Supports Promiscuous Mode Where All Valid Received Frames are Copied to Memory
- Hash Matching of Unicast and Multicast Destination Addresses
- Physical Layer Management through MDIO Interface
- Half-duplex Flow Control by Forcing Collisions on Incoming Frames
- Full-duplex Flow Control with Recognition of Incoming Pause Frames
- Support for 802.1Q VLAN Tagging with Recognition of Incoming VLAN and Priority Tagged Frames
- Multiple Buffers per Receive and Transmit Frame
- Wake-on-LAN Support
- Jumbo Frames Up to 10240 bytes Supported

## 57.3. Block Diagram

Figure 57.1. EMAC Block Diagram

## 57.4. Functional Description

The EMAC has several clock domains:

- System bus clock: DMA and register blocks
- Transmit clock: transmit block
- Receive clock: receive and address checker block

The system bus clock must run at least as fast as the receive clock and transmit clock (25 MHz at 100 Mbit/s, and 2.5 MHz at 10 Mbit/s).

The above block diagram illustrates the different blocks of the EMAC module.

The control registers drive the MDIO interface, setup up DMA activity, start frame transmission and select modes of operation such as full- or half-duplex.

The receive block checks for valid preamble, FCS, alignment and length, and presents received frames to the address checking block and DMA interface.

The transmit block takes data from the DMA interface, adds preamble and, if necessary, pad and FCS, and transmits data according to the CSMA/CD (carrier sense multiple access with collision detect) protocol. The start of transmission is deferred if CRS (carrier sense) is active.

If COL (collision) becomes active during transmission, a jam sequence is asserted and the transmission is retried after a random back off. CRS and COL have no effect in full duplex mode.

The DMA block connects to the external memory through its system bus host interface. It contains receive and transmit FIFOs for buffering frame data. It loads the transmit FIFO and empties the

receive FIFO using system bus host operations. Receive data is not sent to memory until the address checking logic has determined that the frame should be copied. Receive or transmit frames are stored in one or more buffers. Receive buffers have a fixed length of 128 bytes. Transmit buffers range in length between 0 and 2047 bytes, and up to 128 buffers are permitted per frame. The DMA block manages the transmit and receive frame buffer queues. These queues can hold multiple frames.

#### 57.4.1. Clock

Synchronization module in the EMAC requires that the bus clock (MCK) runs at the speed of the `macb_tx/rx_clk` at least, which is 25 MHz at 100 Mbit/s, and 2.5 MHz at 10 Mbit/s.

#### 57.4.2. Memory Interface

Frame data is transferred to and from the EMAC through the DMA interface. All transfers are 32-bit words and may be single accesses or bursts of 2, 3 or 4 words. Burst accesses do not cross sixteen-byte boundaries. Bursts of four words are the default data transfer; single accesses or bursts of less than four words may be used to transfer data at the beginning or the end of a buffer.

The DMA controller performs six types of operation on the bus. In order of priority, these are:

1. Receive buffer manager write
2. Receive buffer manager read
3. Transmit data DMA read
4. Receive data DMA write
5. Transmit buffer manager read
6. Transmit buffer manager write

##### 57.4.2.1.FIFO

The FIFO depths are 128 bytes for receive and 128 bytes for transmit and are a function of the system clock speed, memory latency and network speed.

Data is typically transferred into and out of the FIFOs in bursts of four words. For receive, a bus request is asserted when the FIFO contains four words and has space for 28 more. For transmit, a bus request is generated when there is space for four words, or when there is space for 27 words if the next transfer is to be only one or two words.

Thus the bus latency must be less than the time it takes to load the FIFO and transmit or receive three words (112 bytes) of data.

At 100 Mbit/s, it takes 8960 ns to transmit or receive 112 bytes of data. In addition, six main system bus clock cycles should be allowed for data to be loaded from the bus and to propagate through the FIFOs. For a 133 MHz main system bus clock this takes 45 ns, making the bus latency requirement 8915 ns.

##### 57.4.2.2.Receive Buffers

Received frames, including CRC/FCS optionally, are written to receive buffers stored in memory. Each receive buffer is 128 bytes long. The start location for each receive buffer is stored in memory in a list of receive buffer descriptors at a location pointed to by the Receive Buffer Queue Pointer Register (EMAC\_RBQP). The receive buffer start location is a word address. For the first buffer of a frame, the start location can be offset by up to three bytes depending on the value written to bits 14 and 15 of the Network Configuration Register (EMAC\_NCFGR). If the start location of the buffer is offset the available length of the first buffer of a frame is reduced by the corresponding number of bytes.

Each list entry consists of two words, the first being the address of the receive buffer and the second being the receive status. If the length of a receive frame exceeds the buffer length, the status word for the used buffer is written with zeroes except for the 'Start of Frame' bit and the offset bits, if appropriate. Bit 0 of the address field is written to one to show the buffer has been used. The

receive buffer manager then reads the location of the next receive buffer and fills that with receive frame data. The final buffer descriptor status word contains the complete frame status. Refer to the table below for details of the receive buffer descriptor list.

**Table 57.1.** Receive Buffer Descriptor Entry

Bit	Function
Word 0	
31:2	Address of beginning of buffer
1	Wrap - marks last descriptor in receive buffer descriptor list.
0	Ownership - needs to be zero for the EMAC to write data to the receive buffer. The EMAC sets this to one once it has successfully written a frame to memory. Software has to clear this bit before the buffer can be used again.
Word 1	
31	Global all ones broadcast address detected
30	Multicast hash match
29	Unicast hash match
28	External address match
27	Reserved for future use
26	Specific address register 1 match
25	Specific address register 2 match
24	Specific address register 3 match
23	Specific address register 4 match
22	Type ID match
21	VLAN tag detected (i.e., type ID of 0x8100)
20	Priority tag detected (i.e., type ID of 0x8100 and null VLAN identifier)
19:17	VLAN priority (only valid if bit 21 is set)
16	Concatenation format indicator (CFI) bit (only valid if bit 21 is set)
15	End of frame - when set the buffer contains the end of a frame. If end of frame is not set, then the only other valid status are bits 12, 13 and 14.
14	Start of frame - when set the buffer contains the start of a frame. If both bits 15 and 14 are set, then the buffer contains a whole frame.
13:12	Receive buffer offset - indicates the number of bytes by which the data in the first buffer is offset from the word address. Updated with the current values of the EMAC_NCFGR. If jumbo frame mode is enabled through bit 3 of the EMAC_NCFGR, then bits 13:12 of the receive buffer descriptor entry are used to indicate bits 13:12 of the frame length.
11:0	Length of frame including FCS (if selected). Bits 13:12 are also used if jumbo frame mode is selected.

To receive frames, the buffer descriptors must be initialized by writing an appropriate address to bits 31 to 2 in the first word of each list entry. Bit zero must be written with zero. Bit 1 is the wrap bit and indicates the last entry in the list.

The start location of the receive buffer descriptor list must be written to the EMAC\_RBQP register before setting the 'Receive Enable' bit in the Network Control Register (EMAC\_NCR) to enable receive. As soon as the receive block starts writing received frame data to the receive FIFO, the receive buffer manager reads the first receive buffer location pointed to by the EMAC\_RBQP register.

If the filter block then indicates that the frame should be copied to memory, the receive data DMA operation starts writing data into the receive buffer. If an error occurs, the buffer is recovered. If the current buffer pointer has its wrap bit set or is the 1024th descriptor, the next receive buffer location is read from the beginning of the receive descriptor list. Otherwise, the next receive buffer location is read from the next word in memory.

There is an 11-bit counter to count out the 2048 word locations of a maximum length, receive buffer descriptor list. This is added with the value originally written to the EMAC\_RBQP register to

produce a pointer into the list. A read of the EMAC\_RBQP register returns the pointer value, which is the queue entry currently being accessed. The counter is reset after receive status is written to a descriptor that has its wrap bit set or rolls over to zero after 1024 descriptors have been accessed. The value written to the EMAC\_RBQP register may be any word-aligned address, provided that there are at least 2048 word locations available between the pointer and the top of the memory.

Section 3.6 of the AMBA 2.0 specification states that bursts should not cross 1K boundaries. As receive buffer manager writes are bursts of two words, to ensure that this does not occur, it is best to write the EMAC\_RBQP register with the least three significant bits set to zero. As receive buffers are used, the receive buffer manager sets bit 0 of the first word of the descriptor to indicate used. If a receive error is detected the receive buffer currently being written is recovered. Previous buffers are not recovered. Software should search through the used bits in the buffer descriptors to find out how many frames have been received. It should be checking the 'Start of Frame' and 'End of Frame' bits, and not rely on the value returned by the EMAC\_RBQP register which changes continuously as more buffers are used.

For CRC errored frames, excessive length frames or length field mismatched frames, all of which are counted in the statistics registers, it is possible that a frame fragment might be stored in a sequence of receive buffers. Software can detect this by looking for 'Start of Frame' bit set in a buffer following a buffer with no 'End of Frame' bit set.

For a properly working Ethernet system, there should be no excessively long frames or frames greater than 128 bytes with CRC/FCS errors. Collision fragments are less than 128 bytes long. Therefore, it is a rare occurrence to find a frame fragment in a receive buffer.

If bit 0 is set when the receive buffer manager reads the location of the receive buffer, then the buffer has already been used and cannot be used again until software has processed the frame and cleared bit 0. In this case, the DMA block sets the 'Buffer Not Available' bit in the Receive Status Register (EMAC\_RSR) and triggers an interrupt.

If bit 0 is set when the receive buffer manager reads the location of the receive buffer and a frame is being received, the frame is discarded and the Receive Resource Errors Register (EMAC\_RRE) is incremented.

A receive overrun condition occurs when bus was not granted in time or because HRESP was not OK (bus error). In a receive overrun condition, the receive overrun interrupt is asserted and the buffer currently being written is recovered. The next frame received with an address that is recognized reuses the buffer.

If bit 17 of the EMAC\_NCFGR is set, the FCS of received frames shall not be copied to memory. The frame length indicated in the receive status field shall be reduced by four bytes in this case.

### 57.4.2.3. Transmit Buffer

Frames to be transmitted are stored in one or more transmit buffers. Transmit buffers can be between 0 and 2047 bytes long, so it is possible to transmit frames longer than the maximum length specified in IEEE Standard 802.3. Zero length buffers are allowed. The maximum number of buffers permitted for each transmit frame is 128.

The start location for each transmit buffer is stored in memory in a list of transmit buffer descriptors at a location pointed to by the Transmit Buffer Queue Pointer Register (EMAC\_TBQP). Each list entry consists of two words, the first being the byte address of the transmit buffer and the second containing the transmit control and status. Frames can be transmitted with or without automatic CRC generation. If CRC is automatically generated, pad is also automatically generated to take frames to a minimum length of 64 bytes. The table below defines an entry in the transmit buffer descriptor list. To transmit frames, the buffer descriptors must be initialized by writing an appropriate byte address to bits 31 to 0 in the first word of each list entry. The second transmit buffer descriptor is initialized with control information that indicates the length of the buffer, whether or not it is to be transmitted with CRC and whether the buffer is the last buffer in the frame.

After transmission, the control bits are written back to the second word of the first buffer along with the 'used' bit and other status information. Bit 31 is the 'used' bit which must be zero when the control word is read if transmission is to happen. It is written to one when a frame has been transmitted. Bits 27, 28 and 29 indicate various transmit error conditions. Bit 30 is the 'wrap' bit which can be set for any buffer within a frame. If no wrap bit is encountered after 1024 descriptors, the queue pointer rolls over to the start in a similar fashion to the receive queue.

The EMAC\_TBQP register must not be written while transmit is active. If a new value is written to the EMAC\_TBQP register, the queue pointer resets itself to point to the beginning of the new queue. If transmit is disabled by writing to bit 3 of the EMAC\_NCR, the EMAC\_TBQP register resets to point to the beginning of the transmit queue. Note that disabling receive does not have the same effect on the receive queue pointer.

Once the transmit queue is initialized, transmit is activated by writing to bit 9, the 'Start Transmission' bit of the EMAC\_NCR. Transmit is halted when a buffer descriptor with its 'used' bit set is read, or if a transmit error occurs, or by writing to the 'Transmit Halt' bit of the EMAC\_NCR. (Transmission is suspended if a pause frame is received while the 'Pause Enable' bit is set in the EMAC\_NCFGR.) Rewriting the start bit while transmission is active is allowed.

Transmission control is implemented with a Tx\_go variable which is readable in the Transmit Status Register (EMAC\_TSR) at bit location 3. The Tx\_go variable is reset when:

- transmit is disabled
- a buffer descriptor with its ownership bit set is read
- a new value is written to the EMAC\_TBQP register
- bit 10, tx\_halt, of the EMAC\_NCR is written
- there is a transmit error such as too many retries or a transmit underrun.

To set tx\_go, write to bit 9, tx\_start, of the EMAC\_NCR. Transmit halt does not take effect until any ongoing transmit finishes. If a collision occurs during transmission of a multi-buffer frame, transmission automatically restarts from the first buffer of the frame. If a 'used' bit is read midway through transmission of a multi-buffer frame, this is treated as a transmit error. Transmission stops, tx\_er is asserted and the FCS is bad.

If transmission stops due to a transmit error, the transmit queue pointer resets to point to the beginning of the transmit queue. Software needs to re-initialize the transmit queue after a transmit error.

If transmission stops due to a 'used' bit being read at the start of the frame, the transmission queue pointer is not reset and transmission starts from the same transmit buffer descriptor when the 'Start Transmission' bit is written.

**Table 57.2.** Transmit Buffer Descriptor Entry

Bit	Function
Word 0	
31:0	Byte Address of buffer
Word 1	
31	Used. Needs to be zero for the EMAC to read data from the transmit buffer. The EMAC sets this to one for the first buffer of a frame once it has been successfully transmitted. Software has to clear this bit before the buffer can be used again. <b>Note:</b> This bit is only set for the first buffer in a frame unlike receive where all buffers have the Used bit set once used.
30	Wrap. Marks last descriptor in transmit buffer descriptor list.
29	Retry limit exceeded, transmit error detected
28	Transmit underrun, occurs either when hresp is not OK (bus error) or the transmit data could not be fetched in time or when buffers are exhausted in mid-frame.

.....continued

Bit	Function
27	Buffers exhausted in mid-frame
26:17	Reserved
16	No CRC. When set, no CRC is appended to the current frame. This bit only needs to be set for the last buffer of a frame.
15	Last buffer. When set, this bit indicates the last buffer in the current frame has been reached.
14:11	Reserved
10:0	Length of buffer

### 57.4.3. Transmit Block

This block transmits frames in accordance with the Ethernet IEEE 802.3 CSMA/CD protocol. Frame assembly starts by adding preamble and the start frame delimiter. Data is taken from the transmit FIFO a word at a time. Data is transmitted least significant nibble first. If necessary, padding is added to increase the frame length to 60 bytes. CRC is calculated as a 32-bit polynomial. This is inverted and appended to the end of the frame, taking the frame length to a minimum of 64 bytes. If the No CRC bit is set in the second word of the last buffer descriptor of a transmit frame, neither pad nor CRC are appended.

In full-duplex mode, frames are transmitted immediately. Back-to-back frames are transmitted at least 96 bit times apart to guarantee the interframe gap.

In half-duplex mode, the transmitter checks carrier sense. If asserted, it waits for it to de-assert and then starts transmission after the interframe gap of 96 bit times. If the collision signal is asserted during transmission, the transmitter transmits a jam sequence of 32 bits taken from the data register and then retry transmission after the back off time has elapsed.

The back-off time is based on an XOR of the 10 least significant bits of the data coming from the transmit FIFO and a 10-bit pseudo random number generator. The number of bits used depends on the number of collisions seen. After the first collision, one bit is used, after the second collision, two bits are used, and so on up to 10. Above 10, all 10 bits are used. An error is indicated and no further attempts are made if 16 attempts cause collisions.

If transmit DMA underruns, bad CRC is automatically appended using the same mechanism as jam insertion and the tx\_er signal is asserted. For a properly configured system, this should never happen.

If the 'Back Pressure' bit is set in the EMAC\_NCR in half duplex mode, the transmit block transmits 64 bits of data, which can consist of 16 nibbles of 1011 or in bit-rate mode 64 ones, whenever it sees an incoming frame to force a collision. This provides a way of implementing flow control in half-duplex mode.

### 57.4.4. Pause Frame Support

The following table summarizes the start of an 802.3 pause frame.

**Table 57.3.** Start of an 802.3 Pause Frame

Destination Address	Source Address	Type (MAC Control Frame)	Pause Opcode	Pause Time
0x0180C2000001	6 bytes	0x8808	0x0001	2 bytes

The EMAC\_NCFGR contains a receive 'Pause Enable' bit (13). If a valid pause frame is received, the Pause Time Register (EMAC\_PTR) is updated with the frame's pause time, regardless of its current contents and regardless of the state of the EMAC\_NCFGR bit 13. An interrupt (12) is triggered when a pause frame is received, assuming it is enabled in the Interrupt Mask Register (EMAC\_IMR). If bit 13 is set in the EMAC\_NCFGR and the value of the EMAC\_PTR is non-zero, no new frame is transmitted until the EMAC\_PTR has decremented to zero.

The loading of a new pause time, and hence the pausing of transmission, only occurs when the EMAC is configured for full-duplex operation. If the EMAC is configured for half-duplex, there is no transmission pause, but the pause frame received interrupt is still triggered.

A valid pause frame is defined as having a destination address that matches either the address stored in specific address register 1 or matches 0x0180C2000001 and has the MAC control frame type ID of 0x8808 and the pause opcode of 0x0001. Pause frames that have FCS or other errors are treated as invalid and are discarded. Valid pause frames received increment the Pause Frames Received Register (EMAC\_PFR).

The EMAC\_PTR decrements every 512 bit times (i.e., 128 rx\_clks in nibble mode) once transmission has stopped. For test purposes, the register decrements every rx\_clk cycle once transmission has stopped if bit 12 ('Retry Test') is set in the EMAC\_NCFGR. If the 'Pause Enable' bit (13) is not set in the EMAC\_NCFGR, then the decrementing occurs regardless of whether transmission has stopped or not.

An interrupt (13) is asserted whenever the EMAC\_PTR decrements to zero (assuming it is enabled in the EMAC\_IMR).

#### 57.4.5. Receive Block

The receive block checks for valid preamble, FCS, alignment and length, presents received frames to the DMA block and stores the frames destination address for use by the address checking block. If, during frame reception, the frame is found to be too long or rx\_er is asserted, a bad frame indication is sent to the DMA block. The DMA block then ceases sending data to memory. At the end of frame reception, the receive block indicates to the DMA block whether the frame is good or bad. The DMA block recovers the current receive buffer if the frame was bad. The receive block signals the register block to increment the alignment error, the CRC (FCS) error, the short frame, long frame, jabber error, the receive symbol error statistics and the length field mismatch statistics.

The enable bit for jumbo frames in the EMAC\_NCFGR allows the EMAC to receive jumbo frames of up to 10240 bytes in size. This operation does not form part of the IEEE802.3 specification and is disabled by default. When jumbo frames are enabled, frames received with a frame size greater than 10240 bytes are discarded.

#### 57.4.6. Address Checking Block

The address checking (or filter) block indicates to the DMA block which receive frames should be copied to memory. Whether a frame is copied depends on what is enabled in the EMAC\_NCFGR, the state of the external match pin, the contents of the specific address and hash registers and the frame's destination address. In this implementation of the EMAC, the frame's source address is not checked. Provided that bit 18 of the EMAC\_NCFGR is not set, a frame is not copied to memory if the EMAC is transmitting in half duplex mode at the time a destination address is received. If bit 18 of the EMAC\_NCFGR is set, frames can be received while transmitting in half-duplex mode.

Ethernet frames are transmitted a byte at a time, least significant bit first. The first six bytes (48 bits) of an Ethernet frame make up the destination address. The first bit of the destination address, the LSB of the first byte of the frame, is the group/individual bit: this is One for multicast addresses and Zero for unicast. The All Ones address is the broadcast address, and a special case of multicast.

The EMAC supports recognition of four specific addresses. Each specific address requires two registers, specific address register bottom and specific address register top. Specific address register bottom stores the first four bytes of the destination address and specific address register top contains the last two bytes. The addresses stored can be specific, group, local or universal.

The destination address of received frames is compared against the data stored in the specific address registers once they have been activated. The addresses are deactivated at reset or when their corresponding specific address register bottom is written. They are activated when specific address register top is written. If a receive frame address matches an active address, the frame is copied to memory.

The following example illustrates the use of the address match registers for a MAC address of 21:43:65:87:A9:CB.

Preamble 55

SFD D5

DA (Octet0 - LSB) 21

DA (Octet 1) 43

DA (Octet 2) 65

DA (Octet 3) 87

DA (Octet 4) A9

DA (Octet5 - MSB) CB

SA (LSB) 00

SA 00

SA 00

SA 00

SA 00

SA (MSB) 43

SA (LSB) 21

The sequence above shows the beginning of an Ethernet frame. Byte order of transmission is from top to bottom as shown. For a successful match to specific address 1, the following address matching registers must be set up:

- Base address + 0x98 0x87654321 (Bottom)
- Base address + 0x9C 0x0000CBA9 (Top)

And for a successful match to the Type ID Checking Register (EMAC\_TID), the following should be set up:

- Base address + 0xB8 0x00004321

#### 57.4.7. Broadcast Address

The broadcast address of 0xFFFFFFFF is recognized if the 'No Broadcast' bit in the EMAC\_NCFGR is zero.

#### 57.4.8. Hash Addressing

The hash address register is 64 bits long and takes up two locations in the memory map. The least significant bits are stored in hash register bottom and the most significant bits in hash register top.

The 'Unicast Hash Enable' and the 'Multicast Hash Enable' bits in the EMAC\_NCFGR enable the reception of hash matched frames. The destination address is reduced to a 6-bit index into the 64-bit hash register using the following hash function. The hash function is an exclusive or of every sixth bit of the destination address.

```
hash_index[5] = da[5] ^ da[11] ^ da[17] ^ da[23] ^ da[29] ^ da[35] ^ da[41] ^ da[47]
hash_index[4] = da[4] ^ da[10] ^ da[16] ^ da[22] ^ da[28] ^ da[34] ^ da[40] ^ da[46]
hash_index[3] = da[3] ^ da[09] ^ da[15] ^ da[21] ^ da[27] ^ da[33] ^ da[39] ^ da[45]
hash_index[2] = da[2] ^ da[08] ^ da[14] ^ da[20] ^ da[26] ^ da[32] ^ da[38] ^ da[44]
hash_index[1] = da[1] ^ da[07] ^ da[13] ^ da[19] ^ da[25] ^ da[31] ^ da[37] ^ da[43]
hash_index[0] = da[0] ^ da[06] ^ da[12] ^ da[18] ^ da[24] ^ da[30] ^ da[36] ^ da[42]
```

da[0] represents the least significant bit of the first byte received, that is, the multicast/unicast indicator, and da[47] represents the most significant bit of the last byte received.

If the hash index points to a bit that is set in the hash register, then the frame is matched according to whether the frame is multicast or unicast.

A multicast match is signalled if the 'Multicast Hash Enable' bit is set. da[0] is 1 and the hash index points to a bit set in the hash register.

A unicast match is signalled if the 'Unicast Hash Enable' bit is set. da[0] is 0 and the hash index points to a bit set in the hash register.

To receive all multicast frames, the hash register should be set with all ones and the 'Multicast Hash Enable' bit should be set in the EMAC\_NCFGR.

#### 57.4.9. Copy All Frames (or Promiscuous Mode)

If the 'Copy All Frames' bit is set in the EMAC\_NCFGR, then all non-errored frames are copied to memory. For example, frames that are too long, too short, or have FCS errors or rx\_er asserted during reception are discarded and all others are received. Frames with FCS errors are copied to memory if bit 19 in the EMAC\_NCFGR is set.

#### 57.4.10. Type ID Checking

The contents of the EMAC\_TID register are compared against the length/type ID of received frames (i.e., bytes 13 and 14). Bit 22 in the receive buffer descriptor status is set if there is a match. The reset state of this register is zero which is unlikely to match the length/type ID of any valid Ethernet frame.

**Note:** A type ID match does not affect whether a frame is copied to memory.

#### 57.4.11. VLAN Support

The following table describes an Ethernet encoded 802.1Q VLAN tag.

**Table 57.4.** 802.1Q VLAN Tag

TPID (Tag Protocol Identifier) 16 bits	TCI (Tag Control Information) 16 bits
0x8100	First 3 bits priority, then CFI bit, last 12 bits VID

The VLAN tag is inserted at the 13th byte of the frame, adding an extra four bytes to the frame. If the VID (VLAN identifier) is null (0x000), this indicates a priority-tagged frame. The MAC can support frame lengths up to 1536 bytes, 18 bytes more than the original Ethernet maximum frame length of 1518 bytes. This is achieved by setting bit 8 in the EMAC\_NCFGR.

The following bits in the receive buffer descriptor status word give information about VLAN tagged frames:

- Bit 21 set if receive frame is VLAN tagged (i.e., type ID of 0x8100)
- Bit 20 set if receive frame is priority tagged (i.e., type ID of 0x8100 and null VID). (If bit 20 is set, bit 21 is set also.)
- Bit 19, 18 and 17 set to priority if bit 21 is set
- Bit 16 set to CFI if bit 21 is set

#### 57.4.12. Wake-on-LAN Support

The receive block supports Wake-on-LAN by detecting the following events on incoming receive frames:

- Magic packet
- ARP request to the device IP address

- Specific address 1 filter match
- Multicast hash filter match

If one of these events occurs Wake-on-LAN detection is indicated by asserting the wol output pin for 64 rx\_clk cycles. These events can be individually enabled through bits 19:16 of the Wake-on-LAN Register (EMAC\_WOL). Also, for Wake-on-LAN detection to occur, receive enable must be set in the EMAC\_NCR, however a receive buffer does not have to be available. wol assertion due to ARP request, specific address 1 or multicast filter events occurs even if the frame is errored. For magic packet events, the frame must be correctly formed and error free.

A magic packet event is detected if all of the following are true:

- magic packet events are enabled through bit 16 of the EMAC\_WOL register
- the frame's destination address matches specific address 1
- the frame is correctly formed with no errors
- the frame contains at least 6 bytes of 0xFF for synchronization
- there are 16 repetitions of the contents of specific address 1 register immediately following the synchronization

An ARP request event is detected if all of the following are true:

- ARP request events are enabled through bit 17 of the EMAC\_WOL register
- broadcasts are allowed by bit 5 in the EMAC\_NCFGR
- the frame has a broadcast destination address (bytes 1 to 6)
- the frame has a type ID field of 0x0806 (bytes 13 and 14)
- the frame has an ARP operation field of 0x0001 (bytes 21 and 22)
- the least significant 16 bits of the frame's ARP target protocol address (bytes 41 and 42) match the value programmed in bits 15:0 of the EMAC\_WOL register

The decoding of the ARP fields adjusts automatically if a VLAN tag is detected within the frame. The reserved value of 0x0000 for the Wake-on-LAN target address value does not cause an ARP request event, even if matched by the frame.

A specific address 1 filter match event occurs if all of the following are true:

- specific address 1 events are enabled through bit 18 of the EMAC\_WOL register
- the frame's destination address matches the value programmed in the specific address 1 registers

A multicast filter match event occurs if all of the following are true:

- multicast hash events are enabled through bit 19 of the EMAC\_WOL register
- multicast hash filtering is enabled through bit 6 of the EMAC\_NCFGR
- the frame's destination address matches against the multicast hash filter
- the frame's destination address is not a broadcast

#### 57.4.13. PHY Maintenance

The PHY Maintenance Register (EMAC\_MAN) enables the EMAC to communicate with a PHY by means of the MDIO interface. It is used during auto-negotiation to ensure that the EMAC and the PHY are configured for the same speed and duplex configuration.

The EMAC\_MAN register is implemented as a shift register. Writing to the register starts a shift operation which is signalled as complete when bit 2 is set in the Network Status Register (EMAC\_NSR) (about 2000 MCK cycles later when bit 10 is set to zero, and bit 11 is set to one in the EMAC\_NCFGR). An interrupt is generated as this bit is set. During this time, the MSB of the register is

output on the MDIO pin and the LSB updated from the MDIO pin with each MDC cycle. This causes transmission of a PHY management frame on MDIO.

Reading during the shift operation returns the current contents of the shift register. At the end of management operation, the bits have shifted back to their original locations. For a read operation, the data bits are updated with data read from the PHY. It is important to write the correct values to the register to ensure a valid PHY management frame is produced.

The MDIO interface can read IEEE 802.3 clause 45 PHYs as well as clause 22 PHYs. To read clause 45 PHYs, bits 31:28 should be written as 0x0011. To write clause 45 PHYs, bits 31:28 should be written as 0x0001. See the table below.

**Table 57.5.** Clause 22/Clause 45 PHYs Read/Write Access Configuration

PHY	Access	Field Configuration (EMAC_MAN Bits 31:28)	
		SOF[1:0]	RW[1:0]
Clause 22	Read	01	10
	Write	01	01
Clause 45	Read	00	11
	Write	00	01
	Read + Address	00	10

For a description of MDC generation, see [Network Configuration Register](#).

#### 57.4.14. Physical Interface

Depending on products, the Ethernet MAC is capable of interfacing to RMII or MII Interface. The 'RMII' bit in the User Input/Output Register (EMAC\_USRIO) controls the interface that is selected. When this bit is set, the RMII interface is selected, else the MII interface is selected.

The MII and RMII interfaces are capable of both 10 Mbit/s and 100 Mbit/s data rates as described in the IEEE 802.3u standard. The signals used by the MII and RMII interfaces are described in the table below.

**Table 57.6.** Pin Configuration

Pin Name	MI	RMII
ETXCK_EREFC	ETXCK: Transmit Clock	EREFC: Reference Clock
ECRS	ECRS: Carrier Sense	–
ECOL	ECOL: Collision Detect	–
ERXD	ERXD: Data Valid	ECRSDV: Carrier Sense/Data Valid
ERX0–ERX3	ERX0–ERX3: 4-bit Receive Data	ERX0–ERX1: 2-bit Receive Data
ERXER	ERXER: Receive Error	ERXER: Receive Error
ERXCK	ERXCK: Receive Clock	–
ETXEN	ETXEN: Transmit Enable	ETXEN: Transmit Enable
ETX0–ETX3	ETX0–ETX3: 4-bit Transmit Data	ETX0–ETX1: 2-bit Transmit Data
ETXER	ETXER: Transmit Error	–
EMDC	Management Data Clock	Management Data Clock
EMDIO	Management Data Input Output	Management Data Input Output

The RMII provides a reduced pin count alternative to the IEEE 802.3u MII. It uses two bits for transmit (ETX0 and ETX1) and two bits for receive (ERX0 and ERX1). There is a Transmit Enable (ETXEN), a Receive Error (ERXER), a Carrier Sense (ECRS\_DV), and a 50 MHz Reference Clock (ETXCK\_EREFC) for 100 Mbit/s data rate.

#### 57.4.14.1.RMII Transmit and Receive Operation

The same signals are used internally for both the RMII and the MII operations. The RMII maps the signals in a more pin-efficient manner. The transmit and receive bits are converted from a 4-bit parallel format to a 2-bit parallel scheme that is clocked at twice the rate. The carrier sense and data valid signals are combined into the ECRSDV signal. This signal contains information on carrier sense, FIFO status, and validity of the data. Transmit error bit (ETXER) and collision detect (ECOL) are not used in RMII mode.

### 57.5. Programming Interface

#### 57.5.1. Initialization

##### 57.5.1.1.Configuration

Initialization of the EMAC configuration (e.g., loop-back mode, frequency ratios) must be done while the transmit and receive circuits are disabled. See the description of the EMAC\_NCR and EMAC\_NCFGR earlier in this document.

To change loop-back mode, the following sequence of operations must be followed:

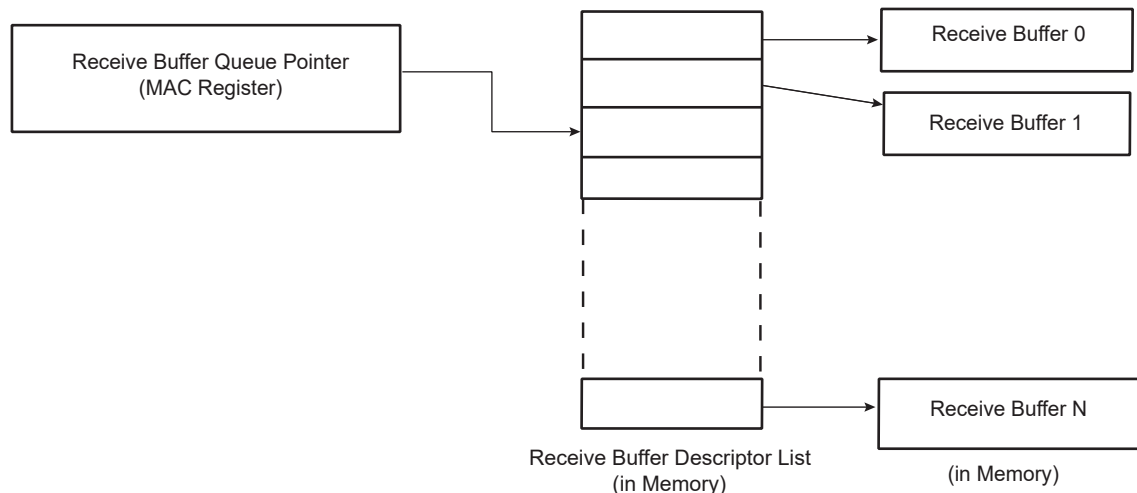

1. Write to EMAC\_NCR to disable transmit and receive circuits.
2. Write to EMAC\_NCR to change loop-back mode.
3. Write to EMAC\_NCR to re-enable transmit or receive circuits.

**Note:** These writes to EMAC\_NCR cannot be combined in any way.

##### 57.5.1.2.Receive Buffer List

Receive data is written to areas of data (i.e., buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (receive buffer queue) is a sequence of descriptor entries as defined in [Receive Buffer Descriptor Entry](#). It points to this data structure.

**Figure 57.2.** Receive Buffer List

To create the list of buffers:

1. Allocate a number (n) of buffers of 128 bytes in system memory.
2. Allocate an area 2n words for the receive buffer descriptor entry in system memory and create n entries in this list. Mark all entries in this list as owned by EMAC, i.e., bit 0 of word 0 set to zero.
3. If less than 1024 buffers are defined, the last descriptor must be marked with the wrap bit (bit 1 in word 0 set to one).

4. Write address of receive buffer descriptor entry to the EMAC\_RBQP register.
5. The receive circuits can then be enabled by writing to the address recognition registers and then to the EMAC\_NCR.

#### 57.5.1.3. Transmit Buffer List

Transmit data is read from areas of data (the buffers) in system memory. These buffers are listed in another data structure that also resides in main memory. This data structure (Transmit Buffer Queue) is a sequence of descriptor entries (as defined in [Transmit Buffer Description Entry](#)) that points to this data structure.

To create this list of buffers:

1. Allocate a number (n) of buffers of between 1 and 2047 bytes of data to be transmitted in system memory. Up to 128 buffers per frame are allowed.
2. Allocate an area 2n words for the transmit buffer descriptor entry in system memory and create N entries in this list. Mark all entries in this list as owned by EMAC, i.e., bit 31 of word 1 set to zero.
3. If fewer than 1024 buffers are defined, the last descriptor must be marked with the wrap bit — bit 30 in word 1 set to one.
4. Write address of transmit buffer descriptor entry to EMAC\_TBQP register.
5. The transmit circuits can then be enabled by writing to the EMAC\_NCR.

#### 57.5.1.4. Address Matching

The EMAC register-pair hash address and the four specific address register-pairs must be written with the required values. Each register-pair comprises a bottom register and top register, with the bottom register being written first. The address matching is disabled for a particular register-pair after the bottom-register has been written and re-enabled when the top register is written. See [Address Checking Block](#) for details of address matching. Each register-pair may be written at any time, regardless of whether the receive circuits are enabled or disabled.

#### 57.5.1.5. Interrupts

There are 15 interrupt conditions that are detected within the EMAC. These are ORed to make a single interrupt. Depending on the overall system design, this may be passed through a further level of interrupt collection (interrupt controller). On receipt of the interrupt signal, the CPU enters the interrupt handler (Refer to the Interrupt Controller). To ascertain which interrupt has been generated, read the Interrupt Status Register (EMAC\_ISR). Note that this register clears itself when read. At reset, all interrupts are disabled.

To enable an interrupt, write to the Interrupt Enable Register (EMAC\_IER) with the pertinent interrupt bit set to one.

To disable an interrupt, write to the Interrupt Disable Register (EMAC\_IDR) with the pertinent interrupt bit set to one.

To check whether an interrupt is enabled or disabled, read the EMAC\_IMR; if the bit is set to one, the interrupt is disabled.

#### 57.5.1.6. Transmitting Frames

To set up a frame for transmission:

1. Enable transmit in the EMAC\_NCR.
2. Allocate an area of system memory for transmit data. This does not have to be contiguous, varying byte lengths can be used as long as they conclude on byte borders.
3. Set-up the transmit buffer list.
4. Set the EMAC\_NCR to enable transmission and enable interrupts.
5. Write data for transmission into these buffers.

6. Write the address to transmit buffer descriptor queue pointer.
7. Write control and length to word one of the transmit buffer descriptor entry.
8. Write to the 'Start Transmission' bit in the EMAC\_NCR.

#### 57.5.1.7.Receiving Frames

When a frame is received and the receive circuits are enabled, the EMAC checks the address and, in the following cases, the frame is written to system memory:

- if it matches one of the four specific address registers.
- if it matches the hash address function.
- if it is a broadcast address (0xFFFFFFFF) and broadcasts are allowed.
- if the EMAC is configured to copy all frames.

The EMAC\_RBQP register points to the next entry (see [Receive Buffer Descriptor Entry](#)) and the EMAC uses this as the address in system memory to write the frame to. Once the frame has been completely and successfully received and written to system memory, the EMAC then updates the receive buffer descriptor entry with the reason for the address match and marks the area as being owned by software. Once this is complete an interrupt receive complete is set. Software is then responsible for handling the data in the buffer and then releasing the buffer by writing the ownership bit back to zero.

If the EMAC is unable to write the data at a rate to match the incoming frame, then an interrupt receive overrun is set. If there is no receive buffer available, i.e., the next buffer is still owned by software, the interrupt receive buffer not available is set. If the frame is not successfully received, a statistics register is incremented and the frame is discarded without informing software.

## 57.6. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	EMAC_NCR	31:24

### 57.6.1. Network Control Register

**Name:** EMAC\_NCR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access						THALT	TSTART	BP
Reset						R/W	R/W	R/W
						0	0	0
Bit	7	6	5	4	3	2	1	0
Access	WESTAT	INCSTAT	CLRSTAT	MPE	TE	RE	LLB	LB
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	0	0	0	0	0	0	0	0

#### Bit 10 – THALT Transmit Halt

Writing one to this bit halts transmission as soon as any ongoing frame transmission ends.

#### Bit 9 – TSTART Start Transmission

Writing one to this bit starts transmission.

#### Bit 8 – BP Back Pressure

If set in half duplex mode, forces collisions on all received frames.

#### Bit 7 – WESTAT Write Enable for Statistics Registers

Setting this bit to one makes the statistics registers writable for functional test purposes.

#### Bit 6 – INCSTAT Increment Statistics Registers

This bit is write only. Writing a one increments all the statistics registers by one for test purposes.

#### Bit 5 – CLRSTAT Clear Statistics Registers

This bit is write only. Writing a one clears the statistics registers.

#### Bit 4 – MPE Management Port Enable

Value	Description
0	Forces MDIO to high impedance state and MDC low
1	Enables the management port

**Bit 3 – TE** Transmit Enable

When set, enables the Ethernet transmitter to send data. When reset transmission, stops immediately, the transmit FIFO and control registers are cleared and the EMAC\_TBQP register resets to point to the start of the transmit descriptor list.

**Bit 2 – RE** Receive Enable

When set, enables the EMAC to receive data. When reset, frame reception stops immediately and the receive FIFO is cleared. The EMAC\_RBQP register is unaffected.

**Bit 1 – LLB** LoopBack Local

Connects txd to rxd, tx\_en to rx\_dv, forces full duplex and drives rx\_clk and tx\_clk with MCK divided by 4. rx\_clk and tx\_clk may glitch as the EMAC is switched into and out of internal loop back. It is important that receive and transmit circuits have already been disabled when making the switch into and out of internal loop back.

**Bit 0 – LB** LoopBack

Asserts the loopback signal to the PHY.

## 57.6.2. Network Configuration Register

**Name:** EMAC\_NCFGR  
**Offset:** 0x04  
**Reset:** 0x00000800  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					IRXFCS	EFRHD	DRFCS	RLCE
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RBOF[1:0]		PAE	RTY	CLK[1:0]			BIG
Access	R/W	R/W	R/W	R/W	R/W	R/W		R/W
Reset	0	0	0	0	1	0		0
Bit	7	6	5	4	3	2	1	0
	UNI	MTI	NBC	CAF	JFRAME		FD	SPD
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

### Bit 19 – IRXFCS Ignore RX FCS

Value	Description
0	Normal operation
1	Frames with FCS/CRC errors are not rejected and no FCS error statistics are counted.

### Bit 18 – EFRHD Enable Frames Received in Half Duplex

Enable Frames to be received in half-duplex mode while transmitting.

### Bit 17 – DRFCS Discard Receive FCS

When set, the FCS field of received frames is not copied to memory.

### Bit 16 – RLCE Receive Length Field Checking Enable

When set, frames with measured lengths shorter than their length fields are discarded. Frames containing a type ID in bytes 13 and 14 — length/type ID = 0600 — are not counted as length errors.

### Bits 15:14 – RBOF[1:0] Receive Buffer Offset

Indicates the number of bytes by which the received data is offset from the start of the first receive buffer.

Value	Name	Description
0	OFFSET_0	No offset from start of receive buffer
1	OFFSET_1	One-byte offset from start of receive buffer
2	OFFSET_2	Two-byte offset from start of receive buffer
3	OFFSET_3	Three-byte offset from start of receive buffer

### Bit 13 – PAE Pause Enable

When set, transmission pauses when a valid pause frame is received.

### Bit 12 – RTY Retry Test

Value	Description
0	Normal operation
1	The back off between collisions is always one slot time. Setting this bit helps in testing the 'too many retries' condition. Also used in the pause frame tests to reduce the pause counters decrement time from 512 bit times, to every rx_clk cycle.

### Bits 11:10 – CLK[1:0] MDC Clock Divider

Set according to system clock speed. This determines by what number system clock is divided to generate MDC. For conformance with 802.3, MDC must not exceed 2.5 MHz (MDC is only active during MDIO read and write operations).

Value	Name	Description
0	MCK_8	MCK divided by 8 (MCK up to 20 MHz)
1	MCK_16	MCK divided by 16 (MCK up to 40 MHz)
2	MCK_32	MCK divided by 32 (MCK up to 80 MHz)
3	MCK_64	MCK divided by 64 (MCK up to 160 MHz)

### Bit 8 – BIG Receive 1536 Bytes Frames

Setting this bit means the EMAC receives frames up to 1536 bytes in length. Normally, the EMAC would reject any frame above 1518 bytes.

### Bit 7 – UNI Unicast Hash Enable

When set to one, unicast frames are received when the 6-bit hash function of the destination address points to a bit that is set in the hash register.

### Bit 6 – MTI Multicast Hash Enable

When set to one, multicast frames are received when the 6-bit hash function of the destination address points to a bit that is set in the hash register.

### Bit 5 – NBC No Broadcast

When set to one, frames addressed to the broadcast address of all ones are not received.

### Bit 4 – CAF Copy All Frames

When set to one, all valid frames are received.

### Bit 3 – JFRAME Jumbo Frames

Set to one to enable jumbo frames of up to 10240 bytes to be accepted.

### Bit 1 – FD Full Duplex

If set to one, the transmit block ignores the state of collision and carrier sense and allows receive while transmitting.

### Bit 0 – SPD Speed

Value	Description
0	10 Mbit/s operation
1	100 Mbit/s operation

57.6.3. Network Status Register

**Name:** EMAC\_NSR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Bit 2 – IDLE PHY Management Logic Status

Value	Description
0	The PHY logic is running.
1	The PHY management logic is idle (i.e., has completed).

Bit 1 – MDIO MDIO Input Status

Returns status of the EMDIO pin. Use the PHY Maintenance Register to read managed frames rather than this bit.

### 57.6.4. Transmit Status Register

**Name:** EMAC\_TSR  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read/Write

This register, when read, provides details of the status of a transmit. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to one by writing to the register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		UND	COMP	BEX	TGO	RLES	COL	UBR
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

**Bit 6 – UND** Transmit Underrun (cleared by writing a one to this bit)

Set when transmit DMA was not able to read data from memory, either because the bus was not granted in time, because a not OK hresp(bus error) was returned or because a used bit was read midway through frame transmission. If this occurs, the transmitter forces bad CRC.

**Bit 5 – COMP** Transmit Complete (cleared by writing a one to this bit)

Set when a frame has been transmitted.

**Bit 4 – BEX** Buffers Exhausted Mid-frame (cleared by writing a one to this bit)

If the buffers run out during transmission of a frame, then transmission stops, FCS shall be bad and tx\_er asserted.

**Bit 3 – TGO** Transmit Go

If high transmit is active.

**Bit 2 – RLES** Retry Limit Exceeded (cleared by writing a one to this bit)**Bit 1 – COL** Collision Occurred (cleared by writing a one to this bit)

Set by the assertion of collision.

**Bit 0 – UBR** Used Bit Read (cleared by writing a one to this bit)

Set when a transmit buffer descriptor is read with its used bit set.

### 57.6.5. Receive Buffer Queue Pointer Register

**Name:** EMAC\_RBQP  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read/Write

This register points to the entry in the receive buffer queue (descriptor list) currently being used. It is written with the start location of the receive buffer descriptor list. The lower order bits increment as buffers are used up and wrap to their original values after either 1024 buffers or when the wrap bit of the entry is set.

Reading this register returns the location of the descriptor currently being accessed. This value increments as buffers are used. Software should not use this register for determining where to remove received frames from the queue as it constantly changes as new frames are received. Software should instead work its way through the buffer descriptor queue checking the used bits.

Receive buffer writes also comprise bursts of two words and, as with transmit buffer reads, it is recommended that bit 2 is always written with zero to prevent a burst crossing a 1K boundary, in violation of section 3.6 of the AMBA specification.

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ADDR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ADDR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ADDR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ADDR[31:0] Receive Buffer Queue Pointer Address**

Written with the address of the start of the receive queue, reads as a pointer to the current buffer being used.

ADDR[1:0] must be 0.

**57.6.6. Transmit Buffer Queue Pointer Register**

**Name:** EMAC\_TBQP  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register points to the entry in the transmit buffer queue (descriptor list) currently being used. It is written with the start location of the transmit buffer descriptor list. The lower order bits increment as buffers are used up and wrap to their original values after either 1024 buffers or when the wrap bit of the entry is set. This register can only be written when bit 3 in the EMAC\_TSR is low.

As transmit buffer reads consist of bursts of two words, it is recommended that bit 2 is always written with zero to prevent a burst crossing a 1K boundary, in violation of section 3.6 of the AMBA specification.

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ADDR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ADDR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ADDR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ADDR[31:0] Transmit Buffer Queue Pointer Address**

Written with the address of the start of the transmit queue, reads as a pointer to the first buffer of the frame being transmitted or about to be transmitted. ADDR[1:0] must be 0.

### 57.6.7. Receive Status Register

**Name:** EMAC\_RSR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register, when read, provides details of the status of a receive. Once read, individual bits may be cleared by writing a one to them. It is not possible to set a bit to one by writing to the register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						OVR	REC	BNA
Access						R/W	R/W	R/W
Reset						0	0	0

**Bit 2 – OVR** Receive Overrun (cleared by writing a one to this bit)

The DMA block was unable to store the receive frame to memory, either because the bus was not granted in time or because a not OK hresp(bus error) was returned. The buffer is recovered if this happens.

**Bit 1 – REC** Frame Received (cleared by writing a one to this bit)

One or more frames have been received and placed in memory.

**Bit 0 – BNA** Buffer Not Available (cleared by writing a one to this bit)

An attempt was made to get a new buffer and the pointer indicated that it was owned by the processor. The DMA rereads the pointer each time a new frame starts until a valid pointer is found. This bit is set at each attempt that fails even if it has not had a successful pointer read since it has been cleared.

## 57.6.8. Interrupt Status Register

**Name:** EMAC\_ISR  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

### Bit 14 – WOL Wake-On-LAN (cleared on read)

Set when a WOL event has been triggered (This flag can be set even if the EMAC is not clocked).

### Bit 13 – PTZ Pause Time Zero (cleared on read)

Set when the EMAC\_PTR, 0x38 decrements to zero.

### Bit 12 – PFRE Pause Frame Received (cleared on read)

Indicates a valid pause has been received.

### Bit 11 – HRESP Hresp Not OK (cleared on read)

Set when the DMA block sees a bus error.

### Bit 10 – ROVR Receive Overrun (cleared on read)

Set when the 'Receive Overrun' bit in EMAC\_ISR gets set.

### Bit 7 – TCOMP Transmit Complete (cleared on read)

Set when a frame has been transmitted.

### Bit 6 – TXERR Transmit Error (cleared on read)

Transmit buffers exhausted in mid-frame - transmit error.

### Bit 5 – RLEX Retry Limit Exceeded (cleared on read)

### Bit 4 – TUND Ethernet Transmit Buffer Underrun (cleared on read)

The transmit DMA did not fetch frame data in time for it to be transmitted or hresp returned not OK. Also set if a used bit is read mid-frame or when a new transmit queue pointer is written.

- Bit 3 – TXUBR** Transmit Used Bit Read (cleared on read)  
Set when a transmit buffer descriptor is read with its used bit set.
- Bit 2 – RXUBR** Receive Used Bit Read (cleared on read)  
Set when a receive buffer descriptor is read with its used bit set.
- Bit 1 – RCOMP** Receive Complete (cleared on read)  
A frame has been stored in memory.
- Bit 0 – MFD** Management Frame Done (cleared on read)  
The PHY Maintenance Register has completed its operation.

## 57.6.9. Interrupt Enable Register

**Name:** EMAC\_IER  
**Offset:** 0x28  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 14 – WOL** Wake-On-LAN  
Enable Wake-On-LAN interrupt.

**Bit 13 – PTZ** Pause Time Zero  
Enable pause time zero interrupt.

**Bit 12 – PFR** Pause Frame Received  
Enable pause frame received interrupt.

**Bit 11 – HRESP** Hresp Not OK  
Enable Hresp not OK interrupt.

**Bit 10 – ROVR** Receive Overrun  
Enable receive overrun interrupt.

**Bit 7 – TCOMP** Transmit Complete  
Enable transmit complete interrupt.

**Bit 6 – TXERR** Transmit Error  
Enable transmit buffers exhausted in mid-frame interrupt.

**Bit 5 – RLE** Retry Limit Exceeded  
Enable retry limit exceeded interrupt.

**Bit 4 – TUND** Ethernet Transmit Buffer Underrun  
Enable transmit underrun interrupt.

**Bit 3 – TXUBR** Transmit Used Bit Read  
Enable transmit used bit read interrupt.

**Bit 2 – RXUBR** Receive Used Bit Read  
Enable receive used bit read interrupt.

**Bit 1 – RCOMP** Receive Complete  
Enable receive complete interrupt.

**Bit 0 – MFD** Management Frame Done  
Enable management done interrupt.

## 57.6.10. Interrupt Disable Register

**Name:** EMAC\_IDR  
**Offset:** 0x2C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Reset	–	–	–	–	–	–	–	–

**Bit 14 – WOL** Wake-On-LAN  
Disable Wake-On-LAN interrupt.

**Bit 13 – PTZ** Pause Time Zero  
Disable pause time zero interrupt.

**Bit 12 – PFR** Pause Frame Received  
Disable pause frame received interrupt.

**Bit 11 – HRESP** Hresp Not OK  
Disable Hresp not OK interrupt.

**Bit 10 – ROVR** Receive Overrun  
Disable receive overrun interrupt.

**Bit 7 – TCOMP** Transmit Complete  
Disable transmit complete interrupt.

**Bit 6 – TXERR** Transmit Error  
Disable transmit buffers exhausted in mid-frame interrupt.

**Bit 5 – RLE** Retry Limit Exceeded  
Disable retry limit exceeded interrupt.

**Bit 4 – TUND** Ethernet Transmit Buffer Underrun  
Disable transmit underrun interrupt.

**Bit 3 – TXUBR** Transmit Used Bit Read  
Disable transmit used bit read interrupt.

**Bit 2 – RXUBR** Receive Used Bit Read  
Disable receive used bit read interrupt.

**Bit 1 – RCOMP** Receive Complete  
Disable receive complete interrupt.

**Bit 0 – MFD** Management Frame Done  
Disable management done interrupt.

## 57.6.11. Interrupt Mask Register

**Name:** EMAC\_IMR  
**Offset:** 0x30  
**Reset:** 0x00007FFF  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access

Reset	1	1	1	1	1	1	1	1

### Bit 14 – WOL Wake-On-LAN

Wake-On-LAN interrupt masked.

### Bit 13 – PTZ Pause Time Zero

Pause time zero interrupt masked.

### Bit 12 – PFR Pause Frame Received

Pause frame received interrupt masked.

### Bit 11 – HRESP Hresp Not OK

Hresp not OK interrupt masked.

### Bit 10 – ROVR Receive Overrun

Receive overrun interrupt masked.

### Bit 7 – TCOMP Transmit Complete

Transmit complete interrupt masked.

### Bit 6 – TXERR Transmit Error

Transmit buffers exhausted in mid-frame interrupt masked.

### Bit 5 – RLE Retry Limit Exceeded

Retry limit exceeded interrupt masked.

### Bit 4 – TUND Ethernet Transmit Buffer Underrun

Transmit underrun interrupt masked.

**Bit 3 – TXUBR** Transmit Used Bit Read  
Transmit used bit read interrupt masked.

**Bit 2 – RXUBR** Receive Used Bit Read  
Receive used bit read interrupt masked.

**Bit 1 – RCOMP** Receive Complete  
Receive complete interrupt masked.

**Bit 0 – MFD** Management Frame Done  
Management done interrupt masked.

## 57.6.12. PHY Maintenance Register

**Name:** EMAC\_MAN  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

To read clause 45 PHYs, bits 31:28 should be written as 0x0011. This overlaps the SOF and RW fields.

Bit	31	30	29	28	27	26	25	24
	SOF[1:0]		RW[1:0]		PHYA[4:1]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	PHYA[0]	REGA[4:0]					CODE[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:30 – SOF[1:0] Start of Frame

Must be written to one for a valid frame.

### Bits 29:28 – RW[1:0] PHY Read/Write Command

Any other value is an invalid PHY management frame.

Value	Description
1	Write command
2	Read command

### Bits 27:23 – PHYA[4:0] PHY Address

### Bits 22:18 – REGA[4:0] PHY Register Address

Specifies the register in the PHY to access.

### Bits 17:16 – CODE[1:0] Must Be Two

Must be written to 2. Reads as written.

### Bits 15:0 – DATA[15:0] PHY Transmit or Receive Data

For a write operation this is written with the data to be written to the PHY.  
After a read operation this contains the data read from the PHY.

57.6.13. Pause Time Register

**Name:** EMAC\_PTR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:0 – PTIME[15:0]** Pause Time  
Stores the current value of the EMAC\_PTR which is decremented every 512 bit times.

57.6.14. EMAC Statistics Registers

**Name:** EMAC\_PFR  
**Offset:** 0x3C  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_PFR is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:0 – FROK[15:0]** Pause Frames Received OK

A 16-bit register counting the number of good pause frames received. A good frame has a length of 64 to 1518 (1536 if bit 8 set in EMAC\_NCFGR) and has no FCS, alignment or receive symbol errors.

## 57.6.15. Frames Transmitted OK Register

**Name:** EMAC\_FTO  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_FTO is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 23:0 – FTOK[23:0] Frames Transmitted OK

A 24-bit register counting the number of frames successfully transmitted, i.e., no underrun and not too many retries.

## 57.6.16. Single Collision Frames Register

**Name:** EMAC\_SCF  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_SCF is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

	SCF[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 15:0 – SCF[15:0] Single Collision Frames

A 16-bit register counting the number of frames experiencing a single collision before being successfully transmitted, i.e., no underrun.

57.6.17. Multicollision Frames Register

**Name:** EMAC\_MCF  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_MCF is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:0 – MCF[15:0]** Multicollision Frames  
A 16-bit register counting the number of frames experiencing between two and fifteen collisions prior to being successfully transmitted, i.e., no underrun and not too many retries.

## 57.6.18. Frames Received OK Register

**Name:** EMAC\_FRO  
**Offset:** 0x4C  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_FRO is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	FROK[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	FROK[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 23:0 – FROK[23:0] Frames Received OK

A 24-bit register counting the number of good frames received, i.e., address recognized and successfully copied to memory. A good frame is of length 64 to 1518 bytes (1536 if bit 8 set in EMAC\_NCFGR) and has no FCS, alignment or receive symbol errors.

57.6.19. Frames Check Sequence Errors Register

**Name:** EMAC\_FCSE  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_FCSE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

	FCSE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – FCSE[7:0]** Frame Check Sequence Errors

An 8-bit register counting frames that are an integral number of bytes, have bad CRC and are between 64 and 1518 bytes in length (1536 if bit 8 set in EMAC\_NCFGR). This register is also incremented if a symbol error is detected and the frame is of valid length and has an integral number of bytes.

57.6.20. Alignment Errors Register

**Name:** EMAC\_ALE  
**Offset:** 0x54  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_ALE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset								
Bit	7	6	5	4	3	2	1	0
	ALE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – ALE[7:0] Alignment Errors**

An 8-bit register counting frames that are not an integral number of bytes long and have bad CRC when their length is truncated to an integral number of bytes and are between 64 and 1518 bytes in length (1536 if bit 8 set in EMAC\_NCFGR). This register is also incremented if a symbol error is detected and the frame is of valid length and does not have an integral number of bytes.

57.6.21. Deferred Transmission Frames Register

**Name:** EMAC\_DTF  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_DTF is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DTF[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 15:0 – DTF[15:0]** Deferred Transmission Frames

A 16-bit register counting the number of frames experiencing deferral due to carrier sense being active on their first attempt at transmission. Frames involved in any collision are not counted nor are frames that experienced a transmit underrun.

57.6.22. Late Collisions Register

**Name:** EMAC\_LCOL  
**Offset:** 0x5C  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_LCOL is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

	LCOL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – LCOL[7:0]** Late Collisions

An 8-bit register counting the number of frames that experience a collision after the slot time (512 bits) has expired. A late collision is counted twice; i.e., both as a collision and a late collision.

57.6.23. Excessive Collisions Register

**Name:** EMAC\_ECOL  
**Offset:** 0x60  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_ECOL is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

	EXCOL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – EXCOL[7:0]** Excessive Collisions  
An 8-bit register counting the number of frames that failed to be transmitted because they experienced 16 collisions.

57.6.24. Transmit Underrun Errors Register

**Name:** EMAC\_TUND  
**Offset:** 0x64  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_TUND is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access								
Reset

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – TUND[7:0]** Transmit Underruns  
An 8-bit register counting the number of frames not transmitted due to a transmit DMA underrun. If this register is incremented, then no other statistics register is incremented.

57.6.25. Carrier Sense Errors Register

**Name:** EMAC\_CSE  
**Offset:** 0x68  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_CSE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Bit	31	30	29	28	27	26	25	24
Access

**Bits 7:0 – CSE[7:0] Carrier Sense Errors**

An 8-bit register counting the number of frames transmitted where carrier sense was not seen during transmission or where carrier sense was deasserted after being asserted in a transmit frame without collision (no underrun). Only incremented in half-duplex mode. The only effect of a carrier sense error is to increment this register. The behavior of the other statistics registers is unaffected by the detection of a carrier sense error.

## 57.6.26. Receive Resource Errors Register

**Name:** EMAC\_RRE  
**Offset:** 0x6C  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_RRE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data. This receive statistics register is only incremented when the 'Receive Enable' bit is set in the Network Control Register (EMAC\_NCR). To write to this register, bit 7 must be set in EMAC\_NCR.

### Bits 15:0 – RRE[15:0] Receive Resource Errors

A 16-bit register counting the number of frames that were address matched but could not be copied to memory because no receive buffer was available.

57.6.27. Receive Overrun Errors Register

**Name:** EMAC\_ROV  
**Offset:** 0x70  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_ROV is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data. This receive statistics register is only incremented when the ‘Receive Enable’ bit is set in the Network Control Register (EMAC\_NCR). To write to this register, bit 7 must be set in EMAC\_NCR.

**Bits 7:0 – ROVR[7:0]** Receive Overrun  
An 8-bit register counting the number of frames that are address recognized but were not copied to memory due to a receive DMA overrun.

57.6.28. Receive Symbol Errors Register

**Name:** EMAC\_RSE  
**Offset:** 0x74  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_RSE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data. This receive statistics register is only incremented when the ‘Receive Enable’ bit is set in the Network Control Register (EMAC\_NCR). To write to this register, bit 7 must be set in EMAC\_NCR.

**Bits 7:0 – RSE[7:0]** Receive Symbol Errors

An 8-bit register counting the number of frames that had rx\_er asserted during reception. Receive symbol errors are also counted as an FCS or alignment error if the frame is between 64 and 1518 bytes in length (1536 if bit 8 is set in the EMAC\_NCFGR). If the frame is larger, it is recorded as a jabber error.

57.6.29. Excessive Length Errors Register

**Name:** EMAC\_ELE  
**Offset:** 0x78  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_ELE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – EXL[7:0]** Excessive Length Errors

An 8-bit register counting the number of frames received exceeding 1518 bytes (1536 if bit 8 set in EMAC\_NCFGR) in length but do not have either a CRC error, an alignment error nor a receive symbol error.

57.6.30. Receive Jabbers Register

**Name:** EMAC\_RJA  
**Offset:** 0x7C  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_RJA is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data. This receive statistics register is only incremented when the ‘Receive Enable’ bit is set in the Network Control Register (EMAC\_NCR). To write to this register, bit 7 must be set in EMAC\_NCR.

**Bits 7:0 – RJB[7:0]** Receive Jabbers

An 8-bit register counting the number of frames received exceeding 1518 bytes (1536 if bit 8 set in EMAC\_NCFGR) in length and have either a CRC error, an alignment error or a receive symbol error.

57.6.31. Undersize Frames Register

**Name:** EMAC\_USF  
**Offset:** 0x80  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_USF is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

**Bits 7:0 – USF[7:0]** Undersize Frames

An 8-bit register counting the number of frames received less than 64 bytes in length but do not have either a CRC error, an alignment error or a receive symbol error.

57.6.32. SQE Test Errors Register

**Name:** EMAC\_STE  
**Offset:** 0x84  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_STE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

**Bits 7:0 – SQER[7:0]** SQE Test Errors

An 8-bit register counting the number of frames where col was not asserted within 96 bit times (an interframe gap) of tx\_en being deasserted in half duplex mode.

57.6.33. Received Length Field Mismatch Register

**Name:** EMAC\_RLE  
**Offset:** 0x88  
**Reset:** 0x00000000  
**Property:** Read/Write

EMAC\_RLE is an EMAC statistics register. It resets to zero on a read and sticks at all ones when it counts to its maximum value. It should be read frequently enough to prevent loss of data.

Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – RLFM[7:0]** Receive Length Field Mismatch

An 8-bit register counting the number of frames received that have a measured length shorter than that extracted from its length field. Checking is enabled through bit 16 of the EMAC\_NCFGR. Frames containing a type ID in bytes 13 and 14 (i.e., length/type ID = 0x0600) are not counted as length field errors, neither are excessive length frames.

## 57.6.34. Hash Register Bottom

### Bit 19 – MTI Multicast Hash Event Enable

When set, multicast hash events causes the wol output to be asserted.

### Bit 18 – SA1 Specific Address Register 1 Event Enable

When set, specific address 1 events causes the wol output to be asserted.

### Bit 17 – ARP ARP Request Event Enable

When set, ARP request events causes the wol output to be asserted.

### Bit 16 – MAG Magic Packet Event Enable

When set, magic packet events causes the wol output to be asserted.

### Bits 15:0 – IP[15:0] ARP Request IP Address

Written to define the least significant 16 bits of the target IP address that is matched to generate a Wake-on-LAN event. A value of zero does not generate an event, even if this is matched by the received frame.

## 58. Flexible Serial Communication Controller (FLEXCOM)

### 58.1. Description

The Flexible Serial Communication Controller (FLEXCOM) offers several serial communication protocols that are managed by the three submodules USART, SPI, and TWI (I2C).

The Universal Synchronous Asynchronous Receiver Transceiver (USART) provides one full-duplex universal synchronous asynchronous serial link. Data frame format is widely programmable (data length, parity, number of stop bits) to support a maximum of standards. The receiver implements parity error, framing error and overrun error detection. The receiver timeout enables handling variable-length frames and the transmitter timeguard facilitates communications with slow remote devices. Multidrop communications are also supported through address bit handling in reception and transmission.

The USART features three test modes: Remote Loopback, Local Loopback and Automatic Echo.

The USART supports specific operating modes providing interfaces on RS485, LIN, LON, , with ISO7816 T = 0 or T = 1 smart card slots, and infrared transceivers. The hardware handshaking feature enables an out-of-band flow control by automatic management of the pins RTS and CTS.

The USART supports the connection to the DMA Controller, which enables data transfers to the transmitter and from the receiver. The DMAC provides chained buffer management without any intervention of the processor.

The Serial Peripheral Interface (SPI) circuit is a synchronous serial data link that provides communication with external devices in Host or Client mode. It also enables communication between processors if an external processor is connected to the system.

The Serial Peripheral Interface is essentially a shift register that serially transmits data bits to other SPIs. During a data transfer, one SPI system acts as the “host” which controls the data flow, while the other devices act as “clients” which have data shifted into and out by the host. Different CPUs can take turn being hosts (multiple host protocol, contrary to single host protocol where one CPU is always the host while all of the others are always clients). One host can simultaneously shift data into multiple clients. However, only one client can drive its output to write data back to the host at any given time.

A client device is selected when the host asserts its NSS signal. If multiple client devices exist, the host generates a separate client select signal for each client (NPCS).

The SPI system consists of two data lines and two control lines:

- Host Out Client In (MOSI)—This data line supplies the output data from the host shifted into the input(s) of the client(s).
- Host In Client Out (MISO)—This data line supplies the output data from a client to the input of the host. There may be no more than one client transmitting data during any particular transfer.
- Serial Clock (SPCK)—This control line is driven by the host and regulates the flow of the data bits. The host can transmit data at a variety of baud rates; there is one SPCK pulse for each bit that is transmitted.
- Client Select (NSS)—This control line allows clients to be turned on and off by hardware.

The Two-wire Interface (TWI) interconnects components on a unique two-wire bus, made up of one clock line and one data line based on a byte-oriented transfer format. It can be used with any Two-wire Interface bus Serial EEPROM and I2C-compatible devices, such as a Real-Time Clock (RTC), Dot Matrix/Graphic LCD Controller and temperature sensor. The TWI is programmable as a host or a client with sequential or single-byte access. Multiple host capability is supported.

Arbitration of the bus is performed internally and puts the TWI in Client mode automatically if the bus arbitration is lost.

A configurable baud rate generator permits the output data rate to be adapted to a wide range of core clock frequencies.

The following table lists the compatibility level of any TWI in Host mode and a full I2C compatible device.

**Table 58.1.** TWI Compatibility with I2C Standard

I2C Standard	TWI
Standard mode speed (100 kHz)	Host, Multi-Host, Client supported
Fast mode speed (400 kHz)	Host, Multi-Host, Client supported
Fast mode Plus speed (1 MHz)	Host, Multi-Host, Client supported
High-speed mode (3.4 MHz)	Host, Client supported
7- or 10-bit <sup>(1)</sup> Client addressing	Supported
Repeated Start (Sr) condition	Supported
ACK and NACK management	Supported
Input filtering	Supported
Slope control	Not supported
Clock stretching	Supported

**Note:**

1. 10-bit support in Host mode only.

## 58.2. Embedded Characteristics

### 58.2.1. USART/UART Characteristics

- 16-data Transmit and Receive FIFOs
- Programmable Baud Rate Generator
- Baud Rate can be Independent of the Processor/Peripheral Clock
- Comparison Function on Received Character
- 5-bit to 9-bit Full-duplex Synchronous or Asynchronous Serial Communications
  - 1, 1.5 or 2 stop bits in Asynchronous mode or 1 or 2 stop bits in Synchronous mode
  - Parity generation and error detection
  - Framing error detection, overrun error detection
  - Digital filter on receive line
  - MSB- or LSB-first
  - Optional break generation and detection
  - By 8 or by 16 oversampling receiver frequency
  - Optional hardware handshaking RTS-CTS
  - Receiver timeout and transmitter timeguard
  - Optional Multidrop mode with address generation and detection
- RS485 with Driver Control Signal
- ISO7816, T = 0 or T = 1 Protocols for Interfacing with Smart Cards
  - NACK handling, error counter with repetition and iteration limit
- IrDA Modulation and Demodulation
  - Communication at up to 115.2 kbit/s
- Up to 16-bit data, Manchester-encoded Frame Support

- LIN Mode
  - Compliant with LIN 1.3 and LIN 2.0 specifications
  - Host or client
  - Processing of frames with up to 256 data bytes
  - Response data length can be configurable or defined automatically by the identifier
  - Self-synchronization in client node configuration
  - Automatic processing and verification of the “synch break” and the “synch field”
  - “Synch break” detection even when partially superimposed with a data byte
  - Automatic identifier parity calculation/sending and verification
  - Parity sending and verification can be disabled
  - Automatic checksum calculation/sending and verification
  - Checksum sending and verification can be disabled
  - Support both “classic” and “enhanced” checksum types
  - Full LIN error checking and reporting
  - Frame Slot mode: host allocates slots to the scheduled frames automatically
  - Generation of the wakeup signal
- LON Mode
  - Compliant with CEA-709 specification
  - Full-layer 2 implementation
  - Differential Manchester encoding/decoding (CDP)
  - Preamble generation including bit- and byte-sync fields
  - LON timings handling (beta1, beta2, IDT, etc.)
  - CRC generation and checking
  - Automated random number generation
  - Backlog calculation and update
  - Collision detection support
  - Supports both comm\_type = 1 and comm\_type = 2 modes
  - Clock drift tolerance up to 16%
  - Optimal for node-to-node communication (no embedded digital line filter)
- Test Modes
  - Remote Loopback, Local Loopback, Automatic Echo
- Supports Connection of:
  - Two DMA Controller (DMAC) channels
  - Offers buffer transfer without processor intervention
- Functional Safety: Protection, Monitors and Reports
  - Register Write protection
  - Reports any write-protected access

### 58.2.2. SPI Characteristics

- 16-data Transmit and Receive FIFOs
- Host or Client Serial Peripheral Bus Interface
  - 8-bit to 16-bit programmable data length per chip select

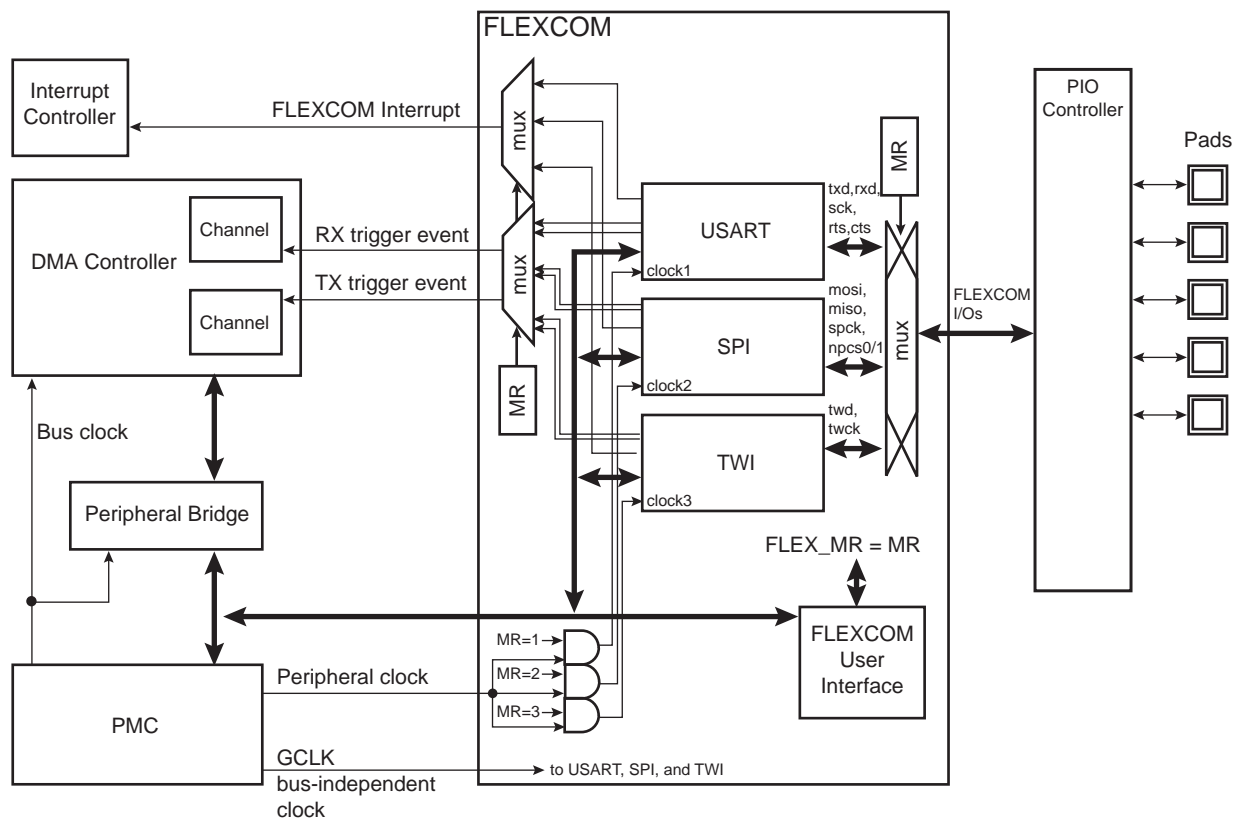

- Programmable phase and polarity per chip select
- Programmable transfer delay between consecutive transfers and delay before SPI clock per chip select
- Programmable delay between chip selects
- Selectable Mode Fault Detection
- Host Mode Can Drive SPCK up to Peripheral Clock
- Host Mode Bit Rate Can Be Independent of the Processor/Peripheral Clock
- Client Mode Operates on SPCK, Asynchronously with Core and Bus Clock
- Four Chip Selects with External Decoder Support Allow Communication with up to 15Peripherals
- Communication with Serial External Devices Supported
  - Serial memories, such as DataFlash and 3-wire EEPROMs
  - Serial peripherals, such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - External coprocessors
- Connection to DMA Channels Optimizes Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Functional Safety: Protection, Monitors and Reports
  - Register Write protection
  - Reports any write-protected access

### 58.2.3. TWI/SMBus Characteristics

- 16-byte Transmit and Receive FIFOs
- Bit Rate can be Independent of the Processor/Peripheral Clock
- SMBus Support
- Compatible with I<sup>2</sup>C Compatible Devices<sup>(1)</sup>
- One, Two or Three Bytes for Client Address
- Sequential Read/Write Operations
- General Call Supported in Client Mode
- Connection to DMA Controller Channels Optimizes Data Transfers
  - One channel for the receiver
  - One channel for the transmitter
- Functional Safety: Protection, Monitors and Reports
  - Register Write protection
  - Reports any write-protected access
- **Note:**
  - a. See table [TWI Compatibility with I2C Standard](#) for further details.

## 58.3. Block Diagram

Figure 58.1. FLEXCOM Block Diagram

## 58.4. I/O Lines Description

Table 58.2. I/O Lines Description

Name	Function	Signal Name by Mode					
		SPI	TWI	2-Wire UART	4-Wire UART	USART	ISO7816
FLEXCOM_IO0	Transmit Data	MOSI	TWD	TXD	TXD	TXD	TXD
FLEXCOM_IO1	Receive Data	MISO	TWCK	RXD	RXD	RXD	
FLEXCOM_IO2	Serial Clock	SPCK	-	-	-	SCK	SCK
FLEXCOM_IO3	Clear to send/Chip Select	NPCS0/NSS	-	-	CTS	-	-
FLEXCOM_IO4	Request to send/Chip Select	NPCS1	-	-	RTS	-	-
FLEXCOM_IO5	Chip Select	NPCS2	-	-	-	-	-
FLEXCOM_IO6	Chip Select	NPCS3	-	-	-	-	-

## 58.5. Product Dependencies

### 58.5.1. I/O Lines

The pins used for interfacing the FLEXCOM are multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired FLEXCOM pins to their peripheral function. If I/O lines of the FLEXCOM are not used by the application, they can be used for other purposes by the PIO Controller.

### 58.5.2. Power Management

The peripheral clock is not continuously provided to the FLEXCOM. The programmer must first enable the FLEXCOM Clock in the Power Management Controller (PMC) before using the USART or SPI or TWI.

### 58.5.3. Interrupt Sources

The FLEXCOM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the FLEXCOM interrupt requires the Interrupt Controller to be programmed first.

## 58.6. Register Accesses

Register accesses support 8-bit, 16-bit and 32-bit access, allowing, for example, an 8-bit part of a 32-bit register to be written in one access. To do so, the access must be done with the right size at the right address.

8-bit, 16-bit and 32-bit accesses are supported for register accesses. However, a field in a register cannot be partially written (for example, if a field is bigger than 8 bits, the whole field must be written).

This feature avoids a read-modify-write process if only a small part of the register is to be modified.

## 58.7. USART Functional Description

### 58.7.1. Baud Rate Generator

The baud rate generator provides the bit period clock named “baud rate clock” to both the receiver and the transmitter.

Configuring the USCLKS field in FLEX\_US\_MR selects the baud rate generator clock from one of the following sources:

- the peripheral clock
- a division of the peripheral clock, the divider being product dependent, but generally set to 8
- a fully programmable generic clock (GCLK) provided by PMC and independent of processor/peripheral clock
- the external clock, available on the SCK pin

The baud rate generator is based upon a 16-bit divider, which is programmed with the CD field of the Baud Rate Generator register (FLEX\_US\_BRGR). If a zero is written to CD, the baud rate generator does not generate any clock. If a one is written to CD, the divider is bypassed and becomes inactive.

If the external SCK clock is selected, the duration of the low and high levels of the signal provided on the SCK pin must be longer than a peripheral clock period. The frequency of the signal provided on SCK must follow constraints depending on the operating mode (see [Baud Rate in Synchronous Mode](#)).

If GCLK is selected, the baud rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the USART transfer. The GCLK frequency must be at least three times lower than peripheral clock frequency.

If GCLK is selected (USCLKS = 2) and the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.

**Figure 58.2.** Baud Rate Generator

### 58.7.1.1.Baud Rate in Asynchronous Mode

If the USART is programmed to operate in Asynchronous mode, the selected clock is first divided by CD, which is field-programmed in FLEX\_US\_BRGR. The resulting clock is provided to the receiver as a sampling clock and then divided by 16 or 8, depending on the programming of FLEX\_US\_MR.OVER.

If OVER is set, the receiver sampling is eight times higher than the baud rate clock. If OVER is cleared, the sampling is performed at 16 times the baud rate clock.

The baud rate is calculated as per the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{(8(2 - \text{OVER})\text{CD})}$$

This gives a maximum baud rate of peripheral clock divided by 8, assuming that peripheral clock is the highest possible clock and that the OVER bit is set.

#### 58.7.1.1.1.Baud Rate Calculation Example

The following table shows calculations of CD to obtain a baud rate at 38,400 bit/s for different source clock frequencies. It also shows the actual resulting baud rate and the error.

**Table 58.3.** Baud Rate Example (OVER = 0)

Source Clock (MHz)	Expected Baud Rate (bit/s)	Calculation Result	CD	Actual Baud Rate (bit/s)	Error
3,686,400	38,400	6.00	6	38,400.00	0.00%
4,915,200	38,400	8.00	8	38,400.00	0.00%
5,000,000	38,400	8.14	8	39,062.50	1.70%
7,372,800	38,400	12.00	12	38,400.00	0.00%
8,000,000	38,400	13.02	13	38,461.54	0.16%
12,000,000	38,400	19.53	20	37,500.00	2.40%
12,288,000	38,400	20.00	20	38,400.00	0.00%
14,318,180	38,400	23.30	23	38,908.10	1.31%
14,745,600	38,400	24.00	24	38,400.00	0.00%
18,432,000	38,400	30.00	30	38,400.00	0.00%
24,000,000	38,400	39.06	39	38,461.54	0.16%
24,576,000	38,400	40.00	40	38,400.00	0.00%
25,000,000	38,400	40.69	40	38,109.76	0.76%
32,000,000	38,400	52.08	52	38,461.54	0.16%
32,768,000	38,400	53.33	53	38,641.51	0.63%

.....continued

Source Clock (MHz)	Expected Baud Rate (bit/s)	Calculation Result	CD	Actual Baud Rate (bit/s)	Error
33,000,000	38,400	53.71	54	38,194.44	0.54%
40,000,000	38,400	65.10	65	38,461.54	0.16%
50,000,000	38,400	81.38	81	38,580.25	0.47%

The baud rate is calculated with the following formula:

$$\text{Baud rate} = \text{MCK} / \text{CD} \times 16$$

The baud rate error is calculated with the following formula. It is not recommended to work with an error higher than 5%.

$$\text{Error} = 1 - \left( \frac{\text{Expected Baud Rate}}{\text{Actual Baud Rate}} \right)$$

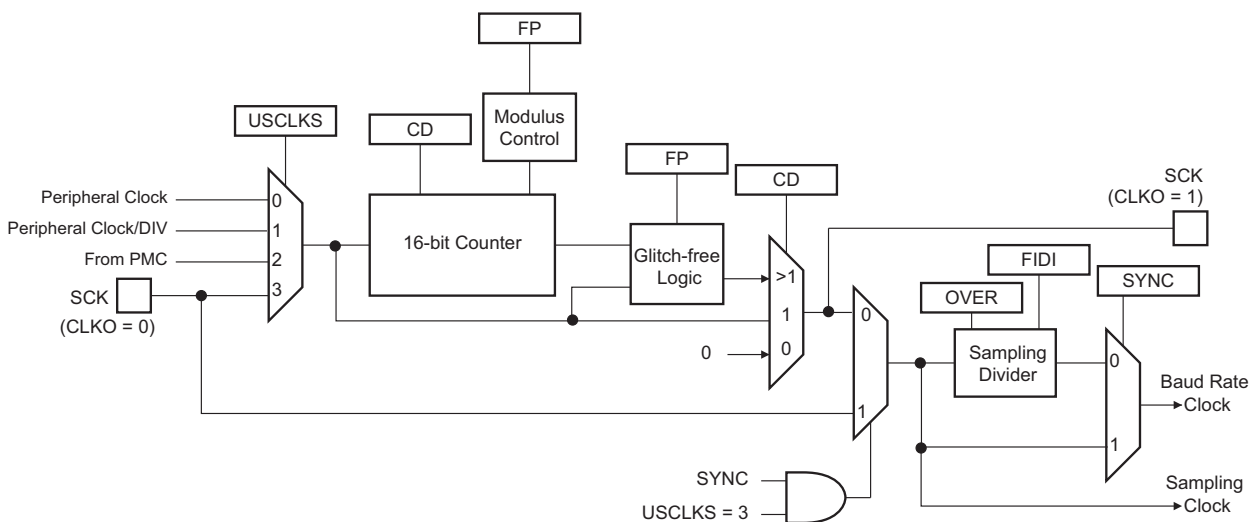

### 58.7.1.2. Fractional Baud Rate in Asynchronous Mode

The baud rate generator previously defined is subject to the following limitation: the output frequency changes by only integer multiples of the reference frequency. An approach to this problem is to integrate a fractional N clock generator that has a high resolution. The generator architecture is modified to obtain baud rate changes by a fraction of the reference source clock. This fractional part is programmed with the FP field in FLEX\_US\_BRGR. If FP is not 0, the fractional part is activated. The resolution is one eighth of the clock divider. The fractional baud rate is calculated using the following formula:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\left( 8(2 - \text{OVER})(\text{CD} + \frac{\text{FP}}{8}) \right)}$$

The modified architecture is presented in the following figure.

**Figure 58.3.** Fractional Baud Rate Generator

**WARNING**

When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

### 58.7.1.3. Baud Rate in Synchronous Mode

If the USART is programmed to operate in Synchronous mode, the selected clock is simply divided by the CD field in FLEX\_US\_BRGR:

$$\text{Baud rate} = \frac{\text{Selected Clock}}{\text{CD}}$$

In Synchronous mode, if the external clock is selected (USCLKS = 3) and CLKO = 0 (Client mode), the clock is provided directly by the signal on the USART SCK pin. No division is active. The value written in FLEX\_US\_BRGR has no effect. When operating in asynchronous modes and the SCK pin is selected for baud rate generation, the external clock frequency must be at least three times lower than the system clock.

In Synchronous mode, SCK must be lower than  $f_{\text{peripheral clock}}/6$ .

**Note:** In Transmit only Synchronous mode (FLEX\_US\_CR.TXEN=1, FLEX\_US\_CR.RXDIS=1, FLEX\_US\_MR.SYNC=1, USCLKS=3), the transmit path (TXD) can be operated at  $f_{\text{peripheral clock}}/3$ .

When either the external clock SCK or the internal clock divided (peripheral clock/DIV or GCLK) is selected and if the user has to ensure a 50:50 mark/space ratio on the SCK pin, the value programmed in CD must be even. If the peripheral clock is selected and if the value programmed in CD is odd, the baud rate generator ensures a 50:50 duty cycle on the SCK pin.

### 58.7.1.4. Baud Rate in ISO 7816 Mode

The ISO7816 specification defines the bit rate with the following formula:

$$B = \frac{D_i}{F_i} \times f$$

where:

- B is the bit rate
- $D_i$  is the bit rate adjustment factor
- $F_i$  is the clock frequency division factor
- f is the ISO7816 clock frequency (Hz)

$D_i$  is a binary value encoded on a 4-bit field, named DI, as represented in the following table.

**Table 58.4.** Binary and Decimal Values for  $D_i$

DI field	0001	0010	0011	0100	0101	0110	1000	1001
$D_i$ (decimal)	1	2	4	8	16	32	12	20

$F_i$  is a binary value encoded on a 4-bit field, named FI, as represented in the following table.

**Table 58.5.** Binary and Decimal Values for  $F_i$

FI field	0000	0001	0010	0011	0100	0101	0110	1001	1010	1011	1100	1101
$F_i$ (decimal)	372	372	558	744	1116	1488	1860	512	768	1024	1536	2048

The following table shows the resulting  $F_i/D_i$  Ratio, which is the ratio between the ISO7816 clock and the baud rate clock.

**Table 58.6.** Possible Values for the  $F_i/D_i$  Ratio

$F_i/D_i$	372	558	744	1116	1488	1806	512	768	1024	1536	2048
1	372	558	744	1116	1488	1860	512	768	1024	1536	2048
2	186	279	372	558	744	930	256	384	512	768	1024
4	93	139.5	186	279	372	465	128	192	256	384	512
8	46.5	69.75	93	139.5	186	232.5	64	96	128	192	256
16	23.25	34.87	46.5	69.75	93	116.2	32	48	64	96	128

32	11.62	17.43	23.25	34.87	46.5	58.13	16	24	32	48	64
12	31	46.5	62	93	124	155	42.66	64	85.33	128	170.6
20	18.6	27.9	37.2	55.8	74.4	93	25.6	38.4	51.2	76.8	102.4

If the USART is configured in ISO7816 mode, the clock selected by the USCLKS field in FLEX\_US\_MR is first divided by the value programmed in field CD field in FLEX\_US\_BRGR. The resulting clock can be provided to the SCK pin to feed the smart card clock inputs. This means that FLEX\_US\_MR.CLKO can be set.

This clock is then divided by the value programmed in the FI\_DI\_RATIO field in the FI DI Ratio register (FLEX\_US\_FIDI). This is performed by the Sampling Divider, which performs a division by up to 65535 in ISO7816 mode. The noninteger values of the Fi/Di Ratio are not supported and the user must program the FI\_DI\_RATIO field to a value as close as possible to the expected value.

The FI\_DI\_RATIO field resets to the value 0x174 (372 in decimal) and is the most common divider between the ISO7816 clock and the bit rate (Fi = 372, Di = 1).

The following figure shows the relation between the Elementary Time Unit, corresponding to a bit time, and the ISO7816 clock.

**Figure 58.4.** Elementary Time Unit (ETU)

### 58.7.2. Receiver and Transmitter Control

After reset, the receiver is disabled. The user must enable the receiver by setting the RXEN bit in the USART Control register (FLEX\_US\_CR). However, the receiver registers can be programmed before the receiver clock is enabled.

After reset, the transmitter is disabled. The user must enable it by setting the TXEN bit in FLEX\_US\_CR. However, the transmitter registers can be programmed before being enabled.

The receiver and the transmitter can be enabled together or independently.

At any time, the software can perform a reset on the receiver or the transmitter of the USART by setting the corresponding bit, RSTRX and RSTTX respectively, in FLEX\_US\_CR. The software resets clear the status flag and reset internal state machines but the user interface configuration registers hold the value configured prior to software reset. Regardless of what the receiver or the transmitter is performing, the communication is immediately stopped.

The user can also independently disable the receiver or the transmitter by setting RXDIS and TXDIS respectively in FLEX\_US\_CR. If the receiver is disabled during a character reception, the USART waits until the end of reception of the current character, then the reception is stopped. If the transmitter is disabled while it is operating, the USART waits the end of transmission of both the current character and character being stored in the USART Transmit Holding register (FLEX\_US\_THR). If a timeguard is programmed, it is handled normally.

### 58.7.3. Synchronous and Asynchronous Modes

#### 58.7.3.1. Transmitter Operations

The transmitter performs the same in both Synchronous and Asynchronous operating modes (SYNC = 0 or SYNC = 1). One start bit, up to 9 data bits, 1 optional parity bit and up to 2 stop bits are successively shifted out on the TXD pin at each falling edge of the programmed serial clock.

The number of data bits is selected by the CHRL field and the MODE9 bit in FLEX\_US\_MR. Nine bits are selected by setting the MODE9 bit regardless of the CHRL field. The parity bit is set according to the PAR field in FLEX\_US\_MR. The even, odd, space, marked or none parity bit can be configured. The MSBF bit in FLEX\_US\_MR configures which data bit is sent first. If written to 1, the most significant bit is sent first. If written to 0, the less significant bit is sent first. The number of stop bits is selected by the NBSTOP field in FLEX\_US\_MR. The 1.5 stop bit is supported in Asynchronous mode only.

**Figure 58.5.** Character Transmit

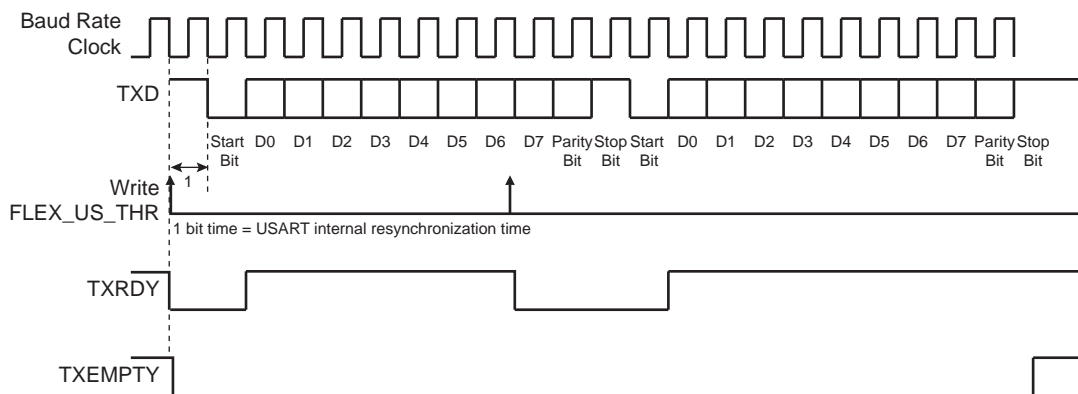

Example: 8-bit, Parity Enabled One Stop

The characters are sent by writing in FLEX\_US\_THR. The transmitter reports two status bits in the USART Channel Status register (FLEX\_US\_CSR): TXRDY (Transmitter Ready), which indicates that FLEX\_US\_THR is empty and TXEMPTY, which indicates that all the characters written in FLEX\_US\_THR have been processed. When the current character processing is completed, the last character written in FLEX\_US\_THR is transferred into the shift register of the transmitter and FLEX\_US\_THR is emptied, thus TXRDY rises.

Both TXRDY and TXEMPTY bits are low when the transmitter is disabled. Writing a character in FLEX\_US\_THR while TXRDY is low has no effect and the written character is lost.

**Figure 58.6.** Transmitter Status

#### 58.7.3.2. Manchester Encoder

When the Manchester encoder is in use, characters transmitted through the USART are encoded based on biphase Manchester II format. To enable this mode, set the FLEX\_US\_MR.MAN bit to 1. Depending on polarity configuration, a logic level (zero or one), is transmitted as a coded signal one-to-zero or zero-to-one. Thus, a transition always occurs at the midpoint of each bit time. It consumes more bandwidth than the original NRZ signal (2x) but the receiver has more error control since the expected input must show a change at the center of a bit cell. An example of Manchester

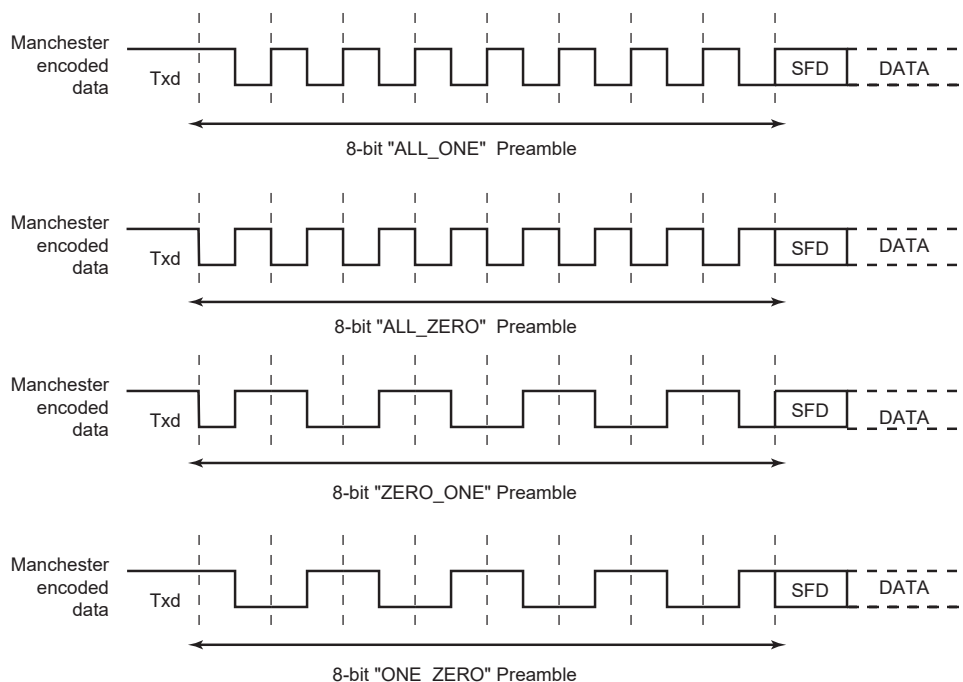

encoded sequence is: the byte 0xB1 or 10110001 encodes to 10 01 10 10 01 01 01 10, assuming the default polarity of the encoder. The following figure illustrates this coding scheme.

**Figure 58.7.** NRZ to Manchester Encoding

The Manchester encoded character can also be encapsulated by adding both a configurable preamble and a start frame delimiter pattern. Depending on the configuration, the preamble is a training sequence, composed of a predefined pattern with a programmable length from 1 to 15 bit times. If the preamble length is set to 0, the preamble waveform is not generated prior to any character. The preamble pattern is chosen among the following sequences: ALL\_ONE, ALL\_ZERO, ONE\_ZERO or ZERO\_ONE, writing the FLEX\_US\_MAN.TX\_PP field. The TX\_PL field is used to configure the preamble length. The following figure illustrates and defines the valid patterns. To improve flexibility, the encoding scheme can be configured using the FLEX\_US\_MAN.TX\_MPOL bit. If the TX\_MPOL bit is set to zero (default), a logic zero is encoded with a zero-to-one transition and a logic one is encoded with a one-to-zero transition. If the TX\_MPOL bit is set to one, a logic one is encoded with a one-to-zero transition and a logic zero is encoded with a zero-to-one transition.

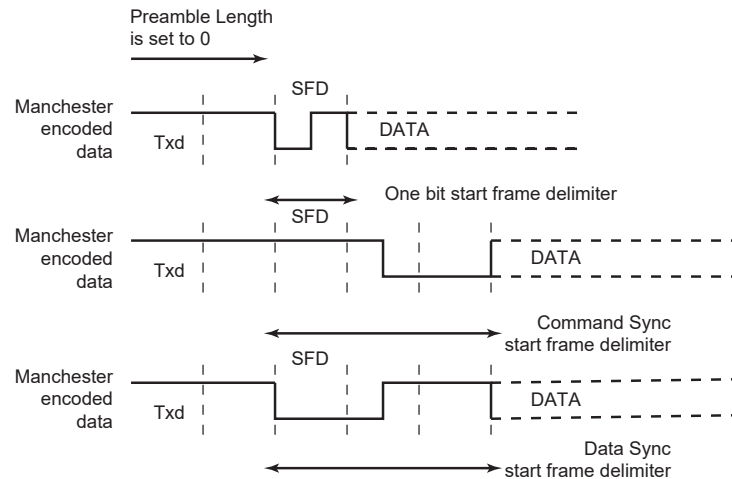

**Figure 58.8.** Preamble Patterns, Default Polarity Assumed

A start frame delimiter is to be configured using the FLEX\_US\_MR.ONEBIT bit. It consists of a user-defined pattern that indicates the beginning of a valid data. The following figure illustrates these patterns. If the start frame delimiter, also known as the start bit, is one bit, (ONEBIT = 1), a logic zero is Manchester encoded and indicates that a new character is being sent serially on the line. If the start frame delimiter is a synchronization pattern also referred to as sync (ONEBIT = 0), a sequence of three bit times is sent serially on the line to indicate the start of a new character. The sync waveform is in itself an invalid Manchester waveform as the transition occurs at the middle of the second bit time. Two distinct sync patterns are used: the command sync and the data sync. The command sync has a logic one level for one and a half bit times, then a transition to logic zero for

the second one and a half bit times. If the FLEX\_US\_MR.MODSYNC bit is set to 1, the next character is a command. If it is set to 0, the next character is a data. When direct memory access is used, the MODSYNC bit can be immediately updated with a modified character located in memory. To enable this mode, the FLEX\_US\_MR.VAR\_SYNC bit must be set. In this case, the FLEX\_US\_MR.MODSYNC bit is bypassed and the sync configuration is held in the FLEX\_US\_THR.TXSYNH bit. The USART character format is modified and includes sync information.

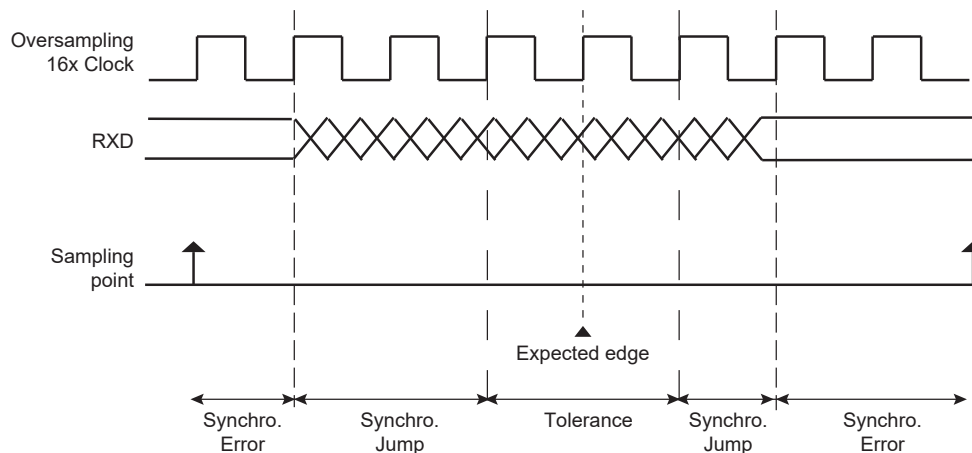

**Figure 58.9. Start Frame Delimiter**

### 58.7.3.2.1. Drift Compensation

Drift compensation is available only in 16X Oversampling mode. An hardware recovery system allows a larger clock drift. To enable the hardware system, the bit in the FLEX\_US\_MAN register must be set. If the RXD edge is one 16X clock cycle from the expected edge, this is considered as normal jitter and no corrective actions is taken. If the RXD event is between 4 and 2 clock cycles before the expected edge, then the current period is shortened by one clock cycle. If the RXD event is between 2 and 3 clock cycles after the expected edge, then the current period is lengthened by one clock cycle. These intervals are considered to be drift and so corrective actions are automatically taken.

**Figure 58.10. Bit Resynchronization**

### 58.7.3.3. Asynchronous Receiver

If the USART is programmed in Asynchronous operating mode (SYNC = 0), the receiver oversamples the RXD input line. The oversampling is either 16 or 8 times the baud rate clock, depending on the FLEX\_US\_MR.OVER bit.

The receiver samples the RXD line. If the line is sampled during one half of a bit time to 0, a start bit is detected and data, parity and stop bits are successively sampled on the bit rate clock.

If the oversampling is 16 (OVER = 0), a start is detected at the eighth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 16 oversampling clock cycles. If the oversampling is 8 (OVER = 1), a start bit is detected at the fourth sample to 0. Data bits, parity bit and stop bit are assumed to have a duration corresponding to 8 oversampling clock cycles.

The number of data bits, first bit sent and Parity mode are selected by the same fields and bits as the transmitter, i.e., respectively CHRL, MODE9, MSBF and PAR. For the synchronization mechanism only, the number of stop bits has no effect on the receiver as it considers only one stop bit, regardless of the NBSTOP field, so that resynchronization between the receiver and the transmitter can occur. Moreover, as soon as the stop bit is sampled, the receiver starts looking for a new start bit so that resynchronization can also be accomplished when the transmitter is operating with one stop bit.

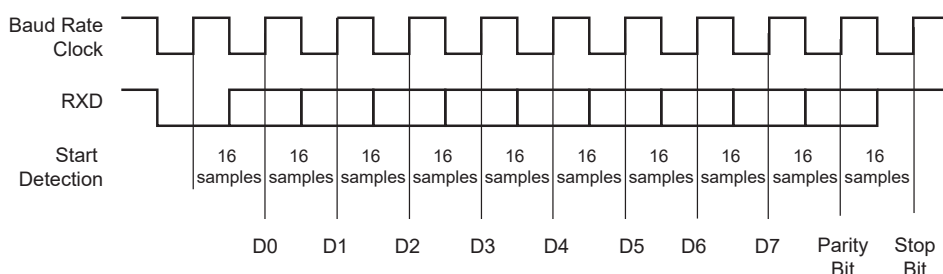

The following figures illustrate start detection and character reception when USART operates in Asynchronous mode.

**Figure 58.11. Asynchronous Start Detection**

**Figure 58.12. Asynchronous Character Reception**

Example: 8-bit, Parity Enabled

#### 58.7.3.4. Manchester Decoder

When the FLEX\_US\_MR.MAN bit is set, the Manchester decoder is enabled. The decoder performs both preamble and start frame delimiter detection. One input line is dedicated to Manchester encoded input data.

An optional preamble sequence can be defined. Its length is user-defined and totally independent of the transmitter side. Use the FLEX\_US\_MAN.RX\_PL field to configure the length of the preamble

sequence. If the length is set to 0, no preamble is detected and the function is disabled. In addition, the polarity of the input stream is programmable with the FLEX\_US\_MAN.RX\_MPOL bit. Depending on the desired application, the preamble pattern matching is to be defined via the FLEX\_US\_MAN.RX\_PP field. See figure [Preamble Patterns, Default Polarity Assumed](#) for available preamble patterns.

Unlike preamble, the start frame delimiter is shared between Manchester Encoder and Decoder. So, if ONEBIT bit = 1, only a zero encoded Manchester can be detected as a valid start frame delimiter. If ONEBIT = 0, only a sync pattern is detected as a valid start frame delimiter. Decoder operates by detecting transition on incoming stream. If RXD is sampled during one quarter of a bit time to zero, a start bit is detected. See the following figure. The sample pulse rejection mechanism applies.

The FLEX\_US\_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive). The user must define RXIDLEV to ensure reliable synchronization. By default, RXIDLEV is set to one (receiver line is at level 1 when there is no activity).

**Figure 58.13.** Asynchronous Start Bit Detection

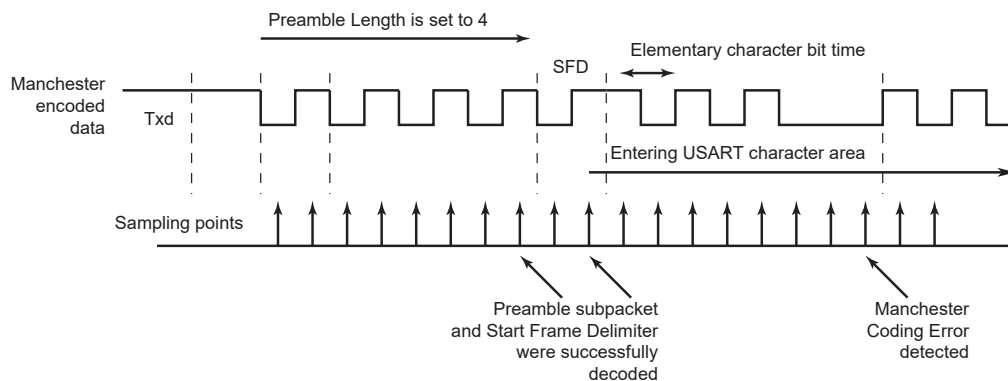

The receiver is activated and starts preamble and frame delimiter detection, sampling the data at one quarter and then three quarters. If a valid preamble pattern or start frame delimiter is detected, the receiver continues decoding with the same synchronization. If the stream does not match a valid pattern or a valid start frame delimiter, the receiver resynchronizes on the next valid edge. The minimum time threshold to estimate the bit value is three quarters of a bit time.

If a valid preamble (if used) followed with a valid start frame delimiter is detected, the incoming stream is decoded into NRZ data and passed to USART for processing. The following figure illustrates Manchester pattern mismatch. When incoming data stream is passed to the USART, the receiver is also able to detect Manchester code violation. A code violation is a lack of transition in the middle of a bit cell. In this case, the MANE flag in FLEX\_US\_CSR is raised. It is cleared by writing a one to FLEX\_US\_CR.RSTSTA. See figure "Manchester Error Flag" below for an example of Manchester error detection during the data phase.

**Figure 58.14.** Preamble Pattern Mismatch

**Figure 58.15. Manchester Error Flag**

When the start frame delimiter is a sync pattern (ONEBIT = 0), both command and data delimiter are supported. If a valid sync is detected, the received character is written as RXCHR field in the Receive Holding register (FLEX\_US\_RHR) and the RXSYNH is updated. RXCHR is set to 1 when the received character is a command, and it is set to 0 if the received character is a data. This mechanism alleviates and simplifies the direct memory access as the character contains its own sync field in the same register.

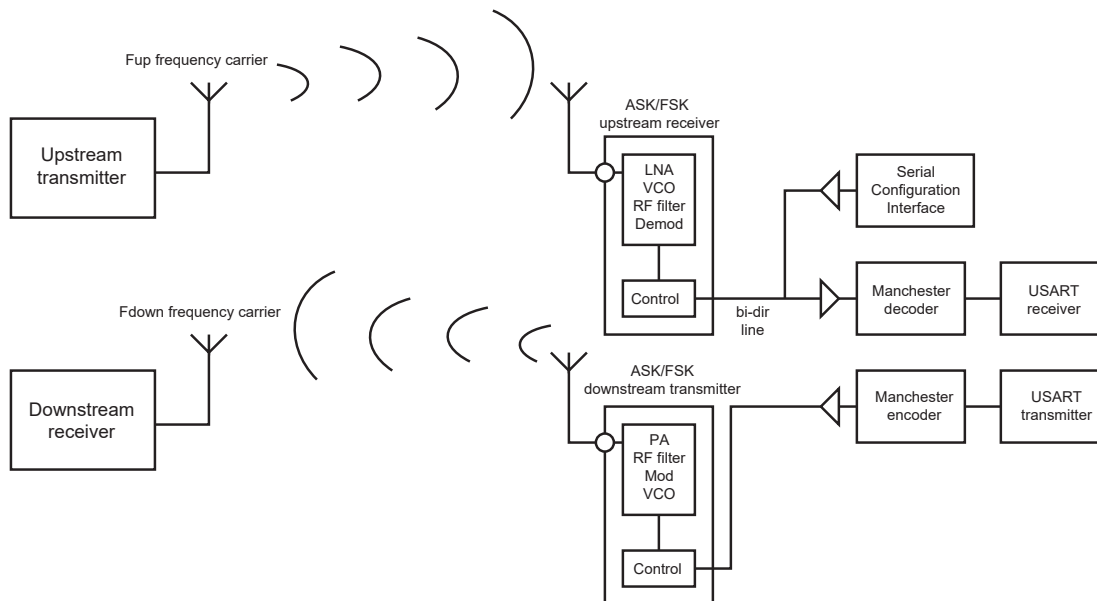

As the decoder is setup to be used in Unipolar mode, the first bit of the frame has to be a zero-to-one transition.

### 58.7.3.5. Radio Interface: Manchester Encoded USART Application

This section describes low data rate RF transmission systems and their integration with a Manchester encoded USART. These systems are based on transmitter and receiver ICs that support ASK and FSK modulation schemes.

The goal is to perform full-duplex radio transmission of characters using two different frequency carriers. See configuration in the following figure.

**Figure 58.16. Manchester Encoded Characters RF Transmission**

The USART peripheral is configured as a Manchester encoder/decoder. Looking at the downstream communication channel, Manchester encoded characters are serially sent to the RF transmitter. This may also include a user defined preamble and a start frame delimiter. Mostly, preamble is used in

the RF receiver to distinguish between a valid data from a transmitter and signals due to noise. The Manchester stream is then modulated. See the following figure for an example of ASK modulation scheme. When a logic one is sent to the ASK modulator, the power amplifier, referred to as PA, is enabled and transmits an RF signal at downstream frequency. When a logic zero is transmitted, the RF signal is turned off. If the FSK modulator is activated, two different frequencies are used to transmit data. When a logic 1 is sent, the modulator outputs an RF signal at frequency  $F_0$  and switches to  $F_1$  if the data sent is a 0. See figure "FSK Modulator Output" below.

From the receiver side, another carrier frequency is used. The RF receiver performs a bit check operation examining demodulated data stream. If a valid pattern is detected, the receiver switches to Receiving mode. The demodulated stream is sent to the Manchester decoder. Because of bit checking inside RF IC, the data transferred to the microcontroller is reduced by a user-defined number of bits. The Manchester preamble length is to be defined in accordance with the RF IC configuration.

**Figure 58.17. ASK Modulator Output**

**Figure 58.18. FSK Modulator Output**

### 58.7.3.6. Synchronous Receiver

In Synchronous mode ( $\text{SYNC} = 1$ ), the receiver samples the RXD signal on each rising edge of the baud rate clock. If a low level is detected, it is considered as a start. All data bits, the parity bit and the stop bits are sampled and the receiver waits for the next start bit. Synchronous mode operations provide a high-speed transfer capability.

Configuration fields and bits are the same as in Asynchronous mode.

The following figure illustrates a character reception in Synchronous mode.

**Figure 58.19.** Synchronous Mode Character Reception

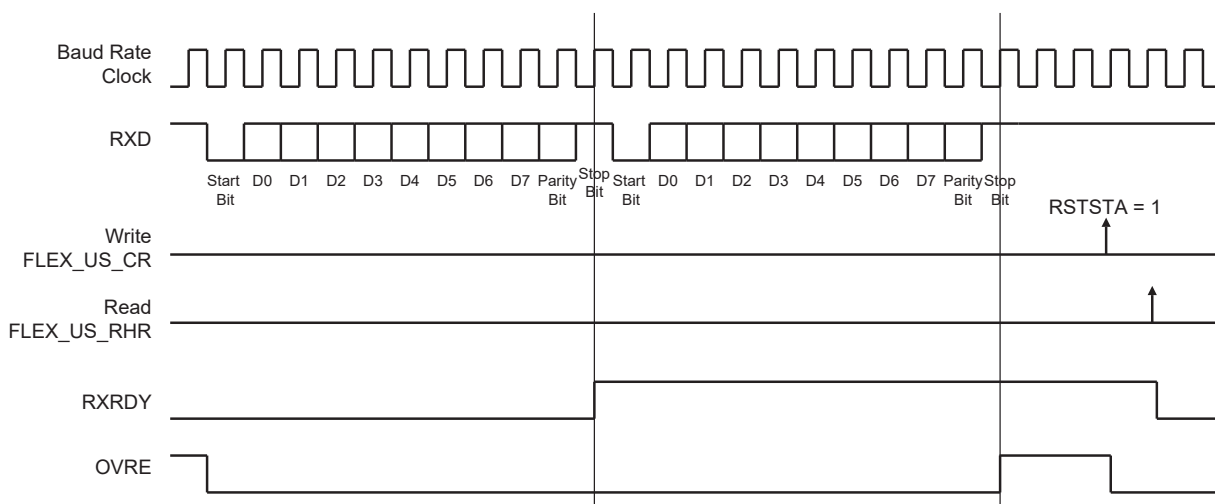

Example: 8-bit, Parity Enabled 1 Stop

### 58.7.3.7.Receiver Operations

When a character reception is completed, it is transferred to the Receive Holding register (FLEX\_US\_RHR) and the FLEX\_US\_CSR.RXRDY bit is raised. If a character is completed while the RXRDY is set, the Overrun Error (OVRE) bit is set. The last character is transferred into FLEX\_US\_RHR and overwrites the previous one. The OVRE bit is cleared by writing a one to Reset Status bit FLEX\_US\_CR.RSTSTA.

**Figure 58.20.** Receiver Status

### 58.7.3.8.Parity

The USART supports five parity modes that are selected by writing to the FLEX\_US\_MR.PAR field. The PAR field also enables the Multidrop mode (see [Multidrop Mode](#)). Even and odd parity bit generation and error detection are supported.

If even parity is selected, the parity generator of the transmitter drives the parity bit to 0 if a number of 1s in the character data bit is even, and to 1 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If odd parity is selected, the parity generator of the transmitter drives the parity bit to 1 if a number of 1s in the character data bit is even, and to 0 if the number of 1s is odd. Accordingly, the receiver parity checker counts the number of received 1s and reports a parity error if the sampled parity bit does not correspond. If the mark parity is used, the parity generator of the transmitter drives the parity bit to 1 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 0. If the space parity is used, the parity generator of the transmitter drives the parity bit to 0 for all characters. The receiver parity checker reports an error if the parity bit is sampled to 1. If parity is disabled, the transmitter does not generate any parity bit and the receiver does not report any parity error.

The following table shows an example of the parity bit for the character 0x41 (character ASCII “A”) depending on the configuration of the USART. Because there are two bits set to 1 in the character value, the parity bit is set to 1 when the parity is odd, or configured to 0 when the parity is even.

**Table 58.7.** Parity Bit Examples

Character	Hexadecimal	Binary	Parity Bit	Parity Mode
A	0x41	0100 0001	1	Odd
A	0x41	0100 0001	0	Even
A	0x41	0100 0001	1	Mark
A	0x41	0100 0001	0	Space
A	0x41	0100 0001	None	None

When the receiver detects a parity error, it sets the Parity Error bit FLEX\_US\_CSR.PARE. The PARE bit can be cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit. The following figure illustrates the parity bit status setting and clearing.

**Figure 58.21.** Parity Error

### 58.7.3.9. Multidrop Mode

If the value 0x6 or 0x07 is written to the FLEX\_US\_MR.PAR field, the USART runs in Multidrop mode. This mode differentiates the data characters and the address characters. Data are transmitted with the parity bit to 0 and addresses are transmitted with the parity bit to 1.

If the USART is configured in Multidrop mode, the receiver sets the PARE parity error bit when the parity bit is high and the transmitter is able to send a character with the parity bit high when a one is written to the FLEX\_US\_CR.SENDA bit.

To handle parity error, the PARE bit is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

The transmitter sends an address byte (parity bit set) when the FLEX\_US\_CR.SENDA bit is written to 1. In this case, the next byte written to FLEX\_US\_THR is transmitted as an address. Any character written in FLEX\_US\_THR when the SENDA command is not written is transmitted normally with parity to 0.

### 58.7.3.10. Transmitter Timeguard

The timeguard feature enables the USART interface with slow remote devices.

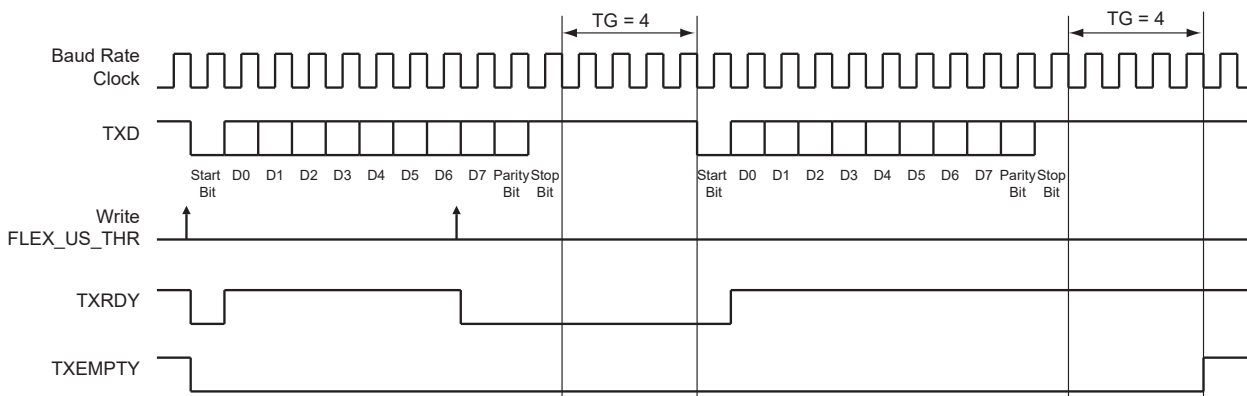

The timeguard function enables the transmitter to insert an idle state on the TXD line between two characters. This idle state actually acts as a long stop bit.

The duration of the idle state is programmed in the TG field of the Transmitter Timeguard register (FLEX\_US\_TTGR). When this field is written to zero, no timeguard is generated. Otherwise, the

transmitter holds a high level on TXD after each transmitted byte during the number of bit periods programmed in TG in addition to the number of stop bits.

As illustrated in the following figure, the behavior of the TXRDY and TXEMPTY status bits is modified by the programming of a timeguard. TXRDY rises only when the start bit of the next character is sent, and thus remains to 0 during the timeguard transmission if a character has been written in FLEX\_US\_THR. TXEMPTY remains low until the timeguard transmission is completed as the timeguard is part of the current character being transmitted.

**Figure 58.22.** Timeguard Operations

The following table indicates the maximum length of a timeguard period that the transmitter can handle in relation to the function of the baud rate.

**Table 58.8.** Maximum Timeguard Length Depending on Baud Rate

Baud Rate (bit/s)	Bit Time (μs)	Timeguard (ms)
1,200	833	212.50
9,600	104	26.56
14,400	69.4	17.71
19,200	52.1	13.28
28,800	34.7	8.85
38,400	26	6.63
56,000	17.9	4.55
57,600	17.4	4.43
115,200	8.7	2.21

### 58.7.3.11. Receiver Timeout

The Receiver Timeout provides support in handling variable-length frames. This feature detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver an end of frame.

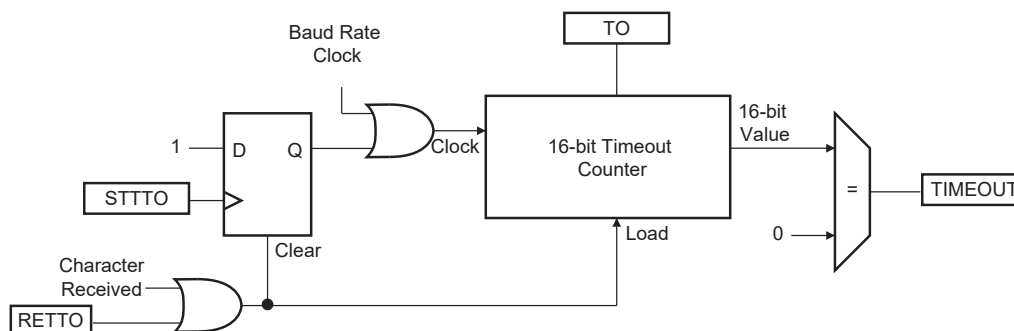

The timeout delay period (during which the receiver waits for a new character) is programmed in the TO field of the Receiver Timeout register (FLEX\_US\_RTOR). If the TO field is written to 0, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 16-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises. Then, the user can either:

- Stop the counter clock until a new character is received. This is performed by writing a '1' to FLEX\_US\_CR.STTTO. In this case, the idle state on RXD before a new character is received does not provide a timeout. This prevents having to handle an interrupt before a character is received and enables waiting for the next idle state on RXD after a frame is received.

- Obtain an interrupt while no character is received. This is performed by writing a '1' to FLEX\_US\_CR.RETTO. In this case, the counter starts counting down immediately from the value TO. This generates a periodic interrupt so that a user timeout can be handled, for example when no key is pressed on a keyboard.

The following figure shows the block diagram of the Receiver Timeout feature.

**Figure 58.23.** Receiver Timeout Block Diagram

The following table gives the maximum timeout period for some standard baud rates.

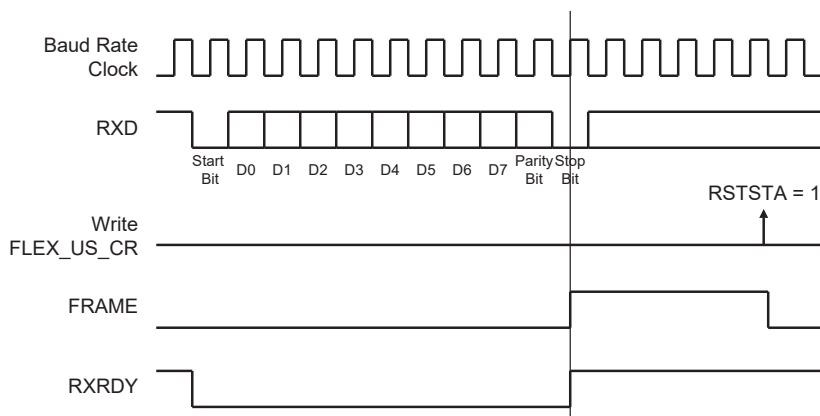

**Table 58.9.** Maximum Timeout Period

Baud Rate (bit/s)	Bit Time (μs)	Timeout (ms)
600	1,667	109,225
1,200	833	54,613
2,400	417	27,306
4,800	208	13,653
9,600	104	6,827
14,400	69	4,551
19,200	52	3,413
28,800	35	2,276
38,400	26	1,704
56,000	18	1,170
57,600	17	1,138
200,000	5	328

### 58.7.3.12. Framing Error

The receiver is capable of detecting framing errors. A framing error happens when the stop bit of a received character is detected at level 0. This can occur if the receiver and the transmitter are fully desynchronized.

A framing error is reported on the FLEX\_US\_CSR.FRAME bit. The FRAME bit is asserted in the middle of the stop bit as soon as the framing error is detected. It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 58.24.** Framing Error Status

### 58.7.3.13. Transmit Break

The user can request the transmitter to generate a break condition on the TXD line. A break condition drives the TXD line low during at least one complete character. It appears the same as a 0x00 character sent with the parity and the stop bits to 0. However, the transmitter holds the TXD line at least during one character until the user requests the break condition to be removed.

A break is transmitted by setting the FLEX\_US\_CR.STTBK bit. This can be done at any time, either while the transmitter is empty (no character in either the shift register or in FLEX\_US\_THR) or when a character is being transmitted. If a break is requested while a character is being shifted out, the character is first completed before the TXD line is held low.

Once the Start Break command is requested, further Start Break commands are ignored until the end of the break is completed.

The break condition is removed by setting the FLEX\_US\_CR.STPBK bit. If the Stop Break command is requested before the end of the minimum break duration (one character, including start, data, parity and stop bits), the transmitter ensures that the break condition completes.

The transmitter considers the break as though it is a character, i.e., the Start Break and Stop Break commands are processed only if the FLEX\_US\_CSR.TXRDY bit = 1 and the start of the break condition clears the TXRDY and TXEMPTY bits as if a character was processed.

Setting both the FLEX\_US\_CR.STTBK and FLEX\_US\_CR.STPBK bits can lead to an unpredictable result. All Stop Break commands requested without a previous Start Break command are ignored. A byte written into the Transmit Holding register while a break is pending, but not started, is ignored.

After the break condition, the transmitter returns the TXD line to 1 for a minimum of 12 bit times. Thus, the transmitter ensures that the remote receiver detects correctly the end of break and the start of the next character. If the timeguard is programmed with a value higher than 12, the TXD line is held high for the timeguard period.

After holding the TXD line for this period, the transmitter resumes normal operations.

The following figure illustrates the effect of both the Start Break (STTBK) and Stop Break (STPBK) commands on the TXD line.

**Figure 58.25.** Break Transmission

#### 58.7.3.14. Receive Break

The receiver detects a break condition when all data, parity and stop bits are low. This corresponds to detecting a framing error with data to 0x00, but FRAME remains low.

When the low stop bit is detected, the receiver asserts the FLEX\_US\_CSR.RXBRK bit.

FLEX\_US\_CSR.RXBRK may be cleared by setting the FLEX\_US\_CR.RSTSTA bit.

An end of receive break is detected by a high level for at least 2/16ths of a bit period in Asynchronous operating mode or one sample at high level in Synchronous operating mode. The end of break detection also asserts the RXBRK bit.

#### 58.7.3.15. Hardware Handshaking

The USART features a hardware handshaking out-of-band flow control. The RTS and CTS pins are used to connect with the remote device, as shown in the following figure.

**Figure 58.26.** Connection with a Remote Device for Hardware Handshaking

Setting the USART to operate with hardware handshaking is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x2.

The USART behavior when hardware handshaking is enabled is the same as the behavior in standard Synchronous or Asynchronous mode, except that the receiver drives the RTS pin as described below and the level on the CTS pin modifies the behavior of the transmitter as described below. Using this mode requires using the DMAC channel for reception. The transmitter can handle hardware handshaking in any case.

**Figure 58.27.** RTS Line Software Control when FLEX\_US\_MR.USART\_MODE = 2

The following figure shows how the transmitter operates if hardware handshaking is enabled. The CTS pin disables the transmitter. If a character is being processed, the transmitter is disabled only after the completion of the current character and transmission of the next character happens as soon as the pin CTS falls.

**Figure 58.28.** Transmitter Behavior when Operating with Hardware Handshaking

If USART FIFOs are enabled (bit FLEX\_US\_CR.FIFOEN), the RTS pin can be controlled by the USART Receive FIFO thresholds. The RTS pin control through Receive FIFO thresholds can be activated with the FLEX\_US\_FMR.FRTSC bit. Once activated, the RTS pin will be controlled by Receive FIFO thresholds, set to level 1 each time RXFTHRES is reached and set to level '0' each time RXFTHRES2 is reached (and RXFTHRES is not reached).

**Figure 58.29.** Receiver Behavior When FIFO Enabled and FRTSC Set to '1'

**Note:** In this mode, RXFTHRES must be > RXFTHRES2.

#### 58.7.4. ISO7816 Mode

The USART features an ISO7816-compatible operating mode. This mode permits interfacing with smart cards and Security Access Modules (SAM) communicating through an ISO7816 link. Both T = 0 and T = 1 protocols defined by the ISO7816 specification are supported.

Setting the USART in ISO7816 mode is performed by writing the FLEX\_US\_MR.USART\_MODE field to the value 0x4 for protocol T = 0 and to the value 0x6 for protocol T = 1.

##### 58.7.4.1. ISO7816 Mode Overview

The ISO7816 is a half-duplex communication on only one bidirectional line. The baud rate is determined by a division of the clock provided to the remote device (see figure in section [Baud Rate Generator](#)).

The USART connects to a smart card as shown in the following figure. The TXD line becomes bidirectional and the baud rate generator feeds the ISO7816 clock on the SCK pin. As the TXD pin becomes bidirectional, its output remains driven by the output of the transmitter but only when the transmitter is active while its input is directed to the input of the receiver. The USART is considered as the host of the communication as it generates the clock.

**Figure 58.30.** Connection of a Smart Card to the USART

When operating in ISO7816, either in T = 0 or T = 1 modes, the character format is partially predefined. The configuration is forced to 8 data bits, and 1 or 2 stop bits, regardless of the values programmed in the CHRL, MODE9 and CHMODE fields. MSBF can be used to transmit LSB or MSB first. The bit INVDATA can be used to transmit in Normal or Inverse mode.

The USART cannot operate concurrently in both Receiver and Transmitter modes as the communication is unidirectional at a time. It has to be configured according to the required mode by enabling or disabling either the receiver or the transmitter as desired. Enabling both the receiver and the transmitter at the same time in ISO7816 mode may lead to unpredictable results.

The ISO7816 specification defines an inverse transmission format. Data bits of the character must be transmitted on the I/O line at their negative value.

#### 58.7.4.2. Protocol T = 0

In T = 0 protocol, a character is made up of 1 start bit, 8 data bits, 1 parity bit and 1 guard time, which lasts two bit times. The transmitter shifts out the bits and does not drive the I/O line during the guard time.

If no parity error is detected, the I/O line remains at 1 during the guard time and the transmitter can continue with the transmission of the next character, as shown in the following figure.

If a parity error is detected by the receiver, it drives the I/O line to 0 during the guard time, as shown in figure "T = 0 Protocol with Parity Error" below. This error bit is also named NACK, for Non Acknowledge. In this case, the character lasts 1 bit time more, as the guard time length is the same and is added to the error bit time which lasts 1 bit time.

When the USART is the receiver and it detects an error, it does not load the erroneous character in the Receive Holding register (FLEX\_US\_RHR). It appropriately sets the PARE bit in the Status register (FLEX\_US\_CSR) so that the software can handle the error.

**Figure 58.31.** T = 0 Protocol without Parity Error

**Figure 58.32.** T = 0 Protocol with Parity Error

#### 58.7.4.2.1.Receive Error Counter

The USART receiver also records the total number of errors. This can be read in the Number of Error (FLEX\_US\_NER) register. The NB\_ERRORS field can record up to 255 errors. Reading FLEX\_US\_NER automatically clears the NB\_ERRORS field.

#### 58.7.4.2.2.Receive NACK Inhibit

The USART can be configured to inhibit an error. This is done by writing a '1' to FLEX\_US\_MR.INACK. In this case, no error signal is driven on the I/O line even if a parity bit is detected.

Moreover, if INACK = 1, the erroneous received character is stored in the Receive Holding register as if no error occurred, and the RXRDY bit rises.

#### 58.7.4.2.3.Transmit Character Repetition

When the USART is transmitting a character and gets a NACK, it can automatically repeat the character before moving on to the next one. Repetition is enabled by writing the FLEX\_US\_MR.MAX\_ITERATION field at a value higher than 0. Each character can be transmitted up to eight times: the first transmission plus seven repetitions.

If MAX\_ITERATION does not equal zero, the USART repeats the character as many times as the value loaded in MAX\_ITERATION.

When the USART repetition number reaches MAX\_ITERATION, and the last repeated character is not acknowledged, the FLEX\_US\_CSR.ITER bit is set. If the repetition of the character is acknowledged by the receiver, the repetitions are stopped and the iteration counter is cleared.

The FLEX\_US\_CSR.ITER bit can be cleared by writing the FLEX\_US\_CR.RSTIT bit to 1.

#### 58.7.4.2.4.Disable Successive Receive NACK

The receiver can limit the number of successive NACKs sent back to the remote transmitter. This is programmed by setting the FLEX\_US\_MR.DSNACK bit. The maximum number of NACKs transmitted is programmed in the MAX\_ITERATION field. As soon as MAX\_ITERATION is reached, no error signal is driven on the I/O line and the FLEX\_US\_CSR.ITER bit is set.

#### 58.7.4.3.Protocol T = 1

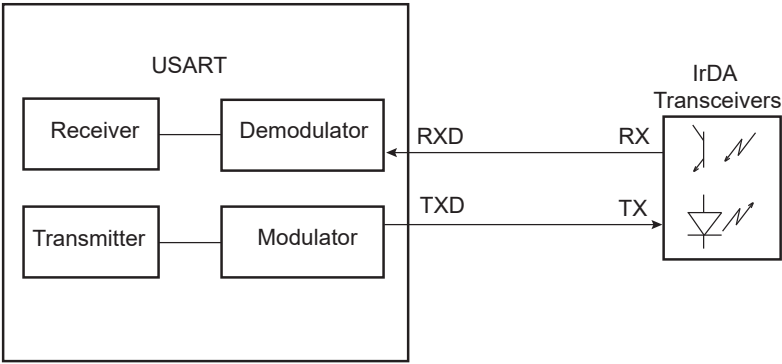

When operating in ISO7816 protocol T = 1, the transmission is similar to an asynchronous format with only one stop bit. The parity is generated when transmitting and checked when receiving. Parity error detection sets the FLEX\_US\_CSR.PARE bit.

#### 58.7.5. IrDA Mode

The USART features an IrDA mode supplying half-duplex point-to-point wireless communication. It embeds the modulator and demodulator which allows a glueless connection to the infrared transceivers, as shown in the following figure. The modulator and demodulator are compliant with the IrDA specification version 1.1 and support data transfer speeds ranging from 2.4 kbit/s to 115.2 kbit/s.

The USART IrDA mode is enabled by setting the FLEX\_US\_MR.USART\_MODE field to the value 0x8. The IrDA Filter register (FLEX\_US\_IF) allows configuring the demodulator filter. The USART transmitter and receiver operate in a normal Asynchronous mode and all parameters are accessible. Note that the modulator and the demodulator are activated.

**Figure 58.33.** Connection to IrDA Transceivers

The receiver and the transmitter must be enabled or disabled according to the direction of the transmission to be managed.

To receive IrDA signals, the following needs to be done:

- Disable TX and Enable RX
- Configure the TXD pin as PIO and set it as an output to 0 (to avoid LED transmission). Disable the internal pullup (better for power consumption).
- Receive data

**58.7.5.1.IrDA Modulation**

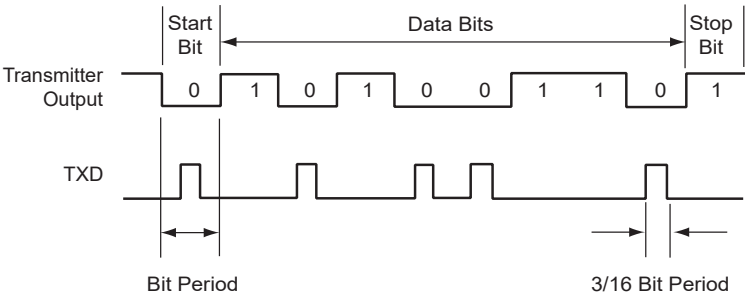

For baud rates up to and including 115.2 kbit/s, the RZI modulation scheme is used. "0" is represented by a light pulse of 3/16th of a bit time. Some examples of signal pulse duration are shown in the following table.

**Table 58.10.** IrDA Pulse Duration

Baud Rate	Pulse Duration (3/16)
2.4 kbit/s	78.13 $\mu$ s
9.6 kbit/s	19.53 $\mu$ s
19.2 kbit/s	9.77 $\mu$ s
38.4 kbit/s	4.88 $\mu$ s
57.6 kbit/s	3.26 $\mu$ s
115.2 kbit/s	1.63 $\mu$ s

The following figure shows an example of character transmission.

**Figure 58.34.** IrDA Modulation

**58.7.5.2.IrDA Baud Rate**

The following table gives some examples of CD values, baud rate error and pulse duration. Note that the requirement on the maximum acceptable error of  $\pm 1.87\%$  must be met.

**Table 58.11.** IrDA Baud Rate Error

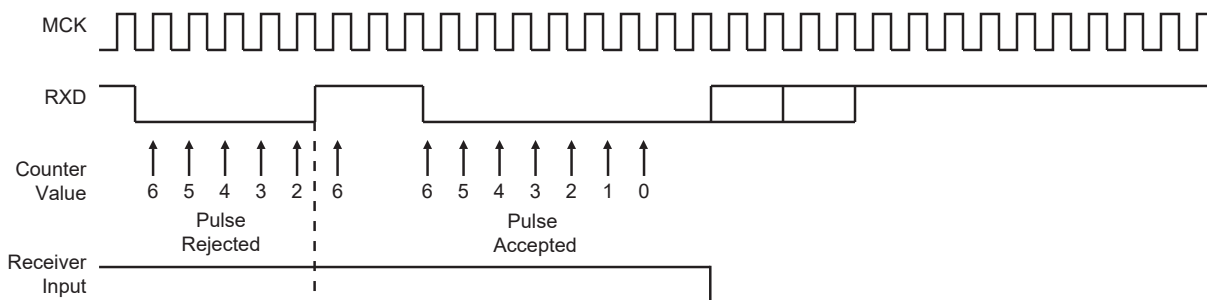

Peripheral Clock	Baud Rate (bit/s)	CD	Baud Rate Error	Pulse Time (μs)
3,686,400	115,200	2	0.00%	1.63
20,000,000	115,200	11	1.38%	1.63
32,768,000	115,200	18	1.25%	1.63
40,000,000	115,200	22	1.38%	1.63
3,686,400	57,600	4	0.00%	3.26
20,000,000	57,600	22	1.38%	3.26
32,768,000	57,600	36	1.25%	3.26

### 58.7.5.3. IrDA Demodulator

The demodulator is based on the IrDA Receive filter comprised of an 8-bit down counter which is loaded with the value programmed in FLEX\_US\_IF. When a falling edge is detected on the RXD pin, the Filter Counter starts counting down at the peripheral clock speed. If a rising edge is detected on the RXD pin, the counter stops and is reloaded with FLEX\_US\_IF. If no rising edge is detected when the counter reaches 0, the input of the receiver is driven low during one bit time.

The following figure illustrates the operations of the IrDA demodulator.

**Figure 58.35.** IrDA Demodulator Operations

The programmed value in the FLEX\_US\_IF register must always meet the following criteria:

$$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$$

As the IrDA mode uses the same logic as the ISO7816, note that the FLEX\_US\_FIDI.FI\_DI\_RATIO field must be set to a value higher than 0 to make sure IrDA communications operate correctly.

### 58.7.6. RS485 Mode

The USART features the RS485 mode to enable line driver control. While operating in RS485 mode, the USART behaves as though in Asynchronous or Synchronous mode and configuration of all the parameters is possible. The difference is that the RTS pin is driven high when the transmitter is operating. The behavior of the RTS pin is controlled by the TXEMPTY bit. A typical connection of the USART to an RS485 bus is shown in the following figure.

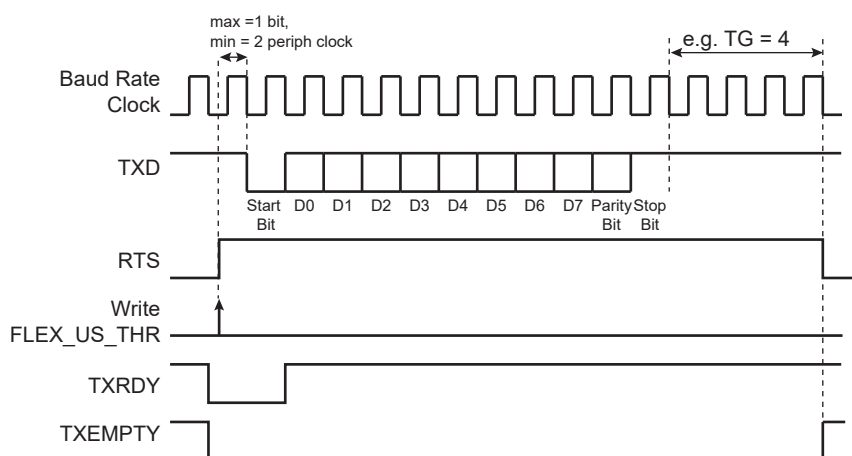

**Figure 58.36.** Typical Connection to an RS485 Bus

The USART is set to RS485 mode by writing the value 0x1 to the FLEX\_US\_MR.USART\_MODE field.

The RTS pin is at a level inverse to the TXEMPTY bit. Significantly, the RTS pin remains high when a timeguard is programmed, so that the line can remain driven after the last character completion. The following figure gives an example of the RTS waveform during a character transmission when the timeguard is enabled.

**Figure 58.37.** Example of RTS Drive with Timeguard

**Note:** In case the minimum period between RTS rising edge and START bit falling edge is not suitable for the application, it is possible to drive the RTS signal by software when FLEX\_US\_MR.USART\_MODE= 0 or 2. FLEX\_US\_CR.RTSSEN/RTSDIS can be configured to manage RTS.

### 58.7.7. USART Comparison Function on Received Character

The CMP flag in FLEX\_US\_CSR is set when the received character matches the conditions programmed in FLEX\_US\_CMPR. The CMP flag is set as soon as FLEX\_US\_RHR is loaded with the new received character. The CMP flag is cleared by writing a one to FLEX\_US\_CR.RSTSTA.

FLEX\_US\_CMPR can be programmed to provide different comparison methods:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.

- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When the FLEX\_US\_CMPR.CMPMODE bit is set to FLAG\_ONLY (value 0), all received data are loaded in FLEX\_US\_RHR and the CMP flag provides the status of the comparison result.

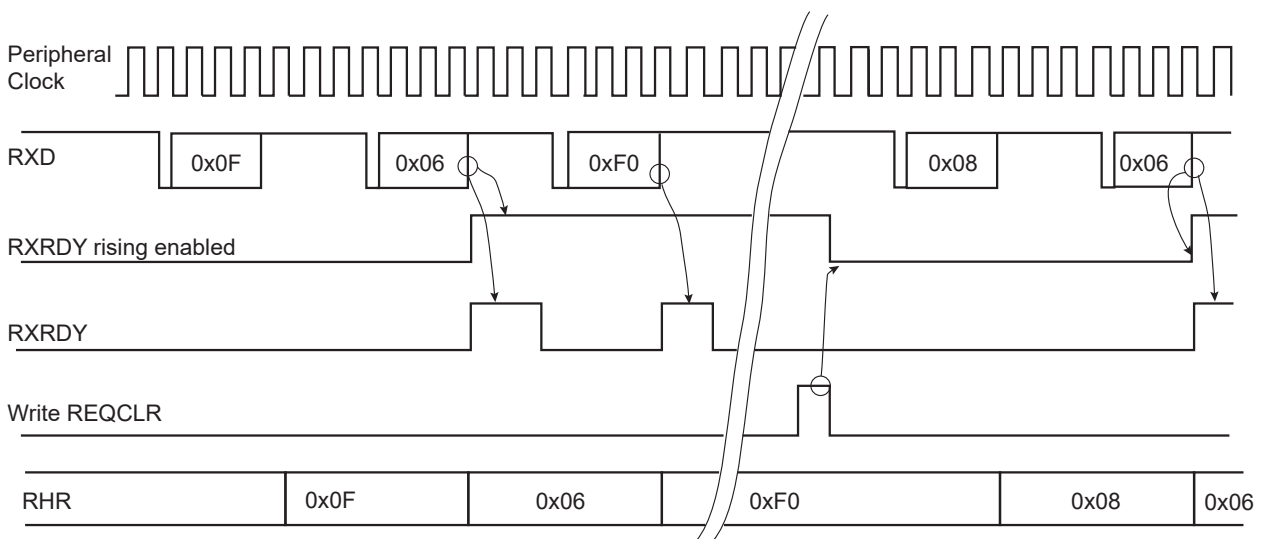

By programming the START\_CONDITION.CMPMODE bit (value 1), the comparison function result triggers the start of the loading of FLEX\_US\_RHR (see the following figure). The trigger condition exists as soon as the received character value matches the condition defined by the programming of VAL1, VAL2 and CMPPAR in FLEX\_US\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_US\_CR.REQCLR bit.

By setting the CMPMODE bit to FILTER (value 2), the comparison result triggers the start of the US\_RHR loading. The trigger condition exists as soon as the received address byte value matches the conditions defined by VAL1, VAL2 in US\_CMPR. The comparison trigger event is restarted automatically after the reception of the data byte. This comparison mode is only available when FLEX\_US\_MR.USART\_MODE is set).

The value programmed in the VAL1 and VAL2 fields must not exceed the maximum value of the received character (see CHRL field in FLEX\_US\_MR).

**Figure 58.38.** Receive Holding Register Management

CMPMODE = 1, VAL1 = VAL2 = 0x06

### 58.7.8. LIN Mode

The LIN mode provides host node and client node connectivity on a LIN bus.

The LIN (Local Interconnect Network) is a serial communication protocol which efficiently supports the control of mechatronic nodes in distributed automotive applications.

The main properties of the LIN bus are:

- Single host/multiple clients concept
- Low-cost silicon implementation based on common UART/SCI interface hardware, an equivalent in software, or as a pure state machine.
- Self synchronization without quartz or ceramic resonator in the client nodes
- Deterministic signal transmission
- Low cost single-wire implementation

- Speed up to 20 kbit/s

LIN provides cost efficient bus communication where the bandwidth and versatility of CAN are not required.

The LIN mode enables processing LIN frames with a minimum of action from the microprocessor.

#### 58.7.8.1. Modes of Operation

The USART can act either as a LIN host node or as a LIN client node.

The node configuration is chosen by setting the USART\_MODE field in the USART Mode register (FLEX\_US\_MR):

- LIN host node (USART\_MODE = 0xA)
- LIN client node (USART\_MODE = 0xB)

In order to avoid unpredictable behavior, any change of the LIN node configuration must be followed by a software reset of the transmitter and of the receiver (except the initial node configuration after a hardware reset). See [Receiver and Transmitter Control](#).

#### 58.7.8.2. Baud Rate Configuration

See [Baud Rate in Asynchronous Mode](#).

- LIN host node: The baud rate is configured in FLEX\_US\_BRGR.
- LIN client node: The initial baud rate is configured in FLEX\_US\_BRGR. This configuration is automatically copied in the LIN Baud Rate register (FLEX\_US\_LINBRR) when writing FLEX\_US\_BRGR. After the synchronization procedure, the baud rate is updated in FLEX\_US\_LINBRR.

#### 58.7.8.3. Receiver and Transmitter Control

See [Receiver and Transmitter Control](#).

#### 58.7.8.4. Character Transmission

See [Transmitter Operations](#).

#### 58.7.8.5. Character Reception

See [Receiver Operations](#).

#### 58.7.8.6. Header Transmission (Host Node Configuration)

All LIN frames start with a header sent by the host node and consisting of a Synch Break Field, a Synch Field and an Identifier Field.

So in host node configuration, the frame handling starts with the sending of the header.

The header is transmitted as soon as the identifier is written in the LIN Identifier register (FLEX\_US\_LINIR). At this moment, the flag TXRDY falls.

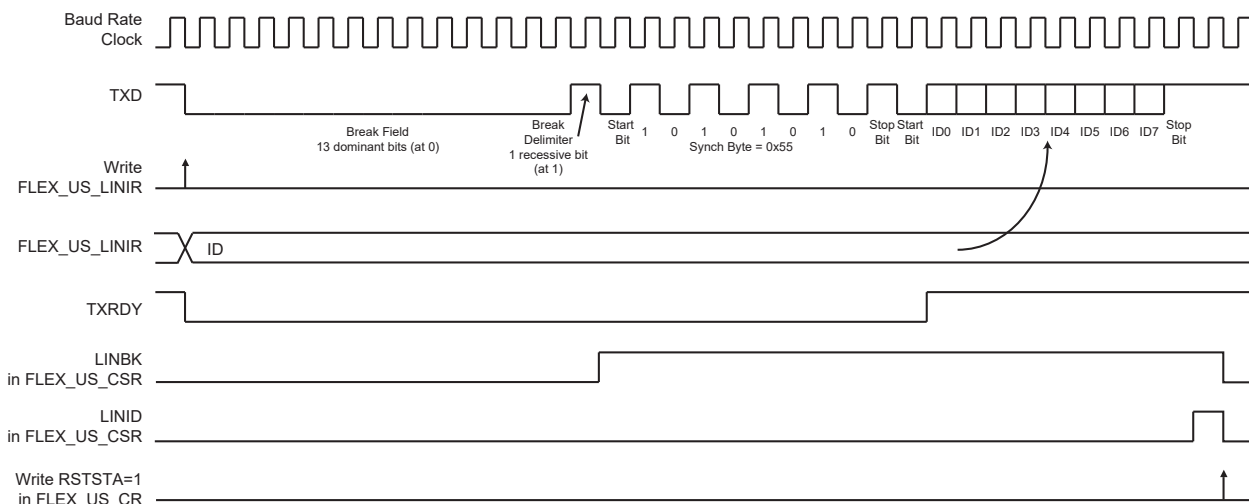

The Break Field, the Synch Field and the Identifier Field are sent automatically one after the other.

The Break Field consists of 13 dominant bits and 1 recessive bit, the Synch Field is the character 0x55 and the Identifier corresponds to the character written in the LIN Identifier register (FLEX\_US\_LINIR). The Identifier parity bits can be automatically computed and sent (see [Identifier Parity](#)).

The flag TXRDY rises when the identifier character is transferred into the shift register of the transmitter.

As soon as the Synch Break Field is transmitted, the FLEX\_US\_CSR.LINBK flag bit is set. Likewise, as soon as the Identifier Field is sent, the FLEX\_US\_CSR.LINID flag bit is set. These flags are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 58.39. Header Transmission**

### 58.7.8.7. Header Reception (Client Node Configuration)

All the LIN frames start with a header which is sent by the host node and consists of a Synch Break Field, Synch Field and Identifier Field.

In client node configuration, the frame handling starts with the reception of the header.

The USART uses a break detection threshold of 11 nominal bit times at the actual baud rate. At any time, if 11 consecutive recessive bits are detected on the bus, the USART detects a Break Field. As long as a Break Field has not been detected, the USART stays idle and the received data are not taken in account.

When a Break Field has been detected, the FLEX\_US\_CSR.LINBK flag is set and the USART expects the Synch Field character to be 0x55. This field is used to update the actual baud rate in order to remain synchronized (see [Client Node Synchronization](#)). If the received Synch character is not 0x55, an Inconsistent Synch Field error is generated (see [LIN Errors](#)).

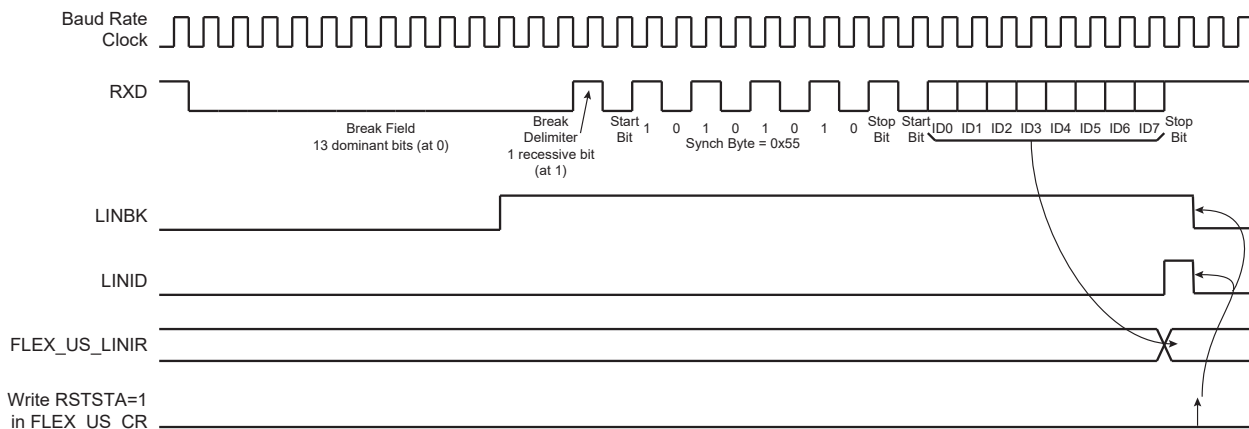

After receiving the Synch Field, the USART expects to receive the Identifier Field.

When the Identifier Field has been received, the FLEX\_US\_CSR.LINID flag bit is set. At this moment, the IDCHR field in the LIN Identifier register (FLEX\_US\_LINIR) is updated with the received character. The Identifier parity bits can be automatically computed and checked (see [Identifier Parity](#)).

If the header is not entirely received within the time given by the maximum length of the header  $t_{Header\_Maximum}$ , the FLEX\_US\_CSR.LINHTE error flag bit is set.

The flag bits LINID, LINBK and LINHTE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 58.40. Header Reception**

### 58.7.8.8. Client Node Synchronization

The synchronization is done only in client node configuration. The procedure is based on time measurement between the falling edges of the Synch Field. The falling edges are available in distances of 2, 4, 6 and 8 bit times.

**Figure 58.41. Synch Field**

The time measurement is made by a 19-bit counter driven by the sampling clock (see [Baud Rate Generator](#)).

When the start bit of the Synch Field is detected, the counter is reset. Then during the next eight  $t_{bit}$  of the Synch Field, the counter is incremented. At the end of these eight  $t_{bit}$ , the counter is stopped. At this moment, the 16 most significant bits of the counter (value divided by 8) give the new clock divider (LINCD) and the 3 least significant bits of this value (the remainder) give the new fractional part (LINFP).

Once the Synch Field has been entirely received, the clock divider (LINCD) and the fractional part (LINFP) are updated in the LIN Baud Rate register (FLEX\_US\_LINBRR) with the computed values, if the Synchronization is not disabled by the SYNCDIS bit in the LIN Mode register (FLEX\_US\_LINMR).

After reception of the Synch Field:

- If it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance  $FTol\_Unsynch$  ( $\pm 15\%$ ), then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX\_US\_CSR.LINSTE error flag bit is set.
- If it appears that the sampled Synch character is not equal to 0x55, then the clock divider (LINCD) and the fractional part (LINFP) are not updated, and the FLEX\_US\_CSR.LINISFE error flag bit is set.

Flags LINSTE and LINISFE are reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

**Figure 58.42.** Client Node Synchronization

The synchronization accuracy depends on several parameters:

- The nominal clock frequency ( $f_{Nom}$ ) (the theoretical client node clock frequency)
- The baud rate
- The oversampling ( $OVER = 0 \Rightarrow 16X$  or  $OVER = 1 \Rightarrow 8X$ )

The following formula is used to compute the deviation of the client bit rate relative to the host bit rate after synchronization ( $f_{CLIENT}$  is the real client node clock frequency).

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - OVER) + \beta] \times \text{Baud rate}}{8 \times f_{CLIENT}} \right) \%$$

$$\text{Baud rate deviation} = \left( 100 \times \frac{[\alpha \times 8 \times (2 - OVER) + \beta] \times \text{Baud rate}}{8 \times \left( \frac{f_{TOL\_UNSYNCH}}{100} \right) \times f_{Nom}} \right) \%$$

$$-0.5 \leq \alpha \leq +0.5 \quad -1 < \beta < +1$$

$f_{TOL\_UNSYNCH}$  is the deviation of the real client node clock from the nominal clock frequency. The LIN Standard imposes that it must not exceed  $\pm 15\%$ . The LIN Standard imposes also that for communication between two nodes, their bit rate must not differ by more than  $\pm 2\%$ . This means that the baud rate deviation must not exceed  $\pm 1\%$ .

Therefore, a minimum value for the nominal clock frequency can be computed as follows:

$$f_{Nom}(\min) = \left( 100 \times \frac{[0.5 \times 8 \times (2 - OVER) + 1] \times \text{Baud rate}}{8 \times \left( \frac{-15}{100} + 1 \right) \times 1\%} \right) \text{Hz}$$

Examples:

- Baud rate = 20 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 2.64 \text{ MHz}$
- Baud rate = 20 kbit/s,  $OVER = 1$  (Oversampling 8X)  $\Rightarrow f_{Nom}(\min) = 1.47 \text{ MHz}$
- Baud rate = 1 kbit/s,  $OVER = 0$  (Oversampling 16X)  $\Rightarrow f_{Nom}(\min) = 132 \text{ kHz}$

- Baud rate = 1 kbit/s, OVER = 1 (Oversampling 8X) =>  $f_{\text{Nom}}(\text{min}) = 74 \text{ kHz}$

#### 58.7.8.9. Identifier Parity

A protected identifier consists of two subfields: the identifier and the identifier parity. Bits 0 to 5 are assigned to the identifier, and bits 6 and 7 are assigned to the parity.

The USART interface can generate/check these parity bits, but this feature can also be disabled. The user can choose between two modes via the FLEX\_US\_LINMR.PARDIS bit:

- PARDIS = 0:
  - During header transmission, the parity bits are computed and sent with the six least significant bits of the IDCHR field of the LIN Identifier register (FLEX\_US\_LINIR). Bits 6 and 7 of this register are discarded.
  - During header reception, the parity bits of the identifier are checked. If the parity bits are wrong, an Identifier Parity error occurs (see [Parity](#)). Only the six least significant bits of the IDCHR field are updated with the received Identifier. Bits 6 and 7 are stuck to 0.
- PARDIS = 1:
  - During header transmission, all the bits of the IDCHR field of the LIN Identifier register (FLEX\_US\_LINIR) are sent on the bus.
  - During header reception, all the bits of the IDCHR field are updated with the received Identifier.

#### 58.7.8.10. Node Action

Depending on the identifier, the node is affected—or not—by the LIN response. Consequently, after sending or receiving the identifier, the USART must be configured. There are three possible configurations:

- PUBLISH: the node sends the response.
- SUBSCRIBE: the node receives the response.
- IGNORE: the node is not concerned by the response, it does not send and does not receive the response.

This configuration is made by the LIN Node Action (NACT) field in USART LIN Mode Register (FLEX\_US\_LINMR).

Example: a LIN cluster that contains a host and two clients:

- Data transfer from the host to client 1 and to client 2:

NACT(host) = PUBLISH

NACT(client 1) = SUBSCRIBE

NACT(client 2) = SUBSCRIBE

- Data transfer from the host to client 1 only:

NACT(host) = PUBLISH

NACT(client 1) = SUBSCRIBE

NACT(client 2) = IGNORE

- Data transfer from client 1 to the host:

NACT(host) = SUBSCRIBE

NACT(client 1) = PUBLISH

NACT(client 2) = IGNORE

- Data transfer from client 1 to client 2:

NACT(host) = IGNORE

NACT(client 1) = PUBLISH

NACT(client 2) = SUBSCRIBE

- Data transfer from client 2 to the host and to client 1:

NACT(host) = SUBSCRIBE

NACT(client 1) = SUBSCRIBE

NACT(client 2) = PUBLISH

### 58.7.8.11. Response Data Length

The LIN response data length is the number of data fields (bytes) of the response excluding the checksum.

The response data length can either be configured by the user or be defined automatically by bits 4 and 5 of the Identifier (compatibility to LIN Specification 1.1). The user can choose between these two modes by the FLEX\_US\_LINMR.DLM bit:

- DLM = 0: The response data length is configured by the user via the FLEX\_US\_LINMR.DLC field. The response data length is equal to (DLC + 1) bytes. DLC can be programmed from 0 to 255, so the response can contain from 1 data byte up to 256 data bytes.
- DLM = 1: The response data length is defined by the Identifier (IDCHR in FLEX\_US\_LINIR) according to the table below. The FLEX\_US\_LINMR.DLC field is discarded. The response can contain 2 or 4 or 8 data bytes.

**Table 58.12.** Response Data Length if DLM = 1

IDCHR[5]	IDCHR[4]	Response Data Length (bytes)
0	0	2
0	1	2
1	0	4
1	1	8

**Figure 58.43.** Response Data Length

### 58.7.8.12. Checksum

The last field of a frame is the checksum. The checksum contains the inverted 8-bit sum with carry, over all data bytes or all data bytes and the protected identifier. Checksum calculation over the data bytes only is called classic checksum and it is used for communication with LIN 1.3 clients. Checksum calculation over the data bytes and the protected identifier byte is called enhanced checksum and it is used for communication with LIN 2.0 clients.

The USART can be configured to:

- Send/Check an Enhanced checksum automatically (CHKDIS = 0 & CHKTYP = 0)
- Send/Check a Classic checksum automatically (CHKDIS = 0 & CHKTYP = 1)
- Not send/check a checksum (CHKDIS = 1)

This configuration is made by the Checksum Type (CHKTYP) and Checksum Disable (CHKDIS) bits of FLEX\_US\_LINMR.

If the checksum feature is disabled, the user can send it manually all the same, by considering the checksum as a normal data byte and by adding 1 to the response data length (see [Response Data Length](#)).

### 58.7.8.13.Frame Slot Mode

This mode is useful only for host nodes. It respects the following rule: each frame slot shall be longer than or equal to  $t_{\text{Frame\_Maximum}}$ .

If the Frame Slot mode is enabled ( $FSDIS = 0$ ) and a frame transfer has been completed, the TXRDY flag is set again only after  $t_{Frame\_Maximum}$  delay, from the start of frame. So the host node cannot send a new header if the frame slot duration of the previous frame is inferior to  $t_{Frame\_Maximum}$ .

If the Frame Slot mode is disabled (FSDIS = 1) and a frame transfer has been completed, the TXRDY flag is set again immediately.

The  $t_{\text{Frame Maximum}}$  is calculated as follows:

If the Checksum is sent (CHKDIS = 0):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times (\text{NData} + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)$ <sup>(1)</sup>
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1 + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (77 + 14 \times \text{DLC}) \times t_{\text{bit}}$

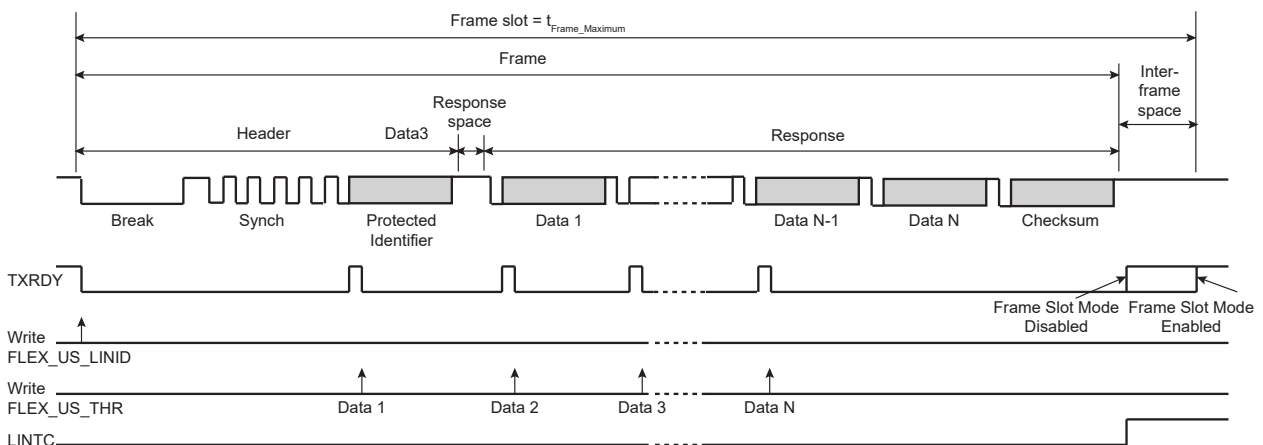

If the Checksum is not sent (CHKDIS = 1):

- $t_{\text{Header\_Nominal}} = 34 \times t_{\text{bit}}$
- $t_{\text{Response\_Nominal}} = 10 \times \text{NData} \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = 1.4 \times (t_{\text{Header\_Nominal}} + t_{\text{Response\_Nominal}} + 1)$  <sup>(1)</sup>
- $t_{\text{Frame\_Maximum}} = 1.4 \times (34 + 10 \times (\text{DLC} + 1) + 1) \times t_{\text{bit}}$
- $t_{\text{Frame\_Maximum}} = (63 + 14 \times \text{DLC}) \times t_{\text{bit}}$

**Note:**

1. The term "+1" leads to an integer result for  $t_{\text{Frame Maximum}}$  (LIN Specification 1.3).

**Figure 58.44.** Frame Slot Mode

## 58.7.8.14.LIN Errors

### 58.7.8.14.1.Bit Error

This error is generated in host or client node configuration, when the USART is transmitting and if the transmitted value on the Tx line is different from the value sampled on the Rx line. If a bit error is detected, the transmission is aborted at the next byte border.

This error is reported by the FLEX\_US\_CSR.LINBE flag.

### 58.7.8.14.2.Inconsistent Synch Field Error

This error is generated in client node configuration, if the Synch Field character received is other than 0x55.

This error is reported by the FLEX\_US\_CSR.LINISFE flag.

### 58.7.8.14.3.Identifier Parity Error

This error is generated in client node configuration, if the parity of the identifier is wrong. This error can be generated only if the parity feature is enabled (PARDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINIPE flag.

### 58.7.8.14.4.Checksum Error

This error is generated in host or client node configuration, if the received checksum is wrong. This flag can be set to 1 only if the checksum feature is enabled (CHKDIS = 0).

This error is reported by the FLEX\_US\_CSR.LINCE flag.

### 58.7.8.14.5.Client Not Responding Error

This error is generated in host or client node configuration, when the USART expects a response from another node (NACT = SUBSCRIBE) but no valid message appears on the bus within the time given by the maximum length of the message frame,  $t_{\text{Frame\_Maximum}}$  (see [Frame Slot Mode](#)). This error is disabled if the USART does not expect any message (NACT = PUBLISH or NACT = IGNORE).

This error is reported by the FLEX\_US\_CSR.LINSNRE.

### 58.7.8.14.6.Synch Tolerance Error

This error is generated in client node configuration if, after the clock synchronization procedure, it appears that the computed baud rate deviation compared to the initial baud rate is superior to the maximum tolerance FTol\_Unsynch ( $\pm 15\%$ ).

This error is reported by the FLEX\_US\_CSR.LINSTE flag.

### 58.7.8.14.7.Header Timeout Error

This error is generated in client node configuration, if the header is not entirely received within the time given by the maximum length of the header,  $t_{\text{Header\_Maximum}}$ .

This error is reported by the FLEX\_US\_CSR.LINHTE flag.

## 58.7.8.15.LIN Frame Handling

### 58.7.8.15.1.Host Node Configuration

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the host node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM, FSDIS and DLC in FLEX\_US\_LINMR to configure the frame transfer.
- Check that FLEX\_US\_CSR.TXRDY is set to 1.
- Write FLEX\_US\_LINIR.IDCHR to send the header.

What comes next depends on the NACT configuration:

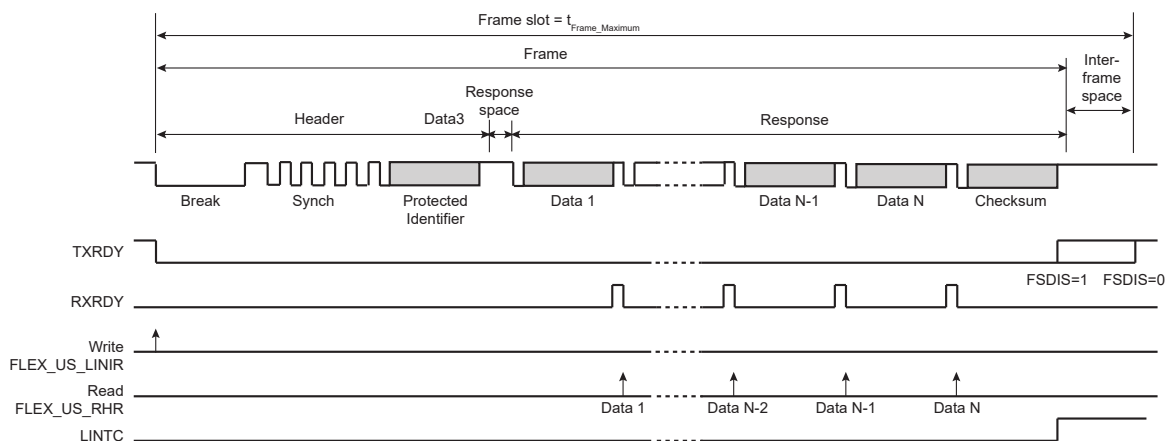

- Case 1: NACT = PUBLISH, the USART sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

**Figure 58.45.** Host Node Configuration, NACT = PUBLISH

**Figure 58.46.** Host Node Configuration, NACT = SUBSCRIBE

**Figure 58.47.** Host Node Configuration, NACT = IGNORE

### 58.7.8.15.2. Client Node Configuration

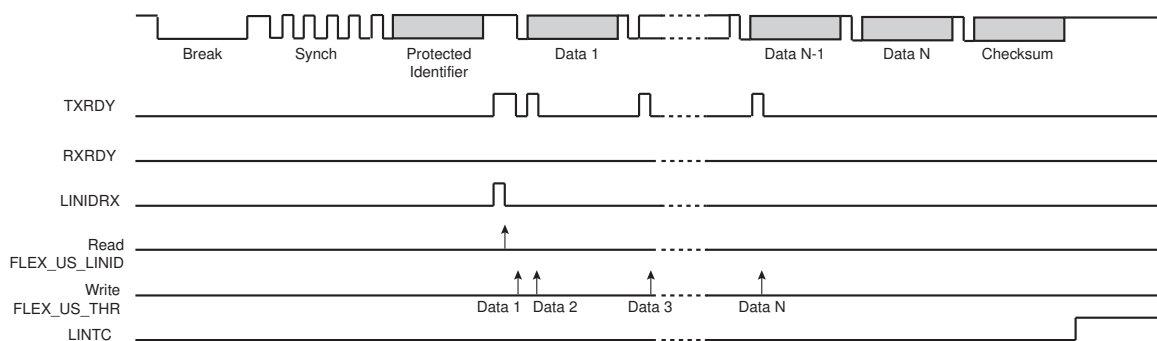

- Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
- Write FLEX\_US\_MR.USART\_MODE to select the LIN mode and the client node configuration.
- Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
- Wait until FLEX\_US\_CSR.LINID rises.
- Check LINISFE and LINPE errors.
- Read FLEX\_US\_RHR.IDCHR.
- Write NACT, PARDIS, CHKDIS, CHKTYPE, DLCM and DLC in FLEX\_US\_LINMR to configure the frame transfer.

**IMPORTANT:** If the NACT configuration for this frame is PUBLISH, FLEX\_US\_LINMR must be written with NACT = PUBLISH even if this field is already correctly configured, in order to set the TXREADY flag and the corresponding write transfer request.

What comes next depends on the NACT configuration:

- Case 1: NACT = PUBLISH, the LIN controller sends the response.
  - Wait until FLEX\_US\_CSR.TXRDY rises.
  - Write FLEX\_US\_THR.TCHR to send a byte.
  - If all the data have not been written, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 2: NACT = SUBSCRIBE, the USART receives the response.
  - Wait until FLEX\_US\_CSR.RXRDY rises.
  - Read FLEX\_US\_RHR.RCHR.
  - If all the data have not been read, repeat the two previous steps.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.
- Case 3: NACT = IGNORE, the USART is not concerned by the response.
  - Wait until FLEX\_US\_CSR.LINTC rises.
  - Check the LIN errors.

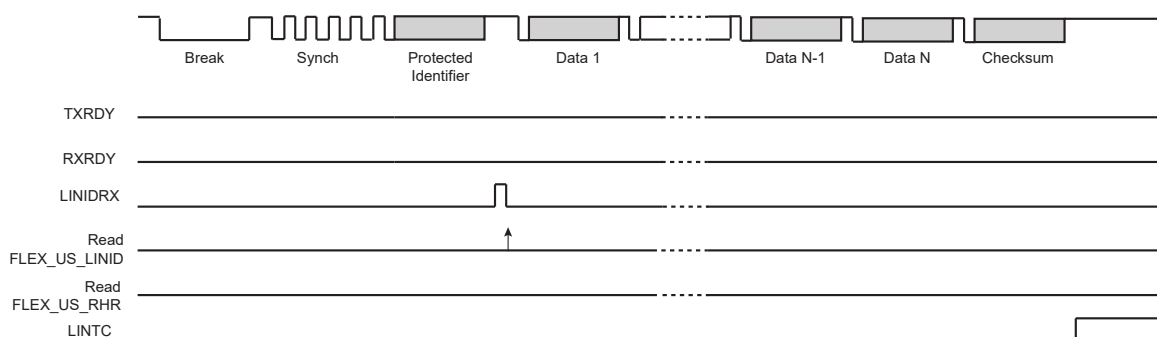

**Figure 58.48. Client Node Configuration, NACT = PUBLISH**

**Figure 58.49. Client Node Configuration, NACT = SUBSCRIBE**

**Figure 58.50. Client Node Configuration, NACT = IGNORE**

#### 58.7.8.16. LIN Frame Handling with the DMA

The USART can be used in association with the DMA in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMA uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMA always writes in the Transmit Holding register (FLEX\_US\_THR) and it always reads in the Receive Holding register (FLEX\_US\_RHR). The size of the data written or read by the DMA in the USART is always a byte.

##### 58.7.8.16.1. Host Node Configuration

The user can choose between two DMA modes by configuring the FLEX\_US\_LINMR.PDCM bit:

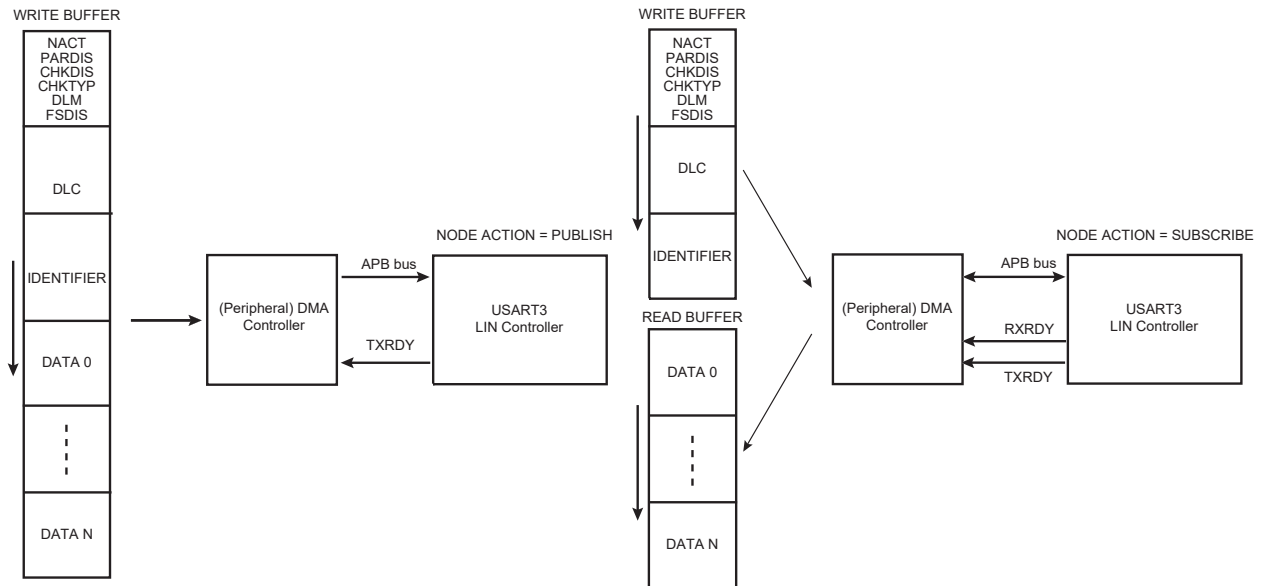

- PDCM = 1: The LIN configuration is stored in the WRITE buffer and it is written by the DMA in the Transmit Holding register FLEX\_US\_THR (instead of the LIN Mode register FLEX\_US\_LINMR). Because the DMA transfer size is limited to a byte, the transfer is split into two accesses. During the first access, the NACT, PARDIS, CHKDIS, CHKTYP, DLM and FSDIS bits are written. During the second access, the 8-bit DLC field is written.

- PDCM = 0: The LIN configuration is not stored in the WRITE buffer and it must be written by the user in FLEX\_US\_LINMR.

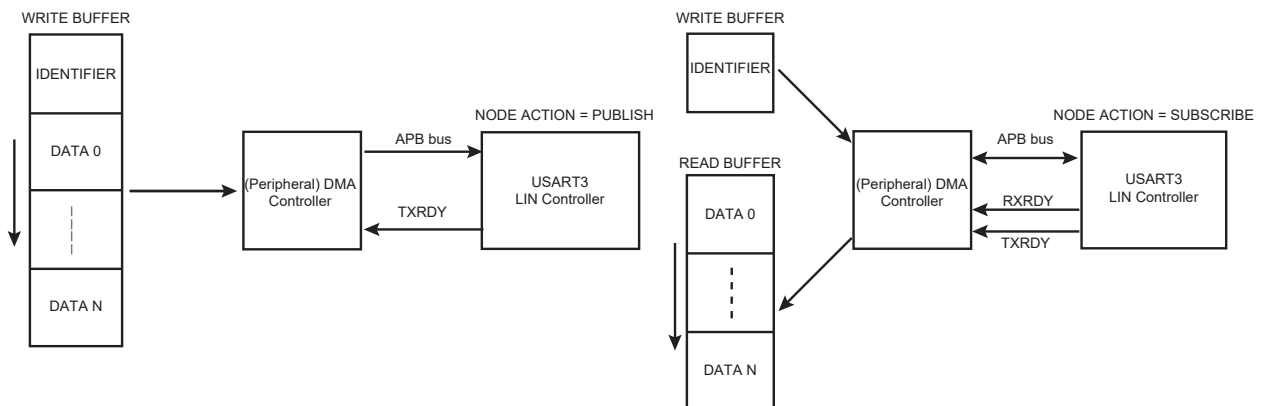

The WRITE buffer also contains the Identifier and the data, if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 58.51.** Host Node with DMA (PDCM = 1)

**Figure 58.52.** Host Node with DMA (PDCM = 0)

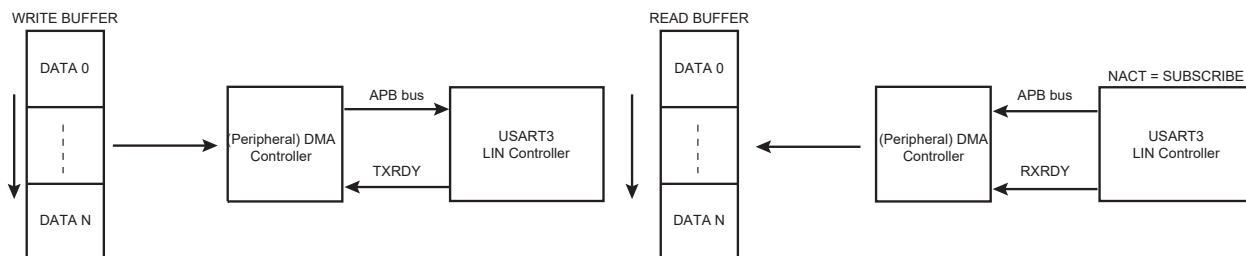

#### 58.7.8.16.2. Client Node Configuration

In this configuration, the DMA transfers only the data. The identifier must be read by the user in the LIN Identifier register (FLEX\_US\_LINIR). The LIN mode must be written by the user in FLEX\_US\_LINMR.

The WRITE buffer contains the data if the USART sends the response (NACT = PUBLISH).

The READ buffer contains the data if the USART receives the response (NACT = SUBSCRIBE).

**Figure 58.53.** Client Node with DMA

### 58.7.8.17. Wakeup Request

Any node in a sleeping LIN cluster may request a wakeup.

In the LIN 2.0 specification, the wakeup request is issued by forcing the bus to the dominant state from 250  $\mu$ s to 5 ms. For this, it is necessary to send the character 0xF0 in order to impose five successive dominant bits. Whatever the baud rate is, this character respects the specified timings.

- Baud rate min = 1 kbit/s  $\rightarrow t_{bit} = 1 \text{ ms} \rightarrow 5 t_{bit} = 5 \text{ ms}$
- Baud rate max = 20 kbit/s  $\rightarrow t_{bit} = 50 \mu\text{s} \rightarrow 5 t_{bit} = 250 \mu\text{s}$

In the LIN 1.3 specification, the wakeup request should be generated with the character 0x80 in order to impose eight successive dominant bits.

Using the FLEX\_US\_LINMR.WKUPTYP bit, the user can choose to send either a LIN 2.0 wakeup request (WKUPTYP = 0) or a LIN 1.3 wakeup request (WKUPTYP = 1).

A wakeup request is transmitted by writing the FLEX\_US\_CR.LINWKUP bit to 1. Once the transfer is completed, the LINTC flag is asserted in the Status register (FLEX\_US\_CSR). It is cleared by writing a one to the FLEX\_US\_CR.RSTSTA bit.

### 58.7.8.18. Bus Idle Timeout

If the LIN bus is inactive for a certain duration, the client nodes shall automatically enter in Sleep mode. In the LIN 2.0 specification, this timeout is defined as 4 seconds. In the LIN 1.3 specification, it is defined as 25,000  $t_{bit}$ .

In client node configuration, the receiver timeout detects an idle condition on the RXD line. When a timeout is detected, the FLEX\_US\_CSR.TIMEOUT bit rises and can generate an interrupt, thus indicating to the driver to go into Sleep mode.

The timeout delay period (during which the receiver waits for a new character) is programmed in the FLEX\_US\_RTOR.TO field. If a zero is written to the TO field, the Receiver Timeout is disabled and no timeout is detected. The FLEX\_US\_CSR.TIMEOUT bit remains at 0. Otherwise, the receiver loads a 17-bit counter with the value programmed in TO. This counter is decremented at each bit period and reloaded each time a new character is received. If the counter reaches 0, the FLEX\_US\_CSR.TIMEOUT bit rises.

If STTTO is performed, the counter clock is stopped until a first character is received.

If RETTO is performed, the counter starts counting down immediately from the value TO.

**Table 58.13.** Receiver Timeout Programming

LIN Specification	Baud Rate	Timeout period	TO
2.0	1,000 bit/s	4s	4,000
	2,400 bit/s		9,600
	9,600 bit/s		38,400
	19,200 bit/s		76,800
	20,000 bit/s		80,000

.....continued

LIN Specification	Baud Rate	Timeout period	TO
1.3	-	25,000 t <sub>bit</sub>	25,000

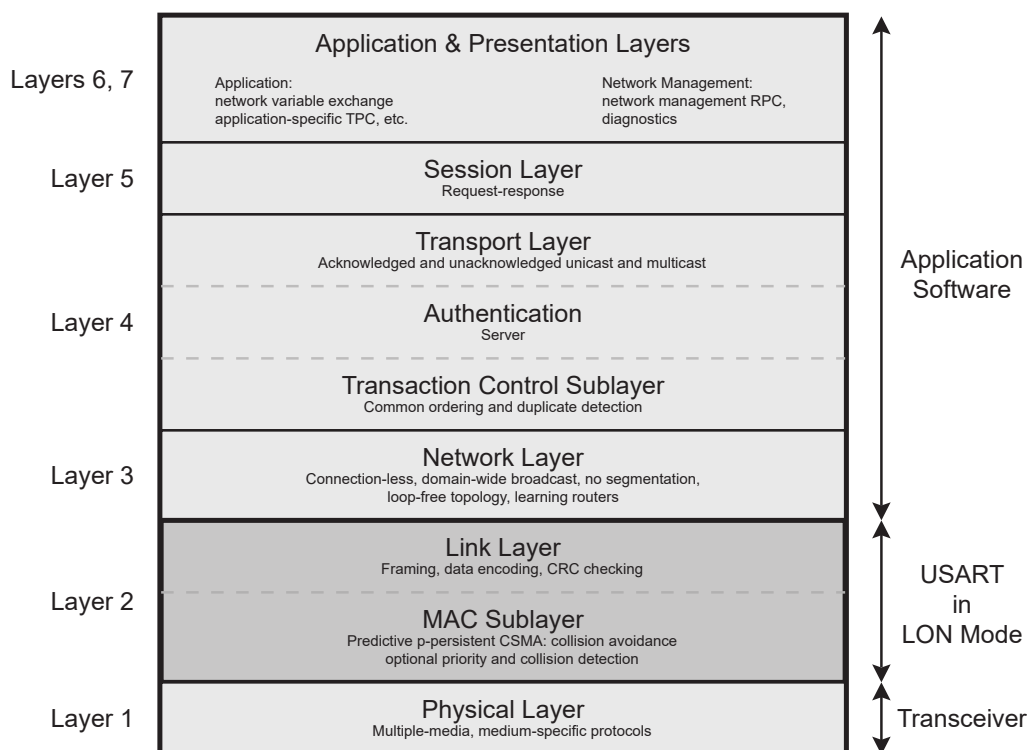

### 58.7.9. LON Mode

The LON mode provides connectivity to the local operating network (LON).

The LON standard covers all seven layers of the OSI (Open Systems Interconnect) reference model from the physical interfaces such as wired, power line, RF, and IP to the application layer and all layers in between.

The LON mode enables the transmission and reception of Physical Protocol Data Unit (PPDU) frames with minimum intervention from the microprocessor.

**Figure 58.54.** LON Protocol Layering

The USART configured in LON mode is a full-layer 2 implementation including standard timings handling, framing (transmit and receive PPDU frames), backlog estimation and other features. At the frame encoding/decoding level, differential Manchester encoding is used (also known as CDP). When configured in LON mode, there is no embedded digital line filter, thus the optimal usage is node-to-node communication.

#### 58.7.9.1. Mode of Operation

To configure the USART to act as a LON node, the USART\_MODE field of the USART Mode register (FLEX\_US\_MR) must be set to 0x9.

To avoid unpredictable behavior, any change of the LON node configuration must be preceded by a software reset of the transmitter and the receiver (except the initial node configuration after a hardware reset) and followed by a transmitter/receiver enable. See [Receiver and Transmitter Control](#).

#### 58.7.9.2. Receiver and Transmitter Control

See [Receiver and Transmitter Control](#).

### 58.7.9.3.Character Transmission

A LON frame is made up of a preamble, a data field (up to 256 bytes) and a 16-bit CRC field. The preamble and CRC fields are automatically generated and the LON node starts the transmission algorithm on a write to LON\_L2HDR. See [Sending a Frame](#).

### 58.7.9.4.Character Reception

When receiving a LON frame, the Receive Holding register (FLEX\_US\_RHR) is updated upon completed character reception and the RXRDY bit in the Status register rises. If a character is completed while the RXRDY bit is set, the OVRE (Overrun Error) bit is set. The LON preamble field is only used for synchronization, therefore only the Data and CRC fields are transmitted to the Receive Holding register (FLEX\_US\_RHR). See [Sending a Frame](#).

### 58.7.9.5.LON Frame

Figure 58.55. LON Framing

#### 58.7.9.5.1.Encoding / Decoding

The USART configured in LON mode encodes transmitted data and decodes received data using differential Manchester encoding. In differential Manchester encoding, a '1' bit is indicated by making the first half of the signal equal to the last half of the previous bit's signal (no transition at the start of the bit-time). A '0' bit is indicated by making the first half of the signal opposite to the last half of the previous bit's signal (a zero bit is indicated by a transition at the beginning of the bit-time). As is the case with normal Manchester encoding, missing transition at the middle of bit-time represents a Manchester code violation.

The FLEX\_US\_MAN.RXIDLEV bit informs the USART of the receiver line idle state value (receiver line inactive) thus ensuring higher reliability of preamble synchronization. By default, RXIDLEV is set (receiver line is at level 1 when there is no activity).

Differential Manchester encoding is polarity-insensitive.

Figure 58.56. LON PPDU

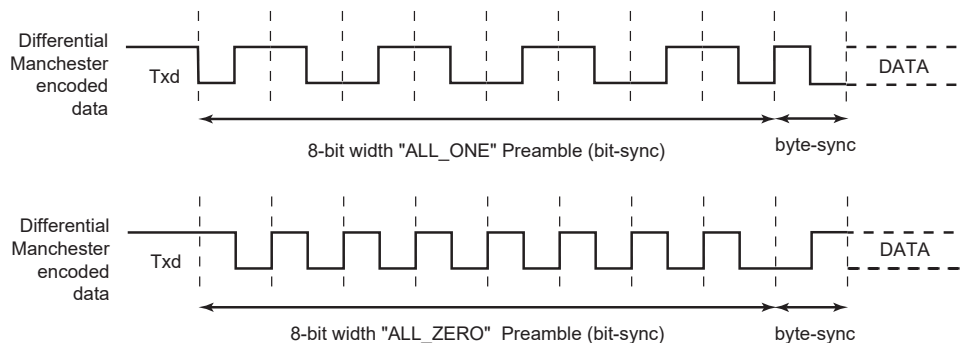

#### 58.7.9.5.2.Preamble Transmission

Each LON frame begins with a preamble of variable length which consists of a bit-sync field and a byte-sync field. The LONPL field of the USART LON Preamble register (FLEX\_US\_LONPR) defines the preamble length. Note that a preamble length of '0' is not allowed.

The LON implementation allows two different preamble patterns ALL\_ONE and ALL\_ZERO which can be configured through the TX\_PL field of the USART Manchester Configuration register (FLEX\_US\_MAN). The following figure illustrates and defines the valid patterns.

Other preamble patterns are not supported.

**Figure 58.57. Preamble Patterns**

#### 58.7.9.5.3. Preamble Reception

LON received frames begin with a preamble of variable length. The receiving algorithm does not check the preamble length, although a minimum of length of 4 bits is required for the receiving algorithm to consider the received preamble as valid.

As is the case with LON preamble transmission, two preamble patterns (ALL\_ONE and ALL\_ZERO) are allowed and can be configured through the RX\_PL field of the USART Manchester Configuration register (FLEX\_US\_MAN). The above figure illustrates and defines the valid patterns.

Other preamble patterns are not supported.

#### 58.7.9.5.4. Header Transmission

Each LON frame, after sending the preamble, starts with the frame header also called L2HDR according to CEA-709 specification. This header consists of the priority bit, the alternative path bit and the backlog increment. It is the first data to be sent.

In LON mode, the transmitting algorithm starts when FLEX\_US\_LONL2HDR is written (it is the first data to send).

#### 58.7.9.5.5. Header Reception

Each LON frame, after receiving the preamble, receives the frame header also called L2HDR according to CEA-709 specification. This header consists of the priority bit, the alternative path bit, and the backlog increment.

The frame header is the first received data and the RXRDY bit rises as soon as the frame header has been received and stored in the Receive Holding register (FLEX\_US\_RHR).

#### 58.7.9.5.6. Data

Data are sent/received serially after the preamble transmission/reception. Data can be either sent/received MSB first or LSB first depending on the MSBF bit value in the USART Mode register (FLEX\_US\_MR).

#### 58.7.9.5.7. CRC

The two last bytes of LON frames are dedicated to CRC.

When transmitting, the CRC of the frame is automatically generated and sent when expected.

When receiving frames, the CRC is automatically checked and the FLEX\_US\_CSR.LCRCE flag is set if the calculated CRC does not match the received one. Note that the two received CRC bytes are seen as two additional data from the user point of view.

#### 58.7.9.5.8. End Of Frame

The USART configured in LON mode terminates the frame with a three  $t_{bit}$  long Manchester code violation. After sending the last CRC bit, it maintains the data transitionless during three bit periods.

### 58.7.9.6.LON Operating Modes

#### 58.7.9.6.1.Transmitting/Receiving Modules

According to the LON node configuration and LON network state, the transmitting module is activated if a transmission request has been made and access to the LON bus granted. It returns to idle state once the transmission ends.

According to the LON node configuration and LON network state, the receiving module is activated if a valid preamble is detected and the transmitting module is not activated.

#### 58.7.9.6.2.comm\_type

In CEA-709 standard 2, communication configurations are defined and configurable through the `comm_type` variable. The `comm_type` variable value can be set in the USART LON Mode register (FLEX\_US\_LONMR) through the COMMT bit. The selection of the `comm_type` determines the MAC behavior in the following ways:

- `comm_type = 1`:
  - An indeterminate time is defined during the Beta 1 period in which all transitions on the channel are ignored (see figure below).
  - The MAC sublayer ignores collisions occurring during the first 25% of the transmitted preamble. Optionally (according to the FLEX\_US\_LONMR.CDTAIL bit), it ignores collisions reported following the transmission of the CRC but prior to the end of transmission.
  - If a collision is detected during preamble transmission, the MAC sublayer can terminate the packet if so configured according to the FLEX\_US\_LONMR.TCOL bit. Collisions detected after the preamble have been sent do not terminate transmission.
- `comm_type = 2`:
  - No indeterminate time is defined at the MAC sublayer.
  - The MAC sublayer always terminates the packet upon notification of a collision.

**Figure 58.58.** LON Indeterminate Time

#### 58.7.9.6.3.Collision Detection

As an option of the CEA-709 standard collision detection is supported through an active low Collision Detect (CD) input from the transceiver.

The Collision Detection source can be either external (see [I/O Lines Description](#)) or internal. The collision detection source selection is defined through the LCDS bit in the USART LON Mode register (FLEX\_US\_LONMR).

The Collision Detection feature can be activated through the COLDET bit of the USART LON Mode register. If the collision detection feature is enabled and CD signal goes low for at least half  $t_{bit}$  period then a collision is detected and reported as defined in [comm\\_type](#).

#### 58.7.9.6.4.Collision Detection Mode

As defined in [comm\\_type](#), if `comm_type = 1` the LON node can be configured to either not terminate transmission upon collision notification during preamble transmission or terminate transmission.

The FLEX\_US\_LONMR.TCOL bit allows to decide whether to terminate transmission or not upon collision notification during preamble transmission.

#### 58.7.9.6.5.Collision Detection after CRC

As defined in [comm\\_type](#), if `comm_type = 1` the LON node can be configured to ignore collisions reported after the CRC has been sent but prior to the end of the frame.

The `FLEX_US_LONMR.CDTAIL` bit can be used to decide whether such collision notifications must be considered or not.

#### 58.7.9.6.6.Random Number Generation

The Predictive p-persistent CSMA algorithm defined in the CEA-709.1 Standard is based on a random number generation.

This random number is automatically generated by an internal algorithm.

In addition, a USART IC DIFF register (`FLEX_US_ICDIFF`) is available to avoid that two same chips with the same software generate the same random number after reset. The value of this register is used by the internal algorithm to generate the random number. Therefore, putting a different value here for each chip ensures that the random number generated after a reset at the same time will not be the same. It is recommended to put the chip ID code here.

#### 58.7.9.7.LON Node Backlog Estimation

As defined in CEA-709, the LON node maintains its own backlog estimation. The node backlog estimation is initially set to one, will always be greater than 1 and will never exceed 63. If the node backlog estimation exceeds the maximum backlog value, the backlog value is set to 63 and a backlog overflow error flag is set (LBLOVFE flag).

The node backlog estimation is incremented each time a frame is sent or received successfully. The increment to the backlog is encoded into the link layer header, and represents the number of messages that the packet shall cause to be generated upon reception.

The backlog decrements under one of the following conditions:

- On waiting to transmit: If Wbase randomizing slots go by without channel activity.
- On receive: If a packet is received with a backlog increment of '0'.
- On transmit: If a packet is transmitted with a backlog increment of '0'.
- On idle: If a packet cycle time expires without channel activity.

#### 58.7.9.7.1.Optional Collision Detection Feature And Backlog Estimation

Each time a frame is transmitted and a collision occurred, the backlog is incremented by 1. In this case, the backlog increment encoded in the link layer is ignored.

#### 58.7.9.8.LON Timings

Figure 58.59. LON Timings

#### 58.7.9.8.1.Beta2

A node wishing to transmit generates a random delay  $T$ . This delay is an integer number of randomizing slots of duration  $\text{Beta2}$ .

The  $\text{beta2}$  length (in  $t_{\text{bit}}$ ) is configurable through `FLEX_US_FIDI`. Note that a length of '0' is not allowed.

#### 58.7.9.8.2.Beta1 Tx/Rx

Beta1 is the period immediately following the end of a packet cycle (see the above figure). A node attempting to transmit monitors the state of the channel, and if it detects no transmission during the Beta1 period, it determines the channel to be idle.

The Beta1 value is different depending on the previous packet type (received packet or transmitted packet).

Beta1Rx and Beta1Tx length can be configured respectively through the USART LON Beta1 Rx register (FLEX\_US\_LONB1RX) and the USART LON Beta1 Tx register (FLEX\_US\_LONB1TX). Note that a length of '0' is not allowed.

#### 58.7.9.8.3.Pcycle Timer

The packet cycle timer is reset to its initial value whenever the backlog is changed. It is started (begins counting down at its current value) whenever the MAC layer becomes idle. An idle MAC layer is defined as:

- Not receiving
- Not transmitting,
- Not waiting to transmit,
- Not timing Beta1,
- Not waiting for priority slots, and not waiting for the first Wbase randomizing window to complete.

On transition from idle to either transmit or receive, the packet cycle timer is halted.

The pcycle timer value can be configured in FLEX\_US\_TTGR. Note that '0' value is not allowed.

#### 58.7.9.8.4.Wbase

The wbase timer represents the base windows size. Its duration, derived from Beta2, equals 16 Beta2 slots.

#### 58.7.9.8.5.Priority Slots

On a channel by channel basis, the protocol supports optional priority. Priority slots, if any, follow immediately after the Beta1 period that follows the transmission of a packet (see the above figure). The number of priority slots per channel ranges from 0 to 127.

The number of priority slots in the LON network configuration is defined through the PSNB field of the USART LON Priority register (FLEX\_US\_LONPRIO). And the priority slot affected to the LON node, if any, is defined through the FLEX\_US\_LONPRIO.NPS field.

#### 58.7.9.8.6.Indeterminate Time

See [comm\\_type](#).

Like Beta1, the IDT value is different depending on whether the previous frame was transmitted or received.

IDTRx and IDTTx can be configured respectively through the USART LON IDT Rx register (FLEX\_US\_LONIDTRX) and the USART LON IDT Tx register (FLEX\_US\_LONIDTTX).

#### 58.7.9.8.7.End of Frame Condition

The USART configured in LON mode terminates the frame with a three  $t_{bit}$  long Manchester code violation. After sending the last CRC bit, it maintains the data transitionless during three bit periods.

While receiving data, the USART configured in LON mode detects an end of frame condition after a  $t_{eof}$  transitionless Manchester code violation. The EOFs field in the USART LON Mode Register can configure  $t_{eof}$ .

### 58.7.9.9.LON Errors

All these flags can be read in the LON Channel Status register (FLEX\_US\_CSR) and generate interrupts if configured in the LON Interrupt Enable register (FLEX\_US\_IER).

These flags can be reset by writing a one to the FLEX\_US\_CR.RSTSTA bit.

#### 58.7.9.9.1.Underrun Error

If the USART is in LON mode and if a character is sent while the Transmit Holding register (FLEX\_US\_THR) is empty, the UNRE bit flag is set.

#### 58.7.9.9.2.Collision Detection

The LCOL flag is set whenever a valid collision has been detected and the LON node is configured to report it (see [Collision Detection](#)).

#### 58.7.9.9.3.LON Frame Early Termination

The LFET flag is set whenever a LON frame has been terminated early due to collision detection.

#### 58.7.9.9.4.Reception Error

The LCRCE flag is set if the received frame has an erroneous CRC and the flag LSFE is set if the received frame is too short (LON frames must be at least 8 bytes long).

These flags can be read in FLEX\_US\_CSR.

#### 58.7.9.9.5.Backlog Overflow

The LBLOVFE flag is set if the LON node backlog estimation goes over 63, which is the maximum backlog value.

### 58.7.9.10.Drift Compensation

It may happen that while receiving a frame, the baud rate used by the sender is not exactly the one expected, due to sender clock drifting for instance. In such case, the hardware drift compensation algorithm is used to recover up to 16% clock drift (expected baud rate  $\pm 16\%$  is supported).

Drift compensation is available only in 16X Oversampling mode. To enable the hardware system, the DRIFT bit of the FLEX\_US\_MAN register must be set. If the RXD edge is between one and three 16X clock cycles away from the expected edge, then the period is shortened or lengthened accordingly to center the RXD edge.

Drift compensation hardware feature allows up to 16% clock drift to be handled, provided system clock is fast enough compared to the selected baud rate.

**Figure 58.60.** Bit Resynchronization

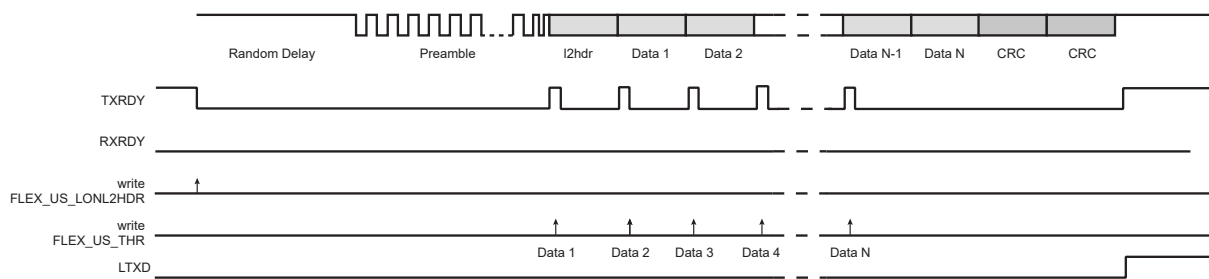

### 58.7.9.11.LON Frame Handling

#### 58.7.9.11.1.Sending a Frame

1. Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.

2. Write FLEX\_US\_MR.USART\_MODE to select the LON mode configuration.
3. Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
4. Write COMMT, COLDET, TCOL, CDTAIL, RDMNBM and DMAM in FLEX\_US\_LONMR to configure the LON operating mode.
5. Write BETA2, BETA1TX, BETA1RX, PCYCLE, PSNB, NPS, IDTTX and ITDRX respectively in FLEX\_US\_FIDI, FLEX\_US\_LONB1TX, FLEX\_US\_LONB1RX, FLEX\_US\_TTGR, FLEX\_US\_LONPRIO, FLEX\_US\_LONIDTTX and FLEX\_US\_LONIDTRX to set the LON network configuration.
6. Write FLEX\_US\_MAN.TX\_PL to select the preamble pattern to use.
7. Write LONPL and LONDL in FLEX\_US\_LONPR and FLEX\_US\_LONDL to set the frame transfer.
8. Check that FLEX\_US\_CSR.TXRDY is set to 1.
9. Write FLEX\_US\_LONL2HDR to send the header.
10. Wait until FLEX\_US\_CSR.TXRDY rises.
11. Write FLEX\_US\_THR.TCHR to send a byte.
12. If all the data have not been written, repeat the two previous steps.
13. Wait until FLEX\_US\_CSR.LTXD rises.
14. Check the LON errors.

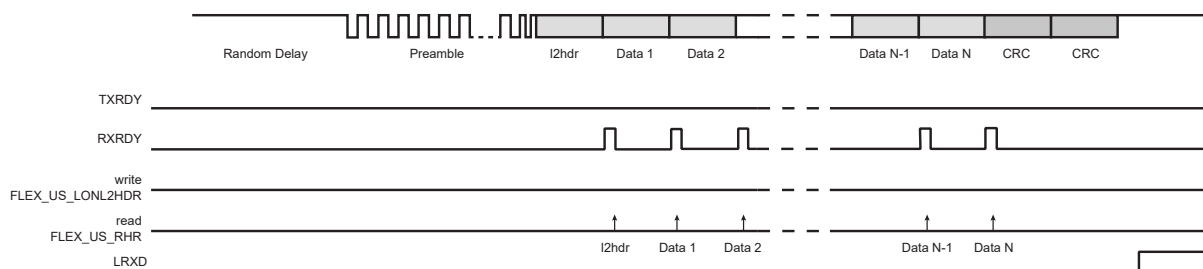

**Figure 58.61. Tx Frame**

#### 58.7.9.11.2.Receiving a Frame

1. Write FLEX\_US\_CR.TXEN and FLEX\_US\_CR.RXEN to enable both the transmitter and the receiver.
2. Write FLEX\_US\_MR.USART\_MODE to select the LON mode configuration.
3. Write FLEX\_US\_BRGR.CD and FLEX\_US\_BRGR.FP to configure the baud rate.
4. Write COMMT, COLDET, TCOL, CDTAIL, RDMNBM and DMAM in FLEX\_US\_LONMR to configure the LON operating mode.
5. Write BETA2, BETA1TX, BETA1RX, PCYCLE, PSNB, NPS, IDTTX and ITDRX respectively in FLEX\_US\_FIDI, FLEX\_US\_LONB1TX, FLEX\_US\_LONB1RX, FLEX\_US\_TTGR, FLEX\_US\_LONPRIO, FLEX\_US\_LONIDTTX and FLEX\_US\_LONIDTRX to set the LON network configuration.
6. Write FLEX\_US\_MAN.RXIDLEV and FLEX\_US\_MAN.RX\_PL to indicate the receiver line value and select the preamble pattern to use.
7. Wait until FLEX\_US\_CSR.RXRDY rises.
8. Read FLEX\_US\_RHR.RCHR.
9. If all the data and the two CRC bytes have not been read, repeat the two previous steps.
10. Wait until FLEX\_US\_CSR.LRXD rises.
11. Check the LON errors.

**Figure 58.62. Rx Frame**

### 58.7.9.12.LON Frame Handling with the Peripheral DMA Controller

The USART can be used in association with the DMA Controller in order to transfer data directly into/from the on- and off-chip memories without any processor intervention.

The DMA uses the trigger flags, TXRDY and RXRDY, to write or read into the USART. The DMA always writes in the Transmit Holding register (FLEX\_US\_THR) and it always reads in the Receive Holding register (FLEX\_US\_RHR). The size of the data written or read by the DMA in the USART is always a byte.

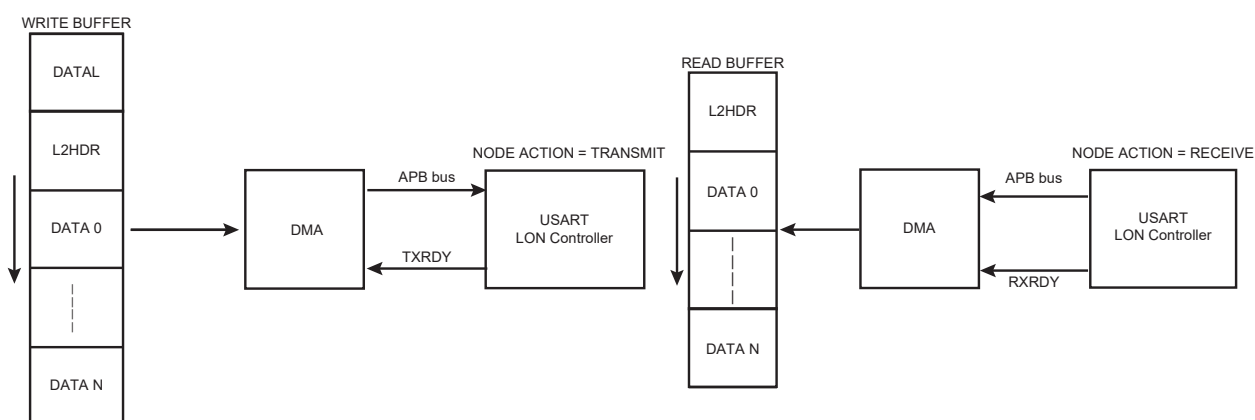

#### 58.7.9.12.1.Configuration

The user can choose between two DMA modes by the DMAM bit in the LON Mode register (FLEX\_US\_LONMR):

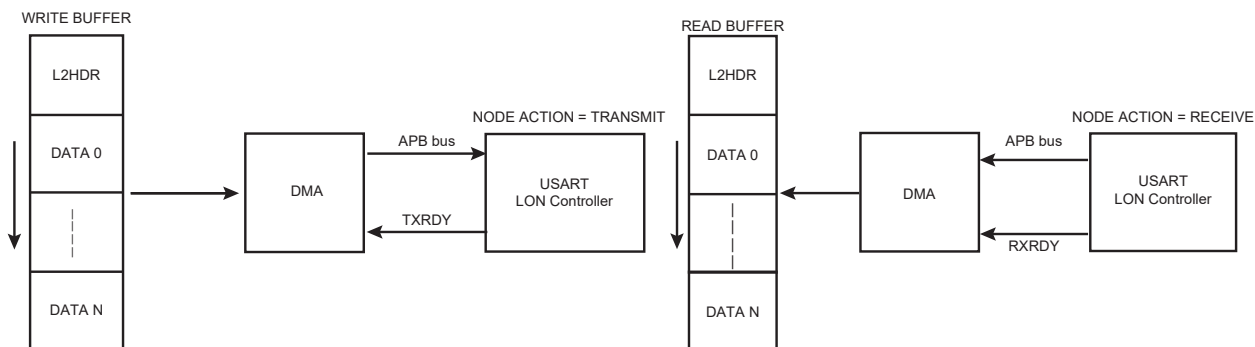

- DMAM = 1: The LON frame data length (DATAL) is stored in the WRITE buffer and it is written by the DMA in the Transmit Holding register FLEX\_US\_THR (instead of the LON Data Length register FLEX\_US\_LONDL).
- DMAM = 0: The LON frame data length (DATAL) is not stored in the WRITE buffer and it must be written by the user in the LON Data Length Register (FLEX\_US\_LONDL).

In both DMA modes, L2HDR is considered as a data and its value must be stored in the WRITE buffer as the first data to write.

**Figure 58.63. DMAM = 1**

**Figure 58.64. DMAM = 0**

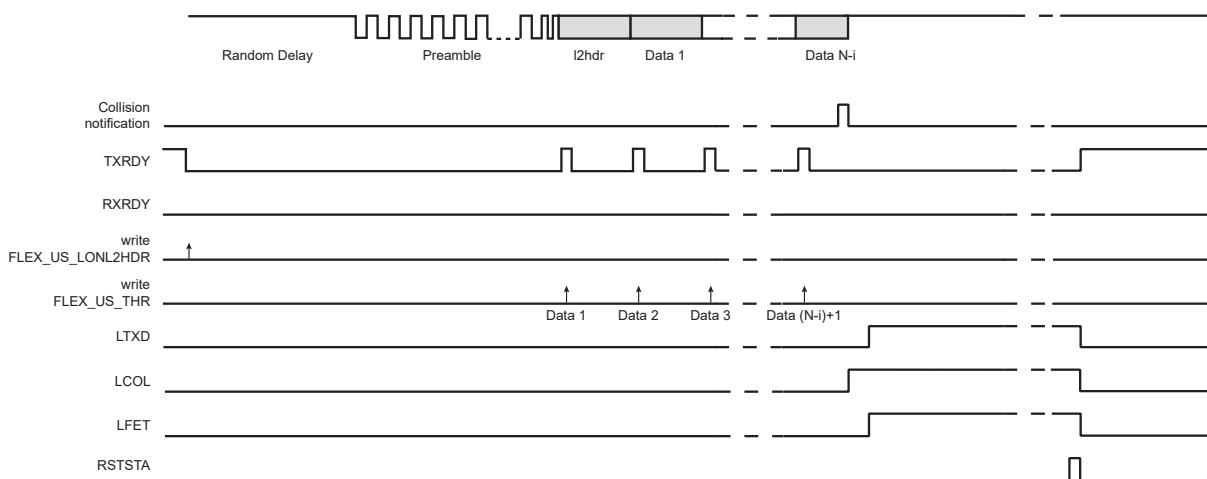

### 58.7.9.12.2.DMA and Collision Detection

As explained in section [comm\\_type](#), depending on LON configuration the transmission may be terminated early upon collision notification which means that the DMA transfer may be stopped before its end.

In case of early end of transmission due to collision detection, the USART in LON mode acts as follows:

- Send the end of frame trigger.
- Hold down TXRDY, thus avoiding any additional DMA transfer.
- Set the LTXD, LCOL and LFET flags in FLEX\_US\_CSR.
- Wait for the application to reconfigure the DMA.
- Wait until the LCOL and LFET flags are cleared through the FLEX\_US\_CR.RSTSTA bit (it will release the TXRDY signal).

**Figure 58.65. DMA, Collision and Early Frame Termination**

### 58.7.10. Test Modes

The USART can be programmed to operate in three different test modes. The internal loopback capability allows on-board diagnostics. In Loopback mode, the USART interface pins are disconnected or not and reconfigured for loopback internally or externally.

#### 58.7.10.1.Normal Mode

Normal mode connects the RXD pin on the receiver input and the transmitter output on the TXD pin.

**Figure 58.66.** Normal Mode Configuration

#### 58.7.10.2. Automatic Echo Mode

Automatic Echo mode allows bit-by-bit retransmission. When a bit is received on the RXD pin, it is sent to the TXD pin, as shown in the following figure. Programming the transmitter has no effect on the TXD pin. The RXD pin is still connected to the receiver input, thus the receiver remains active.

**Figure 58.67.** Automatic Echo Mode Configuration

#### 58.7.10.3. Local Loopback Mode

Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the following figure. The TXD and RXD pins are not used. The RXD pin has no effect on the receiver and the TXD pin is continuously driven high, as in idle state.

**Figure 58.68.** Local Loopback Mode Configuration

#### 58.7.10.4. Remote Loopback Mode

Remote Loopback mode directly connects the RXD pin to the TXD pin, as shown in the following figure. The transmitter and the receiver are disabled and have no effect. This mode allows bit-by-bit retransmission.

**Figure 58.69.** Remote Loopback Mode Configuration

## 58.7.11. USART FIFOs

### 58.7.11.1. Overview

The USART includes two FIFOs which can be enabled/disabled using FLEX\_US\_CR.FIFOEN/FIFODIS. Both the transmitter and the receiver must be disabled before enabling or disabling the FIFOs, using the FLEX\_US\_CR.TXDIS/RXDIS bits.

Writing FLEX\_US\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

When the FIFO is enabled, it is possible to write or to read single data (5-bit to 9-bit data) or multiple data (5-bit to 8-bit data) in the same access to FLEX\_US\_THR/RHR. See [FIFO Single Data Access](#) and [FIFO Multiple Data Access](#).

**Figure 58.70.** USART FIFOs Block Diagram

### 58.7.11.2. Sending Data with FIFO Enabled

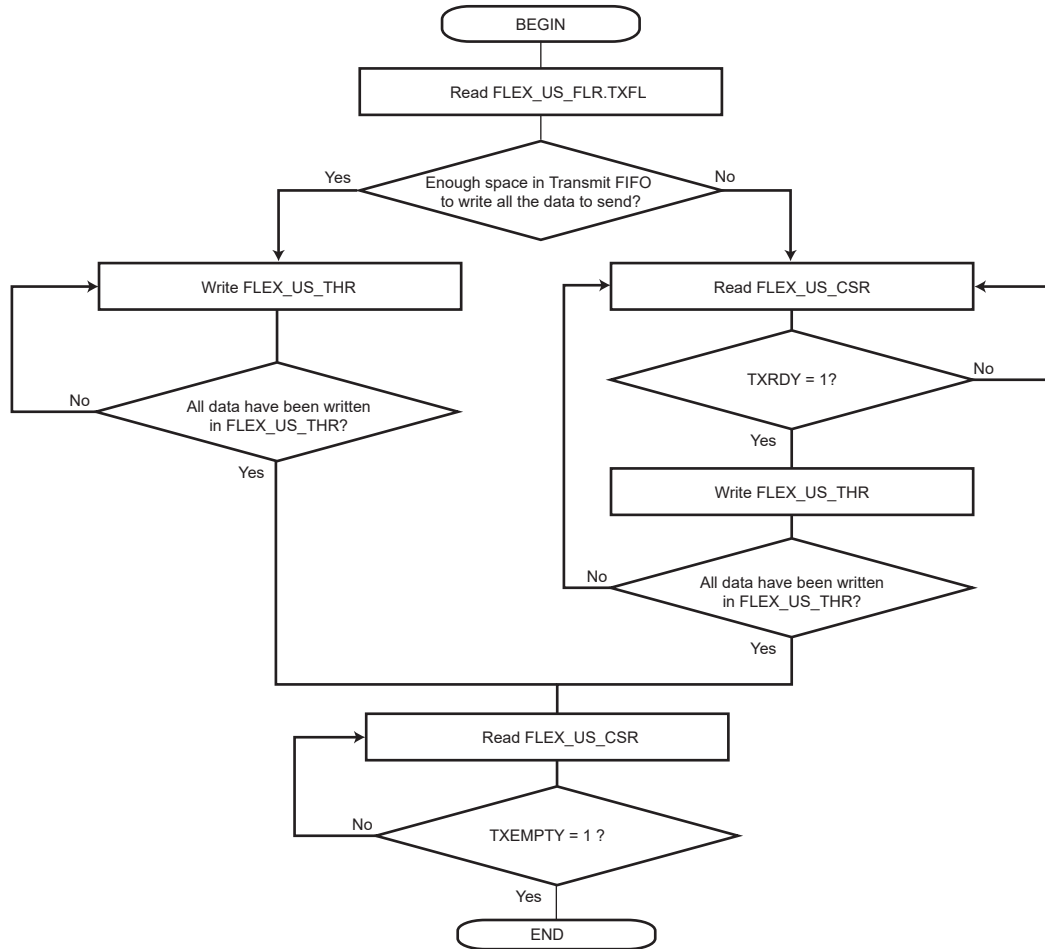

When the Transmit FIFO is enabled, write access to FLEX\_US\_THR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_US\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_US\_CSR.TXRDY and the data can be successively written in FLEX\_US\_THR.

If the FIFO cannot accept the data due to insufficient space, wait for the TXRDY flag to be set before writing the data in FLEX\_US\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

**Figure 58.71.** Sending Data with FIFO Enabled

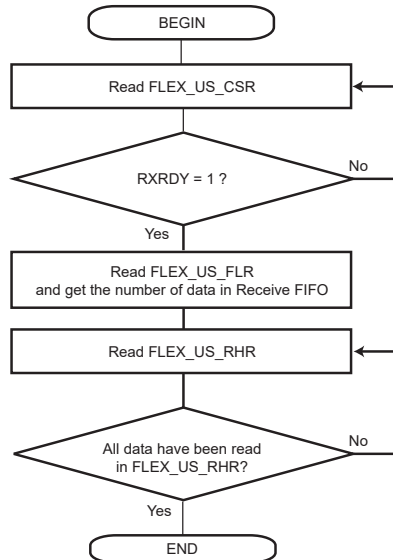

### 58.7.11.3.Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_US\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of data can be checked with FLEX\_US\_FLR.RXFL. All the data can be read successively in FLEX\_US\_RHR without checking the RXRDY flag between each access.

**Figure 58.72.** Receiving Data with FIFO Enabled

#### 58.7.11.4. Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_US\_CR.TXFCLR/RXFCLR.

#### 58.7.11.5. TXEMPTY, TXRDY and RXRDY Behavior

FLEX\_US\_CSR.TXEMPTY, FLEX\_US\_CSR.TXRDY and FLEX\_US\_CSR.RXRDY flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TXRDY indicates if a data can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new data. See figure [TXRDY in Single Data Mode and TXRDYM = 0](#).

RXRDY indicates if an unread data is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread data is in the Receive FIFO. See figure [RXRDY in Single Data Mode and RXRDYM = 0](#) below.

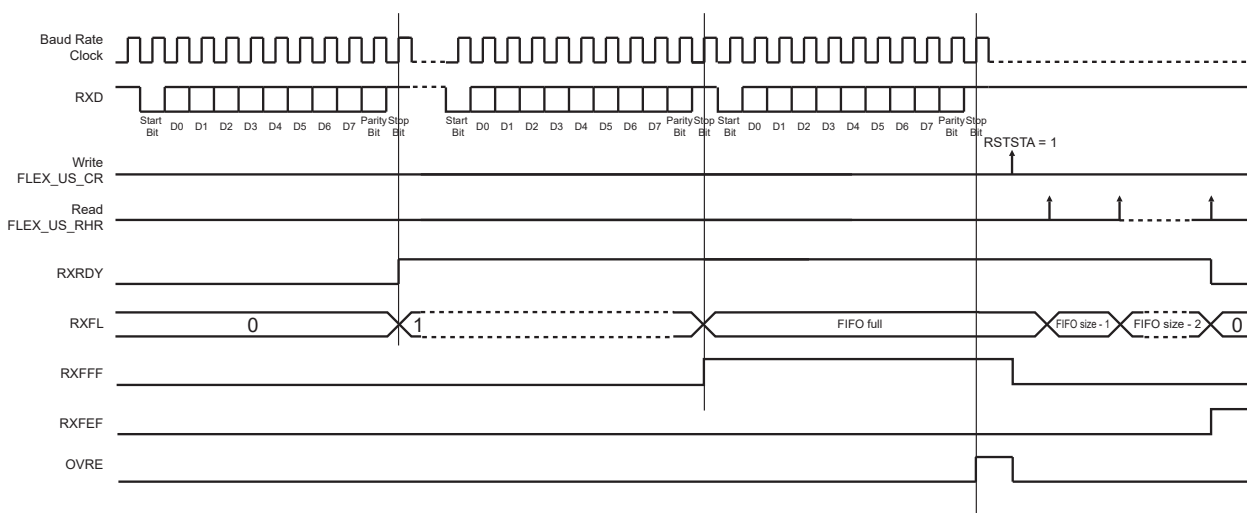

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the USART FIFO Mode register (FLEX\_US\_FMR).

See FLEX\_US\_FMR for the FIFO configuration.

**Figure 58.73.** TXRDY Behavior for Single Data Access and TXRDYM = 0

**Figure 58.74.** RXRDY Behavior for Single Data Access and RXRDYM = 0

#### 58.7.11.6.FIFO Single Data Access

When FIFO is enabled and a byte access is performed in FLEX\_US\_THR (5-bit to 8-bit data size), a single data is written in FIFO. The similar behavior applies for FLEX\_US\_RHR.

If FLEX\_US\_MR.MODE9 is set (9-bit data), or if FLEX\_US\_MR.USART\_MODE is configured to operate in LON mode, LIN Host mode or LIN Client mode, or if FLEX\_US\_MR.MAN is set, any type of access to FLEX\_US\_THR/RHR writes/reads a single data.

See [USART Receive Holding Register \(FLEX\\_US\\_RHR\)](#) and [USART Transmit Holding Register \(FLEX\\_US\\_THR\)](#).

However, for some configurations it is possible to write/read multiple data each time FLEX\_US\_THR/ FLEX\_US\_RHR is accessed. See [FIFO Multiple Data Access](#).

##### 58.7.11.6.1.DMA

The DMA transfer type must be configured in bytes or halfwords when FIFOs operate in Single Data mode (the same applies when FIFOs are disabled).

### 58.7.11.7.FIFO Multiple Data Access

For some operating modes, it is possible to reduce the number of accesses to/from FLEX\_US\_THR/FLEX\_US\_RHR required to transfer an amount of data, by concatenating multiple data (5-bit to 8-bit) when FIFO is enabled (FLEX\_US\_CR.FIFOEN=1) and 5- to 8-bit data characters are transferred (FLEX\_US\_MR.MODE9=0).

Up to four data (5-bit to 8-bit) can be written/read in one FLEX\_US\_THR/FLEX\_US\_RHR access.

When the FIFO is enabled, the number of data to write/read is defined by the type of access in the holding register. If the access is a byte, only one data is written/read (single data access), if the access is a halfword or a word a multiple data access is performed. If the access is a halfword, then two data are written/read and if the access is a word, four data are written/read.

Written/read data are always right-aligned, as described in [USART Receive Holding Register \(FIFO Multi Data\)](#) and [USART Transmit Holding Register \(FIFO Multi Data\)](#).

Multiple data access cannot be used for the following configurations:

- If FLEX\_US\_MR.MODE9 is set
- If FLEX\_US\_MR.USART\_MODE is configured to operated in LON mode, LIN Host mode or LIN Client mode
- FLEX\_US\_MR.MAN is set

As an example of multiple data access, if the Transmit FIFO is empty and there are six data to send, any of the following write accesses may be performed:

- six FLEX\_US\_THR-byte write accesses
- three FLEX\_US\_THR-halfword write accesses
- one FLEX\_US\_THR word write access and one FLEX\_US\_THR halfword write access

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_US\_RHR-byte read accesses
- three FLEX\_US\_RHR-halfword read accesses
- one FLEX\_US\_RHR-word read access and one FLEX\_US\_RHR-halfword read access

#### 58.7.11.7.1.TXRDY and RXRDY Configuration

The TXRDY flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_US\_FMR.TXRDYM/RXRDYM.

As an example, if a word (32-bit) is written in FLEX\_US\_THR, the TXRDYM field must be configured so that the TXRDY flag is at '1' only when at least four data can be written in the Transmit FIFO.

In the same way, if a word (32-bit) is read in FLEX\_US\_RHR, the RXRDYM field must be configured so that the RXRDY flag is at '1' only when at least four unread data are in the Receive FIFO.

#### 58.7.11.7.2.DMA

The DMA transfer type must be configured according to the FLEX\_US\_FMR.TXRDYM/RXRDYM settings.

As an example, FLEX\_US\_FMR.TXRDYM/RXRDYM=0 is not compatible with DMAC\_PDC transfers in word (32-bit).

#### 58.7.11.8.Transmit FIFO Lock

- LIN Mode:

If a frame is aborted using the Abort LIN Transmission bit (FLEX\_US\_CR.LINABT), a lock is set on the Transmit FIFO, preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMA channels, etc., without any risk.

- LON Mode:

If a frame is terminated early due to collision, a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMA channels, etc., without any risk.

The TXFLOCK bit in the USART FIFO Event Status register (FLEX\_US\_FESR) is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_US\_CR.TXFLCLR to '1'.

#### 58.7.11.9.FIFO Overflow/Underflow Error

If the Transmit FIFO is full and a write access is performed on FLEX\_US\_THR, it generates a Transmit FIFO overflow error and sets FLEX\_US\_FESR.TXFPTEF.

If the number of data written in FLEX\_US\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO overflow error is generated and FLEX\_US\_FESR.TXFPTEF is set.

If the number of data read in FLEX\_US\_RHR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO underflow error is generated and FLEX\_US\_FESR.RXFPTEF is set.

No error occurs if the FIFO state/level is checked before writing/reading in FLEX\_US\_THR/ FLEX\_US\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When such error occurs, other FIFO flags may not behave as expected; their states must be ignored.

If a Transmit FIFO overflow error occurs, a transmitter reset must be performed using FLEX\_US\_CR.RSTTX. If a Receive underflow error occurs, a receiver reset must be performed using FLEX\_US\_CR.RSTRX.

#### 58.7.11.10.FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_US\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_US\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_US\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_US\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The Receive FIFO threshold 2 can be set using the field FLEX\_US\_FMR.RXFTHRES2. Each time the Receive FIFO level goes from 'above threshold 2' to 'equal to or below threshold 2', the flag FLEX\_US\_FESR.RXFTHF2 is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF, RXFTHF and RXTHF2 flags can be configured to generate an interrupt using FLEX\_US\_FIER and FLEX\_US\_FIDR.

#### 58.7.11.11.FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_US\_FIER and FLEX\_US\_FIDR.

FIFO flags state can be read in FLEX\_US\_FESR. They are cleared by writing FLEX\_US\_CR.RSTSTA to '1'.

### 58.7.12. 16-bit Data Protocol Support

When configuring 0xC in FLEX\_US\_MR.USART\_MODE, the transmitter sends a 16-bit data frame and the receiver expects an 8-bit data frame. The number of stop bits is defined in the field NBSTOP. The transmitter and/or receiver must operate in asynchronous mode (FLEX\_US\_MR.SYNC must be cleared).

When configuring 0xD in FLEX\_US\_MR.USART\_MODE, the transmitter sends an 8-bit frame whereas the receiver expects a 16-bit frame.

The FIFO mode must be enabled by setting FLEX\_US\_CR.FIFOEN to '1'.

A 16-bit frame starts as soon as two 8-bit characters are written in FLEX\_US\_THR (assuming 0xC is written in the field USART\_MODE).

**Note:** When FLEX\_US\_MR.USART\_MODE = 0xC or 0xD, there must be a parity bit in the frame (FLEX\_US\_MR.USART\_MODE must not be equal to 4).

### 58.7.13. USART Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_USART to enable access to the write protection registers.

To prevent any single software error from corrupting USART behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the [USART Write Protection Mode Register \(FLEX\\_US\\_WPMR\)](#).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the [USART Write Protection Status Register \(FLEX\\_US\\_WPSR\)](#) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_US\_WPSR.

The following registers can be write-protected when WPEN is set:

- [USART Mode Register](#)
- [USART Baud Rate Generator Register](#)
- [USART Receiver Timeout Register](#)
- [USART Transmitter Timeguard Register](#)
- [USART FI DI RATIO Register](#)
- [USART IrDA FILTER Register](#)
- [USART Manchester Configuration Register](#)
- [USART LON Mode Register](#)
- [USART LON Beta1 Tx Register](#)
- [USART LON Beta1 Rx Register](#)
- [USART LON Priority Register](#)
- [USART LON IDT Tx Register](#)
- [USART LON IDT Rx Register](#)
- [USART IC DIFF Register](#)
- [USART Comparison Register](#)

The following register(s) can be write-protected when WPITEN is set:

- [USART Interrupt Enable Register](#)

- [USART Interrupt Disable Register](#)

The following register(s) can be write-protected when WPCREN is set:

- [USART Control Register](#)

## 58.8. SPI Functional Description

### 58.8.1. Modes of Operation

The SPI operates in Host mode or in Client mode.

- The SPI operates in Host mode by writing a 1 to the MSTR bit in the SPI Mode register (FLEX\_SPI\_MR):
  - The pins NPCS0 to NPCS3 are all configured as outputs.
  - The SPCK pin is driven.
  - The MISO line is wired on the receiver input.
  - The MOSI line is driven as an output by the transmitter.
- The SPI operates in Client mode if the MSTR bit in FLEX\_SPI\_MR is written to 0:
  - The MISO line is driven by the transmitter output.
  - The MOSI line is wired on the receiver input.
  - The SPCK pin is driven by the transmitter to synchronize the receiver.
  - The NPCS0 pin becomes an input, and is used as a client select signal (NSS).
  - Pins NPCS1 to NPCS3 are not driven and can be used for other purposes.

The data transfers are identically programmable for both modes of operation. The bit rate generator is activated only in Host mode.

### 58.8.2. Data Transfer

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the SPI Chip Select register (FLEX\_SPI\_CSR). The clock phase is programmed with the NCPHA bit. These two parameters determine the edges of the clock signal on which data are driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Consequently, a host/client pair must use the same parameter pair values to communicate. If multiple clients are connected and require different configurations, the host must reconfigure itself each time it needs to communicate with a different client.

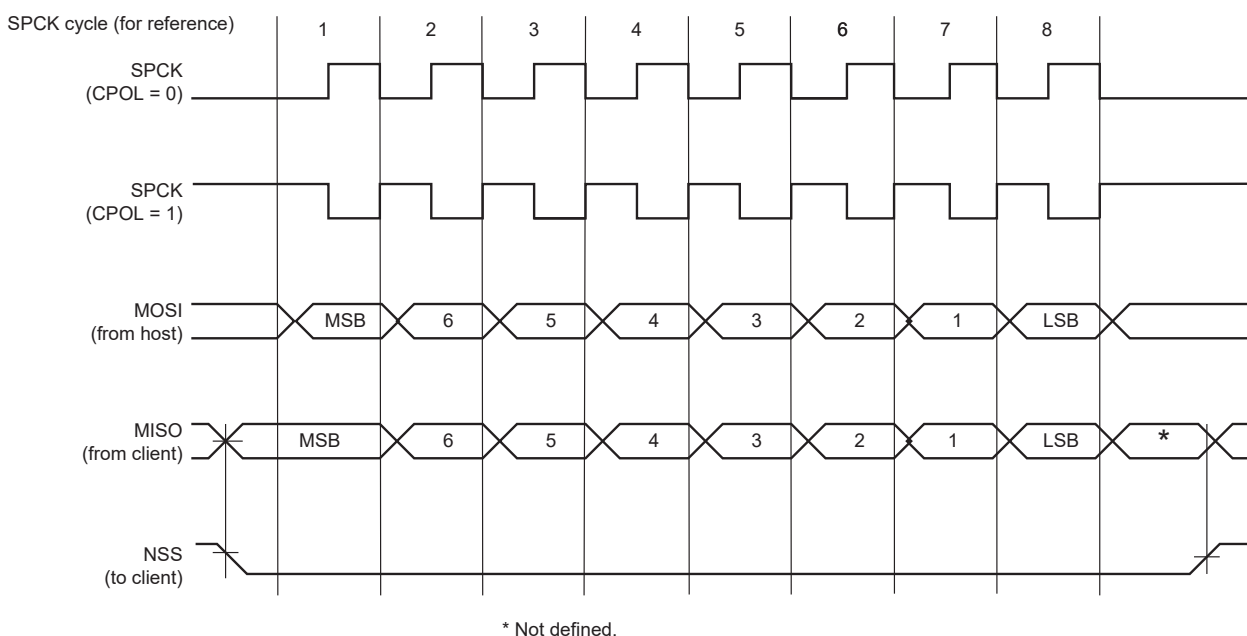

The following table shows the four modes and corresponding parameter settings.

**Table 58.14.** SPI Bus Protocol Mode

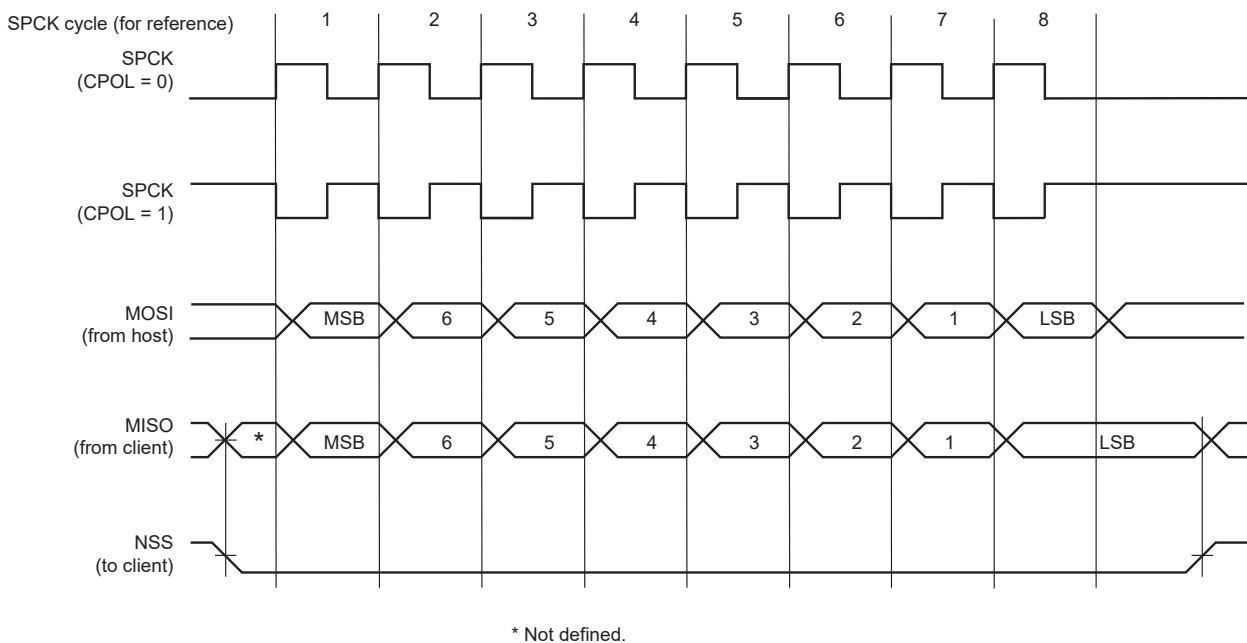

SPI Mode	CPOL	NCPHA	Host Shift SPCK Edge	Client Capture SPCK Edge	SPCK Inactive Level
0	0	1	Falling	Rising	Low
1	0	0	Rising	Falling	Low
2	1	1	Rising	Falling	High
3	1	0	Falling	Rising	High

The following figures show examples of data transfers.

**Figure 58.75.** SPI Transfer Format (NCPHA = 1, 8 bits per transfer) Modes 0 and 2

**Figure 58.76.** SPI Transfer Format (NCPHA = 0, 8 bits per transfer) Modes 1 and 3

### 58.8.3. Host Mode Operations

When configured in Host mode, the SPI operates on the clock generated by the internal programmable bit rate generator. It fully controls the data transfers to and from the client(s)

connected to the SPI bus. The SPI drives the chip select line to the client and the serial clock signal (SPCK).

The SPI features two holding registers, the Transmit Data register (FLEX\_SPI\_TDR) and the Receive Data register (FLEX\_SPI\_RDR), and a single shift register. The holding registers maintain the data flow at a constant rate.

After enabling the SPI, a data transfer starts when the processor writes to FLEX\_SPI\_TDR. The written data are immediately transferred in the shift register and the transfer on the SPI bus starts. While the data in the shift register is shifted on the MOSI line, the MISO line is sampled and shifted in the shift register. Data cannot be loaded in FLEX\_SPI\_RDR without transmitting data. If there is no data to transmit, a dummy data can be used (FLEX\_SPI\_TDR filled with ones). When the WDRBT bit is set, a new data cannot be transmitted if FLEX\_SPI\_RDR has not been read. If Receiving mode is not required, for example when communicating with a client receiver only (such as an LCD), the receive status flags in the SPI Status register (FLEX\_SPI\_SR) can be discarded.

Before writing the TDR, the FLEX\_SPI\_MR.PCS field must be set in order to select a client.

If new data are written in FLEX\_SPI\_TDR during the transfer, it is kept in FLEX\_SPI\_TDR until the current transfer is completed. Then, the received data are transferred from the shift register to FLEX\_SPI\_RDR, the data in FLEX\_SPI\_TDR is loaded in the shift register and a new transfer starts.

As soon as the FLEX\_SPI\_TDR is written, the Transmit Data Register Empty (TDRE) flag in FLEX\_SPI\_SR is cleared. When the data written in FLEX\_SPI\_TDR is loaded into the shift register, the FLEX\_SPI\_SR.TDRE flag is set. The TDRE bit is used to trigger the Transmit DMA channel (see figure below).

The end of transfer is indicated by FLEX\_SPI\_SR.TXEMPTY. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

#### Notes:

1. When the SPI is enabled, the TDRE and TXEMPTY flags are set.
2. The TXEMPTY flag alone cannot be used to detect the end of the buffer DMA transfer.

**Figure 58.77. TDRE and TXEMPTY Flag Behavior**

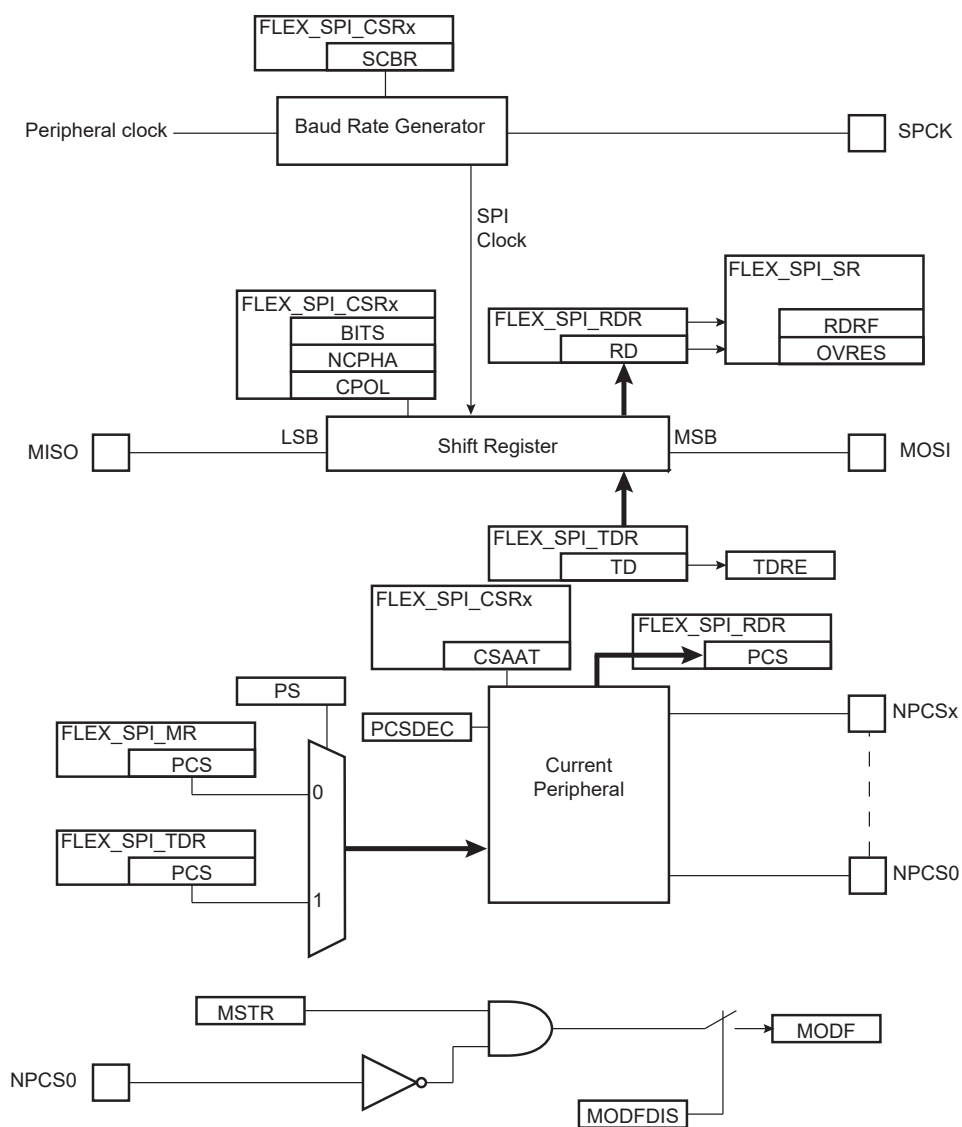

The transfer of received data from the shift register to FLEX\_SPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in FLEX\_SPI\_SR. When the received data are read, the RDRF bit is cleared.

If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user has to read the status register to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Host mode and a flow chart describing how transfers are handled.

### 58.8.3.1.Host Mode Block Diagram

Figure 58.78. Host Mode Block Diagram

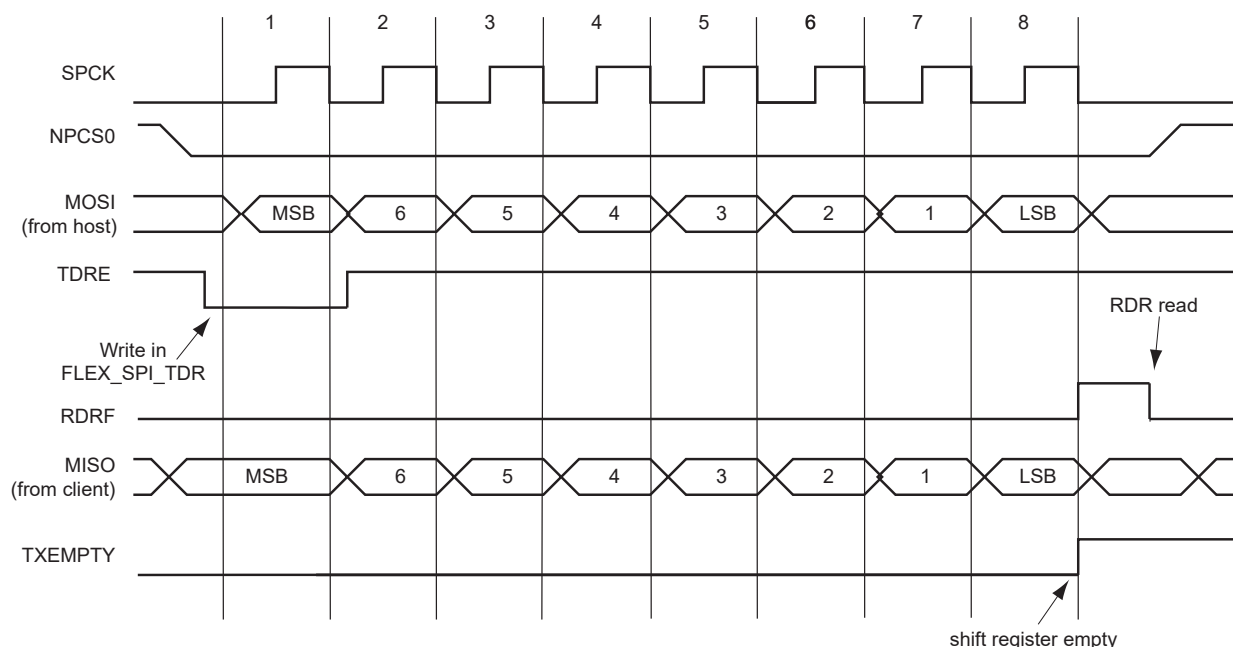

### 58.8.3.2.Host Mode Flowchart

Figure 58.79. Host Mode

The following figure shows the behavior of Transmit Data Register Empty (TDRE), Receive Data Register (RDRF) and Transmission Register Empty (TXEMPTY) status flags within FLEX\_SPI\_SR during an 8-bit data transfer in Fixed mode without the DMAC involved.

**Figure 58.80.** Status Register Flags Behavior

### 58.8.3.3. Clock Generation

The SPI bit rate clock is generated by dividing a source clock which can be the peripheral clock or a programmable clock from the GCLK. The divider can be a value between 1 and 255.

If the SCBR field is programmed to 1 and the clock source is GCLK, the operating bit rate is peripheral clock (refer to the section “Electrical Characteristics” for the SPCK maximum frequency). Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

At reset, SCBR is 0 and the user has to program it to a valid value before performing the first transfer.

The divisor can be defined independently for each chip select, as it has to be programmed in the FLEX\_SPI\_CSR.SCBR field. This allows the SPI to automatically adapt the bit rate for each interfaced peripheral without reprogramming.

If GCLK is selected as source clock (FLEX\_SPI\_MR.BSRCCLK = 1), the bit rate is independent of the processor/bus clock. Thus, the processor clock can be changed while SPI is enabled. The processor clock frequency changes must be performed only by programming the PMC\_MCKR.PRES field (refer to the section “Power Management Controller (PMC)”). Any other method to modify the processor/bus clock frequency (PLL multiplier, etc.) is forbidden when SPI is enabled.

The peripheral clock frequency must be at least three times higher than GCLK.

### 58.8.3.4. Transfer Delays

The figure below shows a chip select transfer change and consecutive transfers on the same chip select. Three delays can be programmed to modify the transfer waveforms:

- The delay between the chip selects. It is programmable only once for all chip selects by writing the FLEX\_SPI\_MR.DLYBCS field. The SPI client device deactivation delay is managed through DLYBCS. If there is only one SPI client device connected to the host, the DLYBCS field does not need to be configured. If several client devices are connected to a host, DLYBCS must be configured depending on the highest deactivation delay. Refer to “SPI Timings” in the section “Electrical Characteristics”.

- The delay before SPCK, independently programmable for each chip select by writing the DLYBS field. The SPI client device activation delay is managed through DLYBS. Refer to “SPI Timings” in the section “Electrical Characteristics” to define DLYBS.
- The delay between consecutive transfers, independently programmable for each chip select by writing the DLYBCT field. The time required by the SPI client device to process received data is managed through DLYBCT. This time depends on the SPI client system activity.

These delays allow the SPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 58.81.** Programmable Delays

### 58.8.3.5. Peripheral Selection

The serial peripherals are selected through the assertion of the NPCS0 to NPCS3 signals. By default, all NPCS signals are high before and after each transfer.

- Fixed Peripheral Select Mode: SPI exchanges data with only one peripheral. Fixed Peripheral Select mode is enabled by writing the FLEX\_SPI\_MR.PS bit to zero. In this case, the current peripheral is defined by the FLEX\_SPI\_MR.PCS field, and the FLEX\_SPI\_TDR.PCS field has no effect.
- Variable Peripheral Select Mode: Data can be exchanged with more than one peripheral without having to reprogram FLEX\_SPI\_MR.PCS. Variable Peripheral Select Mode is enabled by setting the FLEX\_SPI\_MR.PS bit to one. The FLEX\_SPI\_TDR.PCS field is used to select the current peripheral. This means that the peripheral selection can be defined for each new data. The value must be written in a single access to FLEX\_SPI\_TDR in the following format:

[xxxxxxx(7-bit) + LASTXFER(1-bit)<sup>(1)</sup> + xxxx(4-bit) + PCS (4-bit) + TD (8 to 16-bit data)]  
with LASTXFER at 0 or 1 depending on the CSAAT bit, and PCS equal to the chip select to assert, as defined in [SPI Transmit Data Register \(FLEX\\_SPI\\_TDR\)](#).

Note: 1. Optional

The CSAAT, LASTXFER and CSNAAT bits are discussed in [Peripheral Deselection with DMA](#).

If LASTXFER is used, the command must be issued after writing the last character. Instead of LASTXFER, the user can use the SPIDIS command. After the end of the DMA transfer, it is necessary to wait for the TXEMPTY flag and then write SPIDIS into the SPI Control register (FLEX\_SPI\_CR). This does not change the configuration register values). The NPCS is disabled after the last character transfer. Then, another DMA transfer can be started if the FLEX\_SPI\_CR.SPIEN bit has previously been written.

### 58.8.3.6. SPI Direct Access Memory Controller (DMAC)

In both Fixed and Variable modes, the Direct Memory Access Controller (DMAC) can be used to reduce processor overhead.

The fixed peripheral selection allows buffer transfers with a single peripheral. Using the DMAC is an optimal means, as the size of the data transfer between the memory and the SPI is either 8 bits or 16 bits. However, if the peripheral selection is modified, FLEX\_SPI\_MR must be reprogrammed.

The variable peripheral selection allows buffer transfers with multiple peripherals without reprogramming FLEX\_SPI\_MR. Data written in FLEX\_SPI\_TDR is 32 bits wide and defines the real data to be transmitted and the destination peripheral. Using the DMAC in this mode requires 32-bit wide buffers, with the data in the LSBs and the PCS and LASTXFER fields in the MSBs. However, the SPI still controls the number of bits (8 to 16) to be transferred through MISO and MOSI lines with the chip select configuration registers. This is not the optimal means in terms of memory size for the buffers, but it provides a very effective means to exchange data with several peripherals without any intervention of the processor.

### 58.8.3.7. Peripheral Chip Select Decoding

The user can program the SPI to operate with up to 15 client peripherals by decoding the four chip select lines, NPCS0 to NPCS3 with an external decoder/demultiplexer (see the following figure). This can be enabled by setting the FLEX\_SPI\_MR.PCSDEC bit.

When operating without decoding, the SPI makes sure that in any case only one chip select line is activated, i.e., one NPCS line driven low at a time. If two bits are defined low in a PCS field, only the lowest numbered chip select is driven low.

When operating with decoding, the SPI directly outputs the value defined by the PCS field on the NPCS lines of either FLEX\_SPI\_MR or FLEX\_SPI\_TDR (depending on PS).

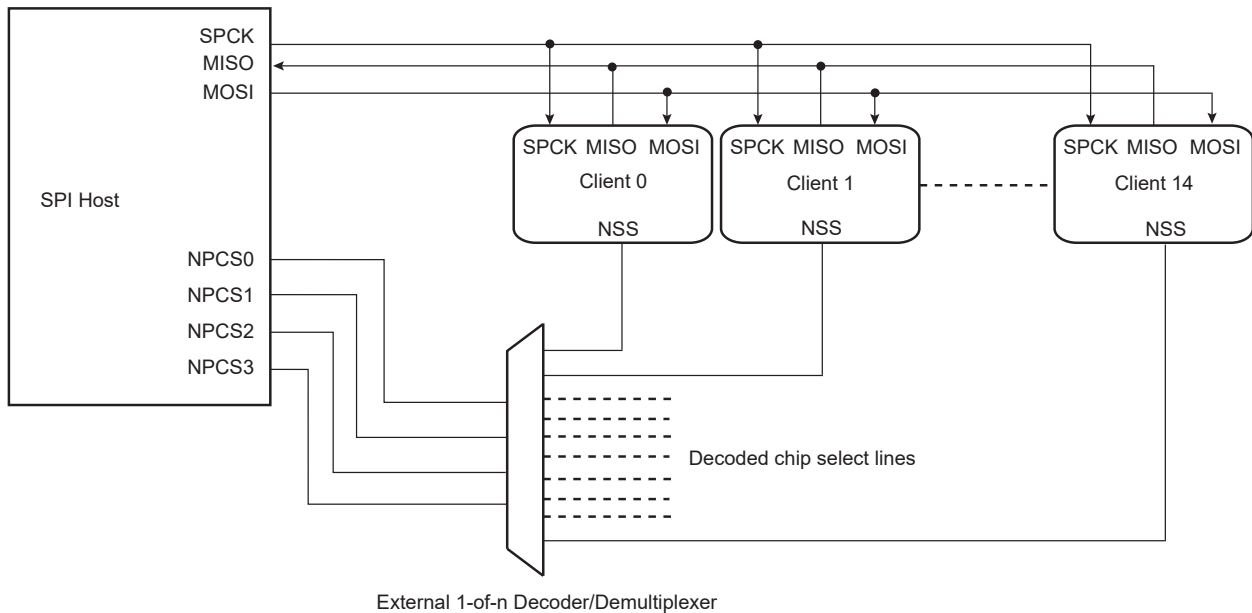

As the SPI sets a default value of 0xF on the chip select lines (i.e., all chip select lines at 1) when not processing any transfer, only 15 peripherals can be decoded.

The SPI has only four Chip Select registers. As a result, when external decoding is activated, each NPCS chip select defines the characteristics of up to four peripherals. As an example, FLEX\_SPI\_CR0 defines the characteristics of the externally decoded peripherals 0 to 3, corresponding to the PCS values 0x0 to 0x3. Consequently, the user has to make sure to connect compatible peripherals on the decoded chip select lines 0 to 3, 4 to 7, 8 to 11 and 12 to 14. The following figure shows this type of implementation.

If the CSAAT bit is used, with or without the DMAC, the mode fault detection for NPCS0 line must be disabled. This is not needed for all other chip select lines since mode fault detection is only on NPCS0.

**Figure 58.82.** Chip Select Decoding Application Block Diagram: Single Host/Multiple Client Implementation

#### 58.8.3.8. Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, **FLEX\_SPI\_TDR** is loaded by the processor, the **TDRE** flag rises as soon as the content of **FLEX\_SPI\_TDR** is transferred into the internal shift register. When this flag is detected high, **FLEX\_SPI\_TDR** can be reloaded. If this reload by the processor occurs before the end of the current transfer, and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted between the two transfers. But depending on the application software handling the SPI status register flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload **FLEX\_SPI\_TDR** in time to keep the chip select active (low). A null **DLYBCT** value (delay between consecutive transfers) in **FLEX\_SPI\_CSR**, gives even less time for the processor to reload **FLEX\_SPI\_TDR**. With some SPI client peripherals, if the chip select line must remain active (low) during a full set of transfers, communication errors can occur.

To facilitate interfacing with such devices, the Chip Select registers [**CSR0**...**CSR3**] can be programmed with the Chip Select Active After Transfer (**CSAAT**) bit to 1. This allows the chip select lines to remain in their current state (low = active) until a transfer to another chip select is required. Even if **FLEX\_SPI\_TDR** is not reloaded, the chip select remains active. To de-assert the chip select line at the end of the transfer, the Last Transfer (**LASTXFER**) bit in **FLEX\_SPI\_CR** must be set after writing the last data to transmit into **FLEX\_SPI\_TDR**.

#### 58.8.3.9. Peripheral Deselection with DMA

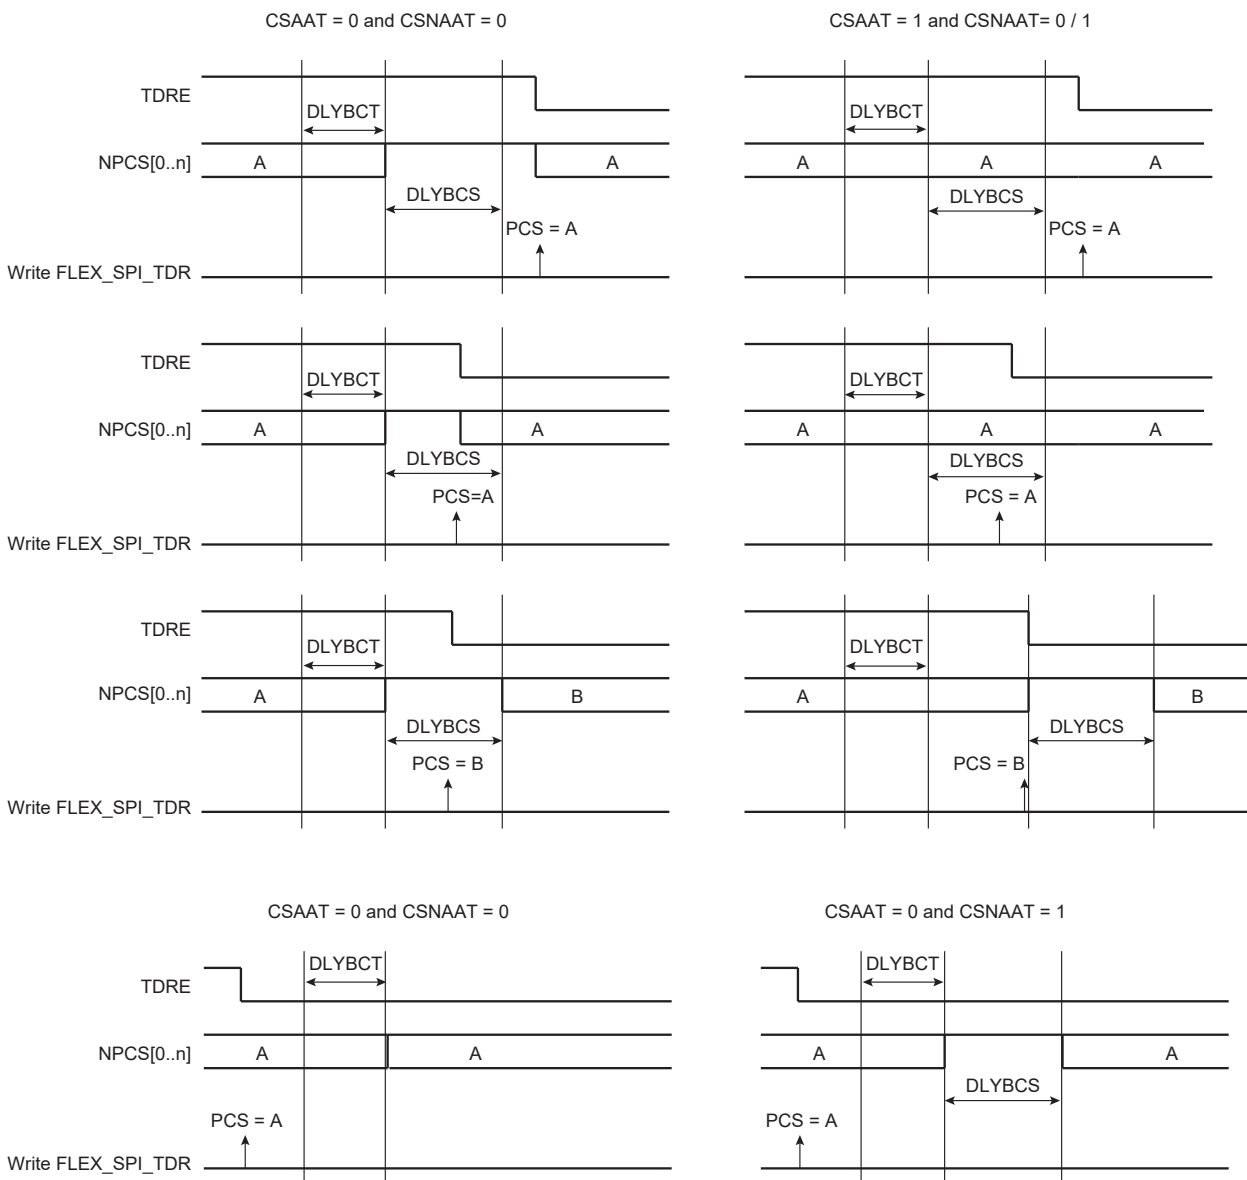

DMA provides faster reloads of **FLEX\_SPI\_TDR** compared to software. However, depending on the system activity, it is never sure that **FLEX\_SPI\_TDR** is written with the next data before the end of the current transfer. Consequently, a data can be lost by the deassertion of the **NPCS** line for SPI client peripherals requiring the chip select line to remain active between two transfers. The only way to ensure a safe transfer in this case is the use of the **CSAAT** and **LASTXFER** bits.

When the **CSAAT** bit is cleared, the **NPCS** does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the **TDRE** flag rises as soon as the content of **FLEX\_SPI\_TDR** is transferred into the internal shift register. When this flag is detected, **FLEX\_SPI\_TDR** can be reloaded. If this reload occurs before the end of the current transfer and if the next transfer is performed on the same chip select as the current transfer, the Chip Select is not deasserted

between the two transfers. This can lead to difficulties to interface with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, FLEX\_SPI\_CSR can be programmed with the Chip Select Not Active After Transfer (CSNAAT) bit to 1. This allows the chip select lines to be deasserted systematically during a time “DLYBCS” (the value of the CSNAAT bit is processed only if the CSAAT bit is cleared for the same chip select).

The following figure shows different peripheral deselection cases and the effect of the CSAAT and CSNAAT bits.

**Figure 58.83.** Peripheral Deselection

### 58.8.3.10. Mode Fault Detection

The SPI has the capability to operate in multi-host environment. Consequently, the NPCS0/NSS line must be monitored. If one of the hosts on the SPI bus is currently transmitting, the NPCS0/NSS line is low and the SPI must not transmit a data. A mode fault is detected when the SPI is programmed in Host mode and a low level is driven by an external host on the NPCS0/NSS signal. In multi-host environment, NPCS0, MOSI, MISO and SPCK pins must be configured in open drain (through the PIO

controller). When a mode fault is detected, the FLEX\_SPI\_SR.MODF bit is set until FLEX\_SPI\_SR is read and the SPI is automatically disabled until it is re-enabled by writing the FLEX\_SPI\_CR.SPIEN bit to 1.

By default, the mode fault detection is enabled. The user can disable it by setting the FLEX\_SPI\_MR.MODFDIS bit.

#### 58.8.4. SPI Client Mode

When operating in Client mode, the SPI processes data bits on the clock provided on the SPI clock pin (SPCK).

The SPI waits until NSS goes active before receiving the serial clock from an external host. When NSS falls, the clock is validated and the data are loaded in FLEX\_SPI\_RDR according to the configuration value of the FLEX\_SPI\_CSR0.BITS field. These bits are processed following a phase and a polarity defined respectively by the FLEX\_SPI\_CSR0.NCPHA and FLEX\_SPI\_CSR0.CPOL bits. Note that the BITS field, CPOL bit and NCPHA bit of the other Chip Select registers have no effect when the SPI is programmed in Client mode.

The bits are shifted out on the MISO line and sampled on the MOSI line.

**Note:** For more information on the BITS field, see also the note below the FLEX\_SPI\_CSRx register bitmap in section [SPI Chip Select Register](#)

When all bits are processed, the received data are transferred in FLEX\_SPI\_RDR and the RDRF bit rises. If FLEX\_SPI\_RDR has not been read before new data are received, the Overrun Error bit (OVRES) in FLEX\_SPI\_SR is set. As long as this flag is set, data are loaded in FLEX\_SPI\_RDR. The user must read FLEX\_SPI\_SR to clear the OVRES bit.

When a transfer starts, the data shifted out is the data present in the shift register. If no data has been written in FLEX\_SPI\_TDR, the last data received is transferred. If no data has been received since the last reset, all bits are transmitted low, as the shift register resets to 0.

When a first data is written in FLEX\_SPI\_TDR, it is transferred immediately in the shift register and the TDRE flag rises. If new data is written, it remains in FLEX\_SPI\_TDR until a transfer occurs, i.e., NSS falls and there is a valid clock on the SPCK pin. When the transfer occurs, the last data written in FLEX\_SPI\_TDR is transferred in the shift register and the TDRE flag rises. This enables frequent updates of critical variables with single transfers.

Then, a new data is loaded in the shift register from FLEX\_SPI\_TDR. If no character is ready to be transmitted, i.e., no character has been written in FLEX\_SPI\_TDR since the last load from FLEX\_SPI\_TDR to the shift register, FLEX\_SPI\_TDR is retransmitted. In this case the Underrun Error Status flag (UNDES) is set in FLEX\_SPI\_SR.

If NSS rises between two characters, it must be kept high for two MCK clock periods or more and the next SPCK capture edge must not occur less than four MCK periods after NSS rise.

In Client mode, if the NSS line rises and the received character length does not match the configuration defined in FLEX\_SPI\_CSR0.BITS, the SFERR flag is set in FLEX\_SPI\_SR.

The following figure shows a block diagram of the SPI when operating in Client mode.

**Figure 58.84.** Client Mode Functional Block Diagram

### 58.8.5. SPI Comparison Function on Received Character

The comparison is only relevant for SPI Client mode (MSTR = 0 in FLEX\_US\_MR).

In Active mode, the CMP flag in FLEX\_SPI\_SR is raised. It is set when the received character matches the conditions programmed in the SPI Comparison register (FLEX\_SPI\_CMPR). The CMP flag is set as soon as FLEX\_SPI\_RDR is loaded with the new received character. The CMP flag is cleared by reading FLEX\_SPI\_SR.

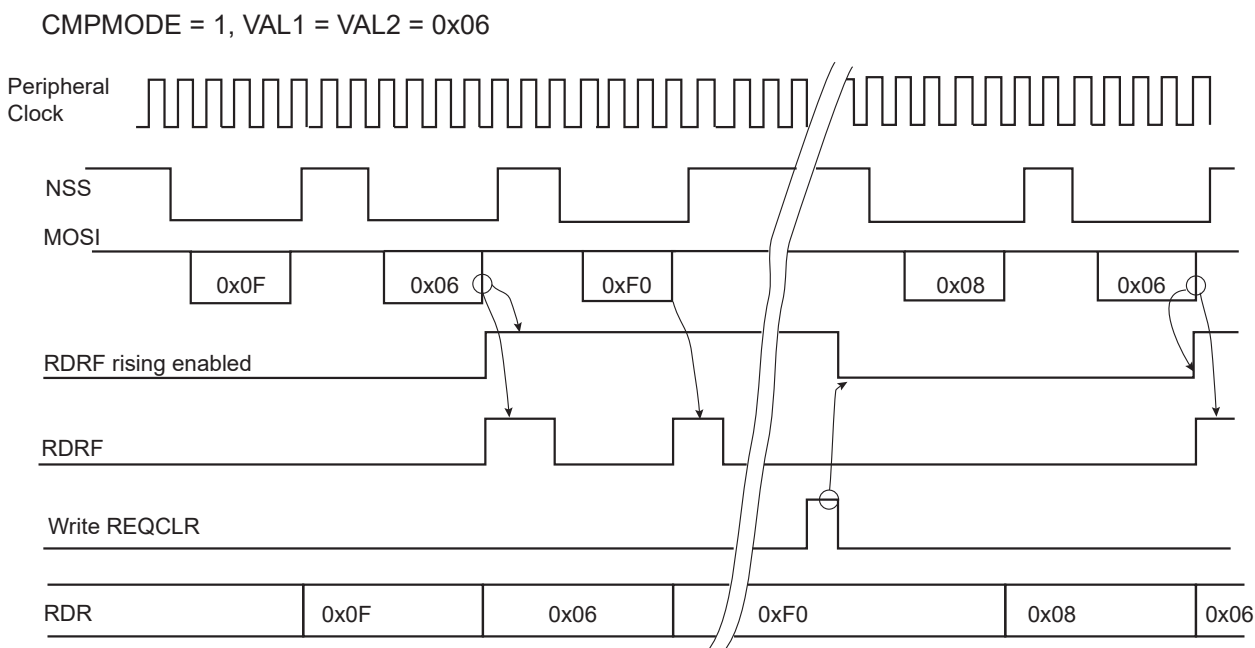

The SPI Comparison register can be programmed to provide different comparison methods. These are listed below:

- If VAL1 equals VAL2, then the comparison is performed on a single value and the flag is set to 1 if the received character equals VAL1.
- If VAL1 is strictly lower than VAL2, then any value between VAL1 and VAL2 sets the CMP flag.
- If VAL1 is strictly higher than VAL2, then the flag CMP is set to 1 if any received character equals VAL1 or VAL2.

When FLEX\_SPI\_MR.CMPMODE is cleared, all received data is loaded in FLEX\_SPI\_RDR and the CMP flag provides the status of the comparison result.

By setting the CMPMODE bit, the comparison result triggers the start of FLEX\_SPI\_RDR loading (see the figure below). The trigger condition exists as soon as the received character value matches the conditions defined by VAL1 and VAL2 in FLEX\_SPI\_CMPR. The comparison trigger event is restarted by writing a 1 to the FLEX\_SPI\_CR.REQCLR bit.

The value programmed in VAL1 and VAL2 fields must not exceed the maximum value of the received character (see BITS field in SPI Chip Select register (FLEX\_SPI\_CSR)).

**Figure 58.85.** Receive Data Register Management

## 58.8.6. SPI FIFOs

### 58.8.6.1. Overview

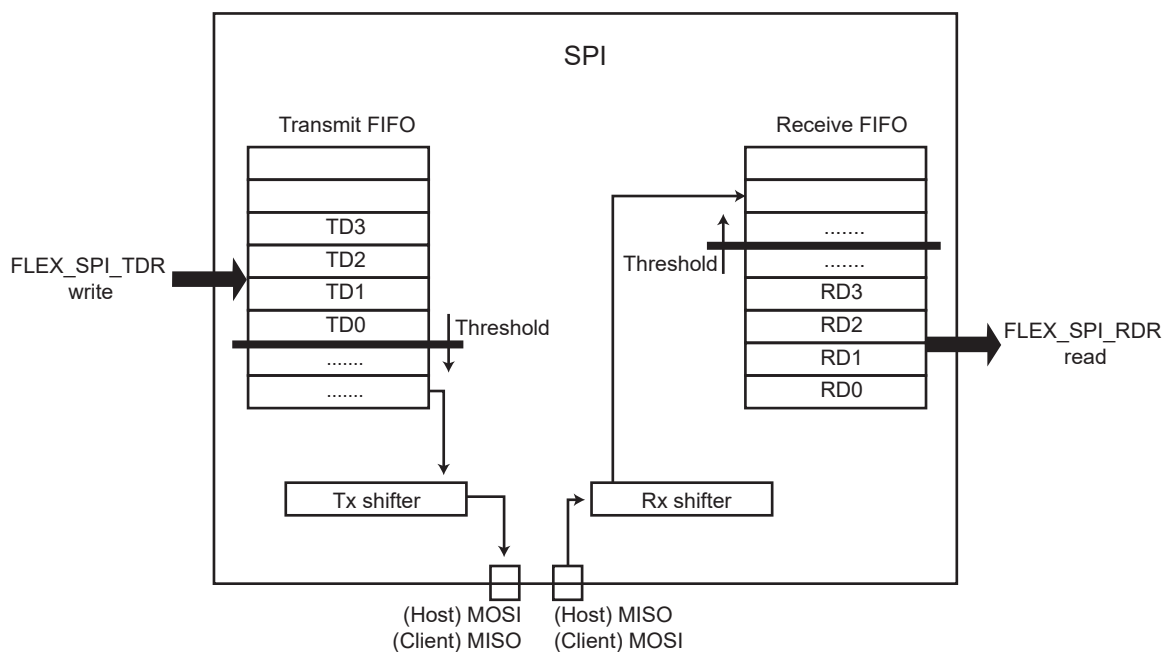

The SPI includes two FIFOs which can be enabled/disabled using the FLEX\_SPI\_CR.FIFOEN/FIFODIS. The SPI module must be disabled before enabling or disabling the SPI FIFOs (FLEX\_SPI\_CR.SPIDIS).

Writing FLEX\_SPI\_CR.FIFOEN to '1' enables a 16-data Transmit FIFO and a 16-data Receive FIFO.

The size of a data (8-bit to 16-bit) is determined by the value configured in FLEX\_SPI\_CSRx.BITS.

It is possible to write or to read single or multiple data in the same access to FLEX\_SPI\_TDR/RDR. See [SPI Single Data Access](#) and [SPI Multiple Data Access](#).

**Figure 58.86.** SPI FIFOs Block Diagram

### 58.8.6.2. Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_SPI\_TDR loads the Transmit FIFO.

The FIFO level is provided in FLEX\_SPI\_FLR.TXFL. If the FIFO can accept the number of data to be transmitted, there is no need to monitor FLEX\_SPI\_SR.TDRE and the data can be successively written in FLEX\_SPI\_TDR.

If the FIFO cannot accept the data due to insufficient space, wait for the TDRE flag to be set before writing the data in FLEX\_SPI\_TDR.

When the space in the FIFO allows only a portion of the data to be written, the TDRE flag must be monitored before writing the remaining data.

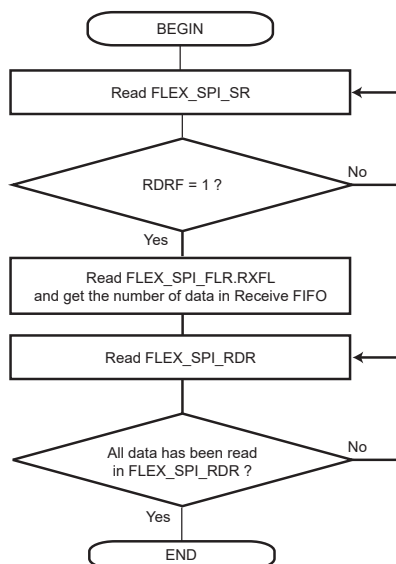

**Figure 58.87.** Sending Data with FIFO Enabled

### 58.8.6.3.Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_SPI\_RDR access reads the FIFO.

When data are present in the Receive FIFO (RDRF flag set to '1'), the exact number of data can be checked with FLEX\_SPI\_FLR.RXFL. All the data can be read successively in FLEX\_SPI\_RDR without checking the RDRF flag between each access.

**Figure 58.88.** Receiving Data with FIFO Enabled

#### 58.8.6.4. Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_SPI\_CR.TXFCLR/RXFCLR.

#### 58.8.6.5. TXEMPTY, TDRE and RDRF Behavior

FLEX\_SPI\_SR.TXEMPTY, FLEX\_SPI\_SR.TDRE and FLEX\_SPI\_SR.RDRF flags display a specific behavior when FIFOs are enabled.

The TXEMPTY flag is cleared as long as there are characters in the Transmit FIFO or in the internal shift register. TXEMPTY is set when there are no characters in the Transmit FIFO and in the internal shift register.

TDRE indicates if a data can be written in the Transmit FIFO. Thus the TDRE flag is set as long as the Transmit FIFO can accept new data. See figure [TDRE Behavior for Single Data Access and TXRDYM = 0](#).

RDRF indicates if an unread data is present in the Receive FIFO. Thus the RDRF flag is set as soon as one unread data is in the Receive FIFO. See figure [RDRF Behavior in Single Data Access and RXRDYM = 0](#).

TDRE and RDRF behavior can be modified using the TXRDYM and RXRDYM fields in the SPI FIFO Mode register (FLEX\_SPI\_FMR) to reduce the number of accesses to FLEX\_SPI\_TDR/RDR. However, for some configurations, the following constraints apply:

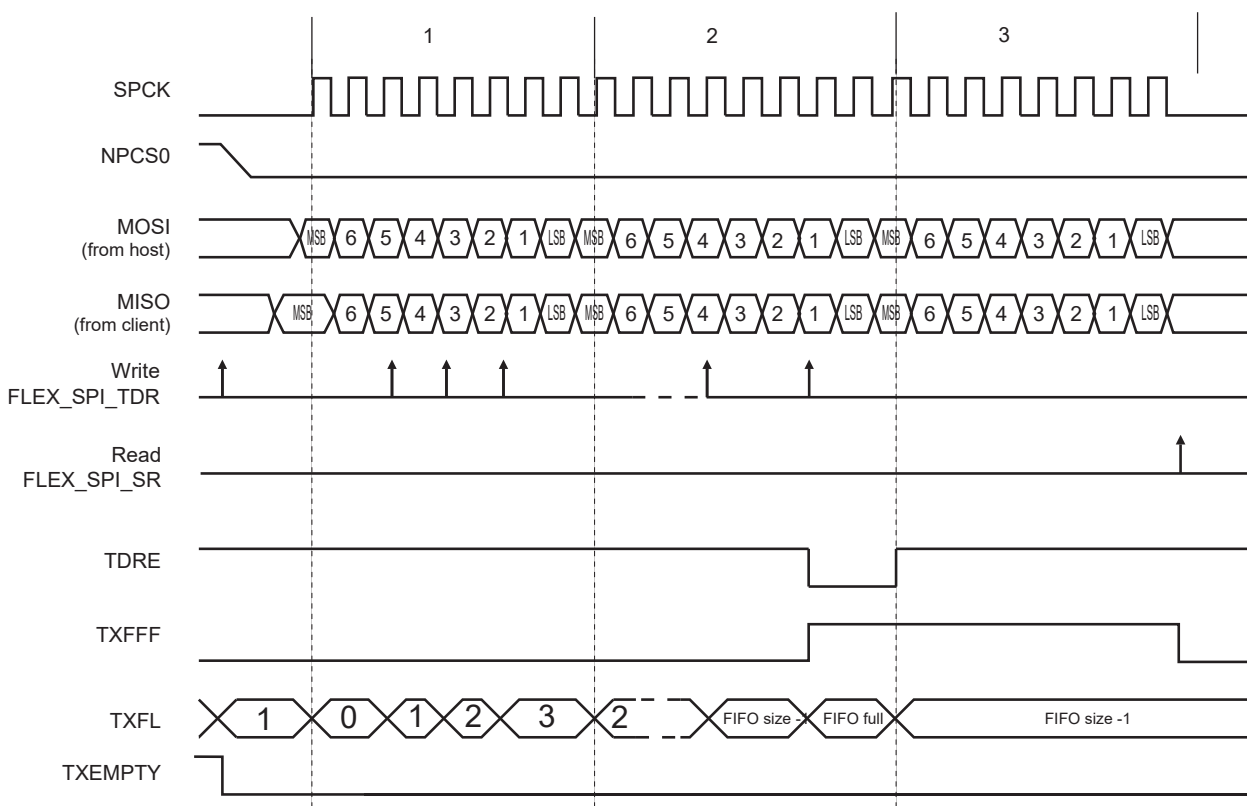

- When Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), TXRDYM/RXRDYM must be cleared.
- In Host mode (FLEX\_SPI\_MR.MSTR=1), RXRDYM must be cleared.

As an example, in Host mode, the Transmit FIFO can be loaded with multiple data in the same access by configuring TXRDYM>0.

See SPI FIFO Mode register ([FLEX\\_SPI\\_FMR](#)) for the FIFO configuration.

**Figure 58.89.** TDRE Behavior for Single Data Access and TXRDYM = 0

**Figure 58.90.** RDRF Behavior for Single Data Access and RXRDYM = 0

#### 58.8.6.6.SPI Single Data Access

When FIFO is enabled and a byte or a halfword access (8-bit to 16-bit data) is performed in FLEX\_SPI\_TDR, a single data is written in FIFO each time FLEX\_SPI\_TDR is accessed. The similar behavior applies for FLEX\_SPI\_RDR.

If Host mode is used (FLEX\_SPI\_MR.MSTR=1) or if Variable Peripheral Select mode is used (FLEX\_SPI\_MR.PS=1), each access to FLEX\_SPI\_RDR must be read a single data.

See [SPI Transmit Data Register](#) and [SPI Receive Data Register](#).

However, for some configurations it is possible to write/read multiple data each time FLEX\_SPI\_TDR/ FLEX\_SPI\_RDR is accessed. See [SPI Multiple Data Access](#).

##### 58.8.6.6.1.DMA

When FIFOs operate in Single Data mode, the DMA transfer type must be configured either in bytes, halfwords or words depending on FLEX\_SPI\_MR.PS bit value and FLEX\_SPI\_CSRx.BITS field value.

The same applies when FIFOs are disabled.

#### 58.8.6.7.SPI Multiple Data Access

For some operating modes, it is possible to reduce the number of accesses to FLEX\_SPI\_TDR/ FLEX\_SPI\_RDR required to transfer an amount of data, by concatenating multiple data (8-bit or 9-bit to 16-bit) when the FIFO is enabled (FLEX\_SPI\_CR.FIFOEN=1) and fixed peripheral select is used (FLEX\_SPI\_MR.PS=0).

Up to two data can be written in one FLEX\_SPI\_TDR write access.

Up to four data can be read in one FLEX\_SPI\_RDR access.

When the FIFO is enabled, the number of data written in a single access to FLEX\_SPI\_TDR is only defined by the type of access.

**Table 58.15.** Number of Data Written for Each Access to FLEX\_SPI\_TDR

Config/Access	Byte	Halfword	Word
8-bit to 16-bit	1	1	2

When the FIFO is enabled, the number of data read in a single access to FLEX\_SPI\_RDR is defined by the type of access and the configuration of FLEX\_SPI\_CSR0.BITS.

**Table 58.16.** Number of Data Read for Each Access to FLEX\_SPI\_RDR

Config/Access	Byte	Halfword	Word
FLEX_SPI_CSR0.BITS=0 8-bit data	1	2	4
FLEX_SPI_CSR0.BITS>0 9-bit to 16-bit data	1	1	2

Multiple data can be read from the Receive FIFO only in Client mode (FLEX\_SPI\_MR.MSTR=0).

The Transmit FIFO can be loaded with multiple data in the same FLEX\_SPI\_TDR access when FLEX\_SPI\_MR.PS=0.

Written/read data are always right-aligned, as described in sections [SPI Receive Data Register \(FIFO Multiple Data, 8-bit\)](#), [SPI Receive Data Register \(FIFO Multiple Data, 16-bit\)](#) and [SPI Transmit Data Register \(FIFO Multiple Data, 8- to 16-bit\)](#).

As an example, if the Transmit FIFO is empty and there are six data to send, either of the following write accesses may be performed:

- six FLEX\_SPI\_TDR-byte write accesses
- three FLEX\_SPI\_TDR-halfword write accesses

With a Receive FIFO containing six data, any of the following read accesses may be performed:

- six FLEX\_SPI\_RDR-byte read accesses
- three FLEX\_SPI\_RDR-halfword read accesses
- one FLEX\_SPI\_RDR-word read access and one FLEX\_SPI\_RDR-halfword read access

#### 58.8.6.7.1.TDRE and RDRF Configuration

The TDRE flag indicates if one or more data can be written in the FIFO depending on the configuration of FLEX\_SPI\_FMR.TXRDYM/RXRDYM.

As an example, if two data are written each time in FLEX\_SPI\_TDR, the TXRDYM field can be configured so that the TDRE flag is at '1' only when at least two data can be written in the Transmit FIFO.

Similarly, if four data are read each time in FLEX\_SPI\_RDR, the RXRDYM field can be configured so that the RDRF flag is at '1' only when at least four unread data are in the Receive FIFO.

#### 58.8.6.7.2.DMA

It is mandatory to configure DMA channel size (byte, halfword or word) according to the FLEX\_SPI\_FMR.TXRDYM/RXRDYM configuration. See constraints in [SPI Multiple Data Access](#).

As an example, when FIFO is enabled, FLEX\_SPI\_FMR.TXRDYM/RXRDYM=0 configuration is not compatible with DMAC\_PDC transfers in word (32-bit).

#### 58.8.6.8.FIFO Overflow/Underflow Error

If the Transmit FIFO is full and a write access is performed on FLEX\_SPI\_TDR, it generates a Transmit FIFO overflow error and sets FLEX\_SPI\_SR.TXFPTEF.

If the number of data written in FLEX\_SPI\_TDR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO overflow error is generated and FLEX\_SPI\_SR.TXFPTEF is set.

If the number of data read in FLEX\_SPI\_RDR (according to the register access size) is greater than the number of unread data in the Receive FIFO, a Receive FIFO underflow error is generated and FLEX\_SPI\_SR.RXFPTEF is set.

No error occurs if the FIFO state/level is checked before writing/reading the required amount of data in FLEX\_SPI\_TDR/SPI\_RDR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When such error occurs, other FIFO flags may not behave as expected; their states must be ignored. A software reset must be performed using FLEX\_SPI\_CR.SWRST (configuration will be lost).

#### 58.8.6.9.FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of data in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of data currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_SPI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_SPI\_SR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_SPI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_SPI\_SR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

#### 58.8.6.10.FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_SPI\_IER and FLEX\_SPI\_IDR.

FIFO flags state can be read in FLEX\_SPI\_SR. They are cleared when FLEX\_SPI\_SR is read.

#### 58.8.7. SPI Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR.OPMODE\_SPI to enable access to the write protection registers.

To prevent any single software error from corrupting SPI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the SPI Write Protection Mode Register (FLEX\_SPI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the SPI Write Protection Status Register (FLEX\_SPI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_SPI\_WPSR.

The following registers can be write-protected when WPEN is set:

- [SPI Mode Register](#)
- [SPI Chip Select Register](#)
- [SPI Comparison Register](#)

The following registers can be write-protected when WPITEN is set:

- [SPI Interrupt Enable Register](#)
- [SPI Interrupt Disable Register](#)

The following register can be write-protected when WPCREN is set:

- [SPI Control Register](#)

#### 58.8.8. Local Loopback Test Mode

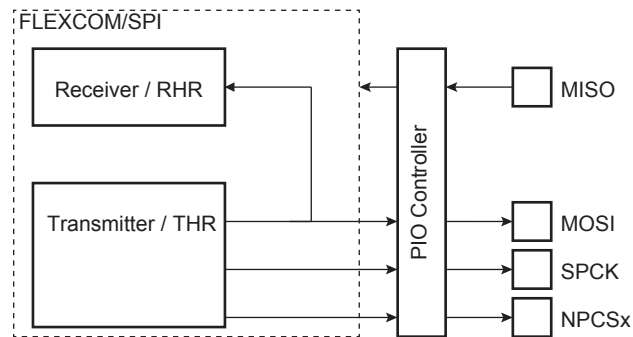

Local Loopback mode connects the output of the transmitter directly to the input of the receiver, as shown in the figure below. The MISO pin has no effect on the receiver and the MOSI pin is driven as in Normal mode.

The MOSI, SPCK and NPCSx are normally transmitted unless the PIO is configured to drive logical values to prevent the SPI external target device from starting.

Local Loopback mode and allows a quick and easy verification of the transmitter and receiver logic.

Local Loopback mode is enabled when FLEX\_SPI\_MR.LLB=1, FLEX\_SPI\_MR.MASTER=1 and the FLEX\_MR.OPMODE=2.

**Figure 58.91.** Local Loopback Mode Configuration

## 58.9. TWI Functional Description

### 58.9.1. Transfer Format

The data put on the TWD line must be 8 bits long. Data are transferred MSB first; each byte must be followed by an acknowledgement. The number of bytes per transfer is unlimited (see figure below).

**Figure 58.92.** Transfer Format

Each transfer begins with a START condition and terminates with a STOP condition (see figure below).

- A high-to-low transition on the TWD line while TWCK is high defines the START condition.
- A low-to-high transition on the TWD line while TWCK is high defines a STOP condition.

**Figure 58.93.** START and STOP Conditions

#### 58.9.1.1. Digital Filter

The TWI features digital filters on data and clock lines that can be configured by software via the TWI Filter register (FLEX\_TWI\_FILTR).

In Standard, Fast and Fast Plus modes, the digital filter must be enabled (FILT=1) and a pulse width threshold defined (THRES > 0).

The field THRES must be set according to the peripheral clock to suppress spikes below 50 ns. The recommended value is calculated using the formula:

$$THRES > 50 \text{ ns} / t_{\text{peripheral\_clock}}(\text{ns})$$

### 58.9.2. Modes of Operation

The TWI has different modes of operation:

- Host Transmitter mode
- Host Receiver mode
- Multi-host Transmitter mode
- Multi-host Receiver mode
- Client Transmitter mode

- Client Receiver mode

These modes are described in the following sections.

### 58.9.3. Host Mode

#### 58.9.3.1. Definition

The host is the device that starts a transfer, generates a clock and stops it.

#### 58.9.3.2. Programming Host Mode

The following fields must be programmed before entering Host mode:

1. DADR (+ IADRSZ + IADR if a 10-bit device is addressed): The device address is used to access client devices in Read or Write mode.
2. CWGR + CKDIV + CHDIV + CLDIV: Clock waveform.
3. SVDIS: Disables Client mode.
4. MSEN: Enables Host mode.

**Note:** If the TWI is already in Host mode, the device address (DADR) can be configured without disabling Host mode.

#### 58.9.3.3. Transfer Speed/Bit Rate

The TWI speed is defined in FLEX\_TWI\_CWGR. The TWI bit rate can be based either on the peripheral clock if the BRSRCCLK bit value is 0 or on a programmable clock source provided by the GCLK if the BRSRCCLK bit value is 1.

If BRSRCCLK = 1, the bit rate is independent of the processor/peripheral clock and thus processor/peripheral clock frequency can be changed without affecting the TWI transfer rate.

The GCLK frequency must be at least three times lower than the peripheral clock frequency.

#### 58.9.3.4. Host Transmitter Mode

After the host initiates a START condition when writing into the Transmit Holding register FLEX\_TWI\_THR, it sends a 7-bit client address, configured in the Host Mode register (DADR in FLEX\_TWI\_MMR), to notify the client device. The bit following the client address indicates the transfer direction, 0 in this case (FLEX\_TWI\_MMR.MREAD = 0).

The TWI transfers require the client to acknowledge each received byte. During the acknowledge clock pulse (ninth pulse), the host releases the data line (HIGH), enabling the client to pull it down in order to generate the acknowledge. If the client does not acknowledge the byte, then the Not Acknowledge flag (NACK) is set in the TWI Status register (FLEX\_TWI\_SR) of the host and a STOP condition is sent. Alternatively, if the FLEX\_TWI\_MMR.NOAP bit is set, no stop condition will be sent and a START or STOP condition must be triggered manually through the FLEX\_TWI\_CR.START or FLEX\_TWI\_CR.STOP bit once the software is ready for the transmission of the condition. The NACK flag must be cleared by reading the TWI Status register (FLEX\_TWI\_SR) before the next write into the TWI Transmit Holding register (FLEX\_TWI\_THR). As with the other status bits, an interrupt can be generated if enabled in the Interrupt Enable register (FLEX\_TWI\_IER). If the client acknowledges the byte, the data written in FLEX\_TWI\_THR is then shifted in the internal shifter and transferred. When an acknowledge is detected, the TXRDY bit is set until a new write in FLEX\_TWI\_THR.

TXRDY is used as transmit ready for the DMA transmit channel.

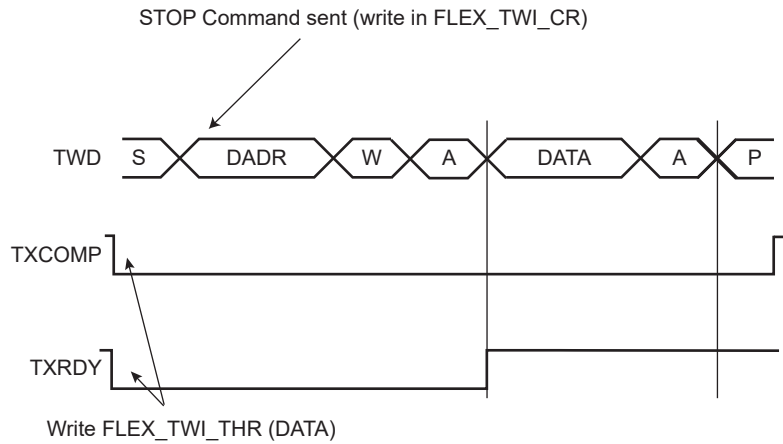

**Note:** To clear the TXRDY flag in Host mode, write the FLEX\_TWI\_CR.MSDIS bit to 1, then write the FLEX\_TWI\_CR.MSEN bit to 1.

While no new data is written in FLEX\_TWI\_THR, the serial clock line is tied low. When new data is written in FLEX\_TWI\_THR, the SCL is released and the data is sent. To generate a STOP event, the STOP command must be performed by writing in the STOP field of the TWI Control register (FLEX\_TWI\_CR).

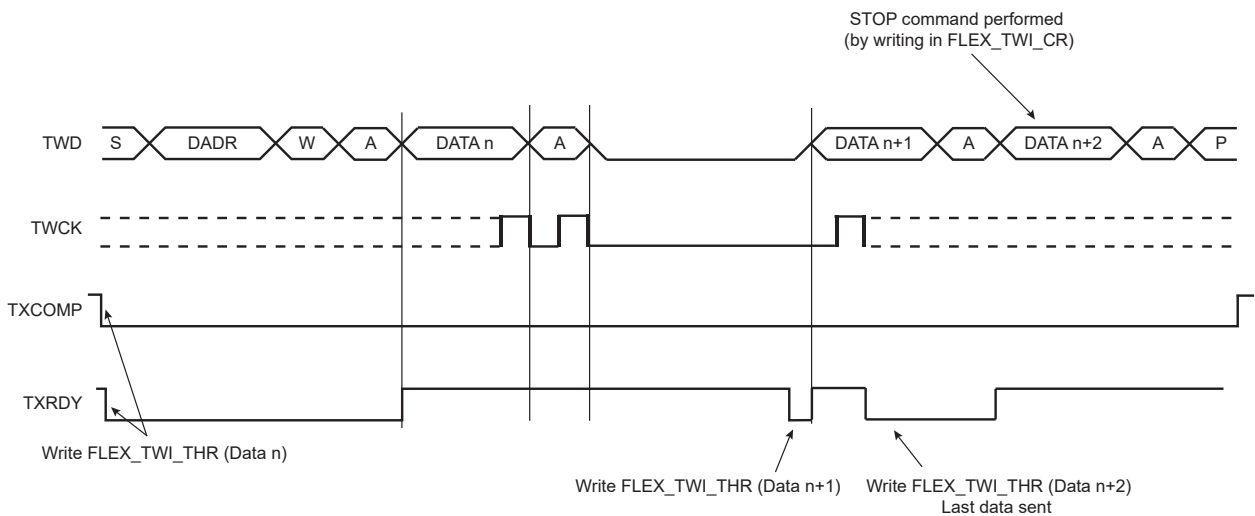

After a host write transfer, the Serial Clock line is stretched (tied low) while no new data is written in FLEX\_TWI\_THR or until a STOP command is performed.

See the following figures.

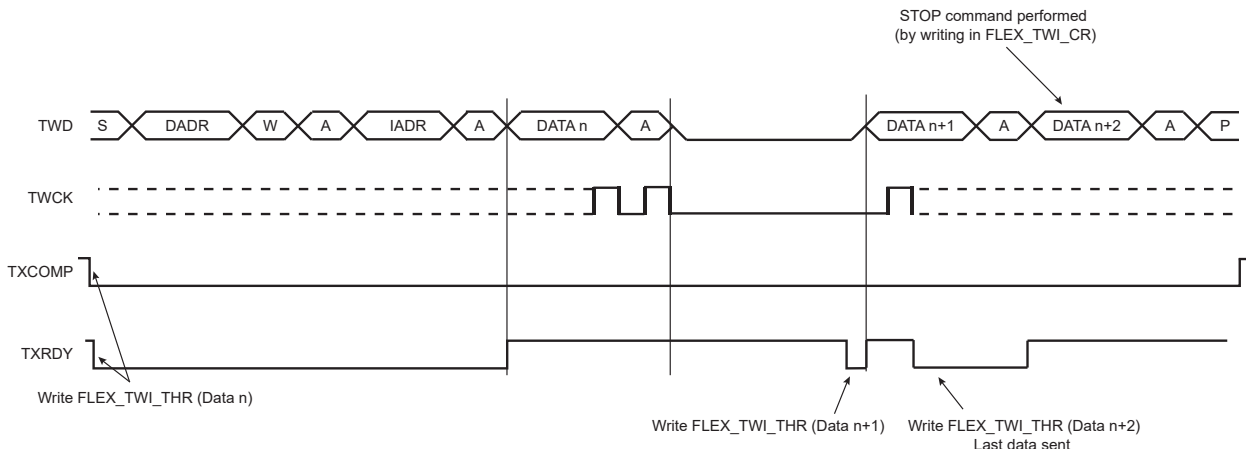

**Figure 58.94.** Host Write with One Data Byte

**Figure 58.95.** Host Write with Multiple Data Bytes

**Figure 58.96.** Host Write with One Byte Internal Address and Multiple Data Bytes

### 58.9.3.5. Host Receiver Mode

The read sequence begins by setting the START bit. After the start condition has been sent, the host sends a 7-bit client address to notify the client device. The bit following the client address indicates the transfer direction, 1 in this case (`FLEX_TWI_MMR.MREAD = 1`). During the acknowledge clock pulse (9th pulse), the host releases the data line (HIGH), enabling the client to pull it down in order to generate the acknowledge. The host polls the data line during this clock pulse and sets the `FLEX_TWI_SR.NACK` bit if the client does not acknowledge the byte.

If an acknowledge is received, the host is then ready to receive data from the client. After data has been received, the host sends an acknowledge condition to notify the client that the data has been received except for the last data (see figure "Host Read with One Data Byte" below). When the `FLEX_TWI_SR.RXRDY` bit is set, a character has been received in the Receive Holding register (`FLEX_TWI_RHR`). The `RXRDY` bit is reset when reading `FLEX_TWI_RHR`.

When a single data byte read is performed, with or without internal address (IADR), the START and STOP bits must be set at the same time. See figure "Host Read with One Data Byte" below. When a multiple data byte read is performed, with or without internal address (IADR), the STOP bit must be set after the next-to-last data received (same condition applies for START bit to generate a repeated start). See figure "Host Read with Multiple Data Bytes" below. For internal address usage, see [Internal Address](#).

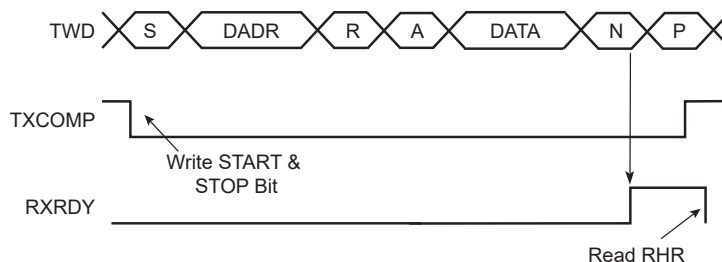

If `FLEX_TWI_RHR` is full (`RXRDY` high) and the host is receiving data, the serial clock line will be tied low before receiving the last bit of the data and until `FLEX_TWI_RHR` is read. Once `FLEX_TWI_RHR` is read, the host will stop stretching the serial clock line and end the data reception. See figure "Host Read Clock Stretching with Multiple Data Bytes" below.

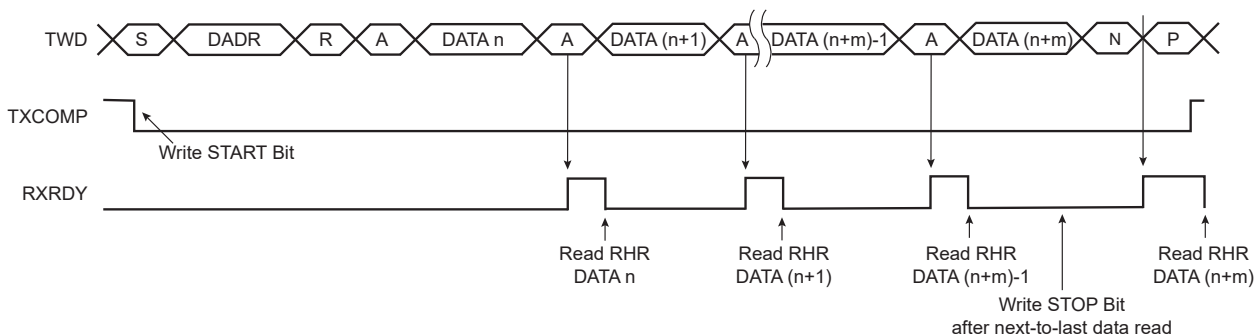

#### WARNING

When receiving multiple bytes in Host Read mode, if the next-to-last access is not read (the `RXRDY` flag remains high), the last access will not be completed until `FLEX_TWI_RHR` is read. The last access stops on the next-to-last bit (clock stretching). When `FLEX_TWI_RHR` is read there is only half a bit period to send the STOP bit (or START bit) command, else another read access might occur (spurious access). A possible workaround is to set the STOP bit (or START bit) before reading `FLEX_TWI_RHR` on the next-to-last access (within IT handler).

**Figure 58.97.** Host Read with One Data Byte

**Figure 58.98.** Host Read with Multiple Data Bytes

**Figure 58.99.** Host Read Clock Stretching with Multiple Data Bytes

RXRDY is used as receive ready trigger event for the DMA receive channel.

### 58.9.3.6. Internal Address

The TWI interface can perform transfers with 7-bit client address devices and with 10-bit client address devices.

#### 58.9.3.6.1.7-bit Client Addressing

When addressing 7-bit client devices, the internal address bytes are used to perform random address (read or write) accesses to reach one or more data bytes, for example, within a memory page location in a serial memory. When performing read operations with an internal address, the TWI performs a write operation to set the internal address into the client device, and then switch to Host Receiver mode. Note that the second start condition (after sending the IADR) is sometimes called “repeated start” (Sr) in I2C fully-compatible devices. See figure [Host Read with One, Two or Three Bytes Internal Address and One Data Byte](#).

See figures [Host Write with One, Two or Three Bytes Internal Address and One Data Byte](#) and [Internal Address Usage](#) for the host write operation with internal address.

The three internal address bytes are configurable through the Host Mode register (FLEX\_TWI\_MMR).

If the client device supports only a 7-bit address, that is, no internal address, IADRSZ must be configured to 0.

The abbreviations listed below are used in the following figures:

S	Start
Sr	Repeated Start
P	Stop
W	Write
R	Read
A	Acknowledge
N	Not Acknowledge
DADR	Device Address
IADR	Internal Address

**Figure 58.100.** Host Write with One, Two or Three Bytes Internal Address and One Data Byte

**Figure 58.101.** Host Read with One, Two or Three Bytes Internal Address and One Data Byte

#### 58.9.3.6.2.10-bit Client Addressing

For a client address higher than seven bits, the user must configure the address size (IADRSZ) and set the other client address bits in the Internal Address register (FLEX\_TWI\_IADR). The two remaining internal address bytes, IADR[15:8] and IADR[23:16], can be used the same way as in 7-bit client addressing.

Example: Address a 10-bit device (10-bit device address is b1 b2 b3 b4 b5 b6 b7 b8 b9 b10)

1. Program IADRSZ = 1.
2. Program DADR with 1 1 1 1 0 b1 b2 (b1 is the MSB of the 10-bit address, b2, etc.).
3. Program FLEX\_TWI\_IADR with b3 b4 b5 b6 b7 b8 b9 b10 (b10 is the LSB of the 10-bit address).

The following figure shows a byte write to a TWI EEPROM. This demonstrates the use of internal addresses to access the device.

**Figure 58.102.** Internal Address Usage

### 58.9.3.7.Repeated Start

In addition to Internal Address mode, repeated start (Sr) can be generated manually by writing the START bit at the end of a transfer instead of the STOP bit. In such case the parameters of the next transfer (direction, SADR, etc.) will need to be set before writing the START bit at the end of the previous transfer.

See [Read/Write Flowcharts](#).

### 58.9.3.8.Bus Clear Command

The TWI interface can perform a Bus Clear command:

1. Configure Host mode (DADR, CKDIV, etc).
2. Read FLEX\_TWI\_SR.SDA/SCL flags and check that the TWD (SDA) and TWCK (SCL) lines hold a high level.
3. Send the Bus Clear command by setting FLEX\_TWI\_CR.CLEAR.

**Note:** When TWD (SDA)=0, the Bus Clear command must be performed via the PIO. When TWCK (SCL)=0, no Bus Clear command can be issued.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATA field must be cleared.

### 58.9.3.9.SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMBEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses has been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

#### 58.9.3.9.1.Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one enables automatic PEC handling in the current transfer. Transfers with and without PEC can freely be intermixed in the same system, since some clients may not

support PEC. The PEC LFSR is always updated on every bit transmitted or received, so that PEC handling on combined transfers will be correct.

In Host Transmitter mode, the host calculates a PEC value and transmits it to the client after all data bytes have been transmitted. Upon reception of this PEC byte, the client will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the client will return an ACK to the host. If the PEC values differ, data was corrupted, and the client will return a NACK value. Some clients may not be able to check the received PEC in time to return a NACK if an error occurred. In this case, the client should always return an ACK after the PEC byte, and some other mechanism must be implemented to verify that the transmission was received correctly.

In Host Receiver mode, the client calculates a PEC value and transmits it to the host after all data bytes have been transmitted. Upon reception of this PEC byte, the host will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the FLEX\_TWI\_SR.PECERR bit is set. In Host Receiver mode, the PEC byte is always followed by a NACK transmitted by the host, since it is the last byte in the transfer.

In combined transfers, the PECRQ bit should only be set in the last of the combined transfers. If Alternative Command mode is enabled, only the NPEC bit should be set.

Consider the following transfer:

S, ADR+W, COMMAND\_BYTE, ACK, SR, ADR+R, DATA\_BYTE, ACK, PEC\_BYTE, NACK, P

See [Read/Write Flowcharts](#) for detailed flowcharts.

### 58.9.3.9.2.Timeouts

The FLEX\_TWI\_SMBTR.TLOWS/TLOWM fields configure the SMBus timeout values. If a timeout occurs, the host transmits a STOP condition and leaves the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

### 58.9.3.10.SMBus Quick Command (Host Mode Only)

The TWI interface can perform a quick command:

1. Configure Host mode (DADR, CKDIV, etc).
2. Write the FLEX\_TWI\_MMR.MREAD bit at the value of the one-bit command to be sent.
3. Start the transfer by setting the FLEX\_TWI\_CR.QUICK bit.

**Note:** If an alternative command is used (ACMEN bit = 1), the DATAL field must be cleared.

**Figure 58.103.** SMBus Quick Command

### 58.9.3.11.TWI High-Speed Host

TWI High-Speed Host mode is enabled when FLEX\_TWI\_CR.HSEN=1 and FLEX\_TWI\_CR.MSEN=1. TWI High-Speed mode operation is similar to TWI operation, with the following exceptions:

1. A host code is sent first at normal speed before enabling TWI High-Speed mode.
2. Arbitration is only possible during host code transmission.

- When TWI High-Speed mode is active, an internal mechanism is enabled to shorten the SCL signal rise time
- When TWI High-Speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (as a consequence, overflow can happen).
- When TWI High-Speed mode is active, the data transfer uses the TWI High Speed mode bit rate which can be defined in FLEX\_TWI\_HSCWGR.

TWI High-Speed mode allows transfers up to 3.4 Mbits/s.

#### 58.9.3.11.1. Read-Write Operation

The TWI high-speed frame always begins with the following sequence:

- START condition (S)
- Host code (0000 1XXX)
- Not-acknowledge (NACK)

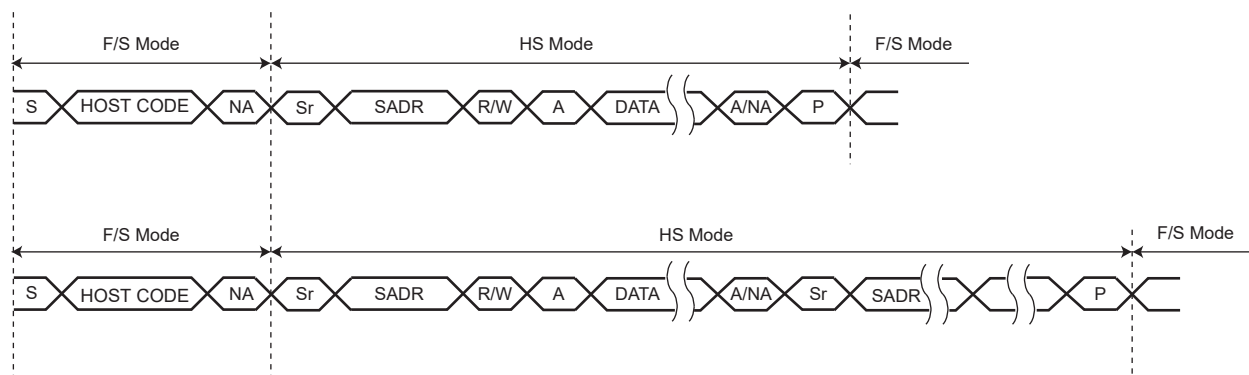

Note that to enable high-speed transfer, the client must send a NACK after receiving the host code.

As described previously, this sequence is sent at normal speed, and in case of multi-host, arbitration can only happen during this sequence.

Host codes are 8-bit reserved codes with the sole purpose of enabling High-Speed mode. Each host must use a different host code, which can be set through the FLEX\_TWI\_HSR.MCODE field.

Once this sequence has been sent, High-Speed mode is enabled and the host sends a repeated start to begin the programmed transfer. High-Speed mode remains enabled after repeated START (Sr) and only switches back to normal speed after a STOP condition (P).

**Figure 58.104.** High-Speed Mode Read-Write

#### 58.9.3.11.2. SCL Rising Time Control

In order to meet the TWI High-Speed mode SCL rise time requirements, the SCL Rise Boost feature is enabled automatically when TWI High-Speed mode is enabled.

SCLRBL bit in FLEX\_TWI\_MMR enables to set the number of system clock periods (MCK) during which the SCL signal will be directly driven to level '1' when the SCL rising edge is sent. This short time during which the SCL pin is directly driven to level '1' allows to increase the SCL slope as much as needed to meet the High-Speed mode rise time requirements.

The SCL Rise Boost feature can be enabled with FLEX\_TWI\_CR.SCLRBE and disabled with FLEX\_TWI\_CR.SCLRBD.

### 58.9.3.11.3.TWI High-Speed Mode Usage

TWI High-Speed mode usage is the same as for standard TWI (see [Read/Write Flowcharts](#)).

### 58.9.3.12.Alternative Command

Another way to configure the transfer is to enable the Alternative Command mode with the ACMEN bit of the TWI Control Register.

In this mode, the transfer is configured through the TWI Alternative Command Register. It is possible to define a simple read or write transfer or a combined transfer with a repeated start.

In order to set a simple transfer, the DATAL field and the DIR field of the TWI Alternative Command Register must be filled accordingly and the NDATAL field must be cleared. To begin the transfer, either set the START bit in the TWI Control Register in case of a read transfer, or write the TWI Transmit Holding Register in case of a write transfer.

For a combined transfer linked by a repeated start, the NDATAL field must be filled with the length of the second transfer and NDIR with the corresponding direction.

The PEC and NPEC bits are used to set a PEC field. In the case of a single transfer with PEC, the PEC bit must be set. In the case of a combined transfer, the NPEC bit must be set.

**Note:** If the Alternative Command mode is used, the FLEX\_TWI\_MMR.IADRSZ field must be set to 0.

See [Read/Write Flowcharts](#) for detailed flowcharts.

### 58.9.3.13.Handling Errors in Alternative Command

In case of NACK generated by a client device or SMBus timeout error, the TWI stops immediately the frame, but the DMA transfer may still be active. To prevent a new frame to be restarted with the remaining DMA data (transmit), the TWI prevents any start of frame until the FLEX\_TWI\_SR.LOCK flag is cleared.

The FLEX\_TWI\_SR.LOCK bit indicates the state of the TWI (locked or not locked).

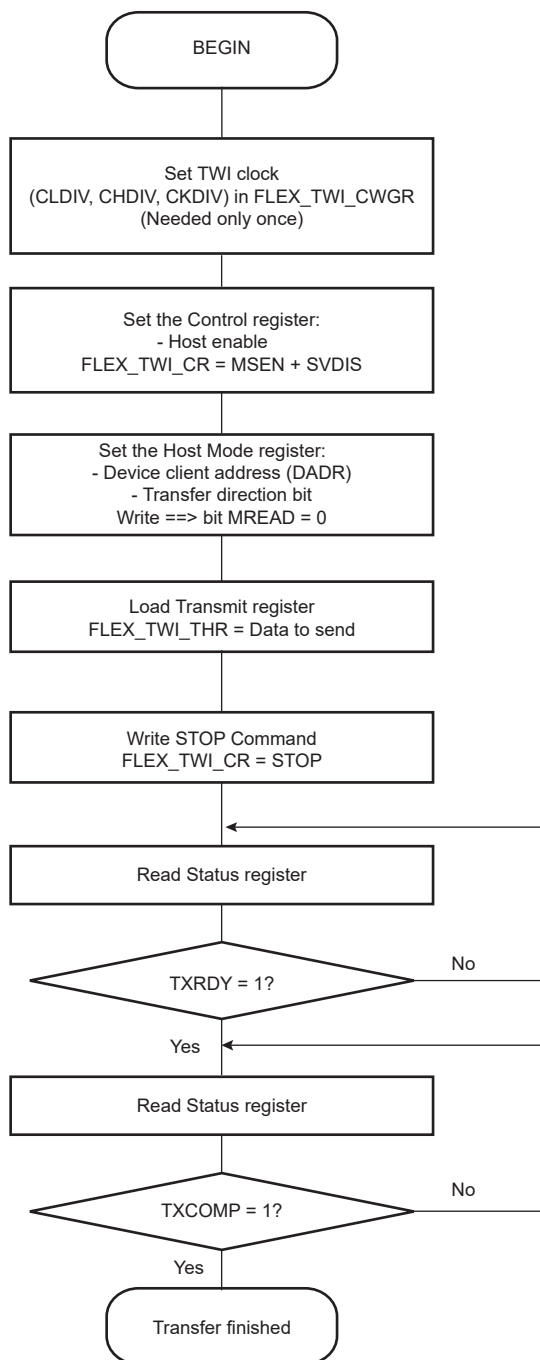

When the TWI is locked, no transfer can begin until the LOCK is cleared using the FLEX\_TWI\_CR.LOCKCLR bit and until the error flags are cleared reading FLEX\_TWI\_SR.

In case of error, FLEX\_TWI\_THR may have been loaded with a new data. The FLEX\_TWI\_CR.THRCLR bit can be used to flush FLEX\_TWI\_THR. If the THRCLR bit is set, the TXRDY and TXCOMP flags are set.

### 58.9.3.14.Read/Write Flowcharts

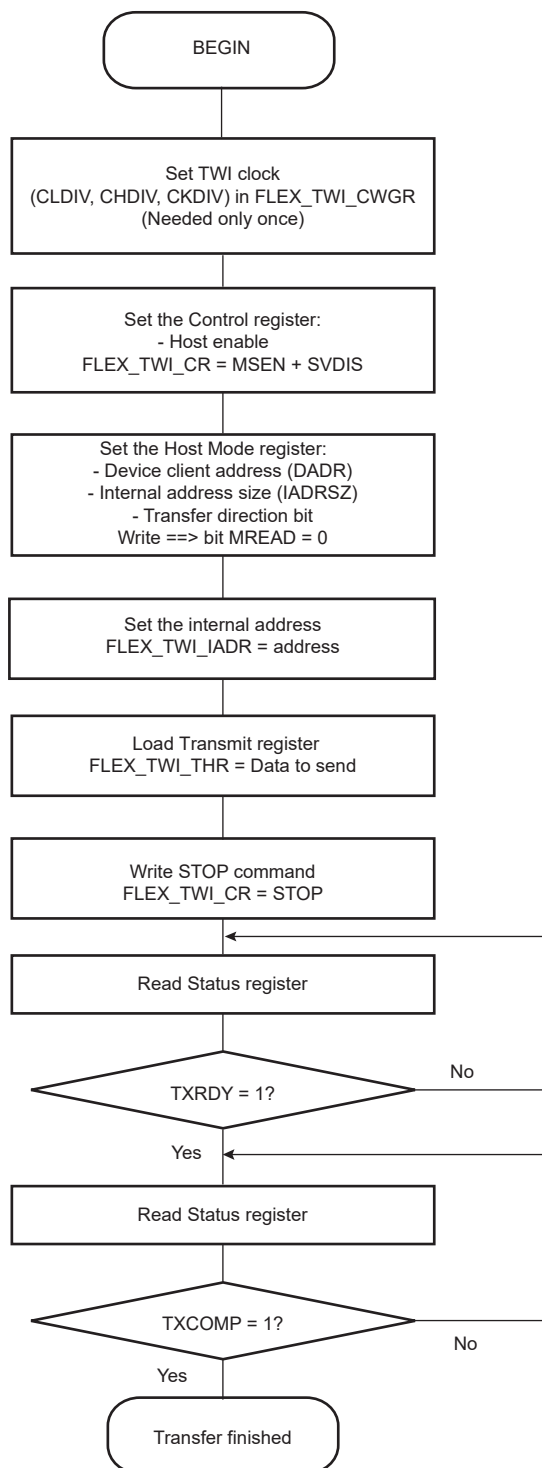

The flowcharts shown in this section provide examples for read and write operations. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable register (FLEX\_TWI\_IER) be configured first.

## 58.9.4. Multi-Host Mode

### 58.9.4.1. Definition

In Multi-Host mode, more than one host may handle the bus at the same time without data corruption by using arbitration.

Arbitration starts as soon as two or more hosts place information on the bus at the same time, and stops (arbitration is lost) for the host that intends to send a logical one while the other host sends a logical zero.

As soon as arbitration is lost by a host, it stops sending data and listens to the bus in order to detect a STOP. When the STOP is detected, the host that has lost arbitration may put its data on the bus by respecting arbitration.

Arbitration is illustrated in figure "Arbitration Cases" below.

#### 58.9.4.2. Different Multi-Host Modes

Two Multi-Host modes are available:

- TWI as Host Only—TWI is considered as a host only and will never be addressed.
- TWI as Host or Client—TWI may be either a host or a client and may be addressed.

**Note:** Arbitration is supported in both Multi-Host modes.

##### 58.9.4.2.1. TWI as Host Only

In this mode, the TWI is considered as a host only (MSEN is always at one) and must be driven like a host with the ARBLST (ARBitration Lost) flag in addition.

If arbitration is lost (ARBLST = 1), the user must reinitiate the data transfer.

If the user starts a transfer (ex.: DADR + START + W + Write in THR) and if the bus is busy, the TWI automatically waits for a STOP condition on the bus to initiate the transfer (see figure "User Sends Data While the Bus is Busy" below).

**Note:** The state of the bus (busy or free) is not indicated in the user interface.

##### 58.9.4.2.2. TWI as Host or Client

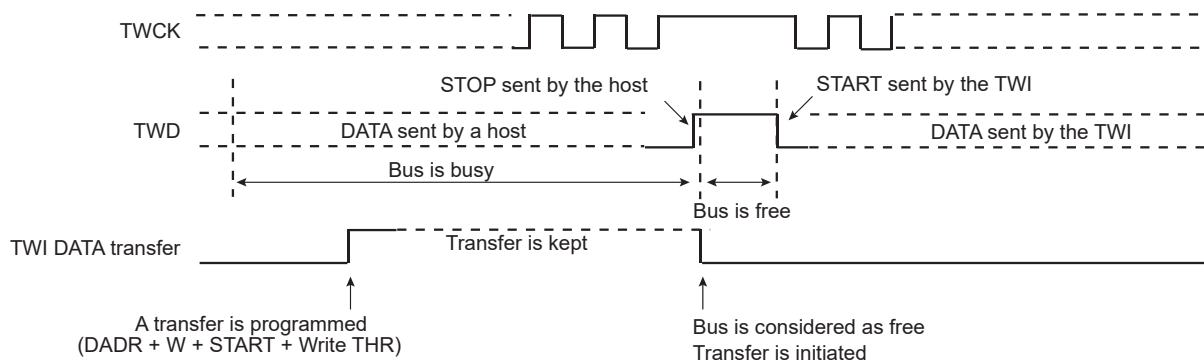

The automatic reversal from host to client is not supported in case of a lost arbitration.

Then, in the case where TWI may be either a host or a client, the user must manage the pseudo Multi-Host mode described in the steps below:

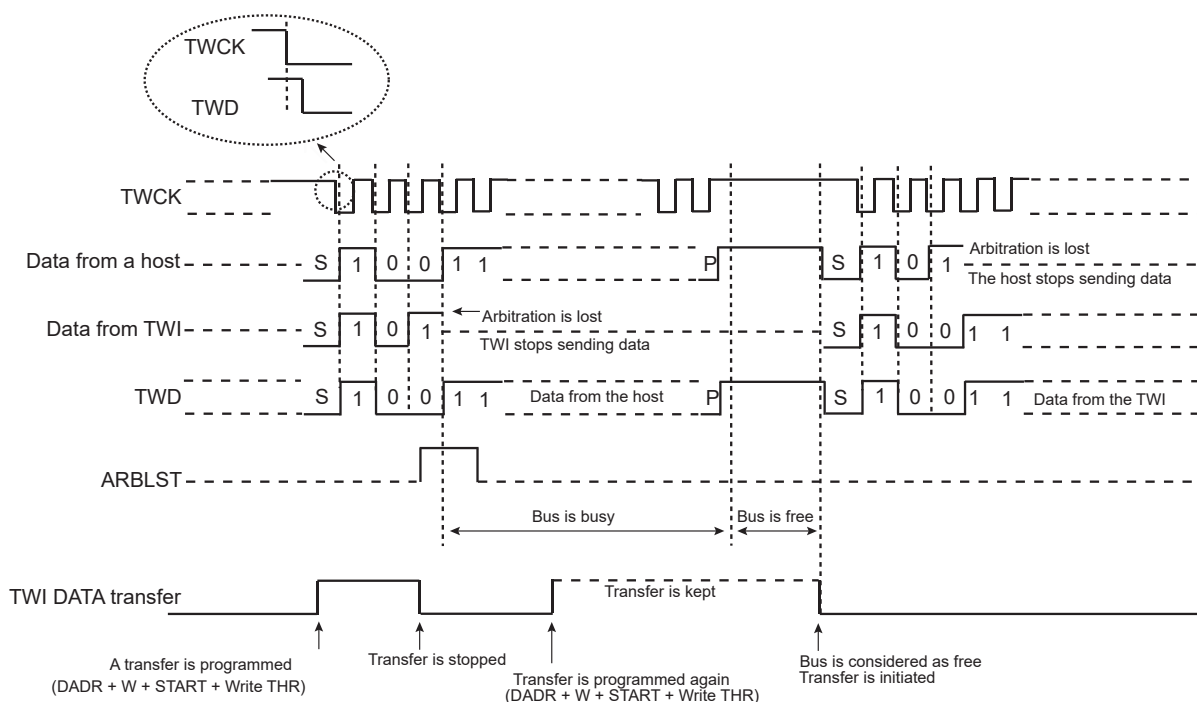

1. Program the TWI in Client mode (SADR + MSDIS + SVEN) and perform a client access (if TWI is addressed).
2. If the TWI has to be set to Host mode, wait until TXCOMP flag is at 1.
3. Program Host mode (DADR + SVDIS + MSEN) and start the transfer (ex: START + Write in THR).
4. As soon as Host mode is enabled, the TWI scans the bus in order to detect if it is busy or free. When the bus is considered as free, the TWI initiates the transfer.
5. As soon as the transfer is initiated and until a STOP condition is sent, the arbitration becomes relevant and the user must monitor the ARBLST flag.
6. If the arbitration is lost (ARBLST is = 1), the user must program the TWI in Client mode in case the host that won the arbitration needs to access the TWI.
7. If the TWI has to be set to Client mode, wait until TXCOMP flag is at 1 and then program Client mode.

**Note:** In case the arbitration is lost and the TWI is addressed, the TWI will not acknowledge even if it is programmed in Client mode as soon as ARBLST = 1. Then the host must repeat SADR.

**Figure 58.119.** User Sends Data While the Bus is Busy

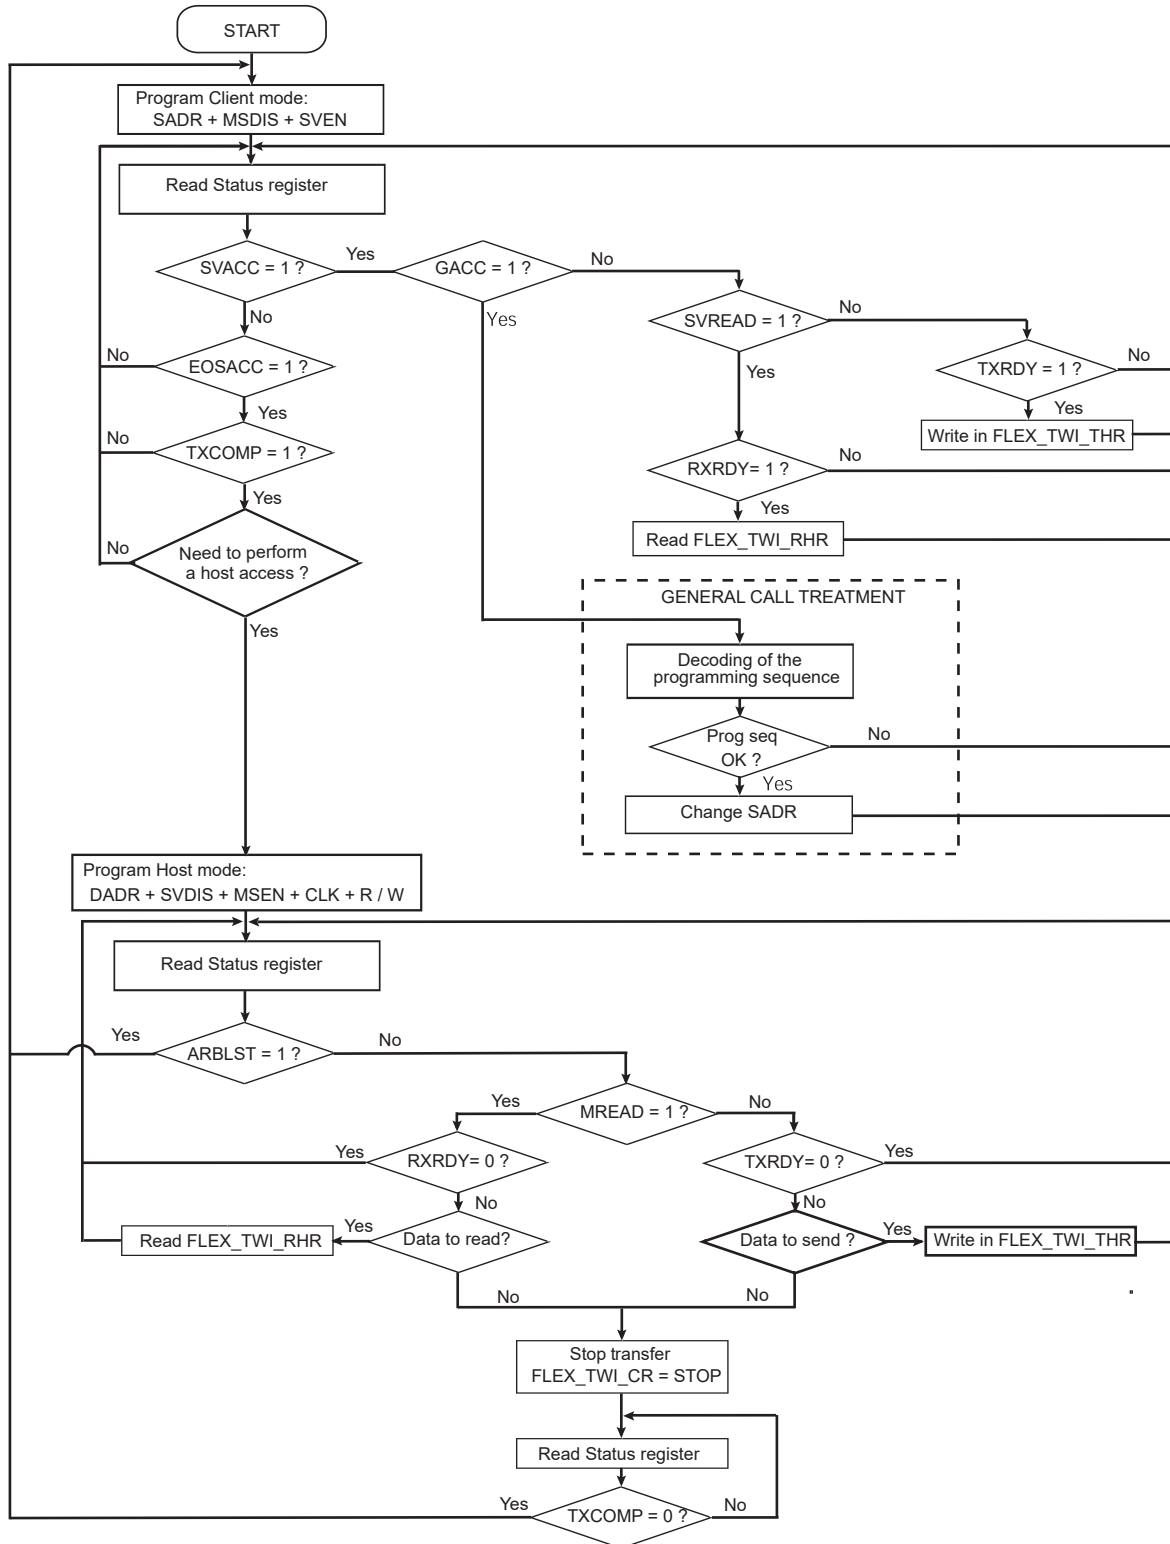

**Figure 58.120.** Arbitration Cases

The flowchart shown in the following figure gives an example of read and write operations in Multi-Host mode.

**Figure 58.121. Multi-Host Mode**

## 58.9.5. Client Mode

### 58.9.5.1. Definition

Client mode is defined as a mode where the device receives the clock and the address from another device called the host.

In this mode, the device never initiates and never completes the transmission (START, REPEATED\_START and STOP conditions are always provided by the host).

### 58.9.5.2. Programming Client Mode

The following fields must be programmed before entering Client mode:

1. FLEX\_TWI\_SMR.SADR: The client device address is used in order to be accessed by host devices in Read or Write mode.
2. (Optional) FLEX\_TWI\_SMR.MASK can be set to mask some SADR address bits and thus allow multiple address matching.
3. FLEX\_TWI\_CR.MSDIS: Disables Host mode.
4. FLEX\_TWI\_CR.SVEN: Enables Client mode.

As the device receives the clock, values written in FLEX\_TWI\_CWGR are not processed.

### 58.9.5.3. Receiving Data

After a START or repeated START condition is detected, and if the address sent by the host matches the client address programmed in the SADR (Client Address) field, the SVACC (Client Access) flag is set and SVREAD (Client Read) indicates the direction of the transfer.

SVACC remains high until a STOP condition or a repeated START is detected. When such a condition is detected, EOSACC (End Of Client Access) flag is set.

#### 58.9.5.3.1. Read Sequence

In the case of a read sequence (SVREAD is high), the TWI transfers data written in FLEX\_TWI\_THR (TWI Transmit Holding register) until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the read sequence TXCOMP (Transmission Complete) flag is set and SVACC is reset.

As soon as data is written in FLEX\_TWI\_THR, the TXRDY (Transmit Holding Register Ready) flag is reset, and it is set when the internal shifter is empty and the sent data acknowledged or not. If the data is not acknowledged, the NACK flag is set.

Note that a STOP or a repeated START always follows a NACK.

See figure "Read Access Ordered by a Host" below.

**Note:** To clear the TXRDY flag in Client mode, write the FLEX\_TWI\_CR.SVDIS bit to 1, then write the FLEX\_TWI\_CR.SVEN bit to 1.

#### 58.9.5.3.2. Write Sequence

In the case of a write sequence (SVREAD is low), the RXRDY (Receive Holding Register Ready) flag is set as soon as a character has been received in FLEX\_TWI\_RHR (TWI Receive Holding register). RXRDY is reset when reading FLEX\_TWI\_RHR.

TWI continues receiving data until a STOP condition or a REPEATED\_START + an address different from SADR is detected. Note that at the end of the write sequence TXCOMP flag is set and SVACC reset.

See figure "Write Access Ordered by a Host" below.

#### 58.9.5.3.3. Clock Stretching Sequence

If FLEX\_TWI\_THR or FLEX\_TWI\_RHR is not written/read in time, the TWI performs a clock stretching.

Clock stretching information is given by the SCLWS (Clock Wait State) bit.

See figures "Clock Stretching in Read Mode" and "Clock Stretching in Write Mode" below.

**Note:** Clock stretching can be disabled by configuring the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, UNRE and OVRE flags will indicate underrun (when FLEX\_TWI\_THR is not filled on time) or overrun (when FLEX\_TWI\_RHR is not read on time).

#### 58.9.5.3.4.General Call

In the case where a GENERAL CALL is performed, the GACC (General Call Access) flag is set.

After GACC is set, it is up to the user to interpret the meaning of the GENERAL CALL and to decode the new address programming sequence.

See figure "Host Performs a General Call" below.

#### 58.9.5.4.Data Transfer

##### 58.9.5.4.1.Read Operation

Read mode is defined as a data requirement from the host.

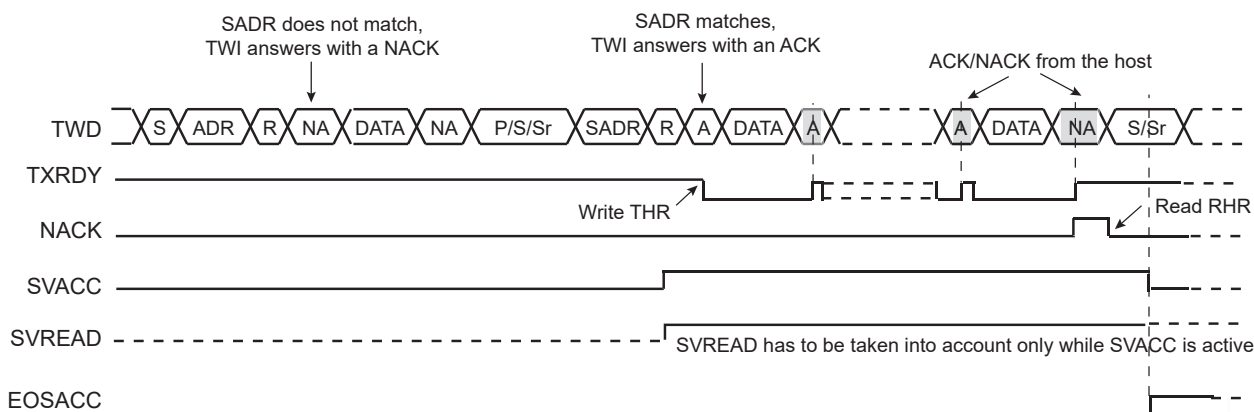

After a START or a REPEATED START condition is detected, the decoding of the address starts. If the client address (SADR) is decoded, SVACC is set and SVREAD indicates the direction of the transfer.

Until a STOP or REPEATED START condition is detected, TWI continues sending data loaded in FLEX\_TWI\_THR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the read operation.

**Figure 58.122.** Read Access Ordered by a Host

#### Notes:

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. TXRDY is reset when data has been transmitted from FLEX\_TWI\_THR to the internal shifter and set when this data has been acknowledged or non acknowledged.

##### 58.9.5.4.2.Write Operation

The Write mode is defined as a data transmission from the host.

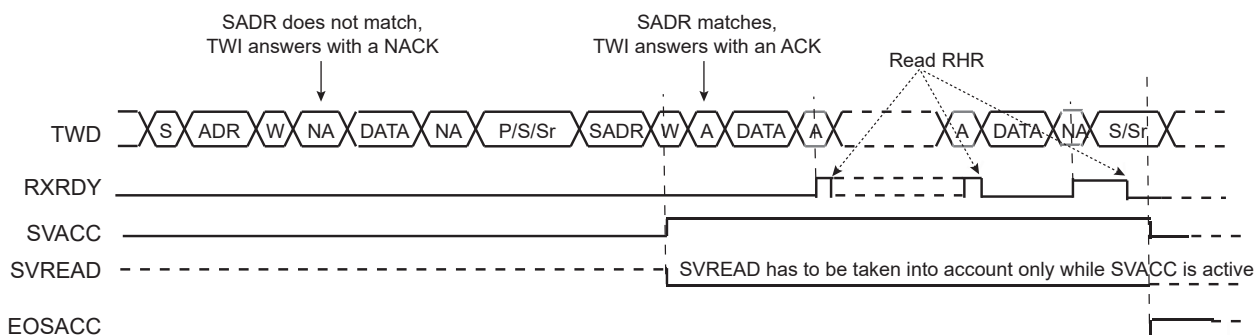

After a START or a REPEATED START, the decoding of the address starts. If the client address is decoded, SVACC is set and SVREAD indicates the direction of the transfer (SVREAD is low in this case).

Until a STOP or REPEATED START condition is detected, TWI stores the received data in FLEX\_TWI\_RHR.

If a STOP condition or a REPEATED START + an address different from SADR is detected, SVACC is reset.

The following figure describes the write operation.

**Figure 58.123.** Write Access Ordered by a Host

**Notes:**

1. When SVACC is low, the state of SVREAD becomes irrelevant.
2. RXRDY is set when data has been transmitted from the internal shifter to FLEX\_TWI\_RHR, and reset when this data is read.

### 58.9.5.4.3. General Call

The general call is performed in order to change the address of the client.

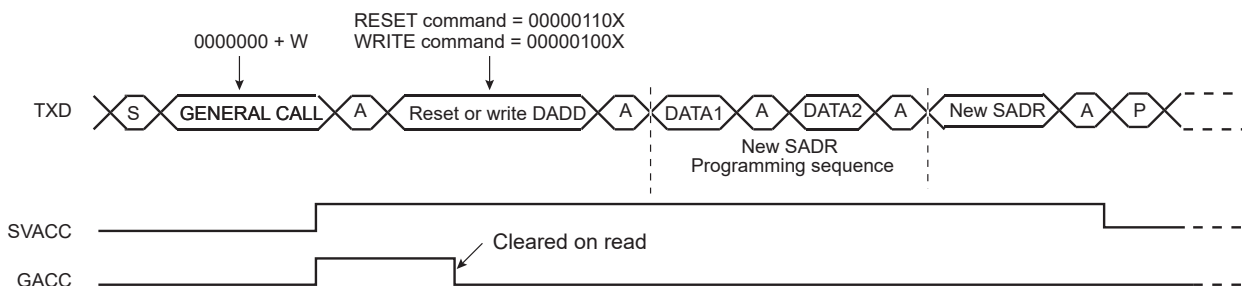

If a GENERAL CALL is detected, GACC is set.

After the detection of general call, it is up to the user to decode the commands which follow.

In case of a WRITE command, the user has to decode the programming sequence and program a new SADR if the programming sequence matches.

The following figure describes the general call access.

**Figure 58.124.** Host Performs a General Call

**Note:** This method enables to create a user-specific programming sequence by choosing the number of programming bytes. The programming sequence has to be provided to the host.

#### 58.9.5.4.4. Clock Stretching

In both Read and Write modes, it may happen that the FLEX\_TWI\_THR/FLEX\_TWI\_RHR buffer is not filled/emptied before the transmission/reception of a new character. In this case, to avoid sending/receiving undesired data, a clock stretching mechanism is implemented.

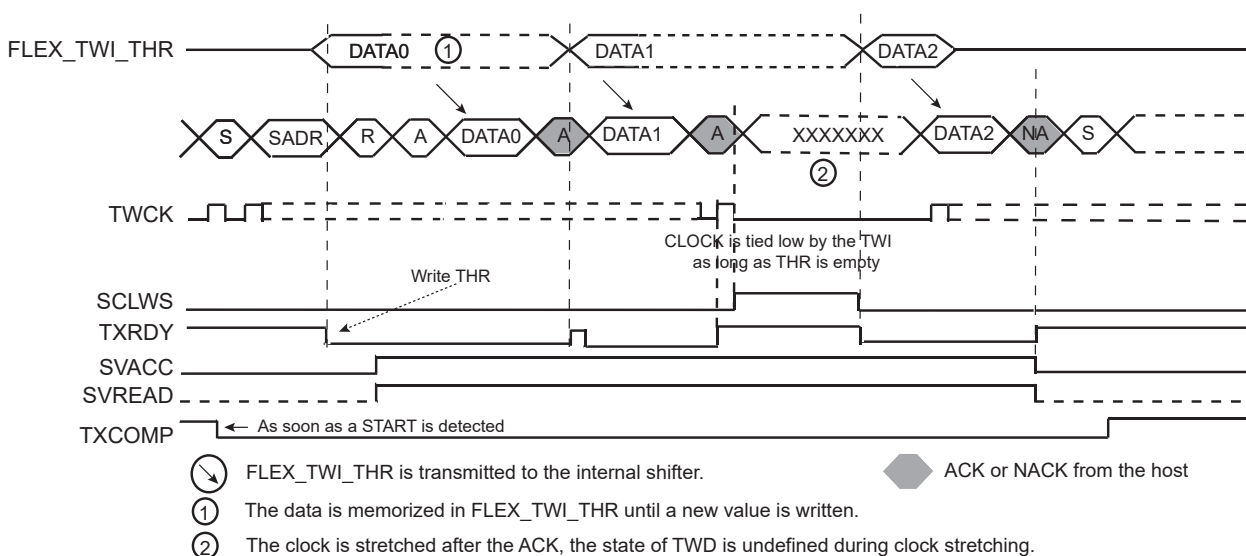

**Note:** Clock stretching can be disabled by setting the FLEX\_TWI\_SMR.SCLWSDIS bit. In that case, the UNRE and OVRE flags indicate an underrun (when FLEX\_TWI\_THR is not filled on time) or an overrun (when FLEX\_TWI\_RHR is not read on time).

##### — Clock Stretching in Read Mode

The clock is tied low if the internal shifter is empty and if a STOP or REPEATED START condition was not detected. It is tied low until the internal shifter is loaded.

The following figure describes clock stretching in Read mode.

**Figure 58.125.** Clock Stretching in Read Mode

#### Notes:

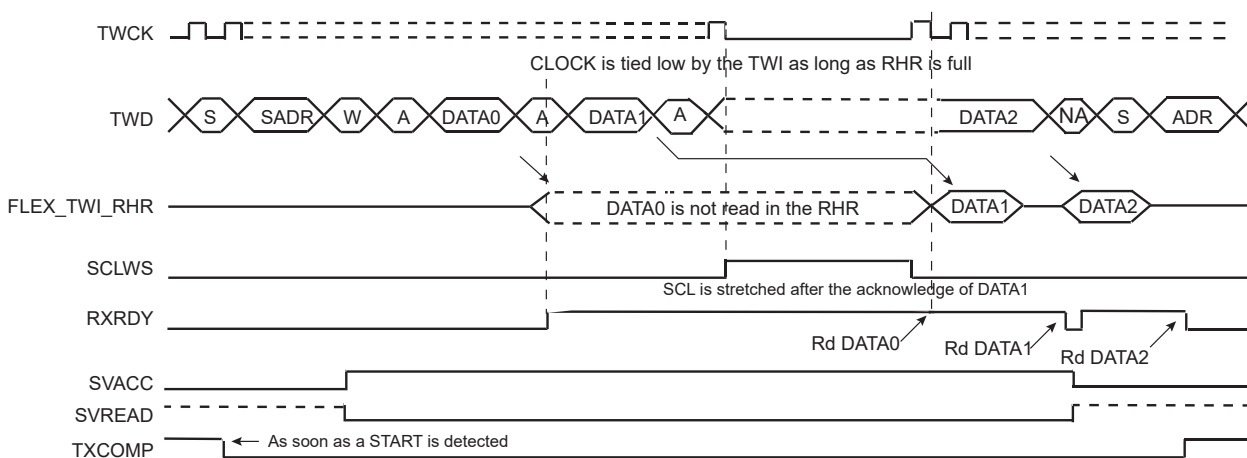

1. TXRDY is reset when data has been written in FLEX\_TWI\_THR to the internal shifter, and set when this data has been acknowledged or non acknowledged.
2. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
3. SCLWS is automatically set when the clock stretching mechanism is started.

##### — Clock Stretching in Write Mode

The clock is tied low if the internal shifter and FLEX\_TWI\_RHR are full. If a STOP or REPEATED\_START condition was not detected, it is tied low until FLEX\_TWI\_RHR is read.

The following figure describes the clock stretching in Write mode.

**Figure 58.126. Clock Stretching in Write Mode**

**Notes:**

1. At the end of the read sequence, TXCOMP is set after a STOP or after a REPEATED\_START + an address different from SADR.
2. SCLWS is automatically set when the clock stretching mechanism is started and automatically reset when the mechanism is finished.

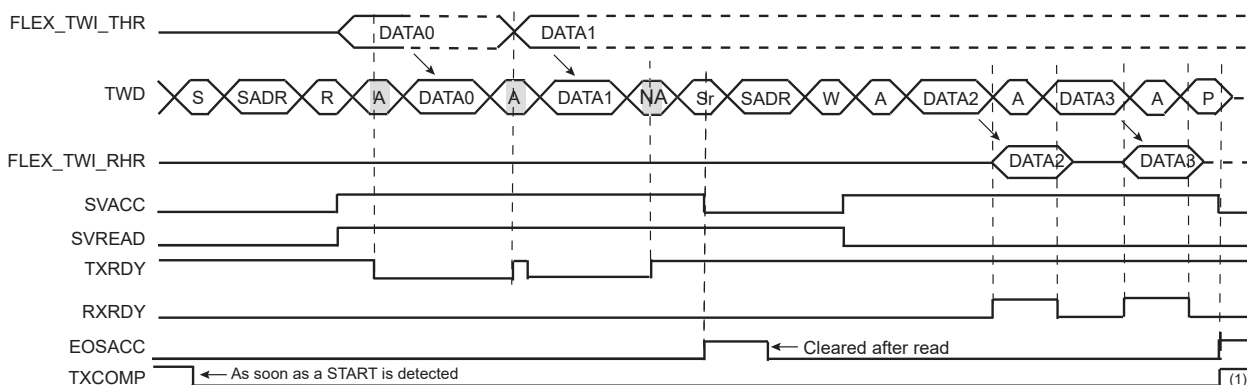

#### 58.9.5.4.5.Reversal after a Repeated Start

##### — Reversal of Read to Write

The host initiates the communication by a read command and finishes it by a write command.

The following figure describes the repeated start and the reversal from Read mode to Write mode.

**Figure 58.127. Repeated Start and Reversal from Read Mode to Write Mode**

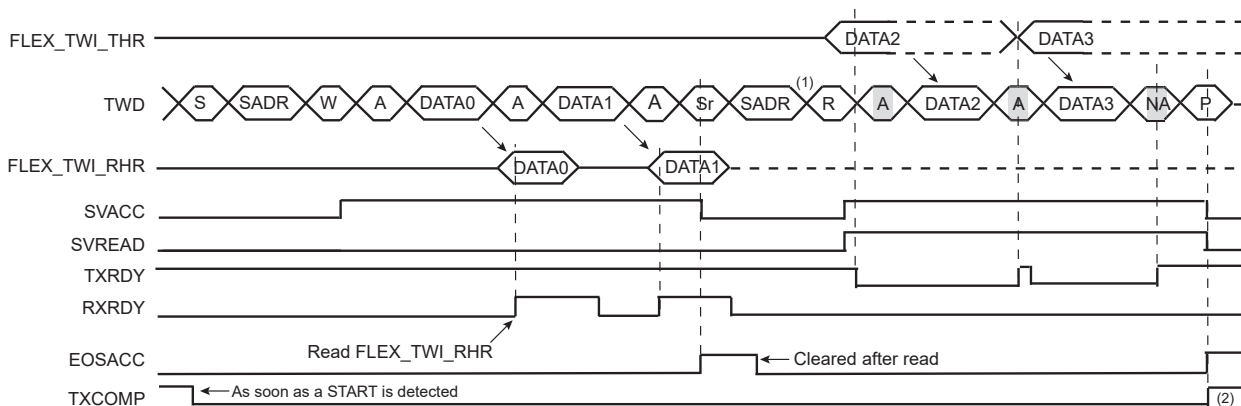

Note:  
1. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

### — Reversal of Write to Read

The host initiates the communication by a write command and finishes it by a read command.

The following figure describes the repeated start and the reversal from Write mode to Read mode.

**Figure 58.128.** Repeated Start and Reversal from Write Mode to Read Mode

Notes:

1. In this case, if FLEX\_TWI\_THR has not been written at the end of the read command, the clock is automatically stretched before the ACK.
2. TXCOMP is only set at the end of the transmission because after the repeated start, SADR is detected again.

### 58.9.5.4.6.SMBus Mode

SMBus mode is enabled when the FLEX\_TWI\_CR.SMEN bit is written to one. SMBus mode operation is similar to I<sup>2</sup>C operation with the following exceptions:

1. Only 7-bit addressing can be used.
2. The SMBus standard describes a set of timeout values to ensure progress and throughput on the bus. These timeout values must be programmed into FLEX\_TWI\_SMBTR.
3. Transmissions can optionally include a CRC byte, called Packet Error Check (PEC).
4. A set of addresses have been reserved for protocol handling, such as alert response address (ARA) and host header (HH) address. Address matching on these addresses can be enabled by configuring FLEX\_TWI\_CR appropriately.

### — Packet Error Checking

Each SMBus transfer can optionally end with a CRC byte, called the PEC byte. Writing the FLEX\_TWI\_CR.PECEN bit to one will send/check the FLEX\_TWI\_ACR.PEC field in the current transfer. The PEC generator is always updated on every bit transmitted or received, so that PEC handling on following linked transfers will be correct.

In Client Receiver mode, the host calculates a PEC value and transmits it to the client after all data bytes have been transmitted. Upon reception of this PEC byte, the client will compare it to the PEC value it has computed itself. If the values match, the data was received correctly, and the client will return an ACK to the host. If the PEC values differ, data was corrupted, and the client will return a NACK value. The FLEX\_TWI\_SR.PECERR bit is set automatically if a PEC error occurred.

In Client Transmitter mode, the client calculates a PEC value and transmits it to the host after all data bytes have been transmitted. Upon reception of this PEC byte, the host will compare it to the PEC value it has computed itself. If the values match, the data was received correctly. If the PEC values differ, data was corrupted, and the host must take appropriate action.

See [Client Read/Write Flowcharts](#) for detailed flowcharts.

### — Timeouts

The TWI SMBus Timing register (FLEX\_TWI\_SMBTR) configures the SMBus timeout values. If a timeout occurs, the client leaves the bus. Furthermore, the FLEX\_TWI\_SR.TOUT bit is set.

#### 58.9.5.5.High-Speed Client Mode

High-speed mode is enabled when the FLEX\_TWI\_CR.HSEN bit is written to one. Furthermore, the analog pad filter must be enabled, the FLEX\_TWI\_FILTR.PADFEN bit must be written to one and the FLEX\_TWI\_FILTR.FILT bit must be cleared. TWI High-speed mode operation is similar to TWI operation with the following exceptions:

1. A host code is received first at normal speed before entering High-speed mode period.
2. When TWI High-speed mode is active, clock stretching is only allowed after acknowledge (ACK), not-acknowledge (NACK), START (S) or repeated START (Sr) (asa consequence, OVF may happen).

TWI High-speed mode allows transfers of up to 3.4 Mbit/s.

The TWI client in High-speed mode requires that the peripheral clock runs at a minimum of 14 MHz if client clock stretching is enabled (SCLWSDIS bit at '0'). If client clock stretching is disabled (SCLWSDIS bit at '1'), the peripheral clock must run at a minimum of 11 MHz (assuming the system has no latency).

#### Notes:

1. When client clock stretching is disabled, FLEX\_TWI\_RHR must always be read before receiving the next data (write access frame generated by the host). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.RXRDY flag, or the DMA. If the receive is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid receive overrun.
2. When client clock stretching is disabled, FLEX\_TWI\_THR must be filled with the first data to send before the beginning of the frame (read access frame generated by the host). It is strongly recommended to use either the polling method on the FLEX\_TWI\_SR.TXRDY flag, or the DMA. If the transmit is managed by an interrupt, the TWI interrupt priority must be set to the right level and its latency minimized to avoid transmit underrun.

#### 58.9.5.5.1.Read/Write Operation

A TWI high-speed frame always begins with the following sequence:

1. START condition (S)
2. Host Code (0000 1XXX)
3. Not-acknowledge (NACK)

When the TWI is programmed in Client mode and TWI High-speed mode is activated, host code matching is activated and internal timings are set to match the TWI High-speed mode requirements.

**Figure 58.129. High-Speed Mode Read/Write**

#### 58.9.5.5.2.Usage

TWI High-speed mode usage is the same as the standard TWI (see [Read/Write Flowcharts](#)).

#### 58.9.5.6.Alternative Command

In Client mode, the Alternative Command mode is used when the SMBus mode is enabled to send or check the PEC byte.

The Alternative Command mode is enabled by setting the ACMEN bit of the TWI Control register, and the transfer is configured in FLEX\_TWI\_ACR.

For a combined transfer with PEC, only the NPEC bit in FLEX\_TWI\_ACR must be set as the PEC byte is sent once at the end of the frame.

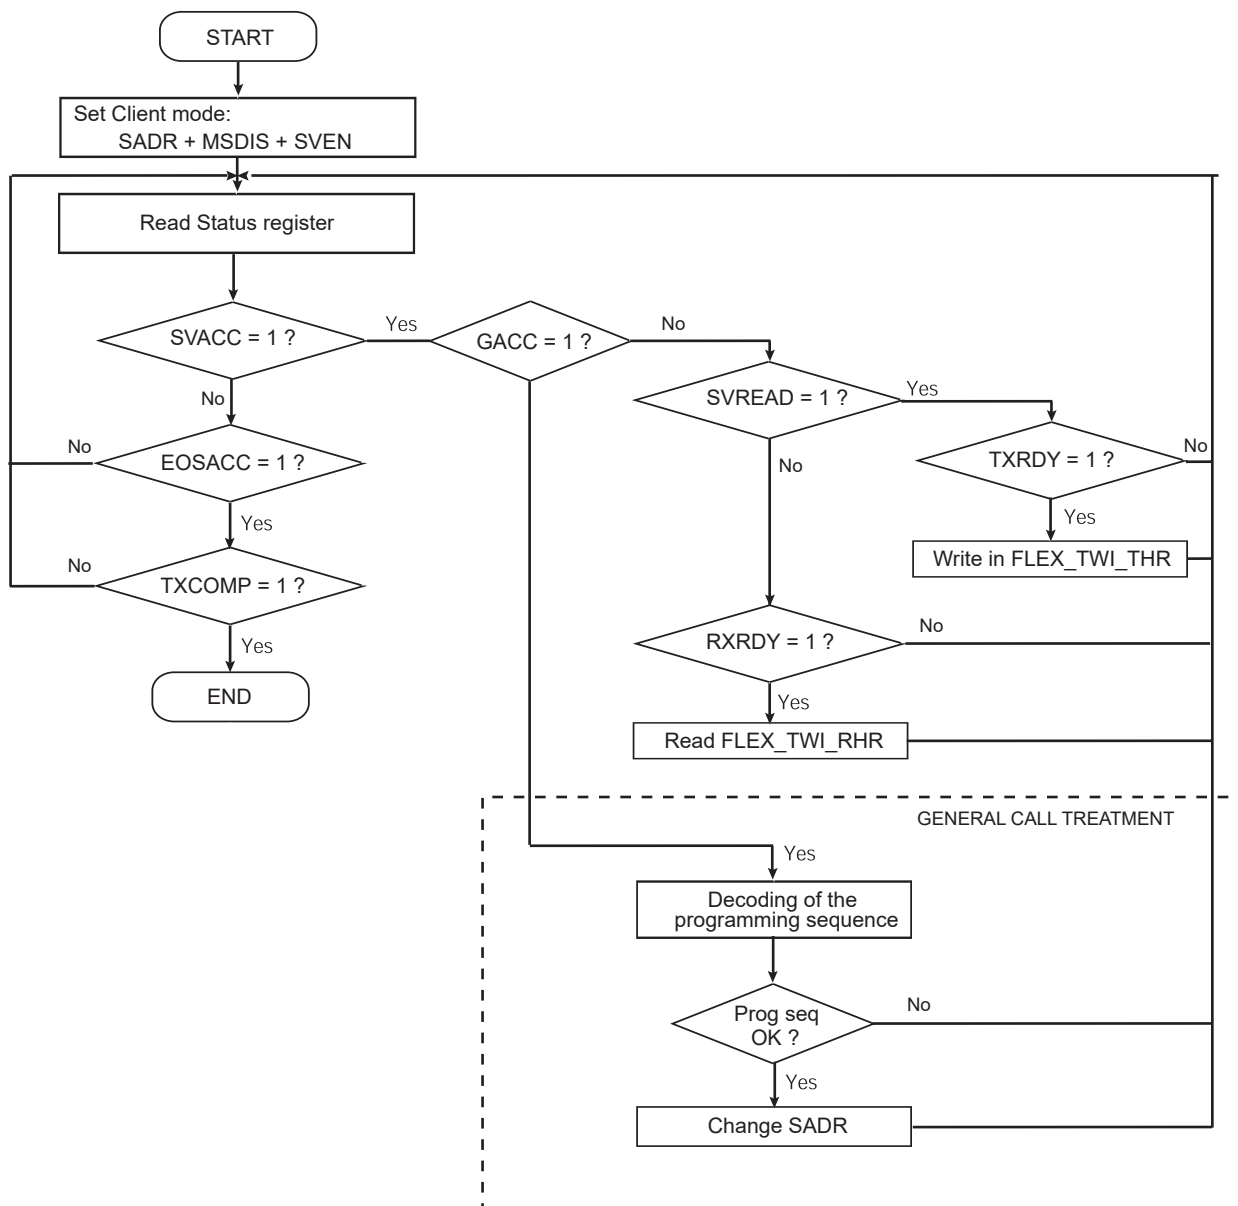

See [Client Read/Write Flowcharts](#) for detailed flowcharts.

#### 58.9.5.7.Client Read/Write Flowcharts

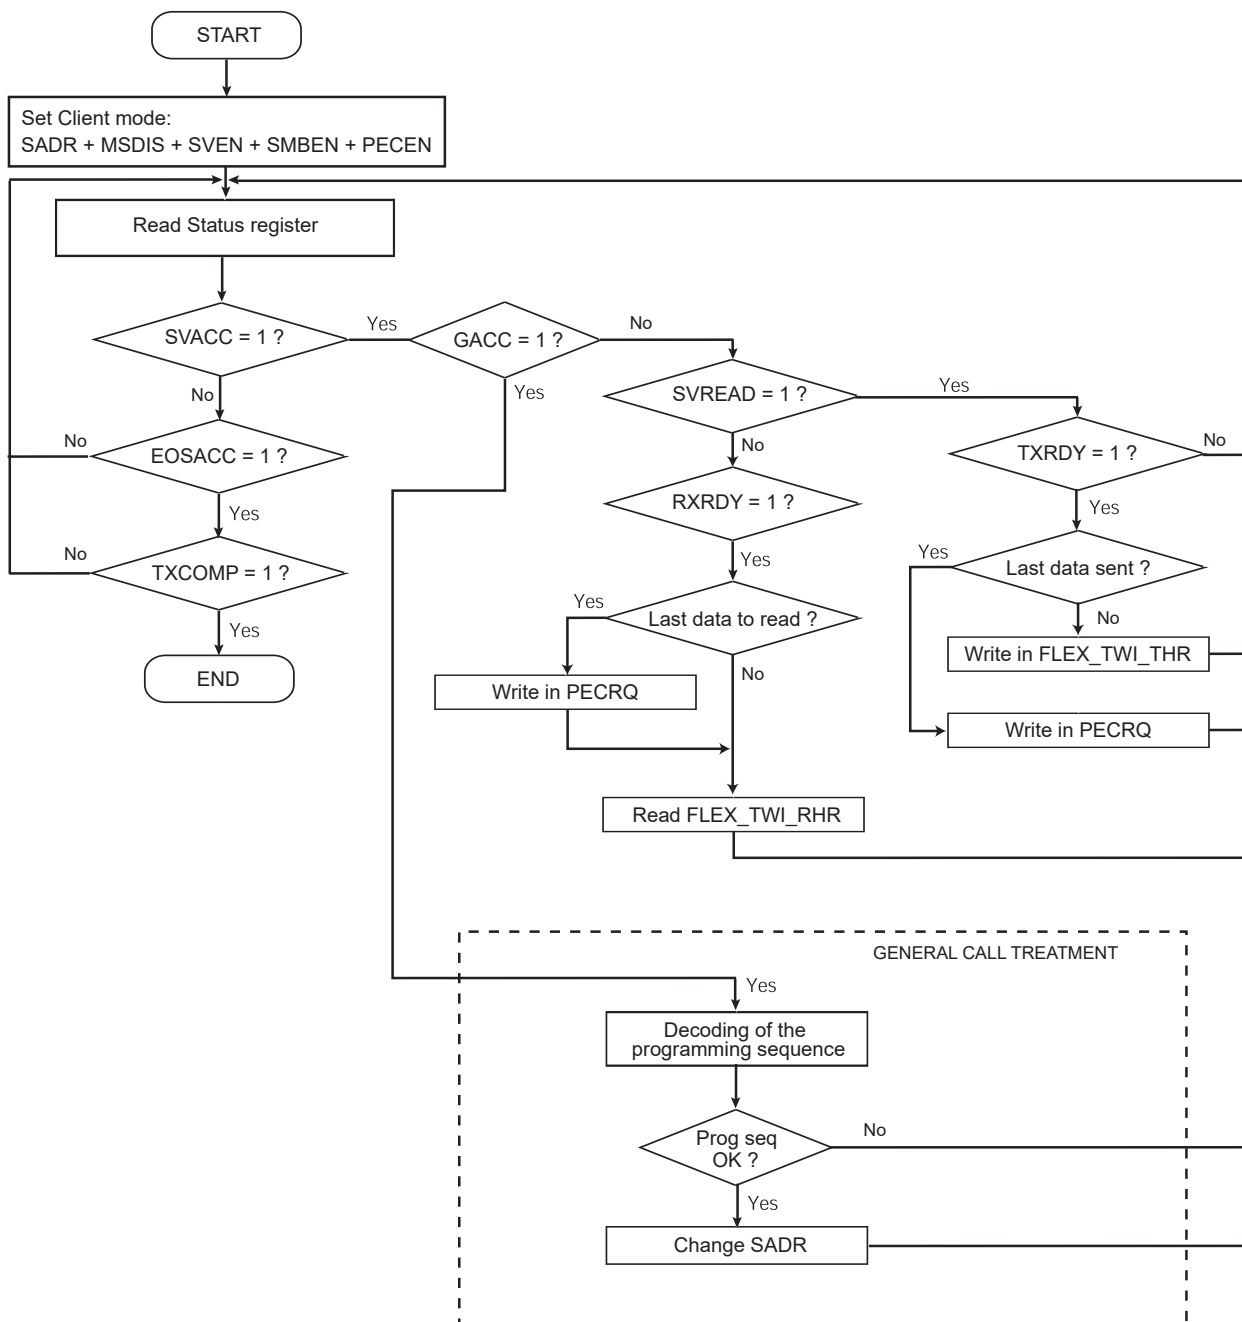

The flowchart shown in the following figure gives an example of read and write operations in Client mode. A polling or interrupt method can be used to check the status bits. The interrupt method requires that the Interrupt Enable register (FLEX\_TWI\_IER) be configured first.

Figure 58.130. Read/Write in Client Mode

**Figure 58.131.** Read/Write in Client Mode with SMBus PEC

**Figure 58.132.** Read/Write in Client Mode with SMBus PEC and Alternative Command Mode

## 58.9.6. TWI FIFOs

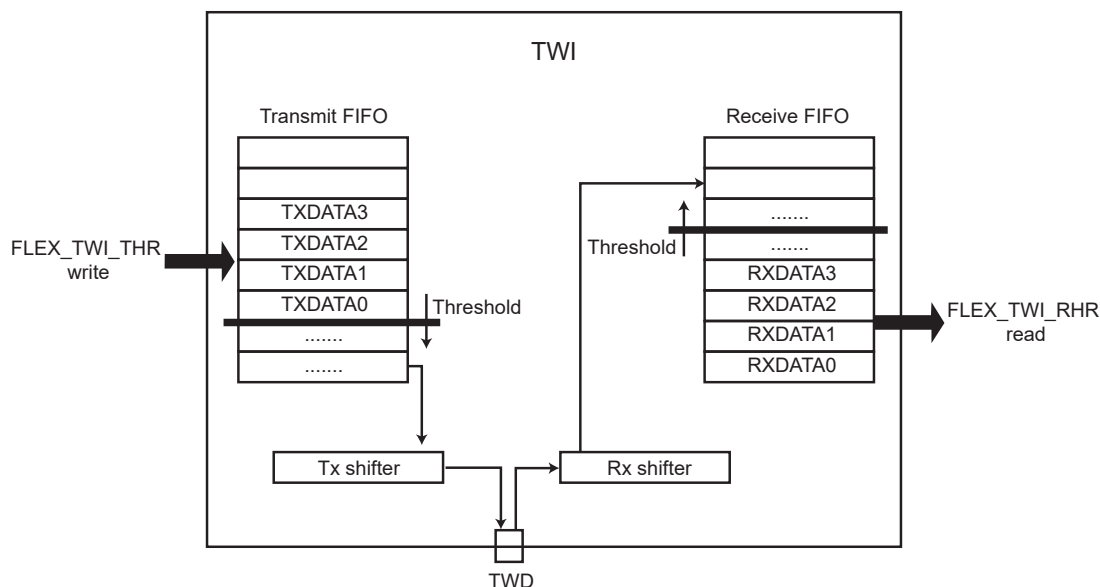

### 58.9.6.1. Overview

The TWI includes two FIFOs which can be enabled/disabled using FLEX\_TWI\_CR.FIFOEN/FIFODIS. Both Host and Client modes must be disabled before enabling or disabling the FIFOs (FLEX\_TWI\_CR.MSDIS/SVDIS).

Writing FLEX\_TWI\_CR.FIFOEN to '1' enables a 16-byte Transmit FIFO and a 16-byte Receive FIFO.

It is possible to write or to read single or multiple bytes in the same access to FLEX\_TWI\_THR/RHR, depending on FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

**Figure 58.133.** TWI FIFOs Block Diagram

#### 58.9.6.2. Sending Data with FIFO Enabled

When the Transmit FIFO is enabled, write access to FLEX\_TWI\_THR loads the Transmit FIFO.

The Transmit FIFO level is provided in FLEX\_TWI\_FLR.TXFL. If the FIFO can accept the number of bytes to be transmitted, there is no need to monitor FLEX\_TWI\_SR.TXRDY and the bytes can be successively written in FLEX\_TWI\_THR.

If the FIFO cannot accept the bytes due to insufficient space, wait for the TXRDY flag to be set before writing the bytes in FLEX\_TWI\_THR.

When the space in the FIFO allows only a portion of the data to be written, the TXRDY flag must be monitored before writing the remaining data.

See figures [Sending Data with FIFO Enabled in Host Mode](#) and [Sending/Receiving Data with FIFO Enabled in Client Mode](#).

**Figure 58.134. Sending Data with FIFO Enabled in Host Mode**

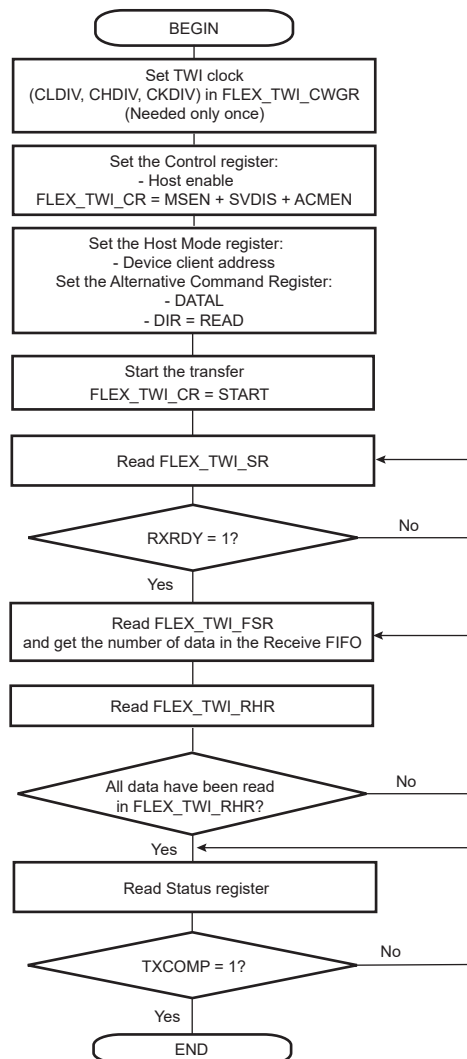

### 58.9.6.3.Receiving Data with FIFO Enabled

When the Receive FIFO is enabled, FLEX\_TWI\_RHR access reads the FIFO.

When data are present in the Receive FIFO (RXRDY flag set to '1'), the exact number of bytes can be checked with FLEX\_TWI\_FLR.RXFL. All the bytes can be read successively in FLEX\_TWI\_RHR without checking the FLEX\_TWI\_SR.RXRDY flag between each access.

See figures [Receiving Data with FIFO Enabled in Host Mode](#) and [Sending/Receiving Data with FIFO Enabled in Client Mode](#).

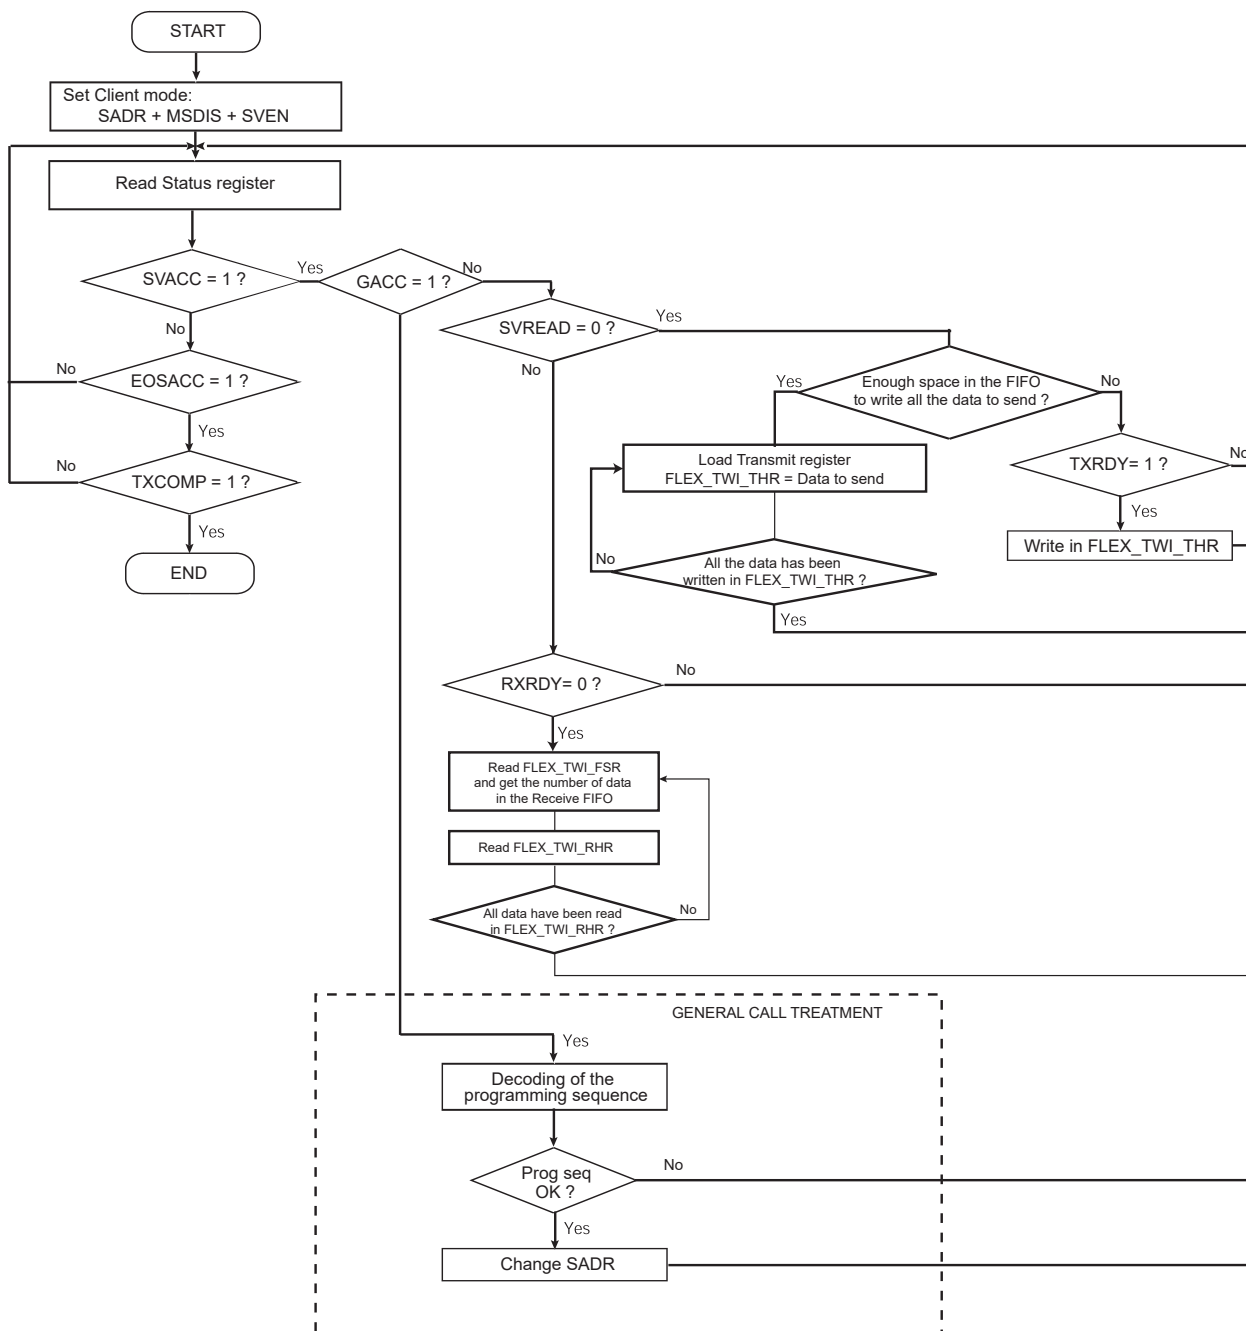

**Figure 58.135.** Receiving Data with FIFO Enabled in Host Mode

#### 58.9.6.4.Sending/Receiving with FIFO Enabled in Client Mode

See [Sending Data with FIFO Enabled](#) and [Receiving Data with FIFO Enabled](#) for details.

**Figure 58.136.** Sending/Receiving Data with FIFO Enabled in Client Mode

#### 58.9.6.5. Clearing/Flushing FIFOs

Each FIFO can be cleared/flushed using FLEX\_TWI\_CR.TXFCLR/RXFCLR.

#### 58.9.6.6. TXRDY and RXRDY Behavior

FLEX\_TWI\_SR.TXRDY/RXRDY flags display a specific behavior when FIFOs are enabled.

TXRDY indicates if a byte can be written in the Transmit FIFO. Thus the TXRDY flag is set as long as the Transmit FIFO can accept new byte. See figure [TXRDY Behavior when TXRDYM = 0 in Host Mode](#).

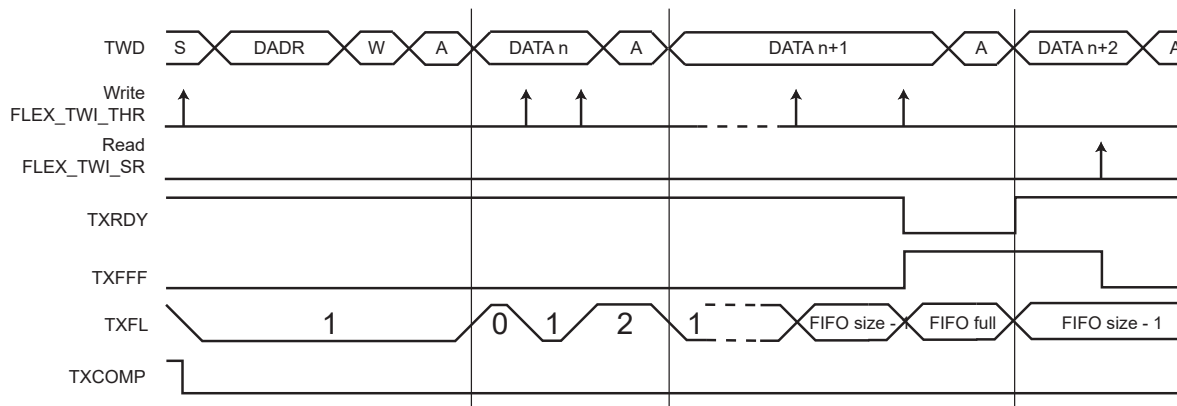

RXRDY indicates if an unread byte is present in the Receive FIFO. Thus the RXRDY flag is set as soon as one unread byte is in the Receive FIFO. See figure [RXRDY Behavior when RXRDYM = 0 in Host and Client Modes](#).

TXRDY and RXRDY behavior can be modified using the TXRDYM and RXRDYM fields in the TWI FIFO Mode register (FLEX\_TWI\_FMR) to reduce the number of accesses to FLEX\_TWI\_THR/RHR.

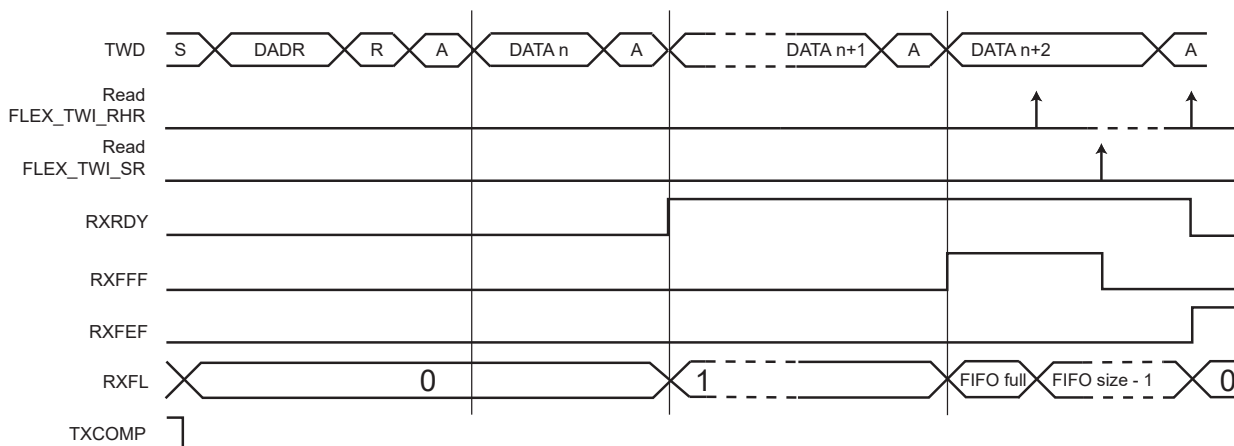

As an example, in Host mode, the Transmit FIFO can be loaded with multiple bytes in the same access by configuring TXRDYM>0.

See FLEX\_TWI\_FMR for the FIFO configuration.

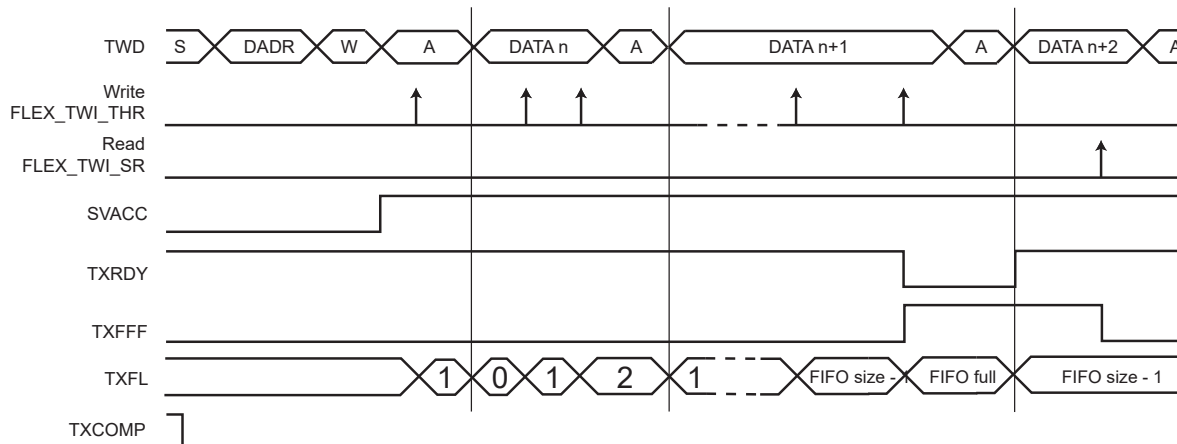

**Figure 58.137.** TXRDY Behavior when TXRDYM = 0 in Host Mode

**Figure 58.138.** RXRDY Behavior when RXRDYM = 0 in Host and Client Modes

**Figure 58.139.** TXRDY Behavior when TXRDYM = 0 in Client Mode

#### 58.9.6.7.TWI Single Data Access

When FIFO is enabled and a byte access is performed in FLEX\_TWI\_THR, one byte is written in the FIFO. The same behavior applies for FLEX\_TWI\_RHR.

See [TWI Transmit Holding Register](#) and [TWI Receive Holding Register](#).

However, it is possible to write/read multiple data each time FLEX\_THR\_THR/FLEX\_US\_RHR is accessed. See [TWI Multiple Data Access](#).

#### 58.9.6.8.TWI Multiple Data Access

It is possible to reduce the number of accesses to/from FLEX\_TWI\_THR/FLEX\_US\_RHR required to transfer an amount of data, by concatenating multiple bytes.

Up to four data can be written/read in one FLEX\_TWI\_THR/FLEX\_TWI\_RHR access when the FIFO is enabled (FLEX\_TWI\_CR.FIFOEN=1) and Sniffer mode is disabled (FLEX\_TWI\_SMR.SNIFF=0).

When the FIFO is enabled, the number of bytes to write/read is defined by the type of access in the holding register. If the access is a byte, only one byte is written/read (single data access), if the access is a halfword or a word a multiple data access is performed. If the access is a halfword, then two bytes are written/read and if the access is a word, four bytes are written/read.

Written/Read data are always right-aligned, as described in sections [TWI Receive Holding Register \(FIFO Enabled\)](#) and [TWI Transmit Holding Register \(FIFO Enabled\)](#).

As an example, if the Transmit FIFO is empty and there are six bytes to send, either of the following write accesses may be performed:

- Six FLEX\_TWI\_THR-byte write accesses
- Three FLEX\_TWI\_THR-halfword write accesses
- One FLEX\_TWI\_THR-word write access and one FLEX\_TWI\_THR halfword write access

With a Receive FIFO containing six bytes, any of the following read accesses may be performed:

- Six FLEX\_TWI\_RHR-byte read accesses
- Three FLEX\_TWI\_RHR-halfword read accesses
- One FLEX\_TWI\_RHR-word read access and one FLEX\_TWI\_RHR-halfword read access

#### 58.9.6.8.1.TXRDY and RXRDY Configuration

It is possible to write one or more bytes in the same FLEX\_TWI\_THR/FLEX\_TWI\_RHR access. The TXRDY flag indicates if one or more bytes can be written in the FIFO depending on the configuration of FLEX\_TWI\_FMR.TXRDYM/RXRDYM.

When two bytes are written for each FLEX\_TWI\_THR access, the TXRDYM field can be configured so that the TXRDY flag is at '1' only when at least two bytes can be written in the Transmit FIFO.

When four bytes are read for each FLEX\_TWI\_RHR access, the RXRDYM field can be configured so that the RXRDY flag is at '1' only when at least four unread bytes are in the Receive FIFO.

#### 58.9.6.8.2.DMA

The DMA transfer type must be configured according to the FLEX\_TWI\_FMR.TXRDYM/RXRDYM settings.

As example, FLEX\_TWI\_FMR.TXRDYM/RXRDYM=0 is not compatible with DMA transfers in word (32-bit).

#### 58.9.6.9.Transmit FIFO Lock

If a frame is terminated early due to a not-acknowledge error (NACK flag), SMBus timeout error (TOUT flag) or host code acknowledge error (MACK flag), a lock is set on the Transmit FIFO preventing any new frame from being sent until it is cleared. This allows clearing the FIFO if needed, resetting DMA channels, etc., without any risk.

FLEX\_TWI\_SR.LOCK is used to check the state of the Transmit FIFO lock.

The Transmit FIFO lock can be cleared by setting FLEX\_TWI\_CR.TXFLCLR to '1'.

#### 58.9.6.10.FIFO Overflow/Underflow Error

If the Transmit FIFO is full and a write access is performed on FLEX\_TWI\_THR, it generates a Transmit FIFO overflow error and sets FLEX\_TWI\_FSR.TXFPTEF.

If the number of data written in FLEX\_TWI\_THR (according to the register access size) is greater than the free space in the Transmit FIFO, a Transmit FIFO overflow error is generated and FLEX\_TWI\_FSR.TXFPTEF is set.

If the number of bytes read in FLEX\_TWI\_RHR (according to the register access size) is greater than the number of unread bytes in the Receive FIFO, a Receive FIFO underflow error is generated and FLEX\_TWI\_FSR.RXFPTEF is set.

No error occurs if the FIFO state/level is checked before writing/reading in FLEX\_TWI\_THR/FLEX\_TWI\_RHR. The FIFO state/level can be checked either with TXRDY, RXRDY, TXFL or RXFL. When such error occurs, other FIFO flags may not behave as expected; their states should be ignored. A software reset must be performed using FLEX\_TWI\_CR.SWRST. Note that issuing a software reset during transmission may leave a client in an unknown state holding the TWD line. In this case, a Bus Clear command may instruct the client to release the TWD line (the first frame sent afterward may not be received properly by the client). See [Bus Clear Command](#) to initiate the Bus Clear command.

#### 58.9.6.11.FIFO Thresholds

Each Transmit and Receive FIFO includes a threshold feature used to set a flag and an interrupt when a FIFO threshold is crossed. Thresholds are defined as a number of bytes in the FIFO, and the FIFO state (TXFL or RXFL) represents the number of bytes currently in the FIFO.

The Transmit FIFO threshold can be set using the field FLEX\_TWI\_FMR.TXFTHRES. Each time the Transmit FIFO level goes from 'above threshold' to 'equal to or below threshold', the flag FLEX\_TWI\_FESR.TXFTHF is set. The application is warned that the Transmit FIFO has reached the defined threshold and that it can be reloaded.

The Receive FIFO threshold can be set using the field FLEX\_TWI\_FMR.RXFTHRES. Each time the Receive FIFO level goes from 'below threshold' to 'equal to or above threshold', the flag FLEX\_TWI\_FESR.RXFTHF is set. The application is warned that the Receive FIFO has reached the defined threshold and that it can be read to prevent an underflow.

The TXFTHF and RXFTHF flags can be configured to generate an interrupt using FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

#### 58.9.6.12.FIFO Flags

FIFOs come with a set of flags which can be configured to generate interrupts through FLEX\_TWI\_FIER and FLEX\_TWI\_FIDR.

FIFO flags state can be read in FLEX\_TWI\_FSR. They are cleared when FLEX\_TWI\_FSR is read.

#### 58.9.7. TWI Comparison Function on Received Character

The TWI has the capability to extend the address matching on up to three client addresses. The FLEX\_TWI\_SMR.SADR1EN/SADR2EN/SADR3EN bits enable address matching on additional addresses which can be configured through the FLEX\_TWI\_SWMR.SADR1/SADR2/SADR3 fields. The DATAMEN bit has no effect.

The SVACC bit is set when there is a comparison match with the received client address.

#### 58.9.8. Sniffer Mode

The Client Sniffer mode of a TWI can be enabled to ease the analysis/debug of a TWI bus activity. The TWI bus to be analyzed can be monitored by one TWI host embedded in the product or by an I2C host outside the product.

In this mode, the TWI reports all (or part of) the TWI bus activity without impacting the TWI bus (no bus drive is performed). Depending on the MASK field value, only some specific transfers can be logged instead of the whole activity.

The peripheral TWIn can be configured to analyze the peripheral TWIn+1 (TWImax analyzes TWI0) in a full transparent mode via predefined internal connections between TWI instances (n is the index of the TWI instance).

The predefined internal connections provide the capability to use the TWD and TWCK pins for alternate functions while the TWI peripheral is configured in Sniffer Client mode and the selected TWI bus to analyze is carried on these internal links.

The following fields must be programmed before entering Client mode:

1. FLEX\_TWI\_SMR.SADR: Use the client device address to indicate which frame(s) to log.
2. FLEX\_TWI\_SMR.MASK: Indicate which SADR bits should be masked and thus which transfers should be logged (set to 0x7F to log the whole TWI bus activity; all SADR bits are masked in this case). General Call accesses will always match.
3. FLEX\_TWI\_SMR.BSEL: Select the TWI bus to analyze (see figure [Sniffer Mode Application Overview](#)).
4. FLEX\_TWI\_SMR.SNIFF: Set to '1' to enable Client Sniffer mode.
5. FLEX\_TWI\_CR.MSDIS: Disable Host mode.
6. FLEX\_TWI\_CR.SVEN: Enable Client mode.

As the device receives the clock, values written in FLEX\_TWI\_CWGR are not relevant.

Once configured in Client Sniffer mode, the FLEX\_TWI\_SR.RXRDY bit indicates when a transfer has been logged in FLEX\_TWI\_RHR. An interrupt can be generated if configured. The FLEX\_TWI\_SR.OVRE flag indicates if an overrun error occurred if the application is not fast enough to read FLEX\_TWI\_RHR.

In Client Sniffer mode, FLEX\_TWI\_RHR logs data as follows:

- The RXDATA field reports the sniffed 8-bit data field.
- The SSTATE field indicates if a START condition has been detected before the 8-bit data field.
- The PSTATE field indicates if a STOP condition has been detected after the previously sniffed 8-bit data field.
- The ASTATE field indicates which acknowledge condition has been detected after the previously sniffed 8-bit data field.

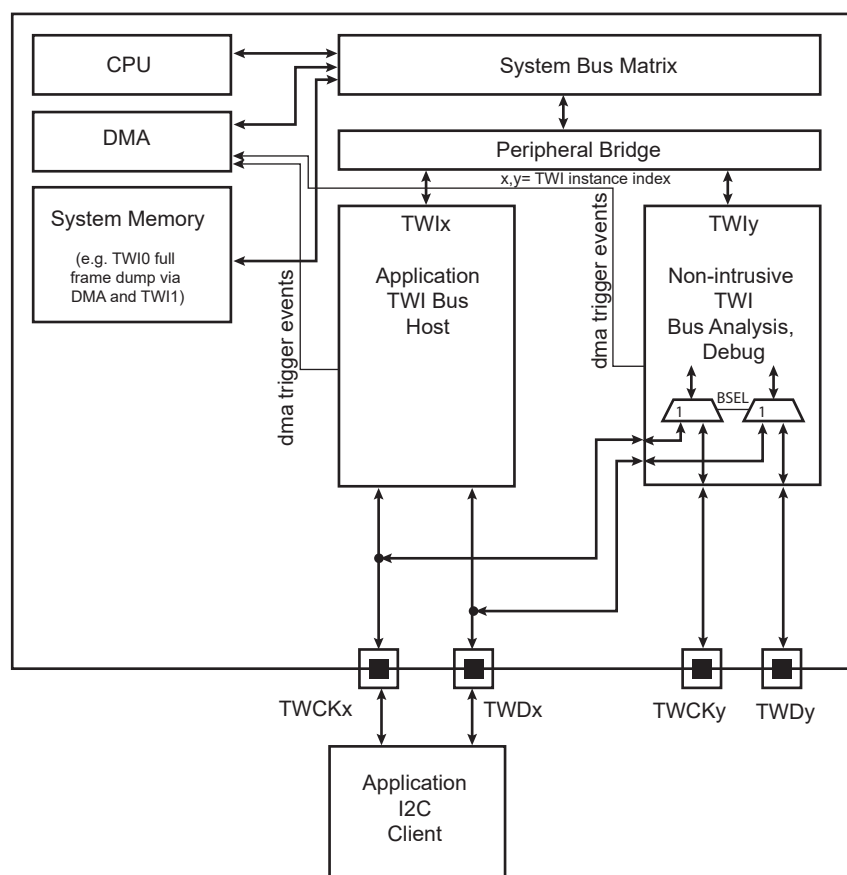

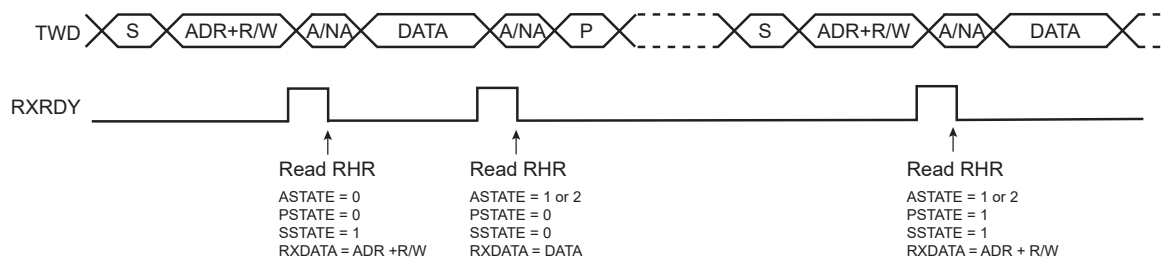

Figure 58.141. Client Sniffer Mode Log

### 58.9.9. TWI Register Write Protection

The FLEXCOM operating mode (FLEX\_MR.OPMODE) must be set to FLEX\_MR\_OPMODE\_TWI to enable access to the write protection registers.

To prevent any single software error from corrupting TWI behavior, certain registers in the address space can be write-protected by setting the WPEN (Write Protection Enable), WPITEN (Write Protection Interrupt Enable), and/or WPCREN (Write Protection Control Enable) bits in the TWI Write Protection Mode Register (FLEX\_TWI\_WPMR).

If a write access to a write-protected register is detected, the Write Protection Violation Status (WPVS) flag in the TWI Write Protection Status Register (FLEX\_TWI\_WPSR) is set and the Write Protection Violation Source (WPVSR) field indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading FLEX\_TWI\_WPSR.

The following register(s) can be write-protected when WPEN is set:

- [TWI Client Mode Register](#)
- [TWI Clock Waveform Generator Register](#)
- [TWI SMBus Timing Register](#)
- [TWI FIFO Mode Register](#)

The following register(s) can be write-protected when WPITEN is set:

- [TWI Interrupt Enable Register](#)
- [TWI Interrupt Disable Register](#)

The following register(s) can be write-protected when WPCREN is set:

- [TWI Control Register](#)

## 58.10. Register Summary

58.10.1. FLEXCOM Mode Register

**Name:** FLEX\_MR  
**Offset:** 0x000  
**Reset:** 0x00000001  
**Property:** Read/Write

Bits 1:0 – OPMODE[1:0] FLEXCOM Operating Mode

Value	Name	Description
0	NO_COM	No communication
1	USART	All UART-related protocols are selected (RS232, RS485, IrDA, ISO7816, LIN, LON) SPI/TWI-related registers are not accessible and have no impact on IOs.
2	SPI	SPI operating mode is selected. USART/TWI related registers are not accessible and have no impact on IOs.
3	TWI	All TWI-related protocols are selected (TWI, SMBus). USART/SPI-related registers are not accessible and have no impact on IOs.

## 58.10.2. FLEXCOM Receive Holding Register

**Name:** FLEX\_RHR  
**Offset:** 0x010  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	RXDATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RXDATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 15:0 – RXDATA[15:0] Receive Data

This register is a mirror of:

- USART Receive Holding Register (FLEX\_US\_RHR) if FLEX\_MR.OPMODE field equals 1
- SPI Receive Data Register (FLEX\_SPI\_RDR) if FLEX\_MR.OPMODE field equals 2
- TWI Transmit Holding Register (FLEX\_TWI\_RHR) if FLEX\_MR.OPMODE field equals 3

### 58.10.3. FLEXCOM Transmit Holding Register

**Name:** FLEX\_THR  
**Offset:** 0x020  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	TXDATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TXDATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – TXDATA[15:0] Transmit Data

This register is a mirror of:

- USART Transmit Holding Register (FLEX\_US\_THR) if FLEX\_MR.OPMODE field equals 1
- SPI Transmit Data Register (FLEX\_SPI\_TDR) if FLEX\_MR.OPMODE field equals 2
- TWI Transmit Holding Register (FLEX\_TWI\_THR) if FLEX\_MR.OPMODE field equals 3

**58.10.4. USART Control Register**

**Name:** FLEX\_US\_CR  
**Offset:** 0x200  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	FIFODIS	FIFOEN		REQCLR		TXFLCLR	RXFCLR	TXFCLR
Access	W	W		W		W	W	W
Reset	–	–		–		–	–	–

Bit	23	22	21	20	19	18	17	16
			LINWKUP	LINABT	RTSDIS	RTSEN		
Access			W	W	W	W		
Reset			–	–	–	–		

Bit	15	14	13	12	11	10	9	8
	RETTO	RSTNACK	RSTIT	SENDA	STTTO	STPBRK	STTBRK	RSTSTA
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	TXDIS	TXEN	RXDIS	RXEN	RSTTX	RSTRX		
Access	W	W	W	W	W	W		
Reset	–	–	–	–	–	–		

**Bit 31 – FIFODIS** FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs.

**Bit 30 – FIFOEN** FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs.

**Bit 28 – REQCLR** Request to Clear the Comparison Trigger

Value	Description
0	No effect.
1	Restarts the comparison trigger to enable FLEX_US_RHR loading.

**Bit 26 – TXFLCLR** Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

**Bit 25 – RXFCLR** Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

#### Bit 24 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

#### Bit 21 – LINWKUP Send LIN Wakeup Signal

Value	Description
0	No effect.
1	Sends a wakeup signal on the LIN bus.

#### Bit 20 – LINABT Abort LIN Transmission

Value	Description
0	No effect.
1	Aborts the current LIN transmission.

#### Bit 19 – RTSDIS Request to Send Disable

Value	Description
0	No effect.
1	Drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 0.

#### Bit 18 – RTSEN Request to Send Enable

Value	Description
0	No effect.
1	Drives the RTS pin to 1 if FLEX_US_MR.USART_MODE field = 2, else drives the RTS pin to 0 if FLEX_US_MR.USART_MODE field = 0.

#### Bit 15 – RETTO Start Timeout Immediately

Value	Description
0	No effect
1	Immediately restarts timeout period.

#### Bit 14 – RSTNACK Reset Non Acknowledge

Value	Description
0	No effect
1	Resets FLEX_US_CSR.NACK.

#### Bit 13 – RSTIT Reset Iterations

Value	Description
0	No effect.
1	Resets FLEX_US_CSR.ITER. No effect if the ISO7816 is not enabled.

#### Bit 12 – SENDA Send Address

Value	Description
0	No effect.
1	In Multidrop mode only, the next character written to FLEX_US_THR is sent with the address bit set.

### Bit 11 – STTTO Clear TIMEOUT Flag and Start Timeout After Next Character Received

Value	Description
0	No effect.
1	Starts waiting for a character before clocking the timeout counter. Immediately disables a timeout period in progress. Resets the FLEX_US_CSR.TIMEOUT status bit.

### Bit 10 – STPBRK Stop Break

Value	Description
0	No effect.
1	Stops transmission of the break after a minimum of one character length and transmits a high level during 12-bit periods. No effect if no break is being transmitted.

### Bit 9 – STTBRK Start Break

Value	Description
0	No effect.
1	Starts transmission of a break after the characters present in FLEX_US_THR and the Transmit Shift Register have been transmitted. No effect if a break is already being transmitted.

### Bit 8 – RSTSTA Reset Status Bits

Value	Description
0	No effect.
1	Resets the PARE, FRAME, OVRE, MANE, LINBE, LINISFE, LINIPE, LINCE, LINSNRE, LINSTE, LINHTE, LINID, LINTC, LINBK, CMP and RXBRK in FLEX_US_CSR status bits, as well as the TXFEF, TXFFF, TXFTHF, RXFEF, RXFFF, RXFTHF, TXFPTEF, RXFPTEF in FLEX_US_FESR status bits.

### Bit 7 – TXDIS Transmitter Disable

Value	Description
0	No effect.
1	Disables the transmitter.

### Bit 6 – TXEN Transmitter Enable

Value	Description
0	No effect.
1	Enables the transmitter if TXDIS is 0.

### Bit 5 – RXDIS Receiver Disable

Value	Description
0	No effect.
1	Disables the receiver.

### Bit 4 – RXEN Receiver Enable

Value	Description
0	No effect.
1	Enables the receiver, if RXDIS is 0.

### Bit 3 – RSTTX Reset Transmitter

Value	Description
0	No effect.
1	Resets the transmitter.

### Bit 2 – RSTRX Reset Receiver

Value	Description
0	No effect.
1	Resets the receiver.

**58.10.5. USART Mode Register**

**Name:** FLEX\_US\_MR  
**Offset:** 0x204  
**Reset:** 0xC0000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	ONEBIT	MODSYNC	MAN	FILTER		MAX_ITERATION[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	-	-	-	-		-	-	-

Bit	23	22	21	20	19	18	17	16
	INVDATA	VAR_SYNC	DSNACK	INACK	OVER	CLKO	MODE9	MSBF
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	-	-	-	-	-	-	-	-

Bit	15	14	13	12	11	10	9	8
	CHMODE[1:0]		NBSTOP[1:0]		PAR[2:0]			SYNC
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	-	-	-	-	-	-	-	-

Bit	7	6	5	4	3	2	1	0
	CHRL[1:0]		USCLKS[1:0]		USART_MODE[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	-	-	-	-	-	-	-	-

**Bit 31 – ONEBIT** Start Frame Delimiter Selector

Value	Description
0	Start frame delimiter is COMMAND or DATA SYNC.
1	Start frame delimiter is one bit.

**Bit 30 – MODSYNC** Manchester Synchronization Mode

Value	Description
0	The Manchester start bit is a 0 to 1 transition
1	The Manchester start bit is a 1 to 0 transition.

**Bit 29 – MAN** Manchester Encoder/Decoder Enable

Value	Description
0	Manchester encoder/decoder are disabled.
1	Manchester encoder/decoder are enabled.

**Bit 28 – FILTER** Receive Line Filter

Value	Description
0	The USART does not filter the receive line.
1	The USART filters the receive line using a three-sample filter (1/16-bit clock) (2 over 3 majority).

**Bits 26:24 – MAX\_ITERATION[2:0]** Maximum Number of Automatic Iterations

Value	Description
0–7	Defines the maximum number of iterations in mode ISO7816, protocol T = 0.

#### Bit 23 – INVDATA Inverted Data

Value	Description
0	The data field transmitted on TXD line is the same as the one written in FLEX_US_THR or the content read in FLEX_US_RHR is the same as RXD line. Normal mode of operation.
1	The data field transmitted on TXD line is inverted (voltage polarity only) compared to the value written in FLEX_US_THR or the content read in FLEX_US_RHR is inverted compared to what is received on RXD line (or ISO7816 IO line). Inverted mode of operation, useful for contactless card application. To be used with configuration bit MSBF.

#### Bit 22 – VAR\_SYNC Variable Synchronization of Command/Data Sync Start Frame Delimiter

Value	Description
0	User defined configuration of command or data sync field depending on MODSYNC value.
1	The sync field is updated when a character is written into FLEX_US_THR.

#### Bit 21 – DSNACK Disable Successive NACK

The MAX\_ITERATION field must be cleared if DSNACK is cleared.

Value	Description
0	NACK is sent on the ISO line as soon as a parity error occurs in the received character (unless INACK is set).
1	Successive parity errors are counted up to the value specified in the MAX_ITERATION field. These parity errors generate a NACK on the ISO line. As soon as this value is reached, no additional NACK is sent on the ISO line. The flag ITER is asserted.

#### Bit 20 – INACK Inhibit Non Acknowledge

Value	Description
0	The NACK is generated.
1	The NACK is not generated.

#### Bit 19 – OVER Oversampling Mode

Value	Description
0	16x Oversampling.
1	8x Oversampling.

#### Bit 18 – CLKO Clock Output Select

Value	Description
0	The USART does not drive the SCK pin (Synchronous Client mode or Asynchronous mode with external baud rate clock source).
1	The USART drives the SCK pin if USCLKS does not select the external clock SCK (USART Synchronous Host mode).

#### Bit 17 – MODE9 9-bit Character Length

Value	Description
0	CHRL defines character length.
1	9-bit character length.

#### Bit 16 – MSBF Bit Order

Value	Description
0	Least significant bit is sent/received first.
1	Most significant bit is sent/received first.

### Bits 15:14 – CHMODE[1:0] Channel Mode

Value	Name	Description
0	NORMAL	Normal mode
1	AUTOMATIC	Automatic Echo. Receiver input is connected to the TXD pin.
2	LOCAL_LOOPBACK	Local Loopback. Transmitter output is connected to the Receiver Input.
3	REMOTE_LOOPBACK	Remote Loopback. RXD pin is internally connected to the TXD pin.

### Bits 13:12 – NBSTOP[1:0] Number of Stop Bits

Value	Name	Description
0	1_BIT	1 stop bit
1	1_5_BIT	1.5 stop bit (SYNC = 0) or reserved (SYNC = 1)
2	2_BIT	2 stop bits

### Bits 11:9 – PAR[2:0] Parity Type

Value	Name	Description
0	EVEN	Even parity
1	ODD	Odd parity
2	SPACE	Parity forced to 0 (Space)
3	MARK	Parity forced to 1 (Mark)
4	NO	No parity
6	MULTIDROP	Multidrop mode

### Bit 8 – SYNC Synchronous Mode Select

Value	Description
0	USART operates in Asynchronous mode (UART).
1	USART operates in Synchronous mode.

### Bits 7:6 – CHRL[1:0] Character Length

Value	Name	Description
0	5_BIT	Character length is 5 bits
1	6_BIT	Character length is 6 bits
2	7_BIT	Character length is 7 bits
3	8_BIT	Character length is 8 bits

### Bits 5:4 – USCLKS[1:0] Clock Selection

Value	Name	Description
0	MCK	Peripheral clock is selected
1	DIV	Peripheral clock divided (DIV = 8) is selected
2	GCLK	PMC generic clock is selected. If the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.
3	SCK	External pin SCK is selected

### Bits 3:0 – USART\_MODE[3:0] USART Mode of Operation

Values not listed in the table below should be considered 'reserved'.

Value	Name	Description
0x0	NORMAL	Normal mode
0x1	RS485	RS485
0x2	HW_HANDSHAKING	Hardware handshaking
0x4	IS07816_T_0	IS07816 Protocol: T = 0
0x6	IS07816_T_1	IS07816 Protocol: T = 1
0x8	IRDA	IrDA
0x9	LON	LON

Value	Name	Description
0xA	LIN_MASTER	LIN Host mode
0xB	LIN_SLAVE	LIN Client mode
0xC	DATA16BIT_MASTER	16-bit data host
0xD	DATA16BIT_SLAVE	16-bit data client

### 58.10.6. USART Interrupt Enable Register (Default Mode)

**Name:** FLEX\_US\_IER (DEFAULT\_MODE)  
**Offset:** 0x208  
**Reset:** –  
**Property:** Write-only

For LIN-specific configurations, see [USART Interrupt Enable Register \(LIN\\_MODE\)](#).

For LON-specific configurations, see [USART Interrupt Enable Register \(LON\\_MODE\)](#).

This register can only be written if the WPITEN bit is cleared in the [USART Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								MANE
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
		CMP			CTSIC			
Access		W			W			
Reset		–			–			

Bit	15	14	13	12	11	10	9	8
			NACK			ITER	TXEMPTY	TIMEOUT
Access			W			W	W	W
Reset			–			–	–	–

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE			RXBRK	TXRDY	RXRDY
Access	W	W	W			W	W	W
Reset	–	–	–			–	–	–

**Bit 24 – MANE** Manchester Error Interrupt Enable

**Bit 22 – CMP** Comparison Interrupt Enable

**Bit 19 – CTSIC** Clear to Send Input Change Interrupt Enable

**Bit 13 – NACK** Non Acknowledge Interrupt Enable

**Bit 10 – ITER** Max number of Repetitions Reached Interrupt Enable

**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 8 – TIMEOUT** Timeout Interrupt Enable

**Bit 7 – PARE** Parity Error Interrupt Enable

**Bit 6 – FRAME** Framing Error Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 2 – RXBRK** Receiver Break Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

**58.10.7. USART Interrupt Enable Register (LIN\_MODE)****Name:** FLEX\_US\_IER (LIN\_MODE)**Offset:** 0x208**Reset:** –**Property:** Write-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
	LINHTE	LINSTE	LINSNRE	LINCE	LINIPE	LINISFE	LINBE	
Access	W	W	W	W	W	W	W	
Reset	–	–	–	–	–	–	–	
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	LINTC	LINID	LINBK				TXEMPTY	TIMEOUT
Access	W	W	W				W	W
Reset	–	–	–				–	–
Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE				TXRDY	RXRDY
Access	W	W	W				W	W
Reset	–	–	–				–	–

**Bit 31 – LINHTE** LIN Header Timeout Error Interrupt Enable**Bit 30 – LINSTE** LIN Synch Tolerance Error Interrupt Enable**Bit 29 – LINSNRE** LIN Client Not Responding Error Interrupt Enable**Bit 28 – LINCE** LIN Checksum Error Interrupt Enable**Bit 27 – LINIPE** LIN Identifier Parity Interrupt Enable**Bit 26 – LINISFE** LIN Inconsistent Synch Field Error Interrupt Enable**Bit 25 – LINBE** LIN Bus Error Interrupt Enable**Bit 15 – LINTC** LIN Transfer Completed Interrupt Enable**Bit 14 – LINID** LIN Identifier Sent or LIN Identifier Received Interrupt Enable**Bit 13 – LINBK** LIN Break Sent or LIN Break Received Interrupt Enable**Bit 9 – TXEMPTY** TXEMPTY Interrupt Enable

**Bit 8 – TIMEOUT** Timeout Interrupt Enable

**Bit 7 – PARE** Parity Error Interrupt Enable

**Bit 6 – FRAME** Framing Error Interrupt Enable

**Bit 5 – OVRE** Overrun Error Interrupt Enable

**Bit 1 – TXRDY** TXRDY Interrupt Enable

**Bit 0 – RXRDY** RXRDY Interrupt Enable

**58.10.8. USART Interrupt Enable Register (LON\_MODE)****Name:** FLEX\_US\_IER (LON\_MODE)**Offset:** 0x208**Reset:** –**Property:** Write-only

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Access	R	R	R			R	R	R
Reset	-	-	-			-	-	-

**Bit 24 – MANE** Manchester Error

Value	Description
0	No Manchester error has been detected since the last RSTSTA command was issued.
1	At least one Manchester error has been detected since the last RSTSTA command was issued.

**Bit 23 – CTS** Image of CTS Input

Value	Description
0	CTS input is driven low.
1	CTS input is driven high.

**Bit 22 – CMP** Comparison Status

Value	Description
0	No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in since the last RSTSTA command was issued.
1	A received character matched the comparison criteria since the last RSTSTA command was issued.

**Bit 19 – CTSIC** Clear to Send Input Change Flag

Value	Description
0	No input change has been detected on the CTS pin since the last read of FLEX_US_CSR.
1	At least one input change has been detected on the CTS pin since the last read of FLEX_US_CSR.

**Bit 13 – NACK** Non Acknowledge Interrupt

Value	Description
0	Non acknowledge has not been detected since the last RSTNACK.
1	At least one non acknowledge has been detected since the last RSTNACK.

#### Bit 10 – ITER Max Number of Repetitions Reached

Value	Description
0	Maximum number of repetitions has not been reached since the last RSTIT command was issued.
1	Maximum number of repetitions has been reached since the last RSTIT command was issued.

#### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

#### Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO).

#### Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

#### Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

#### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

#### Bit 2 – RXBRK Break Received/End of Break

Value	Description
0	No break received or end of break detected since the last RSTSTA command was issued.
1	Break received or end of break detected since the last RSTSTA command was issued.

#### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

When FIFOs are disabled:

0: A character in FLEX\_US\_THR is waiting to be transferred to the Transmit Shift Register, or an STTBRK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

1: There is no character in FLEX\_US\_THR.

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFO enabled is illustrated in [TXEMPTY](#), [TXRDY](#) and [RXRDY Behavior](#).

**Bit 0 – RXRDY** Receiver Ready (cleared by reading FLEX\_US\_RHR)

When FIFOs are disabled:

0: No complete character has been received since the last read of FLEX\_US\_RHR or the receiver is disabled. If characters were received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.

1: At least one complete character has been received and FLEX\_US\_RHR has not yet been read.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read

1: At least one unread data is in the Receive FIFO

RXRDY behavior with FIFO enabled is illustrated in [TXEMPTY](#), [TXRDY](#) and [RXRDY Behavior](#).

**58.10.16.USART Channel Status Register (LIN\_MODE)**

**Name:** FLEX\_US\_CSR (LIN\_MODE)  
**Offset:** 0x214  
**Reset:** –  
**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

**Bit 31 – LINHTE** LIN Header Timeout Error

Value	Description
0	No LIN header timeout error has been detected since the last RSTSTA command was issued.
1	A LIN header timeout error has been detected since the last RSTSTA command was issued.

**Bit 30 – LINSTE** LIN Synch Tolerance Error

Value	Description
0	No LIN synch tolerance error has been detected since the last RSTSTA command was issued.
1	A LIN synch tolerance error has been detected since the last RSTSTA command was issued.

**Bit 29 – LINSNRE** LIN Client Not Responding Error

Value	Description
0	No LIN client not responding error has been detected since the last RSTSTA command was issued.
1	A LIN client not responding error has been detected since the last RSTSTA command was issued.

**Bit 28 – LINCE** LIN Checksum Error

Value	Description
0	No LIN checksum error has been detected since the last RSTSTA command was issued.
1	A LIN checksum error has been detected since the last RSTSTA command was issued.

**Bit 27 – LINIPE** LIN Identifier Parity Error

Value	Description
0	No LIN identifier parity error has been detected since the last RSTSTA command was issued.

Value	Description
1	A LIN identifier parity error has been detected since the last RSTSTA command was issued.

#### Bit 26 – LINISFE LIN Inconsistent Synch Field Error

Value	Description
0	No LIN inconsistent synch field error has been detected since the last RSTSTA
1	The USART is configured as a client node and a LIN Inconsistent synch field error has been detected since the last RSTSTA command was issued.

#### Bit 25 – LINBE LIN Bit Error

Value	Description
0	No bit error has been detected since the last RSTSTA command was issued.
1	A bit error has been detected since the last RSTSTA command was issued.

#### Bit 23 – LINBLS LIN Bus Line Status

Value	Description
0	LIN bus line is set to 0.
1	LIN bus line is set to 1.

#### Bit 15 – LINTC LIN Transfer Completed

Value	Description
0	The USART is idle or a LIN transfer is ongoing.
1	A LIN transfer has been completed since the last RSTSTA command was issued.

#### Bit 14 – LINID LIN Identifier Sent or LIN Identifier Received

If USART operates in LIN Host mode (USART\_MODE = 0xA):

0: No LIN identifier has been sent since the last RSTSTA command was issued.

1: At least one LIN identifier has been sent since the last RSTSTA command was issued.

If USART operates in LIN Client mode (USART\_MODE = 0xB):

0: No LIN identifier has been received since the last RSTSTA command was issued.

1: At least one LIN identifier has been received since the last RSTSTA.

#### Bit 13 – LINBK LIN Break Sent or LIN Break Received

Applicable if USART operates in LIN Host mode (USART\_MODE = 0xA):

0: No LIN break has been sent since the last RSTSTA command was issued.

1: At least one LIN break has been sent since the last RSTSTA.

If USART operates in LIN Client mode (USART\_MODE = 0xB):

0: No LIN break has received sent since the last RSTSTA command was issued.

1: At least one LIN break has been received since the last RSTSTA command was issued.

#### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

#### Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last start timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last start timeout command (FLEX_US_CR.STTTO).

#### Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

#### Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

#### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

#### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

Value	Description
0	A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1	There is no character in FLEX_US_THR.

#### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

Value	Description
0	No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1	At least one complete character has been received and FLEX_US_RHR has not yet been read.

**58.10.17.USART Channel Status Register (LON\_MODE)**

**Name:** FLEX\_US\_CSR (LON\_MODE)  
**Offset:** 0x214  
**Reset:** –  
**Property:** Read-only

This configuration is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

**Bit 28 – LBLOVFE** LON Backlog Overflow Error

Value	Description
0	No backlog overflow error occurred since the last RSTSTA command was issued.
1	At least one backlog error overflow occurred since the last RSTSTA command was issued.

**Bit 27 – LRXD** LON Reception End Flag

Value	Description
0	Reception on going or no reception occurred since the last RSTSTA command was issued.
1	At least one reception has been performed since the last RSTSTA command was issued.

**Bit 26 – LFET** LON Frame Early Termination

Value	Description
0	No frame has been terminated early due to collision detection since the last RSTSTA command was issued.
1	At least one transmission has been terminated due to collision detection since the last RSTSTA command was issued. (This stops the DMA until reset with RSTSTA bit).

**Bit 25 – LCOL** LON Collision Detected Flag

Value	Description
0	No collision occurred while transmitting since the last RSTSTA command was issued.
1	At least one collision occurred while transmitting since the last RSTSTA command was issued.

**Bit 24 – LTXD** LON Transmission End Flag

Value	Description
0	Transmission on going or no transmission occurred since the last RSTSTA command was issued.
1	At least one transmission has been performed since the last RSTSTA command was issued.

#### Bit 10 – UNRE Underrun Error

Value	Description
0	No LON underrun error has occurred since the last RSTSTA command was issued.
1	At least one LON underrun error has occurred since the last RSTSTA command was issued.

#### Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX\_US\_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

#### Bit 7 – LCRCE LON CRC Error

Value	Description
0	No CRC error has been detected since the last RSTSTA command was issued.
1	At least one CRC error has been detected since the last RSTSTA command was issued.

#### Bit 6 – LSFE LON Short Frame Error

Value	Description
0	No short frame received since the last RSTSTA command was issued.
1	At least one short frame received since the last RSTSTA command was issued.

#### Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

#### Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX\_US\_THR)

Value	Description
0	A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1	There is no character in FLEX_US_THR.

#### Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX\_US\_RHR)

Value	Description
0	No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1	At least one complete character has been received and FLEX_US_RHR has not yet been read.

## 58.10.18.USART Receive Holding Register (Default Mode)

**Name:** FLEX\_US\_RHR (DEFAULT\_MODE)  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN=1), a byte access on FLEX\_SPI\_TDR reads one byte (FLEX\_US\_RHR.MODE9=0), see [FIFO Single Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	RXSYNH							RXCHR[8]
Access	R							R
Reset	0							0

Bit	7	6	5	4	3	2	1	0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bit 15 – RXSYNH Received Sync

Value	Description
0	Last character received is a data.
1	Last character received is a command.

### Bits 8:0 – RXCHR[8:0] Received Character

Last character received if RXRDY is set.

## 58.10.19.USART Receive Holding Register (FIFO Multi Data)

**Name:** FLEX\_US\_RHR (FIFO\_MULTI\_DATA)  
**Offset:** 0x218  
**Reset:** 0x00000000  
**Property:** Read-only

To read multi-data in a single access, the FIFO must be enabled (FLEX\_US\_CR.FIFOEN=1) and FLEX\_US\_MR.MODE9=0. The access type (byte, halfword or word) determines the number of data written in a single access (1, 2, 4), see [FIFO Multiple Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
	RXCHR3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RXCHR2[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RXCHR1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RXCHR0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0:7, 8:15, 16:23, 24:31 – RXCHR<sub>x</sub>** Received Character  
 First unread character in the Receive FIFO if RXRDY is set.

## 58.10.20.USART Transmit Holding Register (Default Mode)

**Name:** FLEX\_US\_THR (DEFAULT\_MODE)

**Offset:** 0x21C

**Reset:** –

**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN=1), a byte access on FLEX\_US\_TDR writes one byte (FLEX\_US\_MR.MODE9=0), see [FIFO Single Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	TXSYNH							TXCHR[8]
Access	W							W
Reset	–							–
Bit	7	6	5	4	3	2	1	0
	TXCHR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bit 15 – TXSYNH Sync Field to be Transmitted

Value	Description
0	The next character sent is encoded as a data. Start frame delimiter is DATA SYNC.
1	The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC.

### Bits 8:0 – TXCHR[8:0] Character to be Transmitted

The next character to be transmitted after the current character if TXRDY is not set.

## 58.10.21.USART Transmit Holding Register (FIFO Multi Data)

**Name:** FLEX\_US\_THR (FIFO\_MULTI\_DATA)

**Offset:** 0x21C

**Reset:** –

**Property:** Write-only

To write multi-data in a single access, the FIFO must be enabled (FLEX\_US\_CR.FIFOEN=1) and FLEX\_US\_MR.MODE9=0. The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4), see [FIFO Multiple Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
	TXCHR3[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	TXCHR2[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	TXCHR1[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	TXCHR0[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0:7, 8:15, 16:23, 24:31 – TXCHR<sub>x</sub>** Character to be Transmitted  
Next character to be transmitted.

**58.10.22.USART Baud Rate Generator Register**

**Name:** FLEX\_US\_BRGR  
**Offset:** 0x220  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access							FP[2:0]	
Reset						R/W 0	R/W 0	R/W 0
Bit	15	14	13	12	11	10	9	8
Access	CD[15:8]							
Reset	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0
Bit	7	6	5	4	3	2	1	0
Access	CD[7:0]							
Reset	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0	R/W 0

**Bits 18:16 – FP[2:0] Fractional Part****WARNING**

When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by “selected clock” period from time to time. The duty cycle depends on the value of the CD field.

Value	Description
0	Fractional divider is disabled.
1–7	Baud rate resolution, defined by $FP \times 1/8$ .

**Bits 15:0 – CD[15:0] Clock Divider**

CD	USART_MODE ≠ ISO7816			USART_MODE = ISO7816
	SYNC = 0		SYNC = 1	
	OVER = 0	OVER = 1		
0	Baud Rate Clock disabled			
1 to 65535	CD = Selected Clock / (16 × Baud Rate)	CD = Selected Clock / (8 × Baud Rate)	CD = Selected Clock / Baud Rate	CD = Selected Clock / (FI_DI_RATIO × Baud Rate)

58.10.23.USART Receiver Timeout Register

**Name:** FLEX\_US\_RTOR  
**Offset:** 0x224  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
								TO[16]
Access								R/W
Reset								0
Bit	15	14	13	12	11	10	9	8
	TO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 16:0 – TO[16:0]** Timeout Value

The TO field size is limited to 8 bits if the ISO7816 logic is not implemented on some instances of FLEXCOM. The ISO7816 logic is implemented if it is possible to write FLEX\_US\_MR.MAX\_ITERATIONS=1 (a read operation must be performed after the write operation to check that MAX\_ITERATIONS equals 1).

Value	Description
0	The receiver timeout is disabled.
1–131071	The receiver timeout is enabled and the timeout delay is TO × bit period.

58.10.24.USART Transmitter Timeguard Register

**Name:** FLEX\_US\_TTGR  
**Offset:** 0x228  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

For LON-specific configurations, see [USART Transmitter Timeguard Register \(LON\\_MODE\)](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	TG[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – TG[7:0] Timeguard Value

Value	Description
0	The transmitter timeguard is disabled.
1–255	The transmitter timeguard is enabled and TG is timeguard delay / bit period.

58.10.25.USART Transmitter Timeguard Register (LON\_MODE)

**Name:** FLEX\_US\_TTGR (LON\_MODE)  
**Offset:** 0x228  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	PCYCLE[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	PCYCLE[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	PCYCLE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:0 – PCYCLE[23:0] LON PCYCLE Length

Value	Description
1– 16777215	LON PCYCLE length in t <sub>bit</sub> .

## 58.10.26.USART FI DI RATIO Register

**Name:** FLEX\_US\_FIDI  
**Offset:** 0x240  
**Reset:** 0x174  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

For LON-specific configurations, see [USART Transmitter Timeguard Register \(LON\\_MODE\)](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	FI_DI_RATIO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0
	FI_DI_RATIO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	1	0	0

### Bits 15:0 – FI\_DI\_RATIO[15:0] FI Over DI Ratio Value

Value	Description
0	If ISO7816 mode is selected, the baud rate generator generates no signal.
1–2	Do not use.
3–65535	If ISO7816 mode is selected, the baud rate is the clock provided on SCK divided by FI_DI_RATIO.

58.10.27.USART FI DI RATIO Register (LON\_MODE)

**Name:** FLEX\_US\_FIDI (LON\_MODE)  
**Offset:** 0x240  
**Reset:** 0x174  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	BETA2[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	BETA2[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1
Bit	7	6	5	4	3	2	1	0
	BETA2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	1	0	0

Bits 23:0 – BETA2[23:0] LON BETA2 Length

Value	Description
1–16777215	LON BETA2 length in $t_{bit}$ . <b>Note:</b> The configured value must be lower than $2^{18}$ .

58.10.28.USART Number of Errors Register

**Name:** FLEX\_US\_NER  
**Offset:** 0x244  
**Reset:** 0x00000000  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0x4 or 0x6 in the [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	NB_ERRORS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	-	-	-	-	-	-	-	-

**Bits 7:0 – NB\_ERRORS[7:0]** Number of Errors  
Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

58.10.29.USART IrDA FILTER Register

**Name:** FLEX\_US\_IF  
**Offset:** 0x24C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x8 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	IRDA_FILTER[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 7:0 – IRDA\_FILTER[7:0]** IrDA Filter

The IRDA\_FILTER value must be defined to meet the following criteria:

$t_{\text{peripheral clock}} \times (\text{IRDA\_FILTER} + 3) < 1.41 \mu\text{s}$

**58.10.30.USART Manchester Configuration Register**

**Name:** FLEX\_US\_MAN  
**Offset:** 0x250  
**Reset:** 0xB0011004  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RXIDLEV	DRIFT	ONE	RX_MPOL			RX_PP[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	1	0	1	1			0	0

Bit	23	22	21	20	19	18	17	16
					RX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	1

Bit	15	14	13	12	11	10	9	8
				TX_MPOL			TX_PP[1:0]	
Access				R/W			R/W	R/W
Reset				1			0	0

Bit	7	6	5	4	3	2	1	0
					TX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	1	0	0

**Bit 31 – RXIDLEV** Receiver Idle Value

Value	Description
0	Receiver line idle value is 0.
1	Receiver line idle value is 1.

**Bit 30 – DRIFT** Drift Compensation

Value	Description
0	The USART cannot recover from an important clock drift.
1	The USART can recover from clock drift. The 16X Clock mode must be enabled.

**Bit 29 – ONE** Must Be Set to 1

Bit 29 must always be set to 1 when programming the FLEX\_US\_MAN register.

**Bit 28 – RX\_MPOL** Receiver Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

**Bits 25:24 – RX\_PP[1:0]** Receiver Preamble Pattern detected

The following values assume that RX\_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of '1's.

Value	Name	Description
1	ALL_ZERO	The preamble is composed of '0's.
2	ZERO_ONE	The preamble is composed of '01's.
3	ONE_ZERO	The preamble is composed of '10's.

#### Bits 19:16 – RX\_PL[3:0] Receiver Preamble Length

Value	Description
0	The receiver preamble pattern detection is disabled.
1–15	The detected preamble length is $RX\_PL \times \text{Bit Period}$ .

#### Bit 12 – TX\_MPOL Transmitter Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

#### Bits 9:8 – TX\_PP[1:0] Transmitter Preamble Pattern

The following values assume that TX\_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of '1's.
1	ALL_ZERO	The preamble is composed of '0's.
2	ZERO_ONE	The preamble is composed of '01's.
3	ONE_ZERO	The preamble is composed of '10's.

#### Bits 3:0 – TX\_PL[3:0] Transmitter Preamble Length

Value	Description
0	The transmitter preamble pattern generation is disabled.
1–15	The preamble length is $TX\_PL \times \text{Bit Period}$ .

**58.10.31.USART LIN Mode Register**

**Name:** FLEX\_US\_LINMR  
**Offset:** 0x254  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0xA or 0xB in the [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
							SYNCDIS	PDCM
Access							R/W	R/W
Reset							0	0
Bit	15	14	13	12	11	10	9	8
	DLC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	WKUPTYP	FSDIS	DLM	CHKTYP	CHKDIS	PARDIS	NACT[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 17 – SYNCDIS** Synchronization Disable

Value	Description
0	The synchronization procedure is performed in LIN client node configuration.
1	The synchronization procedure is not performed in LIN client node configuration.

**Bit 16 – PDCM** DMA Mode

Value	Description
0	The LIN mode register FLEX_US_LINMR is not written by the DMA.
1	The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMA.

**Bits 15:8 – DLC[7:0]** Data Length Control

Value	Description
0–255	Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes.

**Bit 7 – WKUPTYP** Wake-up Signal Type

Value	Description
0	Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal.
1	Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal.

**Bit 6 – FSDIS** Frame Slot Mode Disable

Value	Description
0	The Frame Slot mode is enabled.
1	The Frame Slot mode is disabled.

#### Bit 5 – DLM Data Length Mode

Value	Description
0	The response data length is defined by the DLC field of this register.
1	The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR).

#### Bit 4 – CHKTYP Checksum Type

Value	Description
0	LIN 2.0 “enhanced” checksum
1	LIN 1.3 “classic” checksum

#### Bit 3 – CHKDIS Checksum Disable

Value	Description
0	In host node configuration, the checksum is computed and sent automatically. In client node configuration, the checksum is checked automatically.
1	Whatever the node configuration is, the checksum is not computed/sent and it is not checked.

#### Bit 2 – PARDIS Parity Disable

Value	Description
0	In host node configuration, the identifier parity is computed and sent automatically. In host node and client node configuration, the parity is checked automatically.
1	Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.

#### Bits 1:0 – NACT[1:0] LIN Node Action

Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	PUBLISH	The USART transmits the response.
1	SUBSCRIBE	The USART receives the response.
2	IGNORE	The USART does not transmit and does not receive the response.

## 58.10.32.USART LIN Identifier Register

**Name:** FLEX\_US\_LINIR  
**Offset:** 0x258  
**Reset:** 0x00000000  
**Property:** Read/Write

Write is possible only in LIN host node configuration.

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	IDCHR[7:0]							
Access	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R
Reset	0	0	0	0	0	0	0	0

### Bits 7:0 – IDCHR[7:0] Identifier Character

If USART\_MODE = 0xA (host node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART\_MODE = 0xB (client node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

### 58.10.33.USART LIN Baud Rate Register

**Name:** FLEX\_US\_LINBRR  
**Offset:** 0x25C  
**Reset:** 0x00000000  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0xA or 0xB in [USART Mode Register](#).

Returns the baud rate value after the synchronization process completion.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
						LINFP[2:0]

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 18:16 – LINFP[2:0]** Fractional Part after Synchronization

**Bits 15:0 – LINCD[15:0]** Clock Divider after Synchronization

### 58.10.34.USART LON Mode Register

**Name:** FLEX\_US\_LONMR  
**Offset:** 0x260  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	EOFS[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access			LCDS	DMAM	CDTAIL	TCOL	COLDET	COMMT
Reset			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bits 23:16 – EOFS[7:0] End of Frame Condition Size

Value	Description
0–255	Defines the minimum transitionless time for the IP to detect a LON end of frame condition. $t_{eof} = (EOFS+1) \times t_{clock} \times 8 \times (2- OVER)$

#### Bit 5 – LCDS LON Collision Detection Source

Value	Description
0	LON collision detection source is external.
1	LON collision detection source is internal.

#### Bit 4 – DMAM LON DMA Mode

Value	Description
0	The LON data length register FLEX_US_LONDL is not written by the DMA.
1	The LON data length register FLEX_US_LONDL is written by the DMA.

#### Bit 3 – CDTAIL LON Collision Detection on Frame Tail

Value	Description
0	Detect collisions after CRC has been sent but prior end of transmission in LON comm_type = 1 mode.
1	Ignore collisions after CRC has been sent but prior end of transmission in LON comm_type = 1 mode.

#### Bit 2 – TCOL Terminate Frame upon Collision Notification

Value	Description
0	Do not terminate the frame in LON comm_type = 1 mode upon collision detection.
1	Terminate the frame in LON comm_type = 1 mode upon collision detection if possible.

#### Bit 1 – COLDET LON Collision Detection Feature

Value	Description
0	LON collision detection feature disabled.
1	LON collision detection feature enabled.

#### Bit 0 – COMMT LON comm\_type Parameter Value

Value	Description
0	LON comm_type = 1 mode.
1	LON comm_type = 2 mode.

## 58.10.35.USART LON Preamble Register

**Name:** FLEX\_US\_LONPR  
**Offset:** 0x264  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
			LONPL[13:8]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 13:0 – LONPL[13:0] LON Preamble Length

Value	Description
1–16383	LON preamble length in $t_{bit}$ (without byte-sync).

58.10.36.USART LON Data Length Register

**Name:** FLEX\_US\_LONDL  
**Offset:** 0x268  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

Bits 7:0 – LONDL[7:0] LON Data Length

Value	Description
0–255	LON data length is LONDL + 1 byte.

### 58.10.37.USART LON L2HDR Register

**Name:** FLEX\_US\_LONL2HDR  
**Offset:** 0x26C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 7 – PB LON Priority Bit

Value	Description
0	LON priority bit reset.
1	LON priority bit set.

#### Bit 6 – ALTP LON Alternate Path Bit

Value	Description
0	LON alternate path bit reset.
1	LON alternate path bit set.

#### Bits 5:0 – BLI[5:0] LON Backlog Increment

Value	Description
0–63	LON backlog increment to be generated as a result of delivering the LON frame.

58.10.38.USART LON Backlog Register

**Name:** FLEX\_US\_LONBL  
**Offset:** 0x270  
**Reset:** 0x00000000  
**Property:** Read-only

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

Bits 5:0 – LONBL[5:0] LON Node Backlog Value

Value	Description
1–63	LON node backlog value.

### 58.10.39.USART LON Beta1 Tx Register

**Name:** FLEX\_US\_LONB1TX  
**Offset:** 0x274  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	BETA1TX[23:16]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	BETA1TX[15:8]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	BETA1TX[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 23:0 – BETA1TX[23:0] LON Beta1 Length after Transmission

Value	Description
1–16777215	LON beta1 length after transmission in $t_{bit}$ . <b>Note:</b> The configured value must be lower than $2^{18}$ .

## 58.10.40.USART LON Beta1 Rx Register

**Name:** FLEX\_US\_LONB1RX  
**Offset:** 0x278  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	BETA1RX[23:16]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	BETA1RX[15:8]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	BETA1RX[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 23:0 – BETA1RX[23:0] LON Beta1 Length after Reception

Value	Description
1–16777215	LON beta1 length after reception in $t_{bit}$ .
	<b>Note:</b> The configured value must be lower than $2^{18}$ .

58.10.41.USART LON Priority Register

**Name:** FLEX\_US\_LONPRIO  
**Offset:** 0x27C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).  
This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
		NPS[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		PSNB[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bits 14:8 – NPS[6:0] LON Node Priority Slot

Value	Description
0–127	Node priority slot.

Bits 6:0 – PSNB[6:0] LON Priority Slot Number

Value	Description
0–127	Number of priority slots in the LON network configuration.

## 58.10.42.USART LON IDT Tx Register

**Name:** FLEX\_US\_IDTTX  
**Offset:** 0x280  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	IDTTX[23:16]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	IDTTX[15:8]

Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	IDTTX[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:0 – IDTTX[23:0]** LON Indeterminate Time after Transmission (comm\_type = 1 mode only)

Value	Description
0–16777215	LON indeterminate time after transmission in $t_{bit}$ . <b>Note:</b> The configured value must be lower than $2^{18}$ .

### 58.10.43.USART LON IDT Rx Register

**Name:** FLEX\_US\_IDTRX  
**Offset:** 0x284  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:0 – IDTRX[23:0]** LON Indeterminate Time after Reception (comm\_type = 1 mode only)

Value	Description
0–16777215	LON indeterminate time after reception in $t_{bit}$ . <b>Note:</b> The configured value must be lower than $2^{18}$ .

58.10.44.USART IC DIFF Register

**Name:** FLEX\_US\_ICDIFF  
**Offset:** 0x288  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is relevant only if USART\_MODE = 0x9 in the [USART Mode Register](#).

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8

Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

**Bits 3:0 – ICDIFF[3:0]** IC Differentiator Number

**58.10.45.USART Comparison Register**

**Name:** FLEX\_US\_CMPR  
**Offset:** 0x290  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [USART Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
								VAL2[8]
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16
	VAL2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		CMPPAR	CMPMODE[1:0]					VAL1[8]
Access		R/W	R/W	R/W				R/W
Reset		0	0	0				0

Bit	7	6	5	4	3	2	1	0
	VAL1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 24:16 – VAL2[8:0] Second Comparison Value for Received Character**

Value	Description
0–511	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag.

**Bit 14 – CMPPAR Compare Parity**

Value	Description
0	The parity is not checked and a bad parity cannot prevent from waking up the system.
1	The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed.

**Bits 13:12 – CMPMODE[1:0] Comparison Mode**

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.
1	START_CONDITION	Comparison condition must be met to start reception.
2	FILTER	Comparison must be met to receive the current data only

**Bits 8:0 – VAL1[8:0] First Comparison Value for Received Character**

Value	Description
0–511	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag.

**58.10.46.USART FIFO Mode Register**

**Name:** FLEX\_US\_FMR  
**Offset:** 0x2A0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register reads '0' if the FIFO is disabled (see FLEX\_US\_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
			RXFTHRES2[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FRTSC		RXRDYM[1:0]				TXRDYM[1:0]	
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0

**Bits 29:24 – RXFTHRES2[5:0] Receive FIFO Threshold 2**

Value	Description
0–16	Defines the Receive FIFO threshold 2 value (number of bytes). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from “above” threshold state to “equal to or below” threshold state.

**Bits 21:16 – RXFTHRES[5:0] Receive FIFO Threshold**

Value	Description
0–16	Defines the Receive FIFO threshold value (number of bytes). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state.

**Bits 13:8 – TXFTHRES[5:0] Transmit FIFO Threshold**

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of bytes). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state.

**Bit 7 – FRTSC FIFO RTS Pin Control enable (Hardware Handshaking mode only)**

See [Hardware Handshaking](#) for details.

Value	Description
0	RTS pin is not controlled by Receive FIFO thresholds.
1	RTS pin is controlled by Receive FIFO thresholds.

**Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode**

If FIFOs are enabled, the FLEX\_US\_CSR.RXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	<p>RXRDY will be at level '1' when at least one unread data is in the receive FIFO.</p> <p>When DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 byte must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type must be defined as a byte.</p>
1	TWO_DATA	<p>RXRDY will be at level '1' when at least two unread data are in the receive FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA (chunk size=1 and halfword access).</p> <p>If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).</p>
2	FOUR_DATA	<p>RXRDY will be at level '1' when at least four unread data are in the receive FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).</p>

### Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_US\_CSR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	<p>TXRDY will be at level '1' when at least one data can be written in the transmit FIFO.</p> <p>When DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 byte must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type must be defined as a byte.</p>
1	TWO_DATA	<p>TXRDY will be at level '1' when at least two data can be written in the transmit FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).</p>
2	FOUR_DATA	<p>TXRDY will be at level '1' when at least four data can be written in the transmit FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA (chunk size=1 and word access).</p> <p>If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).</p>

## 58.10.47.USART FIFO Level Register

**Name:** FLEX\_US\_FLR  
**Offset:** 0x2A4  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_US\_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			RXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–16	Indicates the number of unread data in the Receive FIFO.

### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–16	Indicates the number of data in the Transmit FIFO.

## 58.10.48.USART FIFO Interrupt Enable Register

**Name:** FLEX\_US\_FIER  
**Offset:** 0x2A8  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24

**Bit 5 – RXFTHF** RXFTHF Interrupt Mask

**Bit 4 – RXFFF** RXFFF Interrupt Mask

**Bit 3 – RXFEF** RXFEF Interrupt Mask

**Bit 2 – TXFTHF** TXFTHF Interrupt Mask

**Bit 1 – TXFFF** TXFFF Interrupt Mask

**Bit 0 – TXFEF** TXFEF Interrupt Mask

## 58.10.51.USART FIFO Event Status Register

**Name:** FLEX\_US\_FESR  
**Offset:** 0x2B4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access							RXFTHF2	TXFLOCK
Reset							0	0
Bit	7	6	5	4	3	2	1	0
Access	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEEF	TXFTHF	TXFFF	TXFEF
Reset	0	0	0	0	0	0	0	0

**Bit 9 – RXFTHF2** Receive FIFO Threshold Flag 2 (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is above RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued.

**Bit 8 – TXFLOCK** Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

**Bit 7 – RXFPTEF** Receive FIFO Underflow Error Flag  
See [FIFO Overflow/Underflow Error](#) for details.

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

**Bit 6 – TXFPTEF** Transmit FIFO Overflow Error Flag  
See [FIFO Overflow/Underflow Error](#) for details.

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued.

**Bit 4 – RXFFF** Receive FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last RSTSTA command was issued.

**Bit 3 – RXFEF** Receive FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last RSTSTA command was issued.

**Bit 2 – TXFTHF** Transmit FIFO Threshold Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued.

**Bit 1 – TXFFF** Transmit FIFO Full Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last RSTSTA command was issued.

**Bit 0 – TXFEF** Transmit FIFO Empty Flag (cleared by writing the FLEX\_US\_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last RSTSTA command was issued.

## 58.10.52.USART Write Protection Mode Register

**Name:** FLEX\_US\_WPMR  
**Offset:** 0x2E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x555341	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

### Bit 2 – WPCREN Write Protection Control Enable

See [USART Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x555341 ("USA" in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x555341 ("USA" in ASCII).

### Bit 1 – WPITEN Write Protection Interrupt Enable

See [USART Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x555341 ("USA" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x555341 ("USA" in ASCII).

### Bit 0 – WPEN Write Protection Enable

See [USART Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 ("USA" in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 ("USA" in ASCII).

### 58.10.53.USART Write Protection Status Register

**Name:** FLEX\_US\_WPSR  
**Offset:** 0x2E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

#### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of FLEX_US_WPSR.
1	A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 58.10.54.SPI Control Register

**Name:** FLEX\_SPI\_CR  
**Offset:** 0x400  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [SPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	FIFODIS	FIFOEN						LASTXFER
Access	W	W						W
Reset	–	–						–

Bit	23	22	21	20	19	18	17	16
							RXFCLR	TXFCLR
Access							W	W
Reset							–	–

Bit	15	14	13	12	11	10	9	8
				REQCLR				
Access				W				
Reset				–				

Bit	7	6	5	4	3	2	1	0
	SWRST						SPIDIS	SPIEN
Access	W						W	W
Reset	–						–	–

### Bit 31 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs

### Bit 30 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs

### Bit 24 – LASTXFER Last Transfer

See [Peripheral Selection](#) for more details.

Value	Description
0	No effect.
1	The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

### Bit 17 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

#### Bit 16 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

#### Bit 12 – REQCLR Request to Clear the Comparison Trigger

Value	Description
0	No effect.
1	Restarts the comparison trigger to enable FLEX_SPI_RDR.

#### Bit 7 – SWRST SPI Software Reset

The SPI is in Client mode after software reset.

Value	Description
0	No effect.
1	Resets the SPI. A software-triggered hardware reset of the SPI interface is performed.

#### Bit 1 – SPIDIS SPI Disable

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX\_US\_THR is loaded. All pins are set to Input mode after completion of the transmission in progress, if any.

Value	Description
0	No effect.
1	Disables the SPI.

#### Bit 0 – SPIEN SPI Enable

Value	Description
0	No effect.
1	Enables the SPI to transfer and receive data.

**58.10.55.SPI Mode Register**

**Name:** FLEX\_SPI\_MR  
**Offset:** 0x404  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	DLYBCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	PCS[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
				CMPMODE				LSBHALF
Access				R/W				R/W
Reset				0				0
Bit	7	6	5	4	3	2	1	0
	LLB		WDRBT	MODFDIS	BR SRCCLK	PCSDEC	PS	MSTR
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

**Bits 31:24 – DLYBCS[7:0]** Delay Between Chip Selects

This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time ensures chip selects do not overlap and solves bus contentions in case of peripherals having long data float times.

If DLYBCS is  $\leq 6$ , six peripheral clock periods are inserted by default.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BRSRCCLK = 0:  $\text{DLYBCS} = \text{Delay Between Chip Selects} \times f_{\text{peripheral clock}}$   
 If FLEX\_SPI\_MR.BRSRCCLK = 1:  $\text{DLYBCS} = \text{Delay Between Chip Selects} \times f_{\text{GCLK}}$

**Bits 19:16 – PCS[3:0]** Peripheral Chip Select

This field is only used if fixed peripheral select is active (PS = 0).

If PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If PCSDEC = 1:

NPCS[3:0] output signals = PCS

**Bit 12 – CMPMODE** Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.

Value	Name	Description
1	START_CONDITION	Comparison condition must be met to start reception of all incoming characters until REQCLR is set.

#### Bit 8 – LSBHALF Last Bit Half Period Compatibility

Value	Description
0	Normal SPI mode of operation: all bits have a 1-bit time duration (standard SPI mode)
1	Compatibility mode when connected to an SPI client having only a half bit period duration time for the last bit of the frame (non-standard SPI mode)

#### Bit 7 – LLB Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Host mode only (MISO is internally connected on MOSI).

Value	Description
0	Local loopback path disabled.
1	Local loopback path enabled.

#### Bit 5 – WDRBT Wait Data Read Before Transfer

Value	Description
0	No Effect. In Host mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state.
1	In Host mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

#### Bit 4 – MODFDIS Mode Fault Detection

Value	Description
0	Mode fault detection is enabled.
1	Mode fault detection is disabled.

#### Bit 3 – BRSRCCLK Bit Rate Source Clock

If the bit BRSRCCLK = 1, the FLEX\_US\_CSRx.SCBR field must be programmed with a value greater than 1.

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

#### Bit 2 – PCSDEC Chip Select Decode

When PCSDEC equals one, up to 15 Chip Select signals can be generated with the four NPCS lines using an external 4- to 16-bit decoder. The Chip Select registers define the characteristics of the 15 chip selects, with the following rules:

FLEX\_SPI\_CSR0 defines peripheral chip select signals 0 to 3.

FLEX\_SPI\_CSR1 defines peripheral chip select signals 4 to 7.

FLEX\_SPI\_CSR2 defines peripheral chip select signals 8 to 11.

FLEX\_SPI\_CSR3 defines peripheral chip select signals 12 to 14.

Value	Description
0	The chip selects are directly connected to a peripheral device.
1	The four NPCS chip select lines are connected to a 4- to 16-bit decoder.

#### Bit 1 – PS Peripheral Select

Value	Description
0	Fixed Peripheral Select
1	Variable Peripheral Select

Bit 0 – MSTR Host/Client Mode

Value	Description
0	SPI is in Client mode.
1	SPI is in Host mode.

## 58.10.56.SPI Receive Data Register (Default Mode)

**Name:** FLEX\_SPI\_RDR (DEFAULT\_MODE)  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN) and FLEX\_SPI\_FMR.RXRDYM = 0, see [SPI Single Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
					PCS[3:0]			
Access					R	R	R	R
Reset					0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RD[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 19:16 – PCS[3:0] Peripheral Chip Select

In Host mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.

**Note:** When using Variable Peripheral Select mode (FLEX\_SPI\_MR.PS = 1), it is mandatory to set the FLEX\_SPI\_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX\_SPI\_RDR.

### Bits 15:0 – RD[15:0] Receive Data

Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

**58.10.57.SPI Receive Data Register (FIFO Multiple Data, 8-bit)****Name:** FLEX\_SPI\_RDR (FIFO\_MULTI\_DATA\_8)**Offset:** 0x408**Reset:** 0x00000000**Property:** Read-only

To read multi-data, the FIFO must be enabled (FLEX\_SPI\_CR.FIFOEN=1) and FLEX\_SPI\_MR.PS=0. The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4), see [SPI Multiple Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
	RD3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RD2[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

	RD0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 0:7, 8:15, 16:23, 24:31 – RDx** Receive Data

First unread data in the Receive FIFO. Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

## 58.10.58.SPI Receive Data Register (FIFO Multiple Data, 16-bit)

**Name:** FLEX\_SPI\_RDR (FIFO\_MULTI\_DATA\_16)  
**Offset:** 0x408  
**Reset:** 0x00000000  
**Property:** Read-only

To read multi-data, the FIFO must be enabled (FLEX\_SPI\_CR.FIFOEN=1) and FLEX\_SPI\_MR.PS=0. The access type (byte, halfword or word) determines the number of data written in a single access (1 or 2), see [SPI Multiple Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
	RD1[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RD1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RD0[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RD0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 0:15, 16:31 – RDx Receive Data

First unread data in the Receive FIFO. Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

## 58.10.59.SPI Transmit Data Register (Default Mode)

**Name:** FLEX\_SPI\_TDR (DEFAULT\_MODE)  
**Offset:** 0x40C  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_SPI\_CR.FIFOEN=1), a byte/halfword access on FLEX\_SPI\_TDR writes one byte/halfword, see [SPI Single Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
								LASTXFER
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
					PCS[3:0]			
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
	TD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	TD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bit 24 – LASTXFER Last Transfer

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

Value	Description
0	No effect.
1	The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

### Bits 19:16 – PCS[3:0] Peripheral Chip Select

This field is only used if variable peripheral select is active (FLEX\_SPI\_MR.PS = 1).

If FLEX\_SPI\_MR.PCSDEC = 0:

PCS = xxx0 NPCS[3:0] = 1110

PCS = xx01 NPCS[3:0] = 1101

PCS = x011 NPCS[3:0] = 1011

PCS = 0111 NPCS[3:0] = 0111

PCS = 1111 forbidden (no peripheral is selected)

(x = don't care)

If FLEX\_SPI\_MR.PCSDEC = 1:

NPCS[3:0] output signals = PCS

### Bits 15:0 – TD[15:0] Transmit Data

Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

## 58.10.60.SPI Transmit Data Register (FIFO Multiple Data, 8- to 16-bit)

**Name:** FLEX\_SPI\_TDR (FIFO\_MULTI\_DATA)

**Offset:** 0x40C

**Reset:** –

**Property:** Write-only

To write multi-data, the FIFO must be enabled (FLEX\_SPI\_CR.FIFOEN=1) and FLEX\_SPI\_MR.PS=0. The access type (byte, halfword or word) determines the number of data written in a single access (1 or 2), see [SPI Single Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24

**Bit 31 – RXFPTEF** Receive FIFO Underflow Error Flag

See [FIFO Overflow/Underflow Error](#) for details.

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

**Bit 30 – TXFPTEF** Transmit FIFO Overflow Error Flag

See [FIFO Overflow/Underflow Error](#) for details.

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

**Bit 29 – RXFTHF** Receive FIFO Threshold Flag

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from "below threshold" to "equal to or above threshold").

**Bit 28 – RXFFF** Receive FIFO Full Flag

This bit reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been filled (changing states from “not full” to “full”).

#### Bit 27 – RXFEF Receive FIFO Empty Flag

This bit reads ‘0’ if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been emptied (changing states from “not empty” to “empty”).

#### Bit 26 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

This bit reads ‘0’ if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR.

#### Bit 25 – TXFFF Transmit FIFO Full Flag (cleared on read)

This bit reads ‘0’ if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	Transmit FIFO is not full or TXFF flag has been cleared.
1	Transmit FIFO has been filled since the last read of FLEX_SPI_SR.

#### Bit 24 – TXFEF Transmit FIFO Empty Flag (cleared on read)

This bit reads ‘0’ if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_SPI_SR.

#### Bit 16 – SPIENS SPI Enable Status

Value	Description
0	SPI is disabled.
1	SPI is enabled.

#### Bit 12 – SFERR Client Mode Frame Error (cleared on read)

Value	Description
0	No frame error has been detected for a client access since the last read of FLEX_SPI_SR.
1	In Client mode, the chip select raised while the character defined in FLEX_SPI_CSR0.BITS was not complete.

#### Bit 11 – CMP Comparison Status (cleared on read)

Value	Description
0	No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR.
1	A received character matched the comparison criteria since the last read of FLEX_SPI_SR.

#### Bit 10 – UNDES Underrun Error Status (Client mode only) (cleared on read)

Value	Description
0	No underrun has been detected since the last read of FLEX_SPI_SR.
1	A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read.

#### Bit 9 – TXEMPTY Transmission Registers Empty (cleared by writing FLEX\_SPI\_TDR)

Value	Description
0	As soon as data is written in FLEX_SPI_TDR.
1	FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay.

**Bit 8 – NSSR** NSS Rising (cleared on read)

Value	Description
0	No rising edge detected on NSS pin since the last read of FLEX_SPI_SR.
1	A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR.

**Bit 3 – OVRES** Overrun Error Status (cleared on read)

An overrun occurs when FLEX\_SPI\_RDR is loaded at least twice from the shift register since the last read of FLEX\_SPI\_RDR.

Value	Description
0	No overrun has been detected since the last read of FLEX_SPI_SR.
1	An overrun has occurred since the last read of FLEX_SPI_SR.

**Bit 2 – MODF** Mode Fault Error (cleared on read)

Value	Description
0	No mode fault has been detected since the last read of FLEX_SPI_SR.
1	A mode fault occurred since the last read of FLEX_SPI_SR.

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing FLEX\_SPI\_TDR)

When FIFOs are disabled:

0: Data has been written to FLEX\_SPI\_TDR and not yet transferred to the internal shift register.

1: The last data written to FLEX\_SPI\_TDR has been transferred to the internal shift register.

TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.

When FIFOs are enabled:

0: Transmit FIFO cannot accept more data.

1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.

TDRE behavior with FIFOs enabled is illustrated in [TXEMPTY, TDRE and RDRF Behavior](#).

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading FLEX\_SPI\_RDR)

When FIFOs are disabled:

0: No data has been received since the last read of FLEX\_SPI\_RDR.

1: Data has been received and the received data has been transferred from the internal shift register to FLEX\_SPI\_RDR since the last read of FLEX\_SPI\_RDR.

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RDRF behavior with FIFOs enabled is illustrated in [TXEMPTY, TDRE and RDRF Behavior](#).

**58.10.62.SPI Interrupt Enable Register**

**Name:** FLEX\_SPI\_IER  
**Offset:** 0x414  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [SPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

**Bit 1 – TDRE** SPI Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

## 58.10.65.SPI Chip Select Register

**Name:** FLEX\_SPI\_CSRx  
**Offset:** 0x0430 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

FLEX\_SPI\_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BSRCCLK = 0:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}} / 32$

If FLEX\_SPI\_MR.BSRCCLK = 1:  $DLYBCT = \text{Delay Between Consecutive Transfers} \times f_{\text{GCLK}} / 32$

### Bits 23:16 – DLYBS[7:0] Delay Before SPCK

This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.

When DLYBS = 0, the delay is half the SPCK clock period.

Otherwise, the following equations determine the delay:

If FLEX\_SPI\_MR.BSRCCLK = 0:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{peripheral clock}}$

If FLEX\_SPI\_MR.BSRCCLK = 1:  $DLYBS = \text{Delay Before SPCK} \times f_{\text{GCLK}}$

### Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate

In Host mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BSRCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:

If FLEX\_SPI\_MR.BSRCCLK = 0:  $SCBR = f_{\text{peripheral clock}} / \text{SPCK Bit Rate}$

If FLEX\_SPI\_MR.BSRCCLK = 1:  $SCBR = f_{\text{GCLK}} / \text{SPCK Bit Rate}$

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.

If BRSRCCLK = 1 in FLEX\_SPI\_MR, SCBR must be programmed with a value greater than 1.

At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.

**Note:** If one of the FLEX\_SPI\_CSRx.SCBR fields is set to 1, the other FLEX\_SPI\_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

#### Bits 7:4 – BITS[3:0] Bits Per Transfer

See [Note](#).

The BITS field determines the number of data bits transferred. Reserved values should not be used.

Value	Name	Description
0	8_BIT	8 bits for transfer
1	9_BIT	9 bits for transfer
2	10_BIT	10 bits for transfer
3	11_BIT	11 bits for transfer
4	12_BIT	12 bits for transfer
5	13_BIT	13 bits for transfer
6	14_BIT	14 bits for transfer
7	15_BIT	15 bits for transfer
8	16_BIT	16 bits for transfer
9–15	Reserved	

#### Bit 3 – CSAAT Chip Select Active After Transfer

Value	Description
0	The Peripheral Chip Select Line rises as soon as the last transfer is achieved.
1	The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select.

#### Bit 2 – CSNAAT Chip Select Not Active After Transfer (Ignored if CSAAT = 1)

If FLEX\_SPI\_MR.BSRCCLK = 0:  $\frac{DLYBCS}{f_{\text{peripheral clock}}}$  (if DLYBCS ≠ 0)

If FLEX\_SPI\_MR.BSRCCLK = 1:  $\frac{DLYBCS}{f_{GCLK}}$

If DLYBCS < 6, a minimum of six periods is introduced.

Value	Description
0	The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select.
1	The Peripheral Chip Select rises systematically after each transfer performed on the same client. It remains inactive after the end of transfer for a minimal duration of:

#### Bit 1 – NCPHA Clock Phase

NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between host and client devices.

Value	Description
0	Data are changed on the leading edge of SPCK and captured on the following edge of SPCK.
1	Data are captured on the leading edge of SPCK and changed on the following edge of SPCK.

#### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between host and client devices.

Value	Description
0	The inactive state value of SPCK is logic level zero.
1	The inactive state value of SPCK is logic level one.

**58.10.66.SPI FIFO Mode Register**

**Name:** FLEX\_SPI\_FMR  
**Offset:** 0x440  
**Reset:** 0x00000000  
**Property:** Read/Write

This register reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO)

Bit	31	30	29	28	27	26	25	24
			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			RXRDYM[1:0]				TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

**Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold**

Value	Description
0–16	Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state.

**Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold**

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state.

**Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode**

If FIFOs are enabled, the FLEX\_SPI\_SR.RDRF flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RDRF will be at level '1' when at least one unread data is in the receive FIFO.  When DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 byte must be configured in the DMA.  When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 1 halfword must be configured in the DMA.  If the transfer is performed by software, the access type can be defined as byte or halfword depending on FLEX_SPI_CSR0.BITS.

Value	Name	Description
1	TWO_DATA	<p>RDRF will be at level '1' when at least two unread data are in the receive FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. When FLEX_SPI_CSR0.BITS&gt;0 (9 to 16 bits transferred on SPI line), the chunk of 1 word (1 word carries 2 halfwords) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type can be defined as halfword (2 bytes per access, 1 access when FLEX_SPI_CSR0.BITS=0), or word (2 halfwords per access, 2 accesses when FLEX_SPI_CSR0.BITS&gt;0).</p>
2	FOUR_DATA	<p>RDRF will be at level '1' when at least four unread data are in the receive FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 word (1 halfword carries 4 bytes) must be configured in the DMA. When FLEX_SPI_CSR0.BITS&gt;0 (9 to 16 bits transferred on SPI line), the chunk of 2 words (1 word carries 4 bytes) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type can be defined as word (4 bytes per access, 1 access when FLEX_SPI_CSR0.BITS=0 or 2 halfwords per access, 2 accesses when FLEX_SPI_CSR0.BITS&gt;0).</p>

### Bits 1:0 – TXRDYM[1:0] Transmit Data Register Empty Mode

If FIFOs are enabled, the FLEX\_SPI\_SR.TDRE flag behaves as follows.

Value	Name	Description
0	ONE_DATA	<p>TDRE will be at level '1' when at least one data can be written in the transmit FIFO.</p> <p>When DMA is enabled to transfer data, the chunk of 1 data (byte or halfword) must be configured in the DMA depending on FLEX_SPI_CSR0.BITS.</p> <p>If the transfer is performed by software, the access type (byte, halfword) must be defined depending on FLEX_SPI_CSR0.BITS.</p>
1	TWO_DATA	<p>TDRE will be at level '1' when at least two data can be written in the transmit FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 2 data) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type must be defined as word (2 data per access, 1 access).</p>

## 58.10.67.SPI FIFO Level Register

**Name:** FLEX\_SPI\_FLR  
**Offset:** 0x444  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_SPI\_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			RXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access

Bit	7	6	5	4	3	2	1	0
			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–16	Indicates the number of unread data in the Receive FIFO.

### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–16	Indicates the number of data in the Transmit FIFO.

**58.10.68.SPI Comparison Register**

**Name:** FLEX\_SPI\_CMPR  
**Offset:** 0x448  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [SPI Write Protection Mode Register](#).

**Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character**

Value	Description
0–65535	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_SPI_CSR.CMP flag.

**Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character**

Value	Description
0–65535	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_SPI_SR.CMP flag.

## 58.10.69.SPI Write Protection Mode Register

**Name:** FLEX\_SPI\_WPMR  
**Offset:** 0x4E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535049	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

### Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x535049 ("SPI" in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x535049 ("SPI" in ASCII).

### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 ("SPI" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 ("SPI" in ASCII).

### Bit 0 – WPEN Write Protection Enable

See [SPI Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x535049 ("SPI" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x535049 ("SPI" in ASCII).

## 58.10.70.SPI Write Protection Status Register

**Name:** FLEX\_SPI\_WPSR  
**Offset:** 0x4E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protect violation has occurred since the last read of FLEX_SPI_WPSR.
1	A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

**58.10.71.TWI Control Register (Default Mode)****Name:** FLEX\_TWI\_CR (DEFAULT\_MODE)**Offset:** 0x600**Reset:** –**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TWI Write Protection Mode register](#).

Bit	31	30	29	28	27	26	25	24
			FIFODIS	FIFOEN		LOCKCLR		THRCLR

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 29 – FIFODIS** FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs

**Bit 28 – FIFOEN** FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs

**Bit 26 – LOCKCLR** Lock Clear

Value	Description
0	No effect.
1	Clear the TWI FSM lock.

**Bit 24 – THRCLR** Transmit Holding Register Clear

Value	Description
0	No effect.
1	Clear the Transmit Holding register and set TXRDY, TXCOMP flags.

**Bit 19 – SCLRBE** SCL Rise Boost Enable

Value	Description
0	No effect.
1	SCL rise time is boosted in High-Speed mode. Duration of the boost is configured with FLEX_TWI_MMR.SCLRBL. See <a href="#">SCL Rising Time Control</a> for details.

**Bit 18 – SCLRBD** SCL Rise Boost Disable

Value	Description
0	No effect.
1	SCL rise time boost is disabled. See <a href="#">SCL Rising Time Control</a> for details.

**Bit 17 – ACMDIS** Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

**Bit 16 – ACMEN** Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

**Bit 15 – CLEAR** Bus CLEAR Command

When TWD (SDA)=0, the Bus Clear command must be performed via the PIO. When TWCK=0, no Bus Clear command can be issued.

Value	Description
0	No effect.
1	When Host mode is enabled and TWD (SDA)=1, sends a Bus Clear command.

**Bit 14 – PECRQ** PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

**Bit 13 – PECDIS** Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

**Bit 12 – PECEN** Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

**Bit 11 – SMBDIS** SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

**Bit 10 – SMBEN** SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

#### Bit 9 – HSDIS TWI High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

#### Bit 8 – HSEN TWI High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

#### Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

#### Bit 6 – QUICK SMBus Quick Command

Value	Description
0	No effect.
1	If Host mode is enabled, an SMBus Quick Command is sent.

#### Bit 5 – SVDIS TWI Client Mode Disabled

Value	Description
0	No effect.
1	Client mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

#### Bit 4 – SVEN TWI Client Mode Enabled

Switching from Host to Client mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Client mode (SVDIS must be written to 0).

#### Bit 3 – MSDIS TWI Host Mode Disabled

Value	Description
0	No effect.
1	Host mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling.

#### Bit 2 – MSEN TWI Host Mode Enabled

Switching from Client to Host mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Host mode (MSDIS must be written to 0).

#### Bit 1 – STOP Send a STOP Condition

Value	Description
0	No effect.

Value	Description
1	<p>STOP condition is sent just after completing the current byte transmission in Host Read mode.</p> <ul style="list-style-type: none"> <li>– In single data byte host read, both START and STOP must be set.</li> <li>– In multiple data bytes host read, the STOP must be set after the last data received but one.</li> <li>– In Host Read mode, if a NACK bit is received, the STOP is automatically performed.</li> <li>– In host data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li> </ul>

#### Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a client. When configured in Host mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding register (FLEX\_TWI\_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Host Mode register (FLEX_TWI_MMR).

## 58.10.72.TWI Control Register (FIFO\_ENABLED)

**Name:** FLEX\_TWI\_CR (FIFO\_ENABLED)  
**Offset:** 0x600  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN=1), see [TWI Multiple Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24
			FIFODIS	FIFOEN		TXFLCLR	RXFCLR	TXFCLR
Access			W	W		W	W	W
Reset			–	–		–	–	–

Bit	23	22	21	20	19	18	17	16
							ACMDIS	ACMEN
Access							W	W
Reset							–	–

Bit	15	14	13	12	11	10	9	8

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	SWRST	QUICK	SVDIS	SVEN	MSDIS	MSEN	STOP	START
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs.

### Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs.

### Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

### Bit 25 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

### Bit 24 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.

Value	Description
1	Empties the Transmit FIFO.

#### Bit 17 – ACMDIS Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

#### Bit 16 – ACMEN Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

#### Bit 15 – CLEAR Bus CLEAR Command

Value	Description
0	No effect.
1	If Host mode is enabled, send a bus clear command.

#### Bit 14 – PECRQ PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

#### Bit 13 – PECDIS Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

#### Bit 12 – PECEN Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

#### Bit 11 – SMBDIS SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

#### Bit 10 – SMBEN SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

#### Bit 9 – HSDIS TWI High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

#### Bit 8 – HSEN TWI High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

#### Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

#### Bit 6 – QUICK SMBus Quick Command

Value	Description
0	No effect.
1	If Host mode is enabled, a SMBus Quick Command is sent.

#### Bit 5 – SVDIS TWI Client Mode Disabled

Value	Description
0	No effect.
1	Client mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

#### Bit 4 – SVEN TWI Client Mode Enabled

Switching from Host to Client mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Client mode (SVDIS must be written to 0).

#### Bit 3 – MSDIS TWI Host Mode Disabled

Value	Description
0	No effect.
1	Host mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling.

#### Bit 2 – MSEN TWI Host Mode Enabled

Switching from Client to Host mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Host mode (MSDIS must be written to 0).

#### Bit 1 – STOP Send a STOP Condition

Value	Description
0	No effect.
1	<p>STOP condition is sent just after completing the current byte transmission in Host Read mode.</p> <ul style="list-style-type: none"> <li>– In single data byte host read, both START and STOP must be set.</li> <li>– In multiple data bytes host read, the STOP must be set after the last data received but one.</li> <li>– In Host Read mode, if a NACK bit is received, the STOP is automatically performed.</li> <li>– In host data write operation, a STOP condition will be sent after the transmission of the current data is finished.</li> </ul>

**Bit 0 – START** Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a client. When configured in Host mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding register (FLEX\_TWI\_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Host Mode register (FLEX_TWI_MMR).

**58.10.73.TWI Host Mode Register**

**Name:** FLEX\_TWI\_MMR  
**Offset:** 0x604

**Bit 24 – NOAP** No Auto-Stop On NACK Error

Value	Description
0	A stop condition is sent automatically upon Not-Acknowledge error detection.
1	No automatic action is performed upon Not-Acknowledge error detection.

**Bits 22:16 – DADR[6:0]** Device Address

The device address is used to access client devices in Read or Write mode. Those bits are only used in Host mode.

**Bits 14:13 – SCLRBL[1:0]** SCL Rise Boost Level

Number of clock periods during which SCL rise is boosted (meaning line driven to level '1').

**Bit 12 – MREAD** Host Read Direction

Value	Description
0	Host write direction.
1	Host read direction.

**Bits 9:8 – IADRSZ[1:0]** Internal Device Address Size

Value	Name	Description
0	NONE	No internal device address
1	1_BYTE	One-byte internal device address
2	2_BYTE	Two-byte internal device address
3	3_BYTE	Three-byte internal device address

**58.10.74.TWI Client Mode Register**

**Name:** FLEX\_TWI\_SMR  
**Offset:** 0x608  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access		SADR[6:0]

Reset	0	0	0	0	0	0		0

**Bits 22:16 – SADR[6:0] Client Address**

The client device address is used in Client mode in order to be accessed by host devices in Read or Write mode.

SADR must be programmed before enabling Client mode or after a general call. Writes at other times have no effect.

**Bits 14:8 – MASK[6:0] Client Address Mask**

A mask can be applied on the client device address in Client mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.

If the MASK field is set to 0, no mask is applied to the SADR field.

**Bit 7 – SNIFF Client Sniffer Mode**

Value	Description
0	Client Sniffer mode is disabled.
1	Client Sniffer mode is enabled.

**Bit 6 – SCLWSDIS Clock Wait State Disable**

Value	Description
0	No effect.
1	Clock stretching disabled in Client mode, OVRE and UNRE will indicate overrun and underrun.

**Bit 5 – BSEL TWI Bus Selection**

Value	Description
0	TWI analyzes the TWCK and TWD pins from its TWI bus.
1	TWIn analyzes the TWCK and TWD pins of the peripheral TWIn+1 (TWImax analyzes TWI0).

#### Bit 4 – SADAT Client Address Treated as Data

When Client Sniffer Mode is enabled, the client address is always received as data in FLEX\_TWI\_RHR and SADAT has no effect.

Value	Description
0	Client address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception).
1	Client address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon client address reception.

#### Bit 3 – SMHH SMBus Host Header

Value	Description
0	Acknowledge of the SMBus Host Header disabled.
1	Acknowledge of the SMBus Host Header enabled.

#### Bit 2 – SMDA SMBus Default Address

Value	Description
0	Acknowledge of the SMBus Default Address disabled.
1	Acknowledge of the SMBus Default Address enabled.

#### Bit 0 – NACKEN Client Receiver Data Phase NACK Enable

Value	Description
0	Normal value to be returned in the ACK cycle of the data phase in Client Receiver mode.
1	NACK value to be returned in the ACK cycle of the data phase in Client Receiver mode.

## 58.10.75.TWI Internal Address Register

**Name:** FLEX\_TWI\_IADR  
**Offset:** 0x60C

Reset	0	0	0	0	0	0	0	0

**Bits 29:24 – HOLD[5:0]** TWD Hold Time Versus TWCK Falling

If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I2C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of  $(HOLD + 3) \times t_{\text{peripheral clock}}$ .

**Bit 20 – BRSRCCLK** Bit Rate Source Clock

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

**Bits 18:16 – CKDIV[2:0]** Clock Divider

The CKDIV is used to increase both SCL high and low periods.

**Bits 15:8 – CHDIV[7:0]** Clock High Divider

The SCL high period is defined as follows:

If FLEX\_TWI\_FILTR.FILT = 0

- If BRSRCCLK = 0:  $CHDIV = ((t_{\text{high}}/t_{\text{peripheral clock}}) - 3)/2^{\text{CKDIV}}$
- If BRSRCCLK = 1:  $CHDIV = (t_{\text{high}}/t_{\text{ext\_ck}})/2^{\text{CKDIV}}$

If FLEX\_TWI\_FILTR.FILT = 1

- If BRSRCCLK = 0:  $CHDIV = ((t_{\text{high}}/t_{\text{peripheral clock}}) - 3 - (\text{THRES}+1))/2^{\text{CKDIV}}$

- If BRSRCCLK = 1:  $CHDIV = ((t_{high} - (THRES+1) * t_{peripheral\ clock}) / t_{ext\_ck}) / 2^{CKDIV}$

**Bits 7:0 – CLDIV[7:0] Clock Low Divider**

The SCL low period is defined as follows:

If FLEX\_TWI\_FILTR.FILT = 0

- If BRSRCCLK = 0:  $CLDIV = ((t_{low} / t_{peripheral\ clock}) - 3) / 2^{CKDIV}$
- If BRSRCCLK = 1:  $CLDIV = (t_{low} / t_{ext\_ck}) / 2^{CKDIV}$

If FLEX\_TWI\_FILTR.FILT = 1

- If BRSRCCLK = 0:  $CLDIV = ((t_{low} / t_{peripheral\ clock}) - 3 - (THRES+1)) / 2^{CKDIV}$
- If BRSRCCLK = 1:  $CLDIV = ((t_{low} - (THRES+1) * t_{peripheral\ clock}) / t_{ext\_ck}) / 2^{CKDIV}$

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	0	0	1

### Bit 26 – SR Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

### Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is '0'.
1	SDA line sampled value is '1'.

### Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is '0'.
1	SCL line sampled value is '1'.

### Bit 23 – LOCK TWI Lock Due to Frame Errors

Value	Description
0	The TWI is not locked.
1	The TWI is locked due to frame errors (see <a href="#">Handling Errors in Alternative Command</a> and <a href="#">TWI FIFOs</a> ).

### Bit 21 – SMBHMH SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received.
1	A SMBus Host Header Address was received.

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

**Bit 19 – PECERR** PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

**Bit 18 – TOUT** Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

**Bit 16 – MACK** Host Code Acknowledge (cleared on read)  
MACK used in Client mode:

Value	Description
0	No host code has been received.
1	A host code has been received.

**Bit 11 – EOSACC** End Of Client Access (cleared on read)

This bit is only used in Client mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	A client access is being performed.
1	Client Access is finished. End Of Client Access is automatically set as soon as SVACC is reset.

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Client mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

Value	Description
0	The clock is not stretched.
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Host mode.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another host of the TWI bus has won the multi-host arbitration. TXCOMP is set at the same time.

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Host mode:

0: Each data byte has been correctly received by the far-end side TWI client component.

1: A data or address byte has not been acknowledged by the client component. Set at the same time as TXCOMP.

NACK used in Client Read mode:

0: Each data byte has been correctly received by the host.

1: In Read mode, a data byte has not been acknowledged by the host. When NACK is set, the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the host will stop the data transfer or reinitiate it.

Note that in Client Write mode, all data are acknowledged by the TWI.

#### Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

#### Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

#### Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Client mode.

GACC behavior can be seen in figure [Host Performs a General Call](#).

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

#### Bit 4 – SVACC Client Access

This bit is only used in Client mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Host](#), [Write Access Ordered by a Host](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a host has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

#### Bit 3 – SVREAD Client Read

This bit is only used in Client mode. When SVACC is low (no client access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Host](#), [Write Access Ordered by a Host](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	Indicates that a write access is performed by a host.
1	Indicates that a read access is performed by a host.

#### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Host mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Host mode can be seen in figures [Host Write with One Data Byte](#), [Host Write with Multiple Data Bytes](#) and [Host Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Client mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Client mode can be seen in figures [Read Access Ordered by a Host](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### **Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Host mode can be seen in figure [Host Read with Multiple Data Bytes](#).

RXRDY behavior in Client mode can be seen in figures [Write Access Ordered by a Host](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### **Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Host mode:

0: During the length of the current frame.

1: When both the holding register and the internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Host mode can be seen in figures [Host Write with One Byte Internal Address and Multiple Data Bytes](#) and [Host Read with Multiple Data Bytes](#).

TXCOMP used in Client mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Client mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

**58.10.78.TWI Status Register (FIFO ENABLED)**

**Name:** FLEX\_TWI\_SR (FIFO\_ENABLED)  
**Offset:** 0x620  
**Reset:** 0x0300F009  
**Property:** Read-only

If FIFO is enabled (FLEX\_US\_CR.FIFOEN bit), see [TWI Multiple Data Access](#) for details.

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	0	0	1

**Bit 26 – SR** Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

**Bit 25 – SDA** SDA Line Value

Value	Description
0	SDA line sampled value is '0'.
1	SDA line sampled value is '1'.

**Bit 24 – SCL** SCL Line Value

Value	Description
0	SCL line sampled value is '0'.
1	SCL line sampled value is '1'.

**Bit 23 – TXFLOCK** Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

**Bit 21 – SMBHMH** SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received.

Value	Description
1	A SMBus Host Header Address was received.

**Bit 20 – SMBDAM** SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

**Bit 19 – PECERR** PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

**Bit 18 – TOUT** Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

**Bit 16 – MACK** Host Code Acknowledge (cleared on read)  
MACK used in Client mode:

Value	Description
0	No host code has been received.
1	A host code has been received.

**Bit 11 – EOSACC** End Of Client Access (cleared on read)

This bit is only used in Client mode.

EOSACC behavior can be seen in figures [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	A Client Access is being performed.
1	Client Access is finished. End Of Client Access is automatically set as soon as SVACC is reset.

**Bit 10 – SCLWS** Clock Wait State

This bit is only used in Client mode.

SCLWS behavior can be seen in figures [Clock Stretching in Read Mode](#) and [Clock Stretching in Write Mode](#).

Value	Description
0	The clock is not stretched.
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

**Bit 9 – ARBLST** Arbitration Lost (cleared on read)

This bit is only used in Host mode.

Value	Description
0	Arbitration won.
1	Arbitration lost. Another host of the TWI bus has won the multi-host arbitration. TXCOMP is set at the same time.

**Bit 8 – NACK** Not Acknowledged (cleared on read)

NACK used in Host mode:

0: Each data byte has been correctly received by the far-end side TWI client component.

1: A data or address byte has not been acknowledged by the client component. Set at the same time as TXCOMP.

NACK used in Client Read mode:

0: Each data byte has been correctly received by the host.

1: In Read mode, a data byte has not been acknowledged by the host. When NACK is set the user must not fill FLEX\_TWI\_THR even if TXRDY is set, because it means that the host will stop the data transfer or re initiate it.

Note that in Client Write mode all data are acknowledged by the TWI.

#### Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

#### Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

#### Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Client mode.

GACC behavior can be seen in figure [Host Performs a General Call](#).

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

#### Bit 4 – SVACC Client Access

This bit is only used in Client mode.

SVACC behavior can be seen in figures [Read Access Ordered by a Host](#), [Write Access Ordered by a Host](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a host has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

#### Bit 3 – SVREAD Client Read

This bit is only used in Client mode. When SVACC is low (no client access has been detected) SVREAD is irrelevant.

SVREAD behavior can be seen in figures [Read Access Ordered by a Host](#), [Write Access Ordered by a Host](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

Value	Description
0	Indicates that a write access is performed by a host.
1	Indicates that a read access is performed by a host.

#### Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX\_TWI\_THR)

TXRDY used in Host mode:

0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX\_TWI\_THR.

1: As soon as a data byte is transferred from FLEX\_TWI\_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).

TXRDY behavior in Host mode can be seen in figures [Host Write with One Data Byte](#), [Host Write with Multiple Data Bytes](#) and [Host Write with One Byte Internal Address and Multiple Data Bytes](#).

TXRDY used in Client mode:

0: As soon as data is written in FLEX\_TWI\_THR, until this data has been transmitted and acknowledged (ACK or NACK).

1: Indicates that FLEX\_TWI\_THR is empty and that data has been transmitted and acknowledged.

If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX\_TWI\_THR to avoid losing it.

TXRDY behavior in Client mode can be seen in figures [Read Access Ordered by a Host](#), [Clock Stretching in Read Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Transmit FIFO is full and cannot accept more data.

1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.

TXRDY behavior with FIFOs enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### **Bit 1 – RXRDY** Receive Holding Register Ready (cleared when reading FLEX\_TWI\_RHR)

When FIFOs are disabled:

0: No character has been received since the last FLEX\_TWI\_RHR read operation.

1: A byte has been received in FLEX\_TWI\_RHR since the last read.

RXRDY behavior in Host mode can be seen in figure [Host Read with Multiple Data Bytes](#).

RXRDY behavior in Client mode can be seen in figures [Write Access Ordered by a Host](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

When FIFOs are enabled:

0: Receive FIFO is empty; no data to read.

1: At least one unread data is in the Receive FIFO.

RXRDY behavior with FIFO enabled is illustrated in [TXRDY and RXRDY Behavior](#).

#### **Bit 0 – TXCOMP** Transmission Completed (cleared by writing FLEX\_TWI\_THR)

TXCOMP used in Host mode:

0: During the length of the current frame.

1: When both holding register and internal shifter are empty and STOP condition has been sent.

TXCOMP behavior in Host mode can be seen in figures [Host Write with One Byte Internal Address and Multiple Data Bytes](#) and [Host Read with Multiple Data Bytes](#).

TXCOMP used in Client mode:

0: As soon as a Start is detected.

1: After a Stop or a Repeated Start + an address different from SADR is detected.

TXCOMP behavior in Client mode can be seen in figures [Clock Stretching in Read Mode](#), [Clock Stretching in Write Mode](#), [Repeated Start and Reversal from Read Mode to Write Mode](#) and [Repeated Start and Reversal from Write Mode to Read Mode](#).

**58.10.79.TWI Interrupt Enable Register**

**Name:** FLEX\_TWI\_IER  
**Offset:** 0x624  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

58.10.84.TWI Transmit Holding Register (Default Mode)

**Name:** FLEX\_TWI\_THR (DEFAULT\_MODE)  
**Offset:** 0x634  
**Reset:** –  
**Property:** Write-only

If FIFO is enabled (FLEX\_TWI\_CR.FIFOEN=1), a byte access on FLEX\_TWI\_THR reads one data in a single access, see [TWI Single Data Access](#) for details.

Reset					0	0	0	0

### Bits 31:24 – THMAX[7:0] Clock High Maximum Cycles

Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

### Bits 23:16 – TLOWM[7:0] Main System Bus Clock Stretch Maximum Cycles

Value	Description
0	TLOW:MEXT timeout check disabled.
1–255	Clock cycles in main system bus maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT.

### Bits 15:8 – TLOWS[7:0] Client Clock Stretch Maximum Cycles

Value	Description
0	TLOW:SEXT timeout check disabled.
1–255	Clock cycles in client maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT.

### Bits 3:0 – PRESC[3:0] SMBus Clock Prescaler

Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula:  $PRESC = \log(f_{MCK} / f_{Prescaled}) / \log(2) - 1$

58.10.87.TWI High-Speed Register

**Name:** FLEX\_TWI\_HSR  
**Offset:** 0x63C

Reset	0	0	0	0	0	0	0	0

### Bit 25 – NPEC Next PEC Request (SMBus Mode only)

Value	Description
0	The next transfer does not use a PEC byte.
1	The next transfer uses a PEC byte.

### Bit 24 – NDIR Next Transfer Direction

Value	Description
0	Write direction.
1	Read direction.

### Bits 23:16 – NDATAL[7:0] Next Data Length

Value	Description
0	No data to send (see <a href="#">Alternative Command</a> ).
1–255	Number of bytes to send for the next transfer.

### Bit 9 – PEC PEC Request (SMBus Mode only)

Value	Description
0	The transfer does not use a PEC byte.
1	The transfer uses a PEC byte.

### Bit 8 – DIR Transfer Direction

Value	Description
0	Write direction.
1	Read direction.

## Bits 7:0 – DATAL[7:0] Data Length

Value	Description
0	No data to send (see <a href="#">Alternative Command</a> ).
1–255	Number of bytes to send during the transfer.

## 58.10.89.TWI Filter Register

**Name:** FLEX\_TWI\_FILTR  
**Offset:** 0x644  
**Reset:** 0x00000000  
**Property:** Read/Write

### Important:

FILT and THRES are used to configure digital filters on data and clock lines.

In Standard, Fast and Fast Plus modes, the digital filter must be enabled (FILT=1) and a pulse width threshold defined (THRES > 0).

The field THRES must be set according to the peripheral clock to suppress spikes lower than 50 ns. The recommended value is calculated using the formula below:

$$\text{THRES} > 50 \text{ ns} / t_{\text{peripheral\_clock}} (\text{ns})$$

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset						R/W	R/W	R/W
						0	0	0
Bit	7	6	5	4	3	2	1	0
Access							PADFEN	FILT
Reset							R/W	R/W
							0	0

### Bits 10:8 – THRES[2:0] Digital Filter Threshold

Value	Description
0	No filtering applied on TWI inputs.
1–7	Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles.

### Bit 1 – PADFEN PAD Filter Enable

Value	Description
0	PAD analog filter is disabled.
1	PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.)

### Bit 0 – FILT RX Digital Filter

TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

Value	Description
0	No filtering applied on TWI inputs.
1	TWI input filtering is active. (Only in Standard and Fast modes)

**58.10.90.TWI High-Speed Clock Waveform Generator Register**

**Name:** FLEX\_TWI\_HSCWGR  
**Offset:** 0x648  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TWI Write Protection Mode Register](#).

FLEX\_TWI\_HSCWGR is only used in High-Speed Host mode.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access						HSCCKDIV[2:0]

Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	0	0	0	0	0	0	0	0

**Bits 18:16 – HSCCKDIV[2:0] High-Speed Clock Divider**

The CKDIV is used to increase both SCL high and low periods.

**Bits 15:8 – HSCHDIV[7:0] High-Speed Clock High Divider**

The SCL high period is defined as follows:

- If BRSRCCLK = 0: CHDIV =  $((t_{\text{high}}/t_{\text{peripheralclock}}) - 3)/2^{\text{CKDIV}}$
- If BRSRCCLK = 1: CHDIV =  $(t_{\text{high}}/t_{\text{ext\_ck}})/2^{\text{CKDIV}}$

**Bits 7:0 – HSCLDIV[7:0] High-Speed Clock Low Divider**

The SCL low period is defined as follows:

- If BRSRCCLK = 0: CLDIV =  $((t_{\text{low}}/t_{\text{peripheralclock}}) - 3)/2^{\text{CKDIV}}$
- If BRSRCCLK = 1: CLDIV =  $(t_{\text{low}}/t_{\text{ext\_ck}})/2^{\text{CKDIV}}$

**58.10.91.TWI FIFO Mode Register**

**Name:** FLEX\_TWI\_FMR  
**Offset:** 0x650  
**Reset:** 0x00000000  
**Property:** Read/Write

This register reads '0' if the FIFO is disabled (see FLEX\_TWI\_CR to enable/disable the internal FIFO).  
 This register can only be written if the WPEN bit is cleared in the [TWI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RXFTHRES[5:0]							
Access			R/W	R/W	R/W	R/W	R/W	R/W

Bit	23	22	21	20	19	18	17	16
	TXFTHRES[5:0]							
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	RXRDYM[1:0]				TXRDYM[1:0]			
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

**Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold**

Value	Description
0–16	Defines the Receive FIFO threshold value (number of bytes). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from “below” threshold state to “equal to or above” threshold state.

**Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold**

Value	Description
0–16	Defines the Transmit FIFO threshold value (number of bytes). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from “above” threshold state to “equal to or below” threshold state.

**Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode**

If FIFOs are enabled, the FLEX\_TWI\_SR.RXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RXRDY will be at level '1' when at least one unread data is in the receive FIFO.  When DMA is enabled to transfer data the chunk of 1 byte must be configured in the DMA.  If the transfer is performed by software, the access type (byte, halfword) must be defined accordingly.
1	TWO_DATA	RXRDY will be at level '1' when at least two unread data are in the receive FIFO.  To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA.  If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).

Value	Name	Description
2	FOUR_DATA	<p>TXRDY will be at level '1' when at least four unread data are in the receive FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).</p>

#### Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode

If FIFOs are enabled, the FLEX\_TWI\_SR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	<p>TXRDY will be at level '1' when at least one data can be written in the transmit FIFO.</p> <p>When DMA is enabled to transfer data, the chunk of 1 byte must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type must be defined as byte.</p>
1	TWO_DATA	<p>TXRDY will be at level '1' when at least two data can be written in the transmit FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).</p>
2	FOUR_DATA	<p>TXRDY will be at level '1' when at least four data can be written in the transmit FIFO.</p> <p>To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA.</p> <p>If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).</p>

## 58.10.92.TWI FIFO Level Register

**Name:** FLEX\_TWI\_FLR  
**Offset:** 0x654  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_TWI\_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			RXFL[5:0]

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

### Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–16	Indicates the number of unread data in the Receive FIFO.

### Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–16	Indicates the number of data in the Transmit FIFO.

### 58.10.93.TWI FIFO Status Register

**Name:** FLEX\_TWI\_FSR  
**Offset:** 0x660  
**Reset:** 0x00000000  
**Property:** Read-only

This register reads '0' if the FIFO is disabled (see FLEX\_TWI\_CR to enable/disable the internal FIFO)

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 7 – RXFPTEF** Receive FIFO Underflow Error Flag  
See [FIFO Overflow/Underflow Error](#) for details.

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

**Bit 6 – TXFPTEF** Transmit FIFO Overflow Error Flag  
See [FIFO Overflow/Underflow Error](#) for details.

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

**Bit 5 – RXFTHF** Receive FIFO Threshold Flag

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR.

**Bit 4 – RXFFF** Receive FIFO Full Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last read of FLEX_TWI_FSR.

### Bit 3 – RXFEF Receive FIFO Empty Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last read of FLEX_TWI_FSR.

### Bit 2 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR.

### Bit 1 – TXFFF Transmit FIFO Full Flag (cleared on read)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last read of FLEX_TWI_FSR.

### Bit 0 – TXFEF Transmit FIFO Empty Flag (cleared on read)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR.

## 58.10.94.TWI FIFO Interrupt Enable Register

**Name:** FLEX\_TWI\_FIER  
**Offset:** 0x664  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TWI Write Protection Mode Register](#).

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x545749	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

### Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x545749 ("TWI" in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x545749 ("TWI" in ASCII).

### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x545749 ("TWI" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x545749 ("TWI" in ASCII).

### Bit 0 – WPEN Write Protection Enable

See [TWI Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x545749 ("TWI" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x545749 ("TWI" in ASCII).

## 58.10.98.TWI Write Protection Status Register

**Name:** FLEX\_TWI\_WPSR  
**Offset:** 0x6E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	WPVSR[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

### Bits 31:8 – WPVSR[23:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 0 – WPVS Write Protect Violation Status

Value	Description
0	No Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR.
1	A Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 59. Quad Serial Peripheral Interface (QSPI)

### 59.1. Description

The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Host mode.

The QSPI can be used in SPI mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors, or in Serial Memory mode to interface to serial Flash memories.

The QSPI allows the system to execute code directly from a serial Flash memory (XIP) without code shadowing to RAM. The serial Flash memory mapping is seen in the system as other memories such as ROM, SRAM, DRAM, embedded Flash memory, etc.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, in place of larger and more expensive parallel Flash memories.

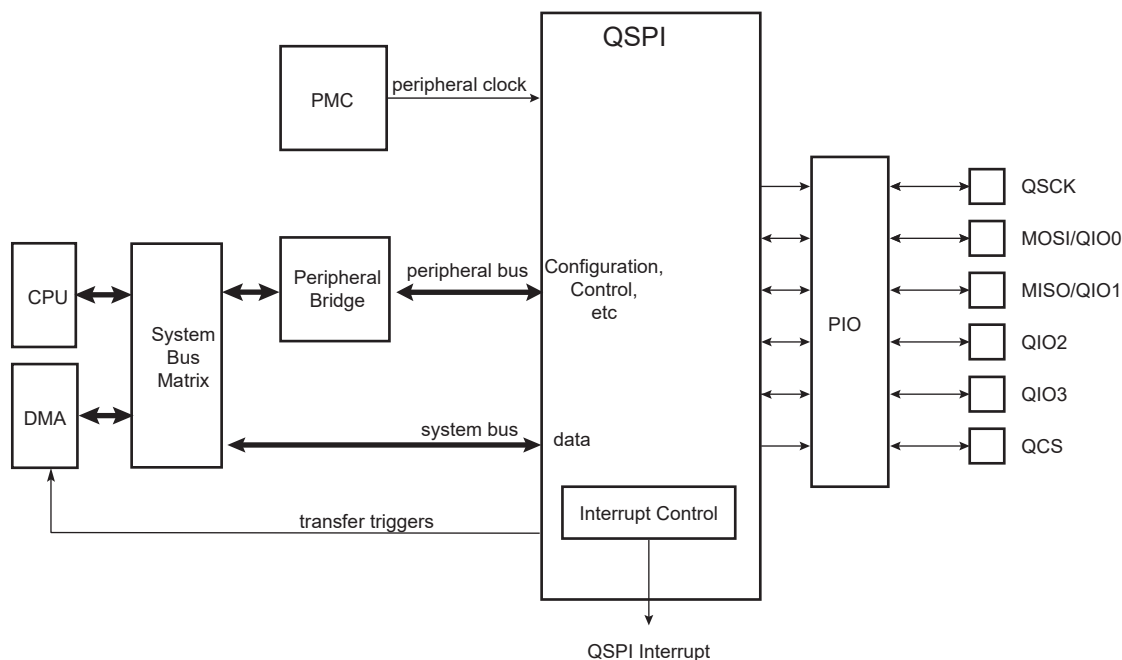

**Note:** Stacked devices with a rollover in the memory address space at each die boundary are not supported.

### 59.2. Embedded Characteristics

- Host SPI Interface
  - Programmable clock phase and clock polarity
  - Programmable transfer delays between consecutive transfers, between clock and data, between deactivation and activation of chip select
- SPI Mode
  - Interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors
  - 8-bit/16-bit/32-bit programmable data length
- Serial Memory Mode
  - Interface to serial Flash memories operating in Single-bit SPI, Dual SPI and Quad SPI
  - Interface to serial Flash Memories operating in Single Data Rate or Double Data Rate Modes
  - Supports “Execute In Place” (XIP)— code execution by the system directly from a serial Flash memory
  - Flexible instruction register for compatibility with all serial Flash memories
  - 32-bit address mode (default is 24-bit address) to support serial Flash memories larger than 128 Mbits
  - Continuous read mode
  - Scrambling/unscrambling “On-The-Fly”
- Connection to DMA Channel Capabilities Optimizes Data Transfers
  - One channel for the receiver, one channel for the transmitter
- Register Write Protection

## 59.3. Block Diagram

Figure 59.1. Block Diagram

## 59.4. Signal Description

Table 59.1. Signal Description

Pin Name	Pin Description	Type
QSCK	Serial Clock	Output
MOSI (QIO0) <sup>(1)(2)</sup>	Data Output (Data Input Output 0)	Output (Input/Output)
MISO (QIO1) <sup>(1)(2)</sup>	Data Input (Data Input Output 1)	Input (Input/Output)
QIO2 <sup>(3)</sup>	Data Input Output 2	Input/Output
QIO3 <sup>(3)</sup>	Data Input Output 3	Input/Output
QCS	Peripheral Chip Select	Output

### Notes:

1. MOSI and MISO are used for single-bit SPI operation.
2. QIO0–QIO1 are used for Dual SPI operation.
3. QIO0–QIO3 are used for Quad SPI operation.

## 59.5. Product Dependencies

### 59.5.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

### 59.5.2. Power Management

The QSPI may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clock.

### 59.5.3. Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

### 59.5.4. Direct Memory Access Controller (DMA)

The QSPI can be used in conjunction with the Direct Memory Access Controller (DMA) in order to reduce processor overhead. For a full description of the DMA, refer to the section “DMA Controller (XDMAC)”.

## 59.6. Functional Description

### 59.6.1. Serial Clock Baud Rate

The QSPI baud rate clock is generated by dividing the peripheral clock by a value between 1 and 256.

### 59.6.2. Serial Clock Phase and Polarity

All combinations of polarity and phase are available when QSPI operates in SPI mode (QSPI\_MR.SMM=0).

In QSPI Serial Memory mode (QSPI\_MR.SMM=1), only Mode 0 is supported.

The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI\_SCR). QSPI\_SCR.CPHA programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of the two parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced client must use the same parameter values to communicate.

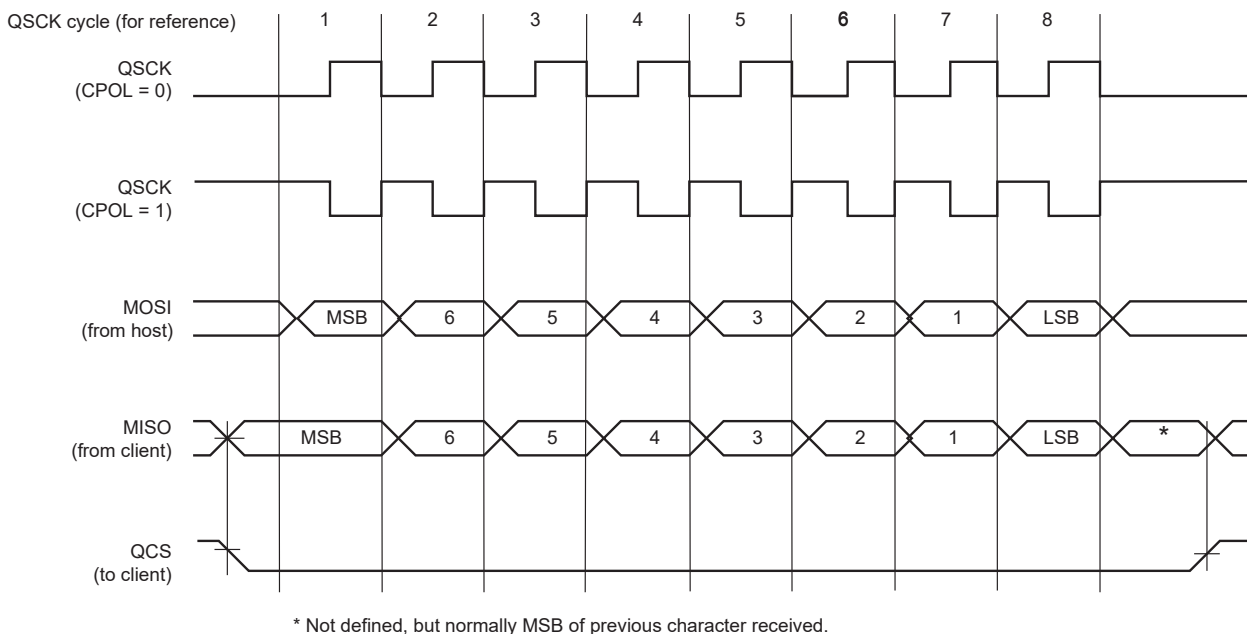

The table below shows the four modes and corresponding parameter settings.

**Table 59.2.** QSPI Bus Clock Modes

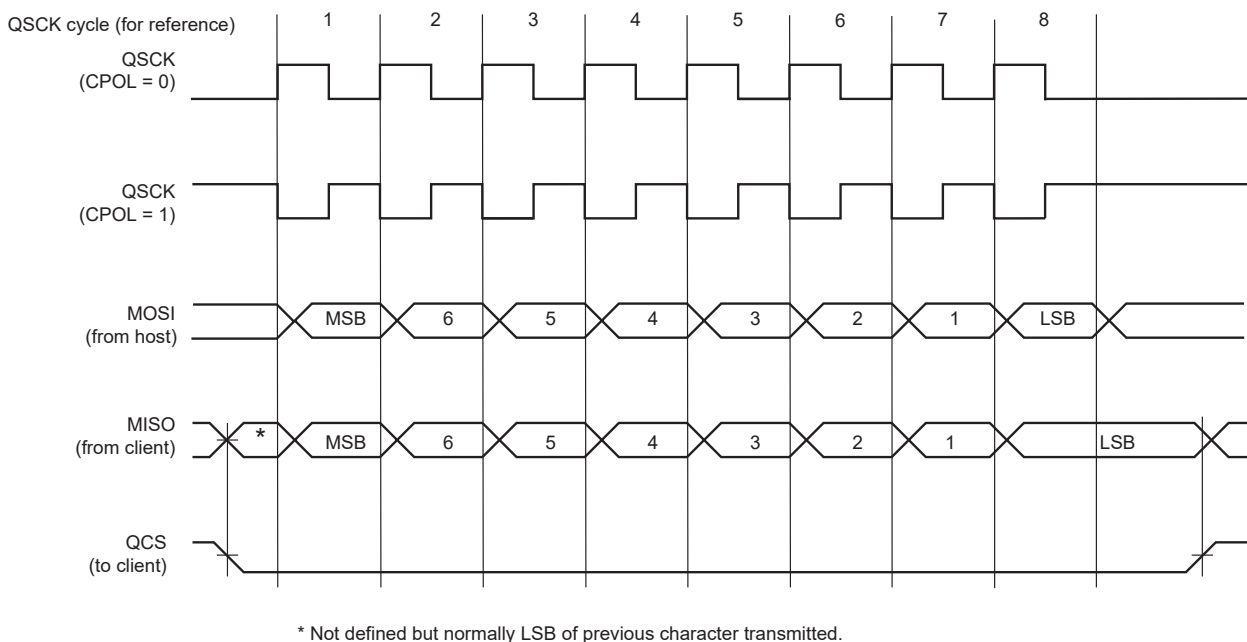

QSPI Clock Mode	QSPI_SCR.CPOL	QSPI_SCR.CPHA	Host Shift QSCK Edge	Client Capture QSCK Edge	QSCK Inactive Level
0 (QSPI, SPI)	0	0	Falling	Falling	Low
1 (SPI)	0	1	Rising	Rising	Low
2 (SPI)	1	0	Rising	Rising	High
3 (SPI)	1	1	Falling	Falling	High

The following figures show examples of data transfers.

**Figure 59.2.** QSPI Transfer Format (QSPI\_SCR.CPHA = 0, 8 bits per transfer), Mode 0 and 2

**Figure 59.3.** QSPI Transfer Format (QSPI\_SCR.CPHA = 1, 8 bits per transfer), Mode 1 and 3

### 59.6.3. Transfer Delays

The figure below shows several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI\_MR.DLYCS. Allows to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI\_SR.DLYBS. Allows the start of QSCK to be delayed after the chip select has been asserted.

- The delay between consecutive transfers, programmed by writing QSPI\_MR.DLYBCT. Allows insertion of a delay between two consecutive transfers. In Serial Memory mode, this delay is not programmable and DLYBCT is ignored. In this mode, DLYBCT must be written to '0'.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

**Figure 59.4.** Programmable Delays

#### 59.6.4. QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI Host.

To activate this mode, QSPI\_MR.SMM must be written to '0' in QSPI\_MR.

##### 59.6.4.1. SPI Mode Operations

The QSPI in standard SPI mode operates on the clock generated by the internal programmable baud rate generator. It fully controls the data transfers to and from the client connected to the SPI bus. The QSPI drives the chip select line to the client (QCS) and the serial clock signal (QSCK).

The QSPI features two holding registers, the Transmit Data register (QSPI\_TDR) and the Receive Data register (QSPI\_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to the QSPI\_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a client receiver only (such as an LCD), the receive status flags in the Status register (QSPI\_SR) can be discarded.

If new data is written in QSPI\_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to the QSPI\_RDR, the data in QSPI\_TDR is loaded in the internal shift register and a new transfer starts.

The transfer of a data written in QSPI\_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in the QSPI\_SR. When new data is written in QSPI\_TDR, this bit is cleared. QSPI\_SR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in the QSPI\_SR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI\_SR.TXEMPTY is set after the completion of this delay. The peripheral clock can be switched off at this time.

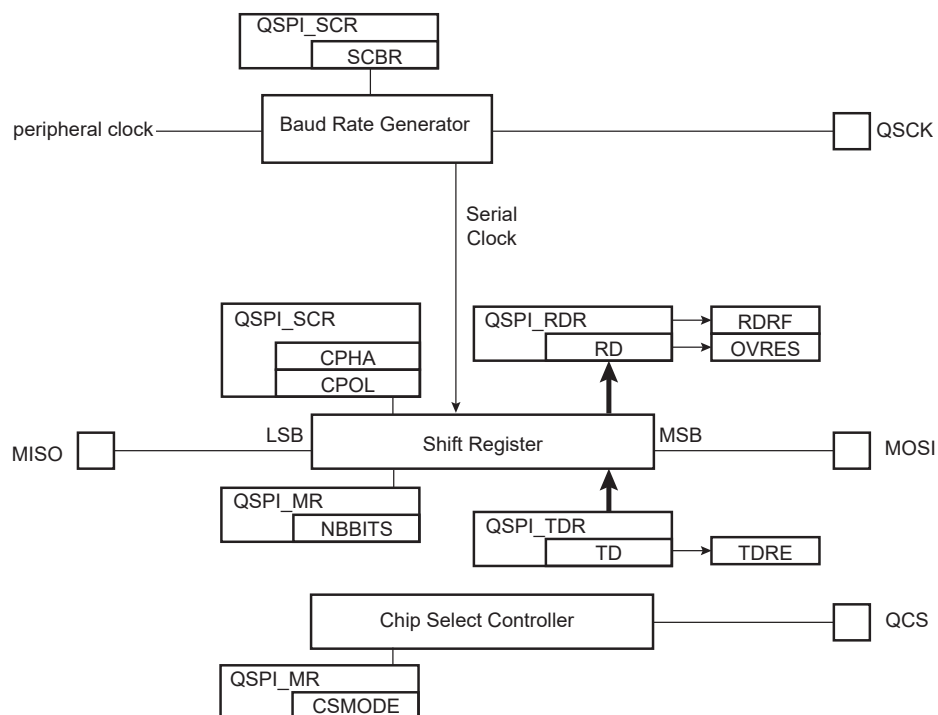

The transfer of received data from the internal shift register in QSPI\_RDR is indicated by the Receive Data Register Full (RDRF) bit in the QSPI\_SR. When the received data is read, QSPI\_SR.RDRF bit is cleared.

If the QSPI\_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI\_SR is set. As long as this flag is set, data is loaded in QSPI\_RDR. The user must read the QSPI\_SR to clear the OVRES bit.

The following figures show, respectively, a block diagram of the SPI when operating in Host mode, and a flow chart describing how transfers are handled.

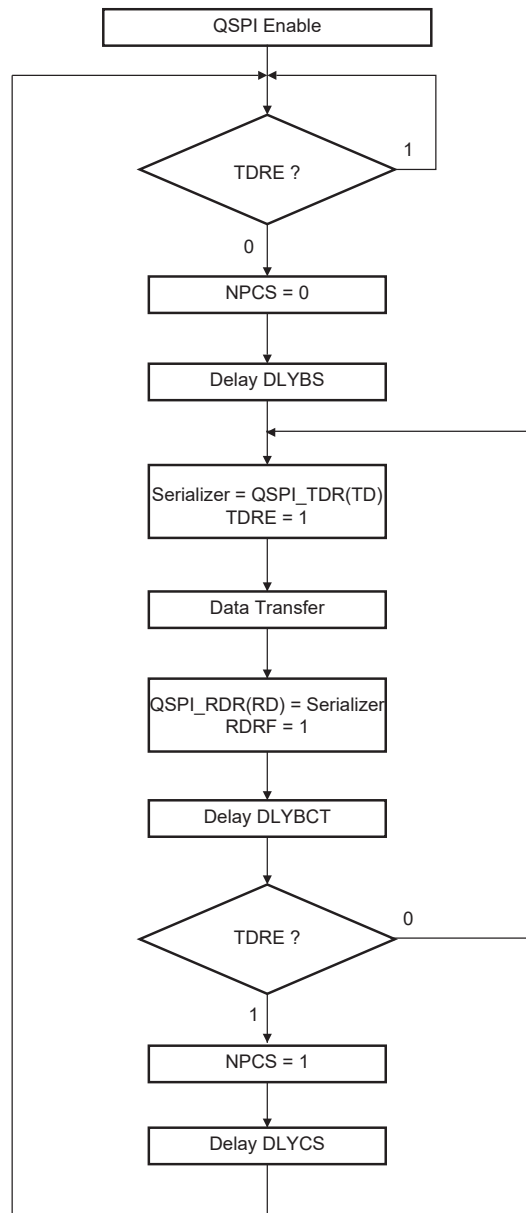

## 59.6.4.2.SPI Mode Block Diagram

Figure 59.5. SPI Mode Block Diagram

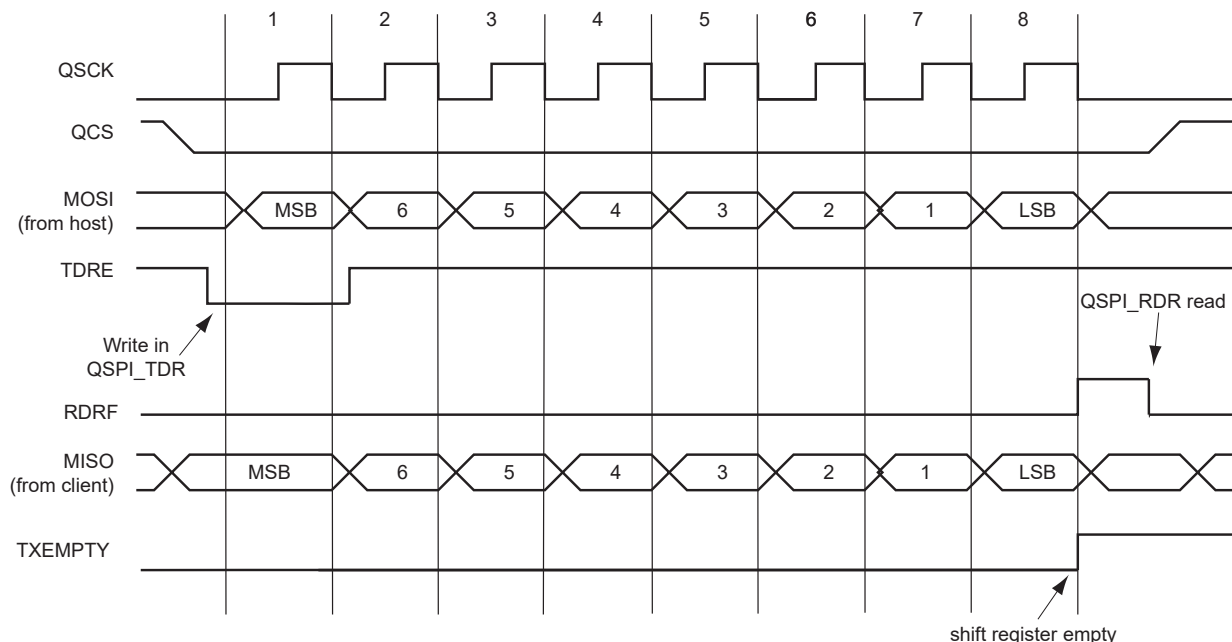

### 59.6.4.3.SPI Mode Flow Diagram

Figure 59.6. SPI Mode Flow Diagram

The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI\_SR during an 8-bit data transfer in Fixed mode, without DMA.

**Figure 59.7.** Status Register Flags Behavior

#### 59.6.4.4. Peripheral Deselection without DMA

During a transfer of more than one data on a Chip Select without the DMA, the QSPI\_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI\_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. Depending on the application software handling the QSPI\_SR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI\_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI\_MR gives even less time for the processor to reload the QSPI\_TDR. With some SPI client peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI\_MR.CSMODE may be configured to '1'. This allows the chip select lines to remain in their current state (low = active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI\_CR). Even if the QSPI\_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI\_CR.LASTXFER must be written to '1' at the same time or after writing the last data to transmit into the QSPI\_TDR.

#### 59.6.4.5. Peripheral Deselection with DMA

When the DMA Controller is used, the Chip Select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading the QSPI\_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI\_MR.CSMODE to '1' may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM, may lengthen the reload time of the QSPI\_TDR by the DMA as well. This means that the QSPI\_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and according to some SPI Client devices, the communication might get lost. It may be necessary to configure QSPI\_MR.CSMODE to '1'.

When QSPI\_MR.CSMODE is configured to '0', the QCS does not rise in all cases between two transfers on the same peripheral. During a transfer on a Chip Select, the flag TDRE rises as soon as the content of the QSPI\_TDR is transferred into the internal shifter. When this flag is detected,

the QSPI\_TDR can be reloaded. If this reload occurs before the end of the current transfer, the Chip Select is not deasserted between the two transfers. This might lead to difficulties for interfacing with some serial peripherals requiring the chip select to be deasserted after each transfer. To facilitate interfacing with such devices, the QSPI\_MR may be configured with QSPI\_MR.CSMODE at '2'.

### 59.6.5. QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XIP execute in place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with single-bit SPI, Dual SPI and Quad SPI protocols.

To activate this mode, QSPI\_MR.SMM must be written to '1'.

In Serial Memory mode, data is transferred either by QSPI\_TDR and QSPI\_RDR or by writing or read in the QSPI memory space (0x70000000) depending on TFRTYP and SMRM configuration.

#### 59.6.5.1. Instruction Frame

In order to control serial Flash memories, the QSPI is able to send instructions via the SPI bus (ex: READ, PROGRAM, ERASE, LOCK, etc.). Because the instruction set implemented in serial Flash memories is memory vendor-dependent, the QSPI includes a complete Instruction Frame register (QSPI\_IFR), which makes it very flexible and compatible with all serial Flash memories.

An instruction frame includes:

- An instruction code (size: 8 bits). The instruction is optional in some cases (see section [Continuous Read mode](#)).
- An address (size: 24 bits or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default the address is 24 bits long, but it can be 32 bits long to support serial Flash memories larger than 128 Mbits (16 Mbytes).
- An option code (size: 1/2/4/8 bits). The option code is not required, but it is useful to activate the XIP mode or the Continuous Read mode (see section [Continuous Read mode](#)) for READ instructions, in some serial Flash memory devices. These modes improve the data read latency.
- Dummy cycles. Dummy cycles are optional but required by some READ instructions.
- Data bytes are optional. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with Single-bit SPI, Dual SPI or Quad SPI protocols.

**Figure 59.8.** Instruction Frame

#### 59.6.5.2. Instruction Frame Transmission

To send an instruction frame, the user must first configure the address to send by writing the field ADDR in the Instruction Address register (QSPI\_IAR). This step is required if the instruction frame

includes an address and no data. When data is present, the address of the instruction is defined by the address of the data accesses in the QSPI memory space, not by QSPI\_IAR.

If the instruction frame includes the instruction code and/or the option code, the user must configure the instruction code and/or the option code to send by writing the fields WRINST, WROPT, RDINST and RDOPT in the Write Instruction Code register (QSPI\_WICR) and the Read Instruction Code register (QSPI\_RICR). QSPI\_WICR configures instruction code and option code for write accesses, and QSPI\_RICR configures instruction code and option code for read accesses. If a frame is without data (QSPI\_IFR.DATAEN = 0), then QSPI\_WICR is used for instruction code and option code.

Then, the user must write QSPI\_IFR to configure the instruction frame depending on which instruction must be sent. If the instruction frame does not include data, writing in this register triggers the send of the instruction frame in the QSPI. If the instruction frame includes data, the send of the instruction frame is triggered by the first data access in the QSPI memory space.

The instruction frame is configured by the following bits and fields of QSPI\_IFR:

- **WIDTH field**—used to configure which data lanes are used to send the instruction code, the address, the option code and to transfer the data. It is possible to use two unidirectional data lanes (MISO-MOSI Single-bit SPI), two bidirectional data lanes (QIO0-QIO1 Dual SPI) or four bidirectional data lanes (QIO0-QIO3 Quad SPI).
- **INSTEN bit**—used to enable the send of an instruction code.
- **ADDREN bit**—used to enable the send of an address after the instruction code.
- **OPTEN bit**—used to enable the send of an option code after the address.
- **DATAEN bit**—used to enable the transfer of data (READ or PROGRAM instruction).
- **OPTL field**—used to configure the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- **ADDRRL bit**—used to configure the address length.
- **TFRTYP field**—used to define which type of data transfer must be performed.
- **DDREN bit**—used to configure the Double Data Rate mode; instruction code is still transmitted in Single Data Rate mode. Instruction code can be transmitted in DDR mode by writing a '1' to QSPI\_IFR.DDRCMDEN.
- **NBDUM field**—used to configure the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are inserted by the serial Flash memory.
- **APBTFRTYP bit**—used to define the APB register transfer to memory type (read or write) when QSPI\_IFR.TFRTYP is written to '0'.
- **DDRCMDEN bit**—used to define if the instruction code must be sent in DDR mode when QSPI\_IFR.DDREN bit is written to '1'.

See [QSPI\\_IFR](#).

If data transfer is enabled, the user can access the serial memory by reading or writing the QSPI memory space:

- To read in the serial memory, but not a memory data, for example a JEDEC-ID or the QSPI\_SR, QSPI\_IFR.TFRTYP must be written to '0'.
- To read in the serial memory, and particularly a memory data, TFRTYP must be written to '1'.
- To write in the serial memory, but not a memory data, for example writing the configuration or the QSPI\_SR, TFRTYP must be written to '0'.

- If the user wants to write in the serial memory in particular to program a memory data, TFRTP must be written to '1'.

If QSPI\_IFR.TFRTP has a value other than '1' and QSPI\_MR.SMRM = 0, the address sent in the instruction frame is the address of the first system bus accesses. The addresses of the next accesses are not used by the QSPI. At each system bus access, an SPI transfer is performed with the same size. For example, a halfword system bus access leads to a 16-bit SPI transfer, and a byte system bus access leads to an 8-bit SPI transfer.

If SMRM = 1 and TFRTP = 0, accesses are made via the QSPI registers and the address sent in the instruction frame is the address defined in QSPI\_IAR.

QSPI\_IFR.APBTFRTP is used to define whether the access is a read access or a write access. Each time QSPI\_IFR is written (in case of read access), or each time QSPI\_TDR is written (in case of write transfer), an SPI transfer is performed with a byte size or halfword size if QSPI\_IFR.WIDTH field is configured to QSPI\_IFR.DDREN=1. Another byte or halfword is read each time QSPI\_RDR is read (flag RDRF shows when a data can be read in QSPI\_RDR) or written each time QSPI\_TDR is written (flag TDRE shows when a new data can be written). The SPI transfer ends by writing QSPI\_CR.LASTXFER.

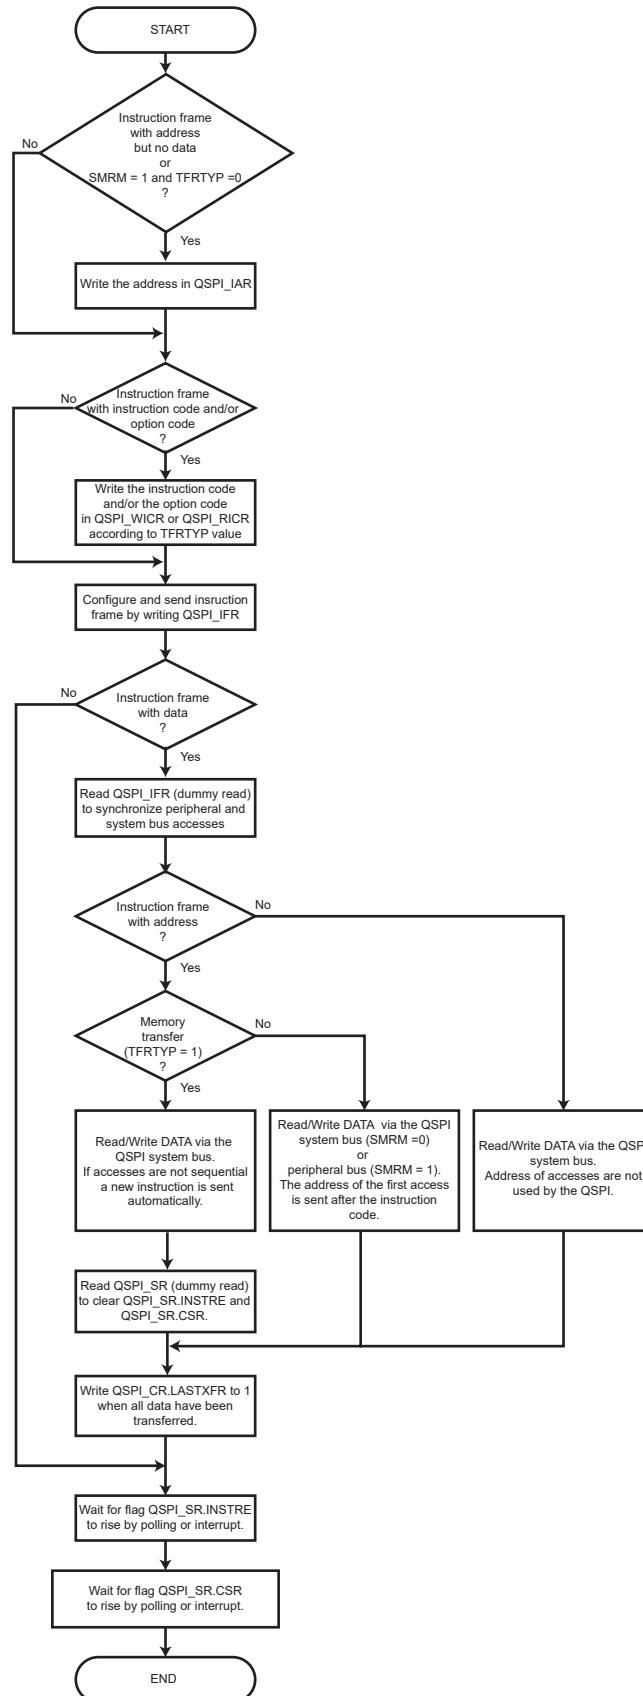

If TFRTP = 1, the address of the first instruction frame is the one of the first read access in the QSPI memory space. Each time the read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the last system bus access address. In this way, the system can read data at a random location in the serial memory. The size of the SPI transfers may differ from the size of the system bus read accesses.

When data transfer is not enabled, the end of the instruction frame is indicated when QSPI\_SR.INSTRE rises. (The QSPI\_SR.CSR flag indicates when chip select rises. A delay between these flags may exist in case of high clock division or a high DLYBCT value).

When data transfer is enabled, the user must indicate when the data transfer is completed in the QSPI memory space by setting QSPI\_CR.LASTXFER. The end of the instruction frame is indicated when QSPI\_SR.INSTRE rises.

The following figure illustrates instruction transmission management.

Figure 59.9. Instruction Transmission Flow Diagram

### 59.6.5.3. Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with QSPI\_IFR.DATAEN = 1 and QSPI\_IFR.TFRTYP = 1.

In this mode, the QSPI is able to read data at random address into the serial Flash memory, allowing the CPU to execute code directly from it (XIP execute-in-place).

In order to fetch data, the user must first configure the instruction frame by writing the QSPI\_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses match the address of the data inside the serial Flash memory.

When Fetch mode is enabled, several instruction frames can be sent before writing QSPI\_CR.LASTXFR. Each time the system bus read accesses become nonsequential (addresses are not consecutive), a new instruction frame is sent with the corresponding address.

### 59.6.5.4. Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.

In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

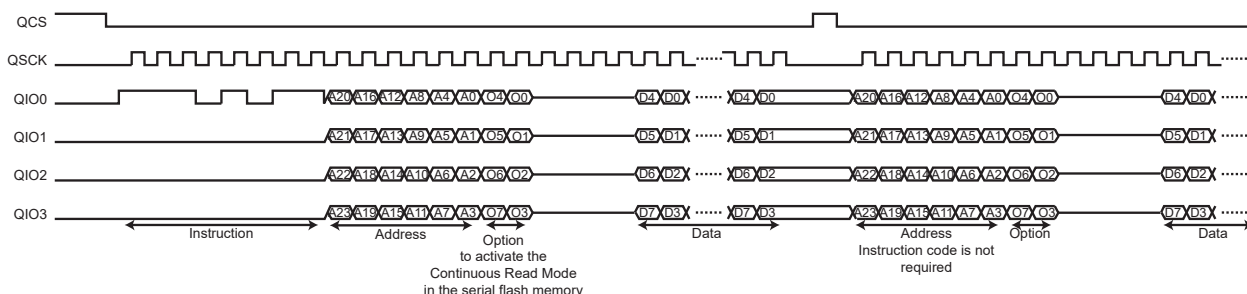

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI\_IFR.TFRTYP = 1). The addresses of the system bus read accesses are often nonsequential and this leads to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to '1' in the QSPI\_IFR (TFRTYP must equal 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

If the Continuous Read mode is not supported by the serial Flash memory or disabled, CRM bit must not be written to '1', otherwise data read out of the serial Flash memory is unpredictable.

Figure 59.10. Continuous Read Mode

### 59.6.5.5. Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI\_SCR.CPOL = 0 and QSPI\_SCR.CPHA = 0; see section [Serial Clock Phase and Polarity](#)).

All system bus accesses described below refer to the system bus address phase. System bus wait cycles and system bus data phases are not shown.

Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000\_00C7 in QSPI\_WICR.
- Write 0x0000\_0010 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.11.** Instruction Transmission Waveform 1

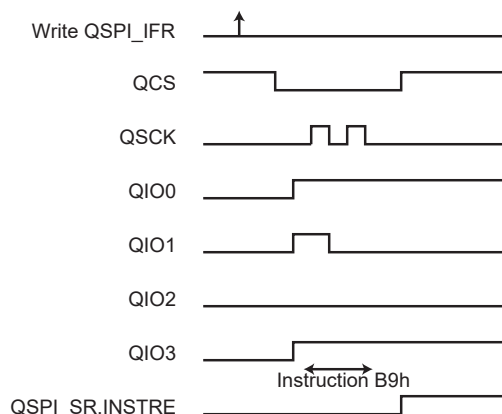

Example 2:

Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000\_00B9 in QSPI\_WICR.
- Write 0x0000\_0016 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.12.** Instruction Transmission Waveform 2

Example 3:

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

Command: BLOCK ERASE (20h)

- Write the address (of the block to erase) in QSPI\_AR.
- Write 0x0000\_0020 in QSPI\_WICR.
- Write 0x0000\_0030 in QSPI\_IFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.13.** Instruction Transmission Waveform 3

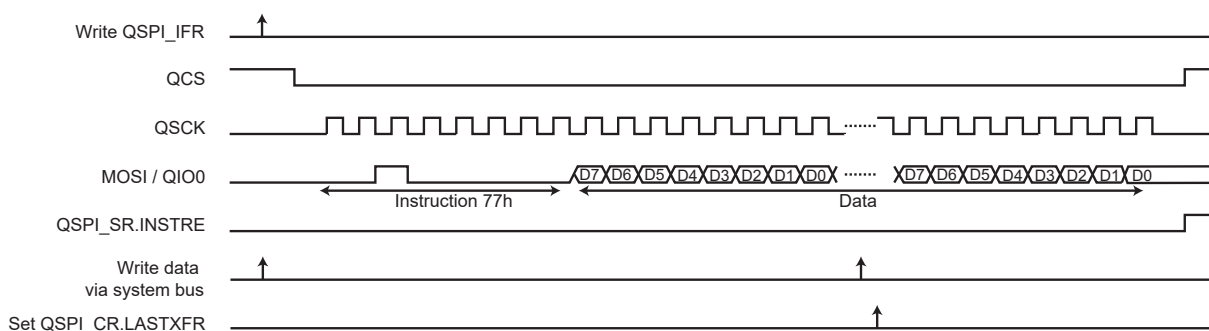

**Example 4:**

Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000\_0077 in QSPI\_WICR.
- Write 0x0000\_0090 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the system bus memory space (0x70000000).  
The address of system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.14.** Instruction Transmission Waveform 4

**Example 5:**

Instruction in Single-bit SPI, with address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000\_0002 in QSPI\_WICR.
- Write 0x0000\_10B3 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Write data in the QSPI system bus memory space (0x70000000).  
The address of the first system bus write access is sent in the instruction frame.  
The address of the next system bus write accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.15. Instruction Transmission Waveform 5**

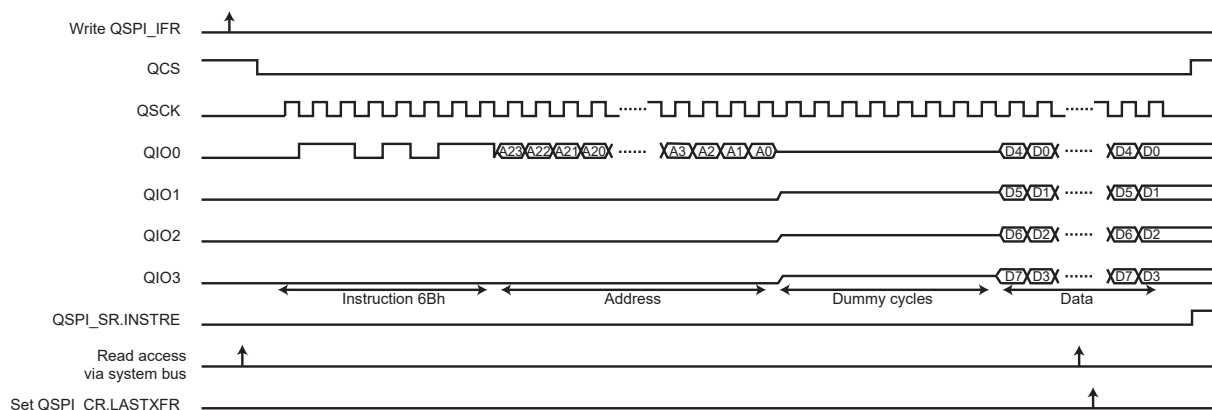

**Example 6:**

Instruction in Single-bit SPI, with address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD\_OUTPUT READ ARRAY (6Bh)

- Write 0x0000\_006B in QSPI\_RICR.
- Write 0x0008\_10B2 in QSPI\_IFR.
- Read QSPI\_IR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x70000000).  
The address of the first system bus read access is sent in the instruction frame.  
The address of the next system bus read accesses is not used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.16. Instruction Transmission Waveform 6**

**Example 7:**

Instruction in Single-bit SPI, with address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles, with fetch and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030\_00EB in QSPI\_RICR.
- Write 0x0004\_33F4 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.

- Read data in the QSPI system bus memory space (0x70000000).  
Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.17. Instruction Transmission Waveform 7**

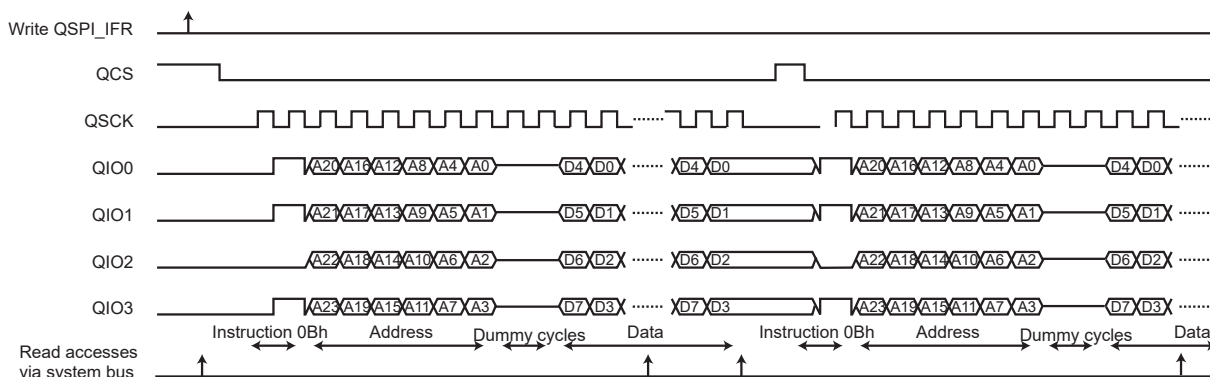

#### Example 8:

Instruction in Quad SPI, with address in Quad SPI, without option, with data read in Quad SPI, with two dummy cycles, with fetch.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000\_000B in QSPI\_RICR.
- Write 0x0002\_20B6 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.
- Read data in the QSPI system bus memory space (0x70000000).  
Fetch is enabled, the address of the system bus read accesses is always used.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.18. Instruction Transmission Waveform 8**

#### Example 9:

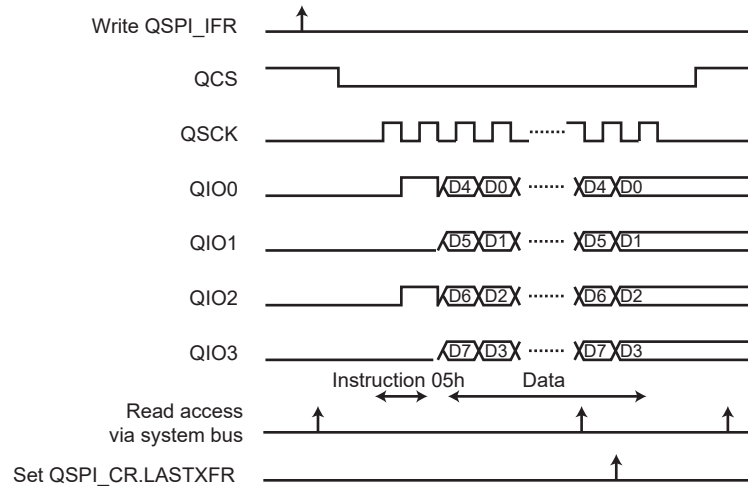

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.

Command: HIGH-SPEED READ (05h)

- Write 0x0000\_0005 in QSPI\_RICR.
- Write 0x0000\_0096 in QSPI\_IFR.
- Read QSPI\_IFR (dummy read) to synchronize system bus accesses.

- Read data in the QSPI system bus memory space (0x70000000). Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.19.** Instruction Transmission Waveform 9

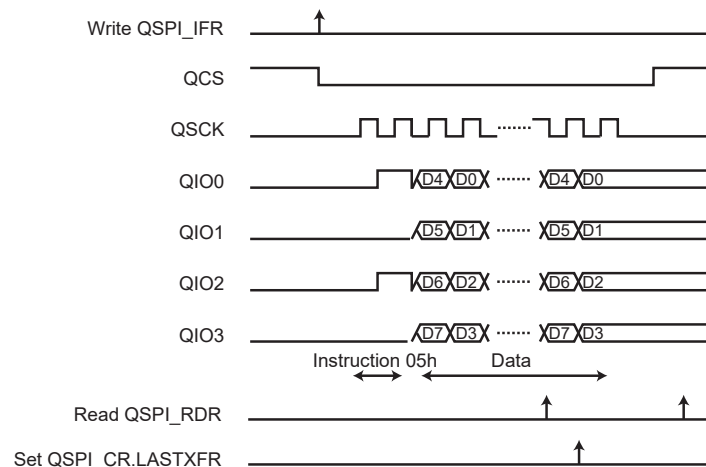

Example 10:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch, read launched through APB interface.

Command: HIGH-SPEED READ (05h)

- Set SMRM to '1' in QSPI\_MR
- Write 0x0000\_0005 in QSPI\_RICR.
- Write 0x0100\_0096 in QSPI\_IFR (will start the transfer).
- Wait flag RDRF and Read data in the QSPI\_RDR register. Fetch is disabled.
- Write a '1' to QSPI\_CR.LASTXFR.
- Wait for QSPI\_SR.INSTRE to rise.

**Figure 59.20.** Instruction Transmission Waveform 10

### 59.6.6. Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories. Data is scrambled when written to memory and unscrambled when data is read.

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI client device (e.g., memory).

The scrambling/unscrambling function can be enabled by writing a '1' to the SCREN bit in the QSPI Scrambling Mode Register (QSPI\_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key Register (QSPI\_SKR). QSPI\_SKR is only accessible in Write mode.

When QSPI\_SMR.SCRKL has been written once to '1', QSPI\_SKR.USRK cannot be written again until the next reset.

If QSPI\_SMR.RVDIS is written to '0', the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI\_SMR.RVDIS is written to '1', the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

#### 59.6.6.1. Clearing Scrambling Keys on a Tamper Event

On a tamper detection event on WKUP pins, an immediate clear of the scrambling key (QSPI\_SKR) is performed if QSPI\_MR.TAMPCLR is set.

### 59.6.7. Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers in the address space can be write-protected by setting the WPEN bit in the QSPI Write Protection Mode Register (QSPI\_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the QSPI Write Protection Status Register (QSPI\_WPSR) is set and the field WPVSR indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading the QSPI\_WPSR.

The following registers can be write-protected when WPEN is set in QSPI\_WPMR:

- [QSPI Mode Register](#)
- [QSPI Serial Clock Register](#)
- [QSPI Scrambling Mode Register](#)
- [QSPI Scrambling Key Register](#)

The following registers can be write-protected when WPCREN is set in QSPI\_WPMR:

- [QSPI Control Register](#)

The following registers can be write-protected when WPITEN is set in QSPI\_WPMR:

- [QSPI Interrupt Enable Register](#)
- [QSPI Interrupt Disable Register](#)

## 59.7. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	QSPI_CR	31:24								LASTXFER
		23:16								
		15:8

### 59.7.1. QSPI Control Register

**Name:** QSPI\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
								LASTXFER
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	SWRST						QSPIDIS	QSPIEN
Access	W						W	W
Reset	–						–	–

#### Bit 24 – LASTXFER Last Transfer

Value	Description
0	No effect.
1	The chip select is deasserted after the character written in QSPI_TDR.TD has been transferred.

#### Bit 7 – SWRST QSPI Software Reset

DMA channels are not affected by software reset.

Value	Description
0	No effect.
1	Reset the QSPI. A software-triggered hardware reset of the QSPI interface is performed.

#### Bit 1 – QSPIDIS QSPI Disable

As soon as QSPIDIS is set, the QSPI finishes its transfer.

All pins are set in Input mode and no data is received or transmitted.

If a transfer is in progress, the transfer is finished before the QSPI is disabled.

If both QSPIEN and QSPIDIS are equal to one when QSPI\_CR is written, the QSPI is disabled.

Value	Description
0	No effect.
1	Disables the QSPI.

#### Bit 0 – QSPIEN QSPI Enable

Value	Description
0	No effect.
1	Enables the QSPI to transfer and receive data.

## 59.7.2. QSPI Mode Register

**Name:** QSPI\_MR  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	DLYCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	DLYBCT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	NBBITS[3:0]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TAMPCLR		CSMODE[1:0]		SMRM	WDRBT		SMM
Access	R/W		R/W	R/W	R/W	R/W		R/W
Reset	0		0	0	0	0		0

### Bits 31:24 – DLYCS[7:0] Minimum Inactive QCS Delay

This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time guarantees the client minimum deselect time.

If DLYCS written to '0', one peripheral clock period is inserted by default.

Otherwise, the following equation determines the delay:

$$\text{DLYCS} = \text{Minimum inactive} \times f_{\text{peripheral clock}}$$

### Bits 23:16 – DLYBCT[7:0] Delay Between Consecutive Transfers

This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.

When DLYBCT is written to '0', no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers. In Serial Memory mode (SMM = 1), DLYBCT must be written to '0' and no delay is inserted.

Otherwise, the following equation determines the delay:

$$\text{DLYBCT} = (\text{Delay Between Consecutive Transfers} \times f_{\text{peripheral clock}}) / 32$$

### Bits 11:8 – NBBITS[3:0] Number Of Bits Per Transfer

NBBITS is used only when SMM is set to '0'.

Value	Name	Description
0	8_BIT	8 bits for transfer
8	16_BIT	16 bits for transfer

### Bit 7 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on QSPI scrambling keys.
1	A tamper detection event immediately clears QSPI scrambling keys.

#### Bits 5:4 – CSMODE[1:0] Chip Select Mode

The CSMODE field determines how the chip select is deasserted

**Note:** This field is forced to LASTXFER when SMM is written to '1'.

Value	Name	Description
0	NOT_RELOADED	The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer.
1	LASTXFER	The chip select is deasserted when the bit LASTXFER is written to '1' and the character written in QSPI_TDR.TD has been transferred.
2	SYSTEMATICALLY	The chip select is deasserted systematically after each transfer.

#### Bit 3 – SMRM Serial Memory Register Mode

Value	Description
0	Serial Memory registers are written via system bus access. See section <a href="#">Instruction Frame Transmission</a> for details.
1	Serial Memory registers are written via peripheral bus (configuration bus) access. See section <a href="#">Instruction Frame Transmission</a> for details.

#### Bit 2 – WDRBT Wait Data Read Before Transfer

0 (DISABLED): No effect. In SPI mode, a transfer can be initiated whatever the state of the QSPI\_RDR is.

1 (ENABLED): In SPI mode, a transfer can start only if the QSPI\_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

#### Bit 0 – SMM Serial Memory Mode

0 (SPI): The QSPI is in SPI mode.

1 (MEMORY): The QSPI is in Serial Memory mode.

### 59.7.3. QSPI Receive Data Register

**Name:** QSPI\_RDR  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	RD[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – RD[15:0] Receive Data

Data received by the QSPI is stored in this register right-justified. Unused bits read zero.

#### 59.7.4. QSPI Transmit Data Register

**Name:** QSPI\_TDR  
**Offset:** 0x0C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	TD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	–

##### Bits 15:0 – TD[15:0] Transmit Data

Data to be transmitted by the QSPI is stored in this register. Information to be transmitted must be written to the Transmit Data register in a right-justified format.

### 59.7.5. QSPI Status Register

**Name:** QSPI\_SR  
**Offset:** 0x10  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								QSPIENS
Access								R
Reset								0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR
Access						R	R	R
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					R	R	R	R
Reset					0	0	0	0

#### Bit 24 – QSPIENS QSPI Enable Status

Value	Description
0	QSPI is disabled.
1	QSPI is enabled.

#### Bit 10 – INSTRE Instruction End Status (cleared on read)

Value	Description
0	No instruction end has been detected since the last read of QSPI_SR.
1	At least one instruction end has been detected since the last read of QSPI_SR.

#### Bit 9 – CSS Chip Select Status

Value	Description
0	The chip select is asserted.
1	The chip select is not asserted.

#### Bit 8 – CSR Chip Select Rise (cleared on read)

Value	Description
0	No chip select rise has been detected since the last read of QSPI_SR.
1	At least one chip select rise has been detected since the last read of QSPI_SR.

#### Bit 3 – OVRES Overrun Error Status (cleared on read)

An overrun occurs when QSPI\_RDR is loaded at least twice from the serializer since the last read of the QSPI\_RDR.

Value	Description
0	No overrun has been detected since the last read of QSPI_SR.
1	At least one overrun error has occurred since the last read of QSPI_SR.

**Bit 2 – TXEMPTY** Transmission Registers Empty (cleared by writing QSPI\_TDR)

Value	Description
0	As soon as data is written in QSPI_TDR.
1	QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay.

**Bit 1 – TDRE** Transmit Data Register Empty (cleared by writing QSPI\_TDR)

TDRE equals zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

Value	Description
0	Data has been written to QSPI_TDR and not yet transferred to the serializer.
1	The last data written in the QSPI_TDR has been transferred to the serializer.

**Bit 0 – RDRF** Receive Data Register Full (cleared by reading QSPI\_RDR)

Value	Description
0	No data has been received since the last read of QSPI_RDR.
1	Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR.

### 59.7.6. QSPI Interrupt Enable Register

**Name:** QSPI\_IER  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [QSPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR
Access						W	W	W
Reset						–	–	–
Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					W	W	W	W
Reset					–	–	–	–

**Bit 10 – INSTRE** Instruction End Interrupt Enable

**Bit 9 – CSS** Chip Select Status Interrupt Enable

**Bit 8 – CSR** Chip Select Rise Interrupt Enable

**Bit 3 – OVRES** Overrun Error Interrupt Enable

**Bit 2 – TXEMPTY** Transmission Registers Empty Enable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Enable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Enable

### 59.7.7. QSPI Interrupt Disable Register

**Name:** QSPI\_IDR  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [QSPI Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR
Access						W	W	W
Reset						–	–	–
Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					W	W	W	W
Reset					–	–	–	–

**Bit 10 – INSTRE** Instruction End Interrupt Disable

**Bit 9 – CSS** Chip Select Status Interrupt Disable

**Bit 8 – CSR** Chip Select Rise Interrupt Disable

**Bit 3 – OVRES** Overrun Error Interrupt Disable

**Bit 2 – TXEMPTY** Transmission Registers Empty Disable

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Disable

**Bit 0 – RDRF** Receive Data Register Full Interrupt Disable

### 59.7.8. QSPI Interrupt Mask Register

**Name:** QSPI\_IMR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						INSTRE	CSS	CSR
Access						R	R	R
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					R	R	R	R
Reset					0	0	0	0

**Bit 10 – INSTRE** Instruction End Interrupt Mask

**Bit 9 – CSS** Chip Select Status Interrupt Mask

**Bit 8 – CSR** Chip Select Rise Interrupt Mask

**Bit 3 – OVRES** Overrun Error Interrupt Mask

**Bit 2 – TXEMPTY** Transmission Registers Empty Mask

**Bit 1 – TDRE** Transmit Data Register Empty Interrupt Mask

**Bit 0 – RDRF** Receive Data Register Full Interrupt Mask

### 59.7.9. QSPI Serial Clock Register

**Name:** QSPI\_SCR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	DLYBS[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	SCBR[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access							CPHA	CPOL
Reset							R/W	R/W
Reset							0	0

#### Bits 23:16 – DLYBS[7:0] Delay Before QSCK

This field defines the delay from QCS valid to the first valid QSCK transition.  
When DLYBS equals zero, the QCS valid to QSCK transition is 1/2 the QSCK clock period.  
Otherwise, the following equation determines the delay:  
$$DLYBS = \text{Delay Before QSCK} \times f_{\text{peripheral clock}}$$

#### Bits 15:8 – SCBR[7:0] Serial Clock Baud Rate

The QSPI uses a modulus counter to derive the QSCK baud rate from the peripheral clock. The baud rate is selected by writing a value from 0 to 255 in the SCBR field. The following equation determines the QSCK baud rate:  
$$SCBR = (f_{\text{peripheral clock}} / \text{QSCK Baudrate}) - 1$$

#### Bit 1 – CPHA Clock Phase

CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between host and client devices.

Value	Description
0	Data is captured on the leading edge of QSCK and changed on the following edge of QSCK.
1	Data is changed on the leading edge of QSCK and captured on the following edge of QSCK (only available in SPI mode, QSPI_MR.SMM=0).

#### Bit 0 – CPOL Clock Polarity

CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between host and client devices.

Value	Description
0	The inactive state value of QSCK is logic level zero.
1	The inactive state value of QSCK is logic level one (only available in SPI mode, QSPI_MR.SMM=0).

## 59.7.10. QSPI Instruction Address Register

**Name:** QSPI\_IAR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ADDR[23:16]

### Bits 31:0 – ADDR[31:0] Address

Address to send to the serial Flash memory in the instruction frame.

### 59.7.11. QSPI Write Instruction Code Register

**Name:** QSPI\_WICR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	WROPT[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – WROPT[7:0]** Write Option Code  
Option code to send to the serial Flash memory in case of write transfer.

**Bits 7:0 – WRINST[7:0]** Write Instruction Code  
Instruction code to send to the serial Flash memory in case of write transfer.

## 59.7.12. QSPI Instruction Frame Register

**Name:** QSPI\_IFR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
						DDRCMDEN		APBTFRTYP
Access						R/W		R/W
Reset						0		0

Bit	23	22	21	20	19	18	17	16
				NBDUM[4:0]				
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	DDREN	CRM		TFRTYP		ADDRL	OPTL[1:0]	
Access	R/W	R/W		R/W		R/W	R/W	R/W
Reset	0	0		0		0	0	0

Bit	7	6	5	4	3	2	1	0
	DATAEN	OPTEN	ADDREN	INSTEN		WIDTH[2:0]		
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

### Bit 26 – DDRCMDEN DDR Mode Command Enable

0 (DISABLED): Transfer of instruction field is performed in Single Data Rate mode even if DDREN bit is written to '1'.

1 (ENABLED): Transfer of instruction field is performed in Double Data Rate mode if DDREN bit is written to '1'. If DDREN bit is written to '0', the instruction field is sent in Single Data Rate mode.

### Bit 24 – APBTFRTYP APB Transfer Type

Value	Description
0	APB register transfer to the memory is a write transfer. Useful when TRFTYP is written to '0' and SMRM to '1'.
1	APB register transfer to the memory is a read transfer. Useful when TRFTYP is written to '0' and SMRM to '1'.

### Bits 20:16 – NBDUM[4:0] Number Of Dummy Cycles

The NBDUM field defines the number of dummy cycles required by the serial Flash memory before data transfer.

### Bit 15 – DDREN DDR Mode Enable

0 (DISABLED): Transfers are performed in Single Data Rate mode.

1 (ENABLED): Transfers are performed in Double Data Rate mode, whereas the instruction field is still transferred in Single Data Rate mode.

**Note:** The DDRCMDEN bit defines how the instruction field is sent when Double Data Rate mode is enabled. If DDRCMDEN bit is at '0', the instruction field is sent in Single Data Rate mode.

### Bit 14 – CRM Continuous Read Mode

0 (DISABLED): Continuous Read mode is disabled.

1 (ENABLED): Continuous Read mode is enabled.

**Bit 12 – TFR\_TYP** Data Transfer Type

Value	Name	Description
0	TRSF_REGISTER	Read/Write transfer from the serial memory. Scrambling is not performed. Read at random location (fetch) in the serial Flash memory is not possible.
1	TRSF_MEMORY	Read/Write data transfer from the serial memory. If enabled, scrambling is performed. Read at random location (fetch) in the serial Flash memory is possible.

**Bit 10 – ADDR\_L** Address Length

The ADDR\_L bit determines the length of the address.

0 (24\_BIT): The address is 24 bits long.

1 (32\_BIT): The address is 32 bits long.

**Bits 9:8 – OPT\_L[1:0]** Option Code Length

The OPT\_L field determines the length of the option code. The value written in OPT\_L must be consistent with the value written in the field WIDTH. For example, OPT\_L = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).

Value	Name	Description
0	OPTION_1BIT	The option code is 1 bit long.
1	OPTION_2BIT	The option code is 2 bits long.
2	OPTION_4BIT	The option code is 4 bits long.
3	OPTION_8BIT	The option code is 8 bits long.

**Bit 7 – DATA\_EN** Data Enable

Value	Description
0	No data is sent/received to/from the serial Flash memory.
1	Data is sent/received to/from the serial Flash memory.

**Bit 6 – OPT\_EN** Option Enable

Value	Description
0	The option is not sent to the serial Flash memory.
1	The option is sent to the serial Flash memory.

**Bit 5 – ADDR\_EN** Address Enable

Value	Description
0	The transfer address is not sent to the serial Flash memory.
1	The transfer address is sent to the serial Flash memory.

**Bit 4 – INST\_EN** Instruction Enable

Value	Description
0	The instruction is not sent to the serial Flash memory.
1	The instruction is sent to the serial Flash memory.

**Bits 2:0 – WIDTH[2:0]** Width of Instruction Code, Address, Option Code and Data

Value	Name	Description
0	SINGLE_BIT_SPI	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI
1	DUAL_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Dual SPI
2	QUAD_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Quad SPI
3	DUAL_IO	Instruction: Single-bit SPI / Address-Option: Dual SPI / Data: Dual SPI
4	QUAD_IO	Instruction: Single-bit SPI / Address-Option: Quad SPI / Data: Quad SPI
5	DUAL_CMD	Instruction: Dual SPI / Address-Option: Dual SPI / Data: Dual SPI
6	QUAD_CMD	Instruction: Quad SPI / Address-Option: Quad SPI / Data: Quad SPI

### 59.7.13. QSPI Read Instruction Code Register

**Name:** QSPI\_RICR  
**Offset:** 0x3C  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	RDOPT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	RDINST[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 23:16 – RDOPT[7:0] Read Option Code

Option code to send to the serial Flash memory in case of read transfer.

#### Bits 7:0 – RDINST[7:0] Read Instruction Code

Instruction code to send to the serial Flash memory in case of read transfer.

## 59.7.14. QSPI Scrambling Mode Register

**Name:** QSPI\_SMR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						SCRKL	RVDIS	SCREN
Access						R/W	R/W	R/W
Reset						0	0	0

### Bit 2 – SCRKL Scrambling Key Lock

Value	Description
0	No action.
1	QSPI_SKR.USRK cannot be written until the next VDDCORE reset.

### Bit 1 – RVDIS Scrambling/Unscrambling Random Value Disable

Value	Description
0	The scrambling/unscrambling algorithm includes the user scrambling key plus a random value that may differ between devices.
1	The scrambling/unscrambling algorithm includes only the user scrambling key.

### Bit 0 – SCREN Scrambling/Unscrambling Enable

0 (DISABLED): The scrambling/unscrambling is disabled.

1 (ENABLED): The scrambling/unscrambling is enabled.

## 59.7.15. QSPI Scrambling Key Register

**Name:** QSPI\_SKR  
**Offset:** 0x44  
**Reset:** –  
**Property:** Write-only

This register can only be written if bit WPEN is cleared in the [QSPI Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	USRK[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	USRK[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	USRK[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	USRK[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 31:0 – USRK[31:0]** User Scrambling Key

## 59.7.16. QSPI Write Protection Mode Register

**Name:** QSPI\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x515350	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

### Bit 2 – WPCREN Write Protection Control Register Enable

Value	Description
0	Disables the write protection on the Control register if WPKEY corresponds to 0x515350.
1	Enables the write protection on the Control register if WPKEY corresponds to 0x515350.

### Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on Interrupt registers if WPKEY corresponds to 0x515350.
1	Enables the write protection on Interrupt registers if WPKEY corresponds to 0x515350.

### Bit 0 – WPEN Write Protection Enable

See section [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII)
1	Enables the write protection if WPKEY corresponds to 0x515350 (QSP in ASCII)

### 59.7.17. QSPI Write Protection Status Register

**Name:** QSPI\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

#### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of the QSPI_WPSR.
1	A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

## 60. Secure Digital MultiMedia Card Controller (SDMMC)

### 60.1. Description

The Secure Digital MultiMedia Card Controller (SDMMC) supports the embedded MultiMedia Card (e.MMC) Specification V4.51, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

The SDMMC includes the register set defined in the “SD Host Controller Simplified Specification V3.00” and additional registers to manage e.MMC devices and enhanced features.

The SDMMC is clocked by three asynchronous clocks (see [Block Diagram](#)) and requires the PMC to be configured first.

### 60.2. Embedded Characteristics

- Compatible with SD Host Controller Standard Specification Version 3.00
- Compatible with MultiMedia Card Specification Version V4.51
- Compatible with SD Memory Card Specification Version 3.00
- Compatible with SDIO Specification Version 3.00
- Support for 1-bit/4-bit SD/SDIO Devices
- Support for 1-bit/4-bit e.MMC Devices
- Support for SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)
- Support for SDSC, SDHC and SDXC
- Support for MMC/e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
- Support for MMC/e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- e.MMC Boot Operation Mode Support
- Support for Block Size from 1 to 512 Bytes
- Support for Stream, Block and Multiblock Data Read and Write
  - Advanced DMA and SDMA capability
- Internal 1024-byte Dual Port RAM
- Support for both Synchronous and Asynchronous Abort
- Support for SDIO Card Interrupt

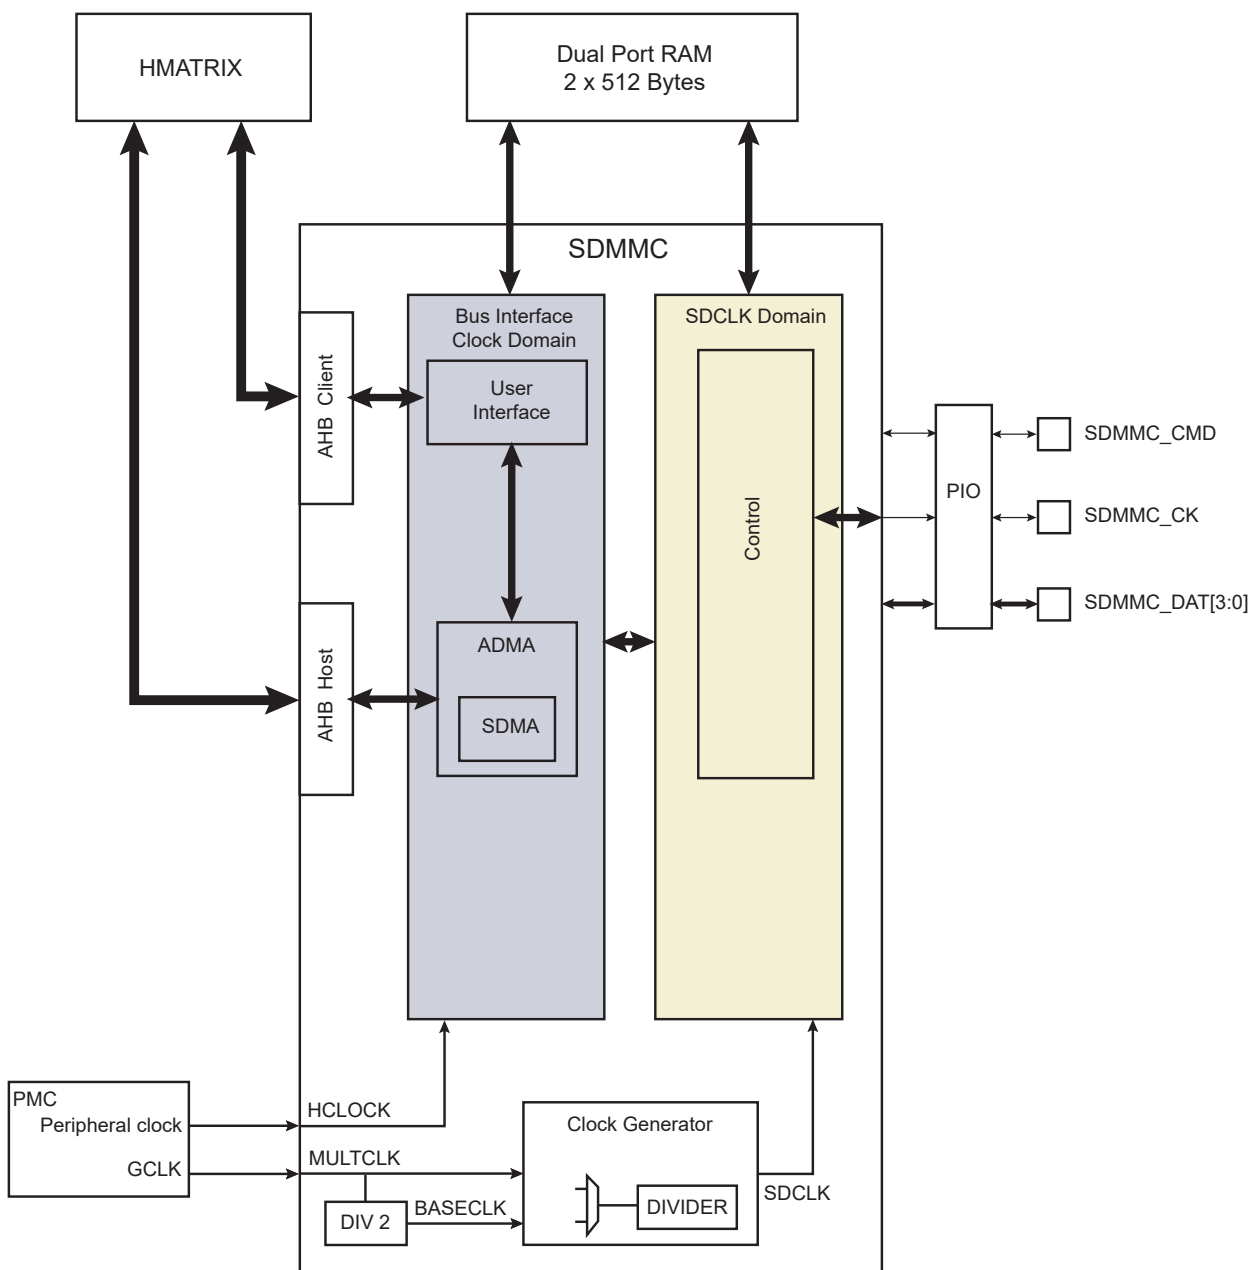

### 60.3. Reference Documents

**Table 60.1.** Reference Documents

Name	Link
SD Host Controller Simplified Specification V3.00	<a href="https://www.sdcard.org">https://www.sdcard.org</a>
SDIO Simplified Specification V3.00	
Physical Layer Simplified Specification V3.01	
Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51	<a href="http://www.jedec.org">http://www.jedec.org</a>

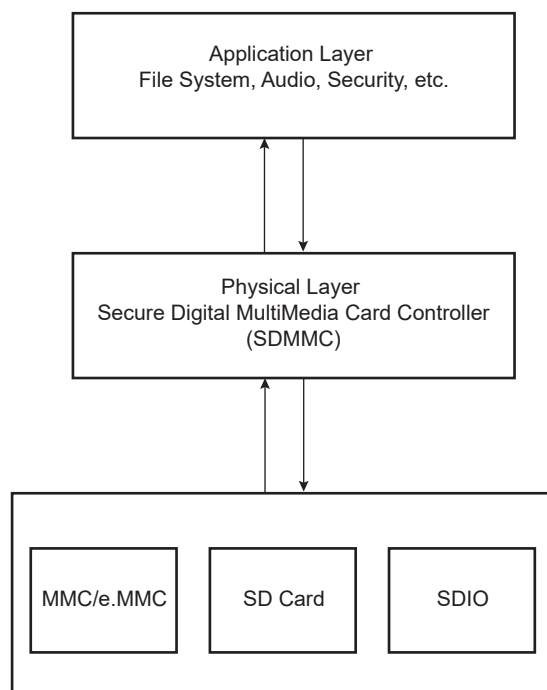

## 60.4. Block Diagram

Figure 60.1. SDMMC Block Diagram

## 60.5. Application Block Diagram

Figure 60.2. Application Block Diagram

## 60.6. Pin Name List

Table 60.2. I/O Lines Description for 8-bit Configuration

Pin Name	Pin Description	Type
SDMMC_CMD	SD Card/SDIO/e.MMC Command/Response Line	I/O
SDMMC_CK	SD Card/SDIO/e.MMC Clock Signal	Output
SDMMC_DAT[3:0]	SD Card/SDIO/e.MMC Data Lines	I/O

**Note:** When several SDMMCs are embedded in a product, SDMMC\_CK refers to SDMMCx\_CK, SDMMC\_CMD to SDMMCx\_CMD and SDMMC\_DATy to SDMMCx\_DATy.

## 60.7. Product Dependencies

### 60.7.1. I/O Lines

The pins used for interfacing the Secure Digital MultiMedia Card (SDMMC) Controller are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the peripheral functions to SDMMC pins.

### 60.7.2. Power Management

The SDMMC is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SDMMC clocks.

### 60.7.3. Interrupt Sources

The SDMMC has an interrupt line connected to the interrupt controller.

Handling the SDMMC interrupt requires programming the interrupt controller before configuring the SDMMC.

## 60.8. SD/SDIO Operating Mode

The SDMMC is fully compliant with the “SD Host Controller Simplified Specification V3.00” for SD/SDIO devices. See this specification for the SDMMC configuration.

See “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” for SD/SDIO management.

## 60.9. eMMC Operating Mode

The SDMMC supports management of eMMC devices. As the “SD Host Controller Simplified Specification V3.00” does not apply to eMMC devices, some registers have been added to those described in this specification in order to manage eMMC devices. Most of the registers described in the “SD Host Controller Simplified Specification V3.00” must be used for eMMC management, but eMMC-specific features are managed using SDMMC\_MC1R and SDMMC\_MC2R.

### 60.9.1. Boot Operation Mode

In Boot Operation mode, the processor can read boot data from the eMMC device by keeping the CMD line low after power-on before issuing the CMD1. The data can be read from either one of the boot partitions or the user area according to BOOT\_PARTITION\_ENABLE in the Extended CSD register (see “Embedded MultiMedia Card (eMMC) Electrical Standard 4.51” ).

#### 60.9.1.1. Boot Procedure, Processor Mode

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to the BOOT\_BUS\_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (eMMC) Electrical Standard 4.51” ).
  - b. Select the speed mode (using SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the eMMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable the interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the eMMC Command Type to BOOT (SDMMC\_MC1R.CMDTYP = 3)
  - g. Set SDMMC\_TMR to read multiple blocks for the eMMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTDSEL = 1).
  - h. Select the NonDMA transfer (SDMMC\_TMR.DMAEN = 0).
  - i. Optional: select the Auto CMD method (using SDMMC\_TMR.ACMDEN).
  - j. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - k. Set the required number of read blocks (using SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to ‘1’.
2. Write SDMMC\_CR = 20(hexa) to set the eMMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to ‘1’.

#### 60.9.1.2. Boot Procedure, SDMA Mode

1. Configure SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (eMMC) Electrical Standard 4.51” ).

- b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD Register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to 1 (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.CMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.TDSEL = 1).
  - h. Select the SDMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 0).
  - i. Write the SDMA system address where the boot data will be copied (SDMMC\_SSAR.ADDR).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).  
Note: Auto CMD23 cannot be used with SDMA.
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to 1.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
  3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
  4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
  5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

### 60.9.1.3.Boot Procedure, ADMA Mode

1. Configure the SDMMC:
  - a. Set the data bus width using SDMMC\_HC1R.DW and SDMMC\_HC1R.EXTDW according to BOOT\_BUS\_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51").
  - b. Select the speed mode (SDMMC\_HC1R.HSEN or SDMMC\_MC1R.DDR) according to BOOT\_MODE in the Extended CSD register.
  - c. Set the SDCLK frequency according to the selected speed mode.
  - d. If the Boot Acknowledge is sent by the e.MMC device (BOOT\_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to '1' (SDMMC\_MC1R.BOOTA = 1).
  - e. Enable interrupt on Boot Acknowledge Received (SDMMC\_NISTER.BOOTAR = 1 and SDMMC\_NISIER.BOOTAR = 1).
  - f. Set the e.MMC Command Type to BOOT (SDMMC\_MC1R.CMDTYP = 3).
  - g. Set SDMMC\_TMR to read multiple blocks for the e.MMC device (SDMMC\_TMR.MSBSEL = 1 and SDMMC\_TMR.DTSEL = 1).
  - h. Select the ADMA transfer (SDMMC\_TMR.DMAEN = 1 and SDMMC\_HC1R.DMASEL = 2 or 3).
  - i. Write the address of the descriptor table in the ADMA system address (SDMMC\_ASARx [1:0].ADMASA).
  - j. Optional: select the Auto CMD method (SDMMC\_TMR.ACMDEN).
  - k. Set the block size to 512 bytes (SDMMC\_BSR.BLKSIZE = 512).
  - l. Set the required number of read blocks (SDMMC\_BCR.BLKCNT). SDMMC\_TMR.BCEN must be set to '1'.
2. Write SDMMC\_CR = 20(hexa) to set the e.MMC in Boot Operation Mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).

4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC\_MC2R.ABOOT to '1'.

## 60.10. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

**60.10.1. SDMMC SDMA System Address / Argument 2 Register**

**Name:** SDMMC\_SSAR  
**Offset:** 0x00  
**Reset:** 0x00000000  
**Property:** Read/Write

This register contains the physical system memory address used for SDMA transfers or the second argument for Auto CMD23.

Bit	31	30	29	28	27	26	25	24
	ADDR/ARG2[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ADDR/ARG2[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ADDR/ARG2[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ADDR/ARG2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ADDR/ARG2[31:0] SDMA System Address/Argument 2**

ADDR: the system memory address for an SDMA transfer. When the SDMMC stops an SDMA transfer, this field points to the system address of the next contiguous data position. This field can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. An interrupt can be generated to instruct the software to update this field. Writing the next system address of the next data position restarts the SDMA transfer.

ARG2: used with Auto CMD23 to set a 32-bit block count value to the CMD23 argument while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by SDMMC\_BCR. In this case, 65535 blocks is the maximum value.

**60.10.2. SDMMC Block Size Register**

**Name:** SDMMC\_BSR  
**Offset:** 0x04  
**Reset:** 0x0000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
	BOUNDARY[2:0]						BLKSIZE[9:8]	
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0
Bit	7	6	5	4	3	2	1	0
	BLKSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 14:12 – BOUNDARY[2:0] SDMA Buffer Boundary**

Specifies the size of the contiguous buffer in the system memory. The SDMA transfer waits at every boundary specified by this field and the SDMMC generates the DMA Interrupt to instruct the software to update SDMMC\_SSAR. If this field is set to 0 (buffer size = 4 Kbytes), the lowest 12 bits of SDMMC\_SSAR.ADDRESS point to data in the contiguous buffer, and the upper 20 bits point to the location of the buffer in the system memory. This function is active when SDMMC\_TMR.DMAEN is set.

Value	Name	Description
0	4K	4-Kbyte boundary
1	8K	8-Kbyte boundary
2	16K	16-Kbyte boundary
3	32K	32-Kbyte boundary
4	64K	64-Kbyte boundary
5	128K	128-Kbyte boundary
6	256K	256-Kbyte boundary
7	512K	512-Kbyte boundary

**Bits 9:0 – BLKSIZE[9:0] Transfer Block Size**

Specifies the block size of data transfers for CMD14, CMD17, CMD18, CMD19, CMD24, CMD25, CMD53 and other data transfer commands such as CMD6, CMD8, ACMD13 and ACMD51. Values ranging from 1 to 512 can be set. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored.

### 60.10.3. SDMMC Block Count Register

**Name:** SDMMC\_BCR  
**Offset:** 0x06  
**Reset:** 0x0000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
	BLKCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	BLKCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – BLKCNT[15:0] Block Count for Current Transfer

This field is used only if SDMMC\_TMR.BCEN (Block Count Enable) is set to 1 and is valid only for multiple block transfers. BLKCNT is the number of blocks to be transferred and it must be set to a value between 1 and the maximum block count. The SDMMC decrements the block count after each block transfer and stops when the count reaches 0. When this field is set to 0, no data block is transferred.

This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored.

When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the previously saved block count is restored.

#### 60.10.4. SDMMC Argument 1 Register

**Name:** SDMMC\_ARG1R  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ARG1[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ARG1[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ARG1[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ARG1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – ARG1[31:0] Argument 1

This register contains the SD command argument which is specified as the bit 39-8 of Command-Format in the “Physical Layer Simplified Specification V3.01” or “Embedded MultiMedia Card (eMMC) Electrical Standard 4.51” .

### 60.10.5. SDMMC Transfer Mode Register

**Name:** SDMMC\_TMR  
**Offset:** 0x0C  
**Reset:** 0x0000  
**Property:** Read/Write

This register is used to control data transfers. The user shall set this register before issuing a command which transfers data (see SDMMC\_CR.DPSEL), or before issuing a Resume command. The user must save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, this register cannot be written while data transactions are in progress. Writes to this register are ignored when SDMMC\_PSR.CMDINHD is 1.

**Table 60.3.** Determining the Transfer Type

MSBSEL	BCEN	BLKCNT (SDMMC_BCR)	Function
0	Don't care	Don't care	Single Transfer
1	0	Don't care	Infinite Transfer
1	1	Not Zero	Multiple Transfer
1	1	Zero	Stop Multiple Transfer

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			MSBSEL	DTDSEL	ACMDEN[1:0]		BCEN	DMAEN
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bit 5 – MSBSEL Multi/Single Block Selection

This bit is set to 1 when issuing multiple-block transfer commands using DAT line(s). For any other commands, set this bit to 0. If this bit is 0, it is not necessary to set SDMMC\_BCR (see the table [Determining the Transfer Type](#)).

#### Bit 4 – DTDSEL Data Transfer Direction Selection

This bit defines the direction of the DAT lines data transfers. Set this bit to 1 to transfer data from the device (SD card/SDIO/eMMC) to the SDMMC, and to 0 for all other commands.

Value	Name	Description
0	WRITE	Writes data from the SDMMC to the device.
1	READ	Reads data from the device to the SDMMC.

#### Bits 3:2 – ACMDEN[1:0] Auto Command Enable

Two methods can be used to stop Multiple-block read and write operation:

- Auto CMD12: when the ACMDEN field is set to 1, the SDMMC issues CMD12 automatically when the last block transfer is completed. An Auto CMD12 error is indicated to SDMMC\_ACESR. Auto CMD12 is not enabled if the command does not require CMD12.
- Auto CMD23: when the ACMDEN field is set to 2, the SDMMC issues a CMD23 automatically before issuing a command specified in SDMMC\_CR.

The following conditions are required to use Auto CMD23:

- A memory card that supports CMD23 (SCR[33] = 1)

- If DMA is used, it must be ADMA (SDMA not supported).
- Only CMD18 or CMD25 is issued.

**Note:** The SDMMC does not check the command index.

Auto CMD23 can be used with or without ADMA. By writing SDMMC\_CR, the SDMMC issues a CMD23 first and then issues a command specified by the SDMMC\_CR.CMDIDX field. If CMD23 response errors are detected, the second command is not issued. A CMD23 error is indicated in SDMMC\_ACESR. The CMD23 argument (32-bit block count value) is set in SDMMC\_SSAR. This field determines the use of auto command functions.

Value	Name	Description
0	DISABLED	Auto Command Disabled
1	CMD12	Auto CMD12 Enabled
2	CMD23	Auto CMD23 Enabled
3	–	Reserved

#### Bit 1 – BCEN Block Count Enable

This bit is used to enable SDMMC\_BCR, which is only relevant for multiple block transfers. When this bit is 0, SDMMC\_BCR is disabled, which is useful when executing an infinite transfer (see the table [Determining the Transfer Type](#)). If an ADMA2 transfer is more than 65535 blocks, this bit is set to 0 and the data transfer length is designated by the Descriptor Table.

Value	Name	Description
0	DISABLED	Block count is disabled.
1	ENABLED	Block count is enabled.

#### Bit 0 – DMAEN DMA Enable

This bit enables the DMA functionality described in section “Supporting DMA” in “SD Host Controller Simplified Specification V3.00”. DMA can be enabled only if it is supported as indicated by the bit SDMMC\_CA0R.ADMA2SUP. One of the DMA modes can be selected using the field SDMMC\_HC1R.DMASEL. If DMA is not supported, this bit is meaningless and then always reads 0. When this bit is set to 1, a DMA operation begins when the user writes to the upper byte of SDMMC\_CR.

Value	Name	Description
0	DISABLED	DMA functionality is disabled.
1	ENABLED	DMA functionality is enabled.

**60.10.6. SDMMC Command Register**

**Name:** SDMMC\_CR  
**Offset:** 0x0E  
**Reset:** 0x0000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
	CMDIDX[5:0]							
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CMDTYP[1:0]		DPSEL	CMDICEN	CMDCCEN		RESPTYP[1:0]	
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

**Bits 13:8 – CMDIDX[5:0] Command Index**

This bit shall be set to the command number (CMD0–63, ACMD0–63) that is specified in bits 45–40 of the Command-Format in the “Physical Layer Simplified Specification V3.01”, “SDIO Simplified Specification V3.00”, and “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”.

**Bits 7:6 – CMDTYP[1:0] Command Type**

Value	Name	Description
0	NORMAL	Other commands
1	SUSPEND	CMD52 to write “Bus Suspend” in the Card Common Control registers (CCCR) (for SDIO only)
2	RESUME	CMD52 to write “Function Select” in the Card Common Control registers (CCCR) (for SDIO only)
3	ABORT	CMD12, CMD52 to write “I/O Abort” in the Card Common Control registers (CCCR) (for SDIO only)

**Bit 5 – DPSEL Data Present Select**

This bit is set to 1 to indicate that data is present and shall be transferred using the DAT lines. It is set to 0 for the following:

- Commands using only CMD line (Ex. CMD52)
- Commands with no data transfer but using Busy signal on DAT[0] line (Ex. CMD38)
- Resume command

Value	Description
0	No data present
1	Data present

**Bit 4 – CMDICEN Command Index Check Enable**

If this bit is set to 1, the SDMMC checks the Index field in the response to see if it has the same value as the command index. If it has not, it is reported as a Command Index Error (CMDIDX) in SDMMC\_EISTR. If this bit is set to 0, the Index field of the response is not checked.

Value	Name	Description
0	DISABLED	The Command Index Check is disabled.
1	ENABLED	The Command Index Check is enabled.

**Bit 3 – CMDCCEN Command CRC Check Enable**

If this bit is set to 1, the SDMMC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error (CMDCRC) in SDMMC\_EISTR. If this bit is set to 0, the CRC field is not checked. The position of the CRC field is determined according to the length of the response.

Value	Name	Description
0	DISABLED	The Command CRC Check is disabled.
1	ENABLED	The Command CRC Check is enabled.

#### Bits 1:0 – RESPTYP[1:0] Response Type

This field is set according to the response type expected for the command index (CMDIDX).

Value	Name	Description
0	NORESP	No Response
1	RL136	Response Length 136
2	RL48	Response Length 48
3	RL48BUSY	Response Length 48 with Busy

## 60.10.7. SDMMC Response Register x

**Name:** SDMMC\_RRx  
**Offset:** 0x10 + x\*0x04 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	CMDRESP[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CMDRESP[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CMDRESP[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CMDRESP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – CMDRESP[31:0] Command Response

The table below describes the mapping of command responses from the SD\_SDIO/e.MMC bus to these registers for each responses type. In this table, R[] refers to a bit range of the response data as transmitted on the SD\_SDIO/e.MMC bus.

Type of Response	Meaning of Response	Response Field	Response Register
R1, R1b (normal response)	Card Status	R[39:8]	SDMMC_RR0[31:0]
R1b (Auto CMD12 response)	Card Status for Auto CMD12	R[39:8]	SDMMC_RR3[31:0]
R1 (Auto CMD23 response)	Card Status for Auto CMD23	R[39:8]	SDMMC_RR3[31:0]
R2 (CID, CSD register)	CID or CSD register	R[127:8]	SDMMC_RR0[31:0] SDMMC_RR1[31:0] SDMMC_RR2[31:0] SDMMC_RR3[23:0]
R3 (OCR register)	OCR register for memory	R[39:8]	SDMMC_RR0[31:0]
R4 (OCR register)	OCR register for I/O	R[39:8]	SDMMC_RR0[31:0]
R5, R5b	SDIO response	R[39:8]	SDMMC_RR0[31:0]
R6 (Published RCA response)	New published RCA[31:16] and Card status bits	R[39:8]	SDMMC_RR0[31:0]

### 60.10.8. SDMMC Buffer Data Port Register

**Name:** SDMMC\_BDPR  
**Offset:** 0x20  
**Reset:** –  
**Property:** Read/Write

**Note:** The reset value is an unpredictable value read from the dual port RAM.

Bit	31	30	29	28	27	26	25	24
	BUFDATA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	BUFDATA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	BUFDATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – BUFDATA[31:0] Buffer Data

The SDMMC data buffer can be accessed through this 32-bit Data Port register.

**60.10.9. SDMMC Present State Register**

**Name:** SDMMC\_PSR  
**Offset:** 0x24  
**Reset:** 0x01F80000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								CMDLL
Access								R
Reset								1

Bit	23	22	21	20	19	18	17	16
	DATLL[3:0]							
Access	R	R	R	R				
Reset	1	1	1	1				

Bit	15	14	13	12	11	10	9	8
					BUFRDEN	BUFWREN	RTACT	WTACT
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
						DLACT	CMDINHDL	CMDINHCL
Access						R	R	R
Reset						0	0	0

**Bit 24 – CMDLL** CMD Line Level

This status is used to check the CMD line level to recover from errors, and for debugging.

**Bits 23:20 – DATLL[3:0]** DAT[3:0] Line Level

This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the Busy signal level from DAT[0].

**Bit 11 – BUFRDEN** Buffer Read Enable

This bit is used for nonDMA read transfers. This flag indicates that valid data exists in the SDMMC data buffer. If this bit is 1, readable data exists in the buffer.

A change from 1 to 0 occurs when all the block data is read from the buffer.

A change from 0 to 1 occurs when block data is ready in the buffer. This raises the Buffer Read Ready (BRDRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTR.BRDRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BRDRDY is set to 1.

**Bit 10 – BUFWREN** Buffer Write Enable

This bit is used for nonDMA write transfers. This flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer.

A change from 1 to 0 occurs when all the block data are written to the buffer.

A change from 0 to 1 occurs when top of block data can be written to the buffer. This raises the Buffer Write Ready (BWRRDY) status flag in SDMMC\_NISTR if SDMMC\_NISTR.BWRRDY is set to 1. An interrupt is generated if SDMMC\_NISIER.BWRRDY is set to 1.

### Bit 9 – RTACT Read Transfer Active

This bit is used to detect completion of a read transfer. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the read command.
- When a read operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- When the last data block as specified by Transfer Block Size (BLKSIZE) is transferred to the system.
- In case of ADMA2, end of read is designated by the descriptor table.
- When all valid data blocks in the SDMMC have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR being set to 1.

A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

### Bit 8 – WTACT Write Transfer Active

This bit indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the SDMMC. See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit is set to 1 in either of the following conditions:

- After the end bit of the write command.
- When a write operation is restarted by writing a 1 to SDMMC\_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- After getting the CRC status of the last data block as specified by the transfer count (single and multiple). In case of ADMA2, transfer count is designated by the descriptor table.
- After getting the CRC status of any block where a data transmission is about to be stopped by a Stop At Block Gap Request (STPBGR) of SDMMC\_BGCR.

During a write transaction and as the result of the Stop At Block Gap Request (STPBGR) being set, a change from 1 to 0 raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if BLKGE is set to 1 in SDMMC\_NISIER. This status is useful to determine whether nonDAT line commands can be issued during Write Busy.

### Bit 2 – DLACT DAT Line Active

This bit indicates whether one of the DAT lines on the bus is in use.

In the case of read transactions:

- This status indicates whether a read transfer is executing on the bus. A change from 1 to 0 resulting from setting the Stop At Block Gap Request (STPBGR) raises the Block Gap Event (BLKGE) status flag in SDMMC\_NISTR if SDMMC\_NISTER.BLKGE is set to 1. An interrupt is generated if SDMMC\_NISIER.BLKGE is set to 1. See the section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the read command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to restart a read transfer.
- This bit is SDMMC cleared in either of the following cases:
  - When the end bit of the last data block is sent from the bus to the SDMMC. In case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.

- When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (STPBGR).
- The SDMMC stops a read operation at the start of the interrupt cycle by driving the Read Wait (DAT[2] line) or by stopping the SD Clock. If the Read Wait signal is already driven (due to the fact that the data buffer cannot receive data), the SDMMC can continue to stop the read operation by driving the Read Wait signal. It is necessary to support the Read Wait in order to use the Suspend/Resume operation.

In the case of write transactions:

- This status indicates that a write transfer is executing on the bus. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See the section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the write command.
  - When writing 1 to SDMMC\_BGCR.CONTR (Continue Request) to continue a write transfer.
- This bit is cleared in either of the following cases:
  - When the card releases Write Busy of the last data block. If the card does not drive a Busy signal for 8 SDCLK, the SDMMC considers the card drive “Not Busy”. In the case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When the card releases Write Busy prior to wait for write transfer as a result of a Stop At Block Gap Request (STPBGR).

Command with Busy:

This status indicates whether a command that indicates Busy (ex. erase command for memory) is executing on the bus. This bit is set to 1 after the end bit of the command with Busy and cleared when Busy is deasserted. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1. See Figures 2.11 to 2.13 in the “SD Host Controller Simplified Specification V3.00” .

Value	Description
0	DAT line inactive.
1	DAT line active.

#### Bit 1 – CMDINH D Command Inhibit (DAT)

This status bit is 1 if either the DAT Line Active (DLACT) or the Read Transfer Active (RTACT) is set to 1. If this bit is 0, it indicates that the SDMMC can issue the next command. Commands with a Busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC\_NISTR if SDMMC\_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC\_NISIER.TRFC is set to 1.

Note: The software can save registers in the 000–00Dh range for a suspend transaction after this bit has changed from 1 to 0.

Value	Description
0	Can issue a command which uses the DAT line(s).
1	Cannot issue a command which uses the DAT line(s).

#### Bit 0 – CMDINH C Command Inhibit (CMD)

If this bit is 0, it indicates the CMD line is not in use and the SDMMC can issue a command using the CMD line. This bit is set to 1 immediately after SDMMC\_CR is written. This bit is cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the CMD12 or CMD23 response, but by the Read/Write command response.

Status issuing Auto CMD12 is not read from this bit. So, if a command is issued during Auto CMD12 operation, the SDMMC manages to issue both commands: CMD12 and a command set by SDMMC\_CR.

Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0.

A change from 1 to 0 raises the Command Complete (CMD\_C) status flag in SDMMC\_NISTR if SDMMC\_NISTR.CMD\_C is set to 1. An interrupt is generated if SDMMC\_NISTR.CMD\_C is set to 1.

If the SDMMC cannot issue the command because of a command conflict error (see SDMMC\_EISTR.CMD\_CRC) or because of a 'Command Not Issued By Auto CMD12' error (see section "SDMMC Auto CMD Error Status Register"), this bit remains 1 and Command Complete is not set.

Value	Description
0	Can issue a command using only CMD line.
1	Cannot issue a command.

### 60.10.10.SDMMC Host Control 1 Register (SD\_SDIO)

**Name:** SDMMC\_HC1R (SD\_SDIO)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
		CARDDTL		DMASEL[1:0]		HSEN	DW	LEDCTRL
Access		R/W		R/W	R/W	R/W	R/W	R/W
Reset		0		0	0	0	0	0

#### Bit 6 – CARDDTL Card Detect Test Level

This bit is enabled while the Card Detect Signal Selection (CARDDSEL) is set to 1 and it indicates whether the card is inserted or not.

Value	Description
0	No card.
1	Card inserted.

#### Bits 4:3 – DMASEL[1:0] DMA Select

One of the supported DMA modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of a selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

#### Bit 2 – HSEN High Speed Enable

Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

**Note:** This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

**Note:** The clock divider (DIV) in the Clock Control register (SDMMC\_CCR) must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

#### Bit 1 – DW Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

Value	Name	Description
0	1_BIT	1-bit mode.
1	4_BIT	4-bit mode.

#### Bit 0 – LEDCTRL LED Control

This bit is used to caution the user not to remove the card while it is being accessed. If the software is going to issue multiple commands, this bit is set to 1 during all transactions.

Value	Name	Description
0	OFF	LED off.
1	ON	LED on.

**60.10.11.SDMMC Host Control 1 Register (e.MMC)**

**Name:** SDMMC\_HC1R (EMMC)  
**Offset:** 0x28  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	7	6	5	4	3	2	1	0
			EXTDW	DMASEL[1:0]		HSEN	DW	
Access			R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	

**Bit 5 – EXTDW** Extended Data Width

This bit controls the 8-bit Bus Width mode for embedded devices. Support of this function is indicated in 8-bit Support for Embedded Device in SDMMC\_CA0R. If a device supports the 8-bit mode, this may be set to 1. If this bit is 0, the bus width is controlled by Data Width (DW).

**Bits 4:3 – DMASEL[1:0]** DMA Select

One of the supported DAM modes can be selected. The DMA modes supported are given in SDMMC\_CA0R. Use of selected DMA is determined by DMA Enable (DMAEN) in SDMMC\_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

**Bit 2 – HSEN** High Speed Enable

Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC\_CA0R.

If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).

If Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, the user needs to reset the SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.

This bit is effective only if SDMMC\_MC1R.DDR is set to 0.

**Note:** The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

**Bit 1 – DW** Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.

**Note:** If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

Value	Name	Description
0	1_BIT	1-bit mode.
1	4_BIT	4-bit mode.

60.10.12.SDMMC Power Control Register

**Name:** SDMMC\_PCR  
**Offset:** 0x29  
**Reset:** 0x0E  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
								SDBPWR
Access								R/W
Reset								0

**Bit 0 – SDBPWR** SD Bus Power  
This bit is automatically cleared by the SDMMC if the card is removed. If this bit is cleared, the SDMMC stops driving SDMMC\_CMD and SDMMC\_DAT[3:0] (tri-state) and drives SDMMC\_CK to low level.

### 60.10.13.SDMMC Block Gap Control Register (SD\_SDIO)

**Name:** SDMMC\_BGCR (SD\_SDIO)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
					INTBG	RWCTRL	CONTR	STPBGR
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bit 3 – INTBG Interrupt at Block Gap

This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the software detects an SDIO card insertion, it sets this bit according to the CCCR of the SDIO card.

Value	Name	Description
0	DISABLED	Interrupt detection disabled.
1	ENABLED	Interrupt detection enabled.

#### Bit 2 – RWCTRL Read Wait Control

The Read Wait control is optional for SDIO cards. If the card supports Read Wait, set this bit to enable use of the Read Wait protocol to stop read data using the SDMMC\_DAT[2] line. Otherwise, the SDMMC stops the SDCLK to hold read data, which restricts command generation. When the software detects an SD card insertion, this bit must be set according to the CCCR of the SDIO card. If the card does not support Read Wait, this bit shall never be set to 1, otherwise an SDMMC\_DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.

Value	Description
0	Disables Read Wait control.
1	Enables Read Wait control.

#### Bit 1 – CONTR Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored. See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	No effect.
1	Restart.

#### Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in

SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not. During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer
1	Stop

## 60.10.14.SDMMC Block Gap Control Register (e.MMC)

**Name:** SDMMC\_BGCR (EMMC)  
**Offset:** 0x2A  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	7	6	5	4	3	2	1	0
							CONTR	STPBGR
Access							R/W	R/W
Reset							0	0

### Bit 1 – CONTR Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.

The SDMMC automatically clears this bit in either of the following cases:

- In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
- In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.

Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored. See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	No effect.
1	Restart.

### Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC\_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not. During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC\_DAT[2]) if supported, or by stopping the SD clock otherwise.

In case of write transfers in which the user writes data to SDMMC\_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC\_BDPR.

This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer
1	Stop

60.10.15.SDMMC Wake-up Control Register (SD\_SDIO)

**Name:** SDMMC\_WCR (SD\_SDIO)  
**Offset:** 0x2B  
**Reset:** 0x00  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
								WKENCINT
Access								R/W
Reset								0

**Bit 0 – WKENCINT** Wake-up Event Enable on Card Interrupt  
This bit enables a wake-up event via Card Interrupt (CINT) in SDMMC\_NISTR. This bit can be set to 1 if FN\_WUS (Wake-up Support) in the CIS (Card Information Structure) is set to 1 in the SDIO card.  
0 (DISABLED): Wake-up Event disabled.  
1 (ENABLED): Wake-up Event enabled.

## 60.10.16.SDMMC Clock Control Register

**Name:** SDMMC\_CCR  
**Offset:** 0x2C  
**Reset:** 0x0000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
	SDCLKFSEL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	USDCLKFSEL[1:0]		CLKGSEL			SDCLKEN	INTCLKS	INTCLKEN
Access	R/W	R/W	R/W			R/W	R/W	R/W
Reset	0	0	0			0	0	0

### Bits 15:8 – SDCLKFSEL[7:0] SDCLK Frequency Select

This register is used to select the frequency of the SDCLK pin. There are two SDCLK Frequency modes according to Clock Generator Select (CLKGSEL).

The length of the clock divider (DIV) is extended to 10 bits (DIV[9:8] = USDCLKFSEL, DIV[7:0] = SDCLKFSEL)

- 10-bit Divided Clock Mode (CLKGSEL = 0):  $f_{SDCLK} = f_{BASECLK} / (2 \times DIV)$ . If DIV = 0 then  $f_{SDCLK} = f_{BASECLK}$
- Programmable Clock Mode (CLKGSEL = 1):  $f_{SDCLK} = f_{MULTCLK} / (DIV + 1)$

When HSEN is set in SDMMC\_HC1R, or DDR is set in SDMMC\_MC1R, the clock divider (DIV) must be non-zero. This field depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this field is set by the user.

If PVALEN = 1, this field is automatically set to a value specified in one of the SDMMC\_PVR.

### Bits 7:6 – USDCLKFSEL[1:0] Upper Bits of SDCLK Frequency Select

These bits expand the SDCLK Frequency Select (SDCLKFSEL) to 10 bits. These two bits are assigned to bit 09-08 of the clock divider as described in SDCLKFSEL.

### Bit 5 – CLKGSEL Clock Generator Select

This bit is used to select the clock generator mode in the SDCLK Frequency Select field. If the Programmable mode is not supported (SDMMC\_CA1R.CLKMULT (Clock Multiplier) set to 0), then this bit cannot be written and is always read at 0.

This bit depends on the setting of Preset Value Enable (PVALEN) in SDMMC\_HC2R.

If PVALEN = 0, this bit is set by the user.

If PVALEN = 1, this bit is automatically set to a value specified in one of the SDMMC\_PVRx.

Value	Description
0	Divided Clock mode (BASECLK is used to generate SDCLK).
1	Programmable Clock mode (MULTCLK is used to generate SDCLK).

### Bit 2 – SDCLKEN SD Clock Enable

The SDMMC stops the SD Clock when writing this bit to 0. SDCLK Frequency Select (SDCLKFSEL) can be changed when this bit is 0. Then, the SDMMC maintains the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If Card Inserted (CARDINS) in SDMMC\_PSR is cleared, this bit is also cleared.

Value	Description
0	SD Clock disabled
1	SD Clock enabled

#### Bit 1 – INTCLKS Internal Clock Stable

This bit is set to 1 when the SD clock is stable after setting SDMMC\_CCR.INTCLKEN (Internal Clock Enable) to 1. The user must wait to set SD Clock Enable (SDCLKEN) until this bit is set to 1.

Value	Description
0	Internal clock not ready.
1	Internal clock ready.

#### Bit 0 – INTCLKEN Internal Clock Enable

This bit is set to 0 when the SDMMC is not used or is awaiting a wake-up interrupt. In this case, its internal clock is stopped to reach a very low power state. Registers are still able to be read and written. The clock starts to oscillate when this bit is set to 1. Once the clock oscillation is stable, the SDMMC sets Internal Clock Stable (INTCLKS) in this register to 1.

Value	Description
0	The internal clock stops.
1	The internal clock oscillates.

## 60.10.17.SDMMC Timeout Control Register

**Name:** SDMMC\_TCR  
**Offset:** 0x2E  
**Reset:** 0x00  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
					DTCVAL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

### Bits 3:0 – DTCVAL[3:0] Data Timeout Counter Value

This value determines the interval at which DAT line timeouts are detected. For more information about timeout generation, see Data Timeout Error (DATTEO) in SDMMC\_EISTR. When setting this register, the user can prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in SDMMC\_EISTER).

$$\text{TIMEOUT}_{(\mu\text{s})} = \frac{2^{13 + \text{DTCVAL}}}{f_{\text{FTEOCLK}}(\text{MHz})}$$

**Note:** DTCVAL = f<sub>(Hexa)</sub> is reserved.

## 60.10.18.SDMMC Software Reset Register

**Name:** SDMMC\_SRR  
**Offset:** 0x2F  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
						SWRSTDAT	SWRSTCMD	SWRSTALL
Access						R/W	R/W	R/W
Reset						0	0	0

### Bit 2 – SWRSTDAT Software Reset for DAT Line

Only part of a data circuit is reset. The DMA circuit is also reset.  
The following registers and bits are cleared by this bit:

- [SDMMC Buffer Data Port Register](#)
  - Buffer is cleared and initialized.
- [SDMMC Present State Register](#)
  - Buffer Read Enable (BUFRDEN)
  - Buffer Write Enable (BUFWREN)
  - Read Transfer Active (RTACT)
  - Write Transfer Active (WTACT)
  - DAT Line Active (DATLL)
  - Command Inhibit (DAT) (CMDINH)
- [SDMMC Block Gap Control Register \(SD\\_SDIO\)](#)
  - Continue Request (CONTR)
  - Stop At Block Gap Request (STPBGR)
- [SDMMC Normal Interrupt Status Register \(SD\\_SDIO\)](#)
  - Buffer Read Ready (BRDRDY)
  - Buffer Write Ready (BWRRDY)
  - DMA Interrupt (DMAINT)
  - Block Gap Event (BLKGE)
  - Transfer Complete (TRFC)

Value	Description
0	Work
1	Reset

### Bit 1 – SWRSTCMD Software Reset for CMD Line

Only part of a command circuit is reset.  
The following registers and bits are cleared by this bit:

- [SDMMC Present State Register](#)
  - Command Inhibit (CMD) (CMDINH)
- [SDMMC Normal Interrupt Status Register \(SD\\_SDIO\)](#) and [SDMMC Normal Interrupt Status Register \(e.MMC\)](#)
  - Command Complete (CMDC)

Value	Description
0	Work
1	Reset

**Bit 0 – SWRSTALL** Software Reset for All

This reset affects the entire SDMMC. During initialization, the SDMMC must be reset by setting this bit to '1'. This bit is automatically cleared to '0' when SDMMC\_CA0R and SDMMC\_CA1R are valid and the user can read them. If this bit is set to '1', the user should issue a reset command and reinitialize the card.

List of registers cleared to '0':

- [SDMMC SDMA System Address / Argument 2 Register](#)
- [SDMMC Block Size Register](#)
- [SDMMC Block Count Register](#)
- [SDMMC Argument 1 Register](#)
- [SDMMC Command Register](#)
- [SDMMC Transfer Mode Register](#)
- [SDMMC Response Register](#)
- [SDMMC Buffer Data Port Register](#)
- [SDMMC Present State Register](#) (except CMDLL, DATLL, WRPPL, CARDDDPL, CARDSS, CARDINS)
- [SDMMC Host Control 1 Register \(SD\\_SDIO\)](#)
- [SDMMC Host Control 1 Register \(e.MMC\)](#)
- [SDMMC Power Control Register](#)
- [SDMMC Block Gap Control Register \(SD\\_SDIO\)](#)
- [SDMMC Block Gap Control Register \(e.MMC\)](#)
- [SDMMC Wake-up Control Register \(SD\\_SDIO\)](#)
- [SDMMC Clock Control Register](#)
- [SDMMC Timeout Control Register](#)
- [SDMMC Normal Interrupt Status Register \(SD\\_SDIO\)](#)
- [SDMMC Error Interrupt Status Register \(SD\\_SDIO\)](#)
- [SDMMC Normal Interrupt Status Enable Register \(SD\\_SDIO\)](#)
- [SDMMC Error Interrupt Status Enable Register \(SD\\_SDIO\)](#)
- [SDMMC Normal Interrupt Signal Enable Register \(SD\\_SDIO\)](#)
- [SDMMC Error Interrupt Signal Enable Register \(SD\\_SDIO\)](#)
- [SDMMC Auto CMD Error Status Register](#)
- [SDMMC Host Control 2 Register \(SD\\_SDIO\)](#)
- [SDMMC ADMA Error Status Register](#)
- [SDMMC ADMA System Address Register](#)
- [SDMMC Slot Interrupt Status Register](#)
- [SDMMC e.MMC Control 1 Register](#)
- [SDMMC e.MMC Control 2 Register](#)
- [SDMMC AHB Control Register](#)
- [SDMMC Clock Control 2 Register](#)
- [SDMMC Capabilities Control Register](#) (except KEY)

Value	Description
0	Work
1	Reset

**60.10.19.SDMMC Normal Interrupt Status Register (SD\_SDIO)**

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
	ERRINT							CINT
Access	R							R/W
Reset	0							0

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bit 15 – ERRINT** Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

**Bit 8 – CINT** Card Interrupt

Writing this bit to '1' does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the SDMMC detects the Card Interrupt without SDCLK to support wake-up. In 4-bit mode, the Card Interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the system. When this bit is set to '1' and the user needs to start this interrupt service, Card Interrupt Status Enable (CINT) in SDMMC\_NISTR may be set to '0' in order to clear the card interrupt statuses latched in the SDMMC and to stop driving the interrupt signal to the system. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set SDMMC\_NISTR.CINT to '1' and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is one card per slot. This bit can only be set to 1 if SDMMC\_NISTR.CINT is set to 1. An interrupt can only be generated if SDMMC\_NISTR.CINT is set to 1.

Value	Description
0	No card interrupt.
1	Card interrupt.

**Bit 5 – BRDRDY** Buffer Read Ready

This status is set to '1' if the Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See BUFRDEN in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTR.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISTR.BRDRDY is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

**Bit 4 – BWRRDY** Buffer Write Ready

This status is set to '1' if the Buffer Write Enable (BUFWREN) changes from '0' to '1'. See BUFWREN in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to write buffer.
1	Ready to write buffer.

**Bit 3 – DMAINT** DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting the “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No DMA Interrupt.
1	DMA Interrupt.

**Bit 2 – BLKGE** Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to 1, this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to 1, this bit is not set to 1.

**In the case of a Read transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

**In the case of a Write transaction:**

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

**Bit 1 – TRFC** Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

**In the case of a Read Transaction:**

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data was read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data was read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of a Write Transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length

and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section "Write Transaction Wait / Continue Timing" in the "SD Host Controller Simplified Specification V3.00" for more details on the sequence of events.

**In the case of command with Busy:**

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears the bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Status Meaning
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don't Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

**Bit 0 – CMDC Command Complete**

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See Command Inhibit (CMD) in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to 1 if SDMMC\_NISTER.CMDC is set to 1. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to 1.

Writing this bit to 1 clears the bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to 1, it can be considered that the response was not received correctly.

CMDC	CMDTEO	Status Meaning
0	0	Interrupted by another factor
Don't care	1	Response not received within 64 SDCLK cycles
1	0	Response received

Value	Description
0	No command complete.
1	Command complete.

**60.10.20.SDMMC Normal Interrupt Status Register (e.MMC)**

**Name:** SDMMC\_NISTR (EMMC)  
**Offset:** 0x30  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	ERRINT	BOOTAR						
Access	R	R/W						
Reset	0	0						

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bit 15 – ERRINT** Error Interrupt

If any of the bits in SDMMC\_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

**Bit 14 – BOOTAR** Boot Acknowledge Received

This bit is set to '1' when the SDMMC received a Boot Acknowledge pattern from the e.MMC. This bit can only be set to '1' if SDMMC\_NISTER.BOOTAR is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BOOTAR is set to '1'. Writing this bit to '1' clears the bit.

Value	Description
0	Boot Acknowledge pattern not received.
1	Boot Acknowledge pattern received.

**Bit 5 – BRDRDY** Buffer Read Ready

This status is set to '1' if Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See Buffer Read Enable (BUFRDEN) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BRDRDY is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

**Bit 4 – BWRRDY** Buffer Write Ready

This status is set to 1 if Buffer Write Enable (BUFWREN) changes from '0' to '1'. See Buffer Write Enable (BUFWREN) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BWRRDY is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to write buffer.

Value	Description
1	Ready to write buffer.

**Bit 3 – DMAINT** DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC\_BSR.

In case of ADMA, by setting “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after the Transfer Complete (TRFC).

This bit can only be set to '1' if SDMMC\_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.DMAINT is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No DMA interrupt.
1	DMA interrupt.

**Bit 2 – BLKGE** Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR is set to '1', this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to '1', this bit is not set to '1'.

**In the case of a Read transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.

**In the case of a Write transaction:**

This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

This bit can only be set to '1' if SDMMC\_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.BLKGE is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

**Bit 1 – TRFC** Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.

**In the case of a Read Transaction:**

This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data was read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR (after valid data was read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of a Write Transaction:**

This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC\_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.

**In the case of command with Busy:**

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINH) in SDMMC\_PSR.

This bit can only be set to '1' if SDMMC\_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.TRFC is set to '1'.

Writing this bit to '1' clears the bit.

The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Status Meaning
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don't Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

#### Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See CMRINHC in SDMMC\_PSR for details on how to control this bit.

This bit can only be set to '1' if SDMMC\_NISTER.CMDC is set to '1'. An interrupt can only be generated if SDMMC\_NISIER.CMDC is set to '1'.

Writing this bit to '1' clears the bit.

The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to '1', it can be considered that the response was not received correctly.

CMDC	CMDTEO	Status Meaning
0	0	Interrupted by another factor
Don't care	1	Response not received within 64 SDCLK cycles
1	0	Response received

Value	Description
0	No command complete.
1	Command complete.

**60.10.21.SDMMC Error Interrupt Status Register (SD\_SDIO)**

**Name:** SDMMC\_EISTR (SD\_SDIO)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
							ADMA	ACMD
Access							R/W	R/W
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 9 – ADMA** ADMA Error

This bit is set to '1' when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

**Bit 8 – ACMD** Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from '0' to '1'. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12 but also when auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

**Bit 7 – CURLIM** Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PCR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 5 – DATCRC Data CRC error

This bit is set to '1' when detecting a CRC error when transferring read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 4 – DATTEO Data Timeout Error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SD Host Controller Simplified Specification V3.00”).
- Busy timeout after Write CRC status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 3 – CMDIDX Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 2 – CMDEND Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.

This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 1 – CMDCRC Command CRC Error

The Command CRC Error is generated in two cases.

If a response is returned and the Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response. The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table above).

This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.

Writing this bit to '1' clears the bit.

#### Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table below, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.

This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.

Writing this bit to '1' clears the bit.

CMDCRC	CMDTEO	Error Types
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

## 60.10.22.SDMMC Error Interrupt Status Register (e.MMC)

**Name:** SDMMC\_EISTR (EMMC)  
**Offset:** 0x32  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
				BOOTAE			ADMA	ACMD
Access				R/W			R/W	R/W
Reset				0			0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bit 12 – BOOTAE Boot Acknowledge Error

This bit is set to '1' when detecting that the e.MMC Boot Acknowledge Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.BOOTAE is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.BOOTAE is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

### Bit 9 – ADMA ADMA Error

This bit is set to 1 when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC\_AESR.

In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST\_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC\_AESR indicates that an error occurred in ST\_FDS state. The user may find that the Valid bit is not set at the error descriptor.

This bit can only be set to '1' if SDMMC\_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ADMA is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

### Bit 8 – ACMD Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC\_ACESR[4:0] has changed from 0 to 1. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12, but also when Auto CMD12 is not executed due to the previous command error.

This bit can only be set to '1' if SDMMC\_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.ACMD is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.

Value	Description
1	Error.

#### Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC\_PSR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.

This bit can only be set to '1' if SDMMC\_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CURLIM is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.

This bit can only be set to '1' if SDMMC\_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATEND is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 5 – DATCRC Data CRC Error

This bit is set to '1' when detecting a CRC error during a transfer of read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.

This bit can only be set to '1' if SDMMC\_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATCRC is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 4 – DATTEO Data Timeout error

This bit is set to '1' when detecting one of following timeout conditions.

- Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00”).
- Busy timeout after Write CRC Status.
- Write CRC Status timeout.
- Read data timeout

This bit can only be set to '1' if SDMMC\_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.DATTEO is set to '1'.

Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 3 – CMDIDX Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.

This bit can only be set to '1' if SDMMC\_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDIDX is set to '1'.  
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 2 – CMDEND Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.  
This bit can only be set to '1' if SDMMC\_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDEND is set to '1'.  
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

#### Bit 1 – CMDCRC Command CRC Error

The Command CRC Error is generated in two cases.  
If a response is returned and Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.  
The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table "Relations between CMDCRC and CMDTEO").  
This bit can only be set to '1' if SDMMC\_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDCRC is set to '1'.  
Writing this bit to 1 clears the bit.

#### Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table "Relations between CMDCRC and CMDTEO", this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.  
This bit can only be set to '1' if SDMMC\_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC\_EISIER.CMDTEO is set to '1'.  
Writing this bit to '1' clears the bit.

CMDCRC	CMDTEO	Error Types
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

### 60.10.23.SDMMC Normal Interrupt Status Enable Register (SD\_SDIO)

**Name:** SDMMC\_NISTR (SD\_SDIO)  
**Offset:** 0x34  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
								CINT
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

#### Bit 8 – CINT Card Interrupt Status Enable

If this bit is set to 0, the SDMMC clears interrupt requests to the system. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. The user may clear this bit before servicing the Card Interrupt and may set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.

0 (MASKED): The CINT status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The CINT status flag in SDMMC\_NISTR is enabled.

#### Bit 5 – BRDRDY Buffer Read Ready Status Enable

0 (MASKED): The BRDRDY status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The BRDRDY status flag in SDMMC\_NISTR is enabled.

#### Bit 4 – BWRRDY Buffer Write Ready Status Enable

0 (MASKED): The BWRRDY status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The BWRRDY status flag in SDMMC\_NISTR is enabled.

#### Bit 3 – DMAINT DMA Interrupt Status Enable

0 (MASKED): The DMAINT status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The DMAINT status flag in SDMMC\_NISTR is enabled.

#### Bit 2 – BLKGE Block Gap Event Status Enable

0 (MASKED): The BLKGE status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The BLKGE status flag in SDMMC\_NISTR is enabled.

#### Bit 1 – TRFC Transfer Complete Status Enable

0 (MASKED): The TRFC status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The TRFC status flag in SDMMC\_NISTR is enabled.

#### Bit 0 – CMDC Command Complete Status Enable

0 (MASKED): The CMDC status flag in SDMMC\_NISTR is masked.

1 (ENABLED): The CMDC status flag in SDMMC\_NISTR is enabled.

## 60.10.24.SDMMC Normal Interrupt Status Enable Register (e.MMC)

**Name:** SDMMC\_NISTR (EMMC)  
**Offset:** 0x34  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
		BOOTAR						
Access		R/W						
Reset		0						

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

### Bit 14 – BOOTAR Boot Acknowledge Received Status Enable

0 (MASKED): The BOOTAR status flag in SDMMC\_NISTR is masked.  
1 (ENABLED): The BOOTAR status flag in SDMMC\_NISTR is enabled.

### Bit 5 – BRDRDY Buffer Read Ready Status Enable

0 (MASKED): The BRDRDY status flag in SDMMC\_NISTR is masked.  
1 (ENABLED): The BRDRDY status flag in SDMMC\_NISTR is enabled.

### Bit 4 – BWRRDY Buffer Write Ready Status Enable

0 (MASKED): The BWRRDY status flag in SDMMC\_NISTR is masked.  
1 (ENABLED): The BWRRDY status flag in SDMMC\_NISTR is enabled.

### Bit 3 – DMAINT DMA Interrupt Status Enable

0 (MASKED): The DMAINT status flag in SDMMC\_NISTR is masked.  
1 (ENABLED): The DMAINT status flag in SDMMC\_NISTR is enabled.

### Bit 2 – BLKGE Block Gap Event Status Enable

0 (MASKED): The BLKGE status flag in SDMMC\_NISTR is masked.  
1 (ENABLED): The BLKGE status flag in SDMMC\_NISTR is enabled.

### Bit 1 – TRFC Transfer Complete Status Enable

0 (MASKED): The TRFC status flag in SDMMC\_NISTR is masked.  
1 (ENABLED): The TRFC status flag in SDMMC\_NISTR is enabled.

### Bit 0 – CMDC Command Complete Status Enable

0 (MASKED): The CMDC status flag in SDMMC\_NISTR is masked.  
1 (ENABLED): The CMDC status flag in SDMMC\_NISTR is enabled.

## 60.10.25.SDMMC Error Interrupt Status Enable Register (SD\_SDIO)

**Name:** SDMMC\_EISTER (SD\_SDIO)  
**Offset:** 0x36  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
							ADMA	ACMD
Access							R/W	R/W
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bit 9 – ADMA ADMA Error Status Enable

0 (MASKED): The ADMA status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The ADMA status flag in SDMMC\_EISTR is enabled.

### Bit 8 – ACMD Auto CMD Error Status Enable

0 (MASKED): The ACMD status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The ACMD status flag in SDMMC\_EISTR is enabled.

### Bit 7 – CURLIM Current Limit Error Status Enable

0 (MASKED): The CURLIM status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The CURLIM status flag in SDMMC\_EISTR is enabled.

### Bit 6 – DATEND Data End Bit Error Status Enable

0 (MASKED): The DATEND status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The DATEND status flag in SDMMC\_EISTR is enabled.

### Bit 5 – DATCRC Data CRC Error Status Enable

0 (MASKED): The DATCRC status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The DATCRC status flag in SDMMC\_EISTR is enabled.

### Bit 4 – DATTEO Data Timeout Error Status Enable

0 (MASKED): The DATTEO status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The DATTEO status flag in SDMMC\_EISTR is enabled.

### Bit 3 – CMDIDX Command Index Error Status Enable

0 (MASKED): The CMDIDX status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The CMDIDX status flag in SDMMC\_EISTR is enabled.

### Bit 2 – CMDEND Command End Bit Error Status Enable

0 (MASKED): The CMDEND status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The CMDEND status flag in SDMMC\_EISTR is enabled.

### Bit 1 – CMDCRC Command CRC Error Status Enable

0 (MASKED): The CMDCRC status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The CMDCRC status flag in SDMMC\_EISTR is enabled.

**Bit 0 – CMDTEO** Command Timeout Error Status Enable

0 (MASKED): The CMDTEO status flag in SDMMC\_EISTR is masked.

1 (ENABLED): The CMDTEO status flag in SDMMC\_EISTR is enabled.

## 60.10.26.SDMMC Error Interrupt Status Enable Register (e.MMC)

**Name:** SDMMC\_EISTR (EMMC)  
**Offset:** 0x36  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
				BOOTAE			ADMA	ACMD
Access				R/W			R/W	R/W
Reset				0			0	0

Bit	7	6	5	4	3	2	1	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bit 12 – BOOTAE Boot Acknowledge Error Status Enable

0 (MASKED): The BOOTAE status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The BOOTAE status flag in SDMMC\_EISTR is enabled.

### Bit 9 – ADMA ADMA Error Status Enable

0 (MASKED): The ADMA status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The ADMA status flag in SDMMC\_EISTR is enabled.

### Bit 8 – ACMD Auto CMD Error Status Enable

0 (MASKED): The ACMD status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The ACMD status flag in SDMMC\_EISTR is enabled.

### Bit 7 – CURLIM Current Limit Error Status Enable

0 (MASKED): The CURLIM status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The CURLIM status flag in SDMMC\_EISTR is enabled.

### Bit 6 – DATEND Data End Bit Error Status Enable

0 (MASKED): The DATEND status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The DATEND status flag in SDMMC\_EISTR is enabled.

### Bit 5 – DATCRC Data CRC Error Status Enable

0 (MASKED): The DATCRC status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The DATCRC status flag in SDMMC\_EISTR is enabled.

### Bit 4 – DATTEO Data Timeout Error Status Enable

0 (MASKED): The DATTEO status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The DATTEO status flag in SDMMC\_EISTR is enabled.

### Bit 3 – CMDIDX Command Index Error Status Enable

0 (MASKED): The CMDIDX status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The CMDIDX status flag in SDMMC\_EISTR is enabled.

### Bit 2 – CMDEND Command End Bit Error Status Enable

0 (MASKED): The CMDEND status flag in SDMMC\_EISTR is masked.  
1 (ENABLED): The CMDEND status flag in SDMMC\_EISTR is enabled.

**Bit 1 – CMDCRC** Command CRC Error Status Enable

- 0 (MASKED): The CMDCRC status flag in SDMMC\_EISTR is masked.
- 1 (ENABLED): The CMDCRC status flag in SDMMC\_EISTR is enabled.

**Bit 0 – CMDTEO** Command Timeout Error Status Enable

- 0 (MASKED): The CMDTEO status flag in SDMMC\_EISTR is masked.
- 1 (ENABLED): The CMDTEO status flag in SDMMC\_EISTR is enabled.

## 60.10.27.SDMMC Normal Interrupt Signal Enable Register (SD\_SDIO)

**Name:** SDMMC\_NISIER (SD\_SDIO)  
**Offset:** 0x38  
**Reset:** 0x0000  
**Property:** Read/Write

Bit	15	14	13	12	11	10	9	8
								CINT
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

### Bit 8 – CINT Card Interrupt Signal Enable

0 (MASKED): No interrupt is generated when the CINT status rises in SDMMC\_NISTR.  
1 (ENABLED): An interrupt is generated when the CINT status rises in SDMMC\_NISTR.

### Bit 5 – BRDRDY Buffer Read Ready Signal Enable

0 (MASKED): No interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.  
1 (ENABLED): An interrupt is generated when the BRDRDY status rises in SDMMC\_NISTR.

### Bit 4 – BWRRDY Buffer Write Ready Signal Enable

0 (MASKED): No interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.  
1 (ENABLED): An interrupt is generated when the BWRRDY status rises in SDMMC\_NISTR.

### Bit 3 – DMAINT DMA Interrupt Signal Enable

0 (MASKED): No interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.  
1 (ENABLED): An interrupt is generated when the DMAINT status rises in SDMMC\_NISTR.

### Bit 2 – BLKGE Block Gap Event Signal Enable

0 (MASKED): No interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.  
1 (ENABLED): An interrupt is generated when the BLKGE status rises in SDMMC\_NISTR.

### Bit 1 – TRFC Transfer Complete Signal Enable

0 (MASKED): No interrupt is generated when the TRFC status rises in SDMMC\_NISTR.  
1 (ENABLED): An interrupt is generated when the TRFC status rises in SDMMC\_NISTR.

### Bit 0 – CMDC Command Complete Signal Enable

0 (MASKED): No interrupt is generated when the CMDC status rises in SDMMC\_NISTR.  
1 (ENABLED): An interrupt is generated when the CMDC status rises in SDMMC\_NISTR.

## 60.10.28.SDMMC Normal Interrupt Signal Enable Register (e.MMC)

**Name:** SDMMC\_NISIER (EMMC)  
**Offset:** 0x38  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
		BOOTAR						
Access		R/W						
Reset		0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bit 9 – ADMA ADMA Error Signal Enable

0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC\_EISTR.

### Bit 8 – ACMD Auto CMD Error Signal Enable

0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC\_EISTR.

### Bit 7 – CURLIM Current Limit Error Signal Enable

0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.

### Bit 6 – DATEND Data End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC\_EISTR.

### Bit 5 – DATCRC Data CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.

### Bit 4 – DATTEO Data Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.

### Bit 3 – CMDIDX Command Index Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

### Bit 2 – CMDEND Command End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

### Bit 1 – CMDCRC Command CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

**Bit 0 – CMDTEO** Command Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

### 60.10.30.SDMMC Error Interrupt Signal Enable Register (e.MMC)

**Name:** SDMMC\_EISIER (EMMC)  
**Offset:** 0x3A  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
				BOOTAE			ADMA	ACMD
Access				R/W			R/W	R/W
Reset				0			0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bit 12 – BOOTAE Boot Acknowledge Error Signal Enable

0 (MASKED): No interrupt is generated when the BOOTAE status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the BOOTAE status rises in SDMMC\_EISTR.

#### Bit 9 – ADMA ADMA Error Signal Enable

0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC\_EISTR.

#### Bit 8 – ACMD Auto CMD Error Signal Enable

0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC\_EISTR.

#### Bit 7 – CURLIM Current Limit Error Signal Enable

0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC\_EISTR.

#### Bit 6 – DATEND Data End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC\_EISTR.

#### Bit 5 – DATCRC Data CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC\_EISTR.

#### Bit 4 – DATTEO Data Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC\_EISTR.

#### Bit 3 – CMDIDX Command Index Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC\_EISTR.

#### Bit 2 – CMDEND Command End Bit Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.  
1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC\_EISTR.

**Bit 1 – CMDCRC** Command CRC Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC\_EISTR.

**Bit 0 – CMDTEO** Command Timeout Error Signal Enable

0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC\_EISTR.

### 60.10.31.SDMMC Auto CMD Error Status Register

**Name:** SDMMC\_ACESR  
**Offset:** 0x3C  
**Reset:** 0x0000  
**Property:** Read-only

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access	R			R	R	R	R	R
Reset	0			0	0	0	0	0

#### Bit 7 – CMDNI Command Not Issued by Auto CMD12 Error

This bit is set to 1 when CMD\_wo\_DAT is not executed due to an Auto CMD12 error (SDMMC\_ACESR[4:1]). This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

#### Bit 4 – ACMDIDX Auto CMD Index Error

This bit is set to 1 when the Command Index error occurs in response to a command.

Value	Description
0	No error.
1	Error.

#### Bit 3 – ACMDEND Auto CMD End Bit Error

This bit is set to 1 when detecting that the end bit of the command response is 0.

Value	Description
0	No error.
1	Error.

#### Bit 2 – ACMDCRC Auto CMD CRC Error

This bit is set to 1 when detecting a CRC error in the command response (see table [Relation between ACMDCRC and ACMDTEO](#) for more details).

#### Bit 1 – ACMDTEO Auto CMD Timeout Error

This bit is set to 1 if no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (SDMMC\_ACESR[4:2]) are meaningless.

**Table 60.4.** Relation between ACMDCRC and ACMDTEO

ACMDCRC	ACMDTEO	Error Types
0	0	No error
0	1	Response Timeout error
1	0	Response CRC error
1	1	CMD line conflict

**Bit 0 – ACMD12NE** Auto CMD12 Not Executed

If a memory multiple block data transfer is not started due to a command error, this bit is not set to 1 because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the SDMMC cannot issue Auto CMD12 to stop a memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (SDMMC\_ACESR[4:1]) are meaningless.

This bit is set to 0 when an Auto CMD error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

**60.10.32.SDMMC Host Control 2 Register (SD\_SDIO)**

**Name:** SDMMC\_HC2R (SD\_SDIO)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
	PVALEN	ASINTEN						
Access	R/W	R/W						
Reset	0	0						

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bit 15 – PVALEN** Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When PVALEN is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR. If this bit is set to 0, SDMMC\_CCR.SDCLKFSEL and SDMMC\_CCR.CLKGSEL are set by the user. If this bit is set to 1, SDMMC\_CCR.SDCLKFSEL and SDMMC\_CCR.CLKGSEL are set by the SDMMC as specified in SDMMC\_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

**Bit 14 – ASINTEN** Asynchronous Interrupt Enable

This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support (ASINTSUP) is set to 1 in SDMMC\_CA0R. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode. If this bit is set to 1, the user can stop the SDCLK during the asynchronous interrupt period to save power. During this period, the SDMMC continues to deliver the Card Interrupt to the host when it is asserted by the card.

Value	Description
0	Disabled
1	Enabled

60.10.33.SDMMC Host Control 2 Register (e.MMC)

**Name:** SDMMC\_HC2R (EMMC)  
**Offset:** 0x3E  
**Reset:** 0x0000  
**Property:** Read/Write

**Note:** This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	PVALEN							
Access	R/W							
Reset	0							

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bit 15 – PVALEN** Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When Preset Value Enable (PVALEN) is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC\_PVR.

If this bit is set to 0, SDMMC\_CCR.SDCLKFSEL and SDMMC\_CCR.CLKGSEL are set by the user.

If this bit is set to 1, SDMMC\_CCR.SDCLKFSEL and SDMMC\_CCR.CLKGSEL are set by the SDMMC as specified in SDMMC\_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

**60.10.34.SDMMC Capabilities 0 Register**

**Name:** SDMMC\_CA0R  
**Offset:** 0x40  
**Reset:** 0x27E832B2  
**Property:** Read/Write

**Note:** The reset values match the capabilities of the MPU alone. The user should adjust the capability registers so that they also match the board design. Modify preset values only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC\_CACR.

Bit	31	30	29	28	27	26	25	24
	SLTYPE[1:0]		ASINTSUP	SB64SUP		V18VSUP	V30VSUP	V33VSUP
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	1	0		1	1	1

Bit	23	22	21	20	19	18	17	16
	SRSUP	SDMASUP	HSSUP		ADMA2SUP	ED8SUP	MAXBLKL[1:0]	
Access	R	R	R		R	R	R	R
Reset	1	1	1		1	0	0	0

Bit	15	14	13	12	11	10	9	8
	BASECLKF[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	1	0	0	1	0

Bit	7	6	5	4	3	2	1	0
	TEOCLKU		TEOCLKF[5:0]					
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	1		1	1	0	0	1	0

**Bits 31:30 – SLTYPE[1:0] Slot Type**

Indicates usage of a slot by a specific system. An SDMMC control register set is defined per slot. Embedded Slot for One Device means that only one nonremovable device is connected to a bus slot. The Standard Host Driver controls a removable card (SLTYPE = 0) or one embedded device (SLTYPE = 1) connected to an SD bus slot.

Value	Name	Description
0	REMOVABLECARD	Removable Card Slot
1	EMBEDDED	Embedded Slot for One Device
2	–	Reserved
3	–	Reserved

**Bit 29 – ASINTSUP Asynchronous Interrupt Support**

See section “Asynchronous Interrupt” in the “SDIO Simplified Specification V3.00” .

Value	Description
0	Asynchronous interrupt not supported
1	Asynchronous interrupt supported

**Bit 28 – SB64SUP 64-Bit System Bus Support**

Reading this bit to 1 means that the SDMMC supports the 64-bit Address Descriptor mode and is connected to the 64-bit address system bus.

Value	Description
0	64-bit address bus not supported

Value	Description
1	64-bit address bus supported

**Bit 26 – V18VSUP** Voltage Support 1.8V

Value	Description
0	1.8V voltage supply not supported
1	1.8V voltage supply supported

**Bit 25 – V30VSUP** Voltage Support 3.0V

Value	Description
0	3.0V voltage supply not supported
1	3.0V voltage supply supported

**Bit 24 – V33VSUP** Voltage Support 3.3V

Value	Description
0	3.3V voltage supply not supported
1	3.3V voltage supply supported

**Bit 23 – SRSUP** Suspend/Resume Support (read-only)

Indicates whether the SDMMC supports the Suspend/Resume functionality. If set to 0, the user does not issue either Suspend or Resume commands because the Suspend and Resume mechanism (see “Suspend and Resume Mechanism” in the “SD Host Controller Simplified Specification V3.00” ) is not supported.

Value	Description
0	Suspend/Resume not supported
1	Suspend/Resume supported

**Bit 22 – SDMASUP** SDMA Support (read-only)

Indicates whether the SDMMC is capable of using SDMA to transfer data between system memory and the SDMMC directly.

Value	Description
0	SDMA not supported
1	SDMA supported

**Bit 21 – HSSUP** High Speed Support (read-only)

Indicates whether the SDMMC and the system support High Speed mode and they can supply SDCLK frequency from 25 MHz to 50 MHz.

Value	Description
0	High Speed not supported
1	High Speed supported

**Bit 19 – ADMA2SUP** ADMA2 Support (read-only)

Indicates whether the SDMMC is capable of using ADMA2.

Value	Description
0	ADMA2 not supported
1	ADMA2 supported

**Bit 18 – ED8SUP** 8-Bit Support for Embedded Device (read-only)

Indicates whether the SDMMC is capable of using the 8-bit bus width mode.

Value	Description
0	8-bit bus width not supported

Value	Description
1	8-bit bus width supported

**Bits 17:16 – MAXBLKL[1:0]** Max Block Length (read-only)

Indicates the maximum block size that the user can read and write to the buffer in the SDMMC. Three sizes can be defined, as shown below. It is noted that the transfer block length is always 512 bytes for SD Memory Cards regardless of this field.

Value	Name	Description
0	512	512 bytes
1	1024	1024 bytes
2	2048	2048 bytes
3	NONE	Reserved

**Bits 15:8 – BASECLKF[7:0]** Base Clock Frequency

Indicates the frequency of the base clock (BASECLK). The user uses this value to calculate the clock divider value (see SDCLK Frequency Select (SDCLKFSEL) in SDMMC\_CCR).

If this field is set to 0, the user must get the information via another method.

$$f_{\text{BASECLK}} = \text{BASECLKF}_{\text{MHz}}$$

**Bit 7 – TEOCLKU** Timeout Clock Unit

Indicates the unit of the base clock frequency used to detect Data Timeout Error.

Value	Description
0	KHz
1	MHz

**Bits 5:0 – TEOCLKF[5:0]** Timeout Clock Frequency

Shows the timeout clock frequency (TEOCLK) used to detect Data Timeout Error.

If set to 0, the user must get the information via another method.

The Timeout Clock Unit (TEOCLKU) defines the unit of this field's value.

– TEOCLKU = 0:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{KHz}}$

– TEOCLKU = 1:  $f_{\text{TEOCLK}} = \text{TEOCLKF}_{\text{MHz}}$

## 60.10.35.SDMMC Capabilities 1 Register

**Name:** SDMMC\_CA1R  
**Offset:** 0x44  
**Reset:** 0x00010070  
**Property:** Read/Write

**Note:** The reset values match the capabilities of the MPU alone. The user should adjust the capability registers so that they also match the board design. Modify preset values only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC\_CACR.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	CLKMULT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		DRVDSUP	DRVCSUP	DRVASUP		DDR50SUP	SDR104SUP	SDR50SUP
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		1	1	1		0	0	0

### Bits 23:16 – CLKMULT[7:0] Clock Multiplier

This field indicates the multiplier factor between the Base Clock (BASECLK) used for the Divided Clock Mode and the Multiplied Clock (MULTCLK) used for the Programmable Clock mode (see SDMMC\_CCR).

Reading this field to 0 means that the Programmable Clock mode is not supported.

$$f_{\text{MULTCLK}} = f_{\text{BASECLK}} \times (\text{CLKMULT} + 1)$$

### Bit 6 – DRVDSUP Driver Type D Support

Value	Description
0	Driver type D is not supported.
1	Driver type D is supported.

### Bit 5 – DRVCSUP Driver Type C Support

Value	Description
0	Driver type C is not supported.
1	Driver type C is supported.

### Bit 4 – DRVASUP Driver Type A Support

Value	Description
0	Driver type A is not supported.
1	Driver type A is supported.

## Bit 2 – DDR50SUP DDR50 Support

Value	Description
0	DDR50 mode is not supported.
1	DDR50 mode is supported.

## Bit 1 – SDR104SUP SDR104 Support

Value	Description
0	SDR104 mode is not supported.
1	SDR104 mode is supported.

## Bit 0 – SDR50SUP SDR50 Support

Value	Description
0	SDR50 mode is not supported.
1	SDR50 mode is supported.

## 60.10.36.SDMMC Maximum Current Capabilities Register

**Name:** SDMMC\_MCCAR  
**Offset:** 0x48  
**Reset:** 0x00000000  
**Property:** Read/Write

**Note:** The user should adjust the Maximum Current Capabilities register so that it matches board design. The preset values can be modified only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC\_CACR.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	MAXCUR18V[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access	MAXCUR30V[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Access	MAXCUR33V[7:0]							
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 23:16 – MAXCUR18V[7:0] Maximum Current for 1.8V

This field indicates the maximum current capability for 1.8V voltage. This value is meaningful only if V18VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR18V at 0 means that the user must get information via another method.

$$I_{\max_{mA}} = 4 \times \text{MAXCURR18V}$$

### Bits 15:8 – MAXCUR30V[7:0] Maximum Current for 3.0V

This field indicates the maximum current capability for 3.0V voltage. This value is meaningful only if V30VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR30V at 0 means that the user must get information via another method.

$$I_{\max_{mA}} = 4 \times \text{MAXCURR30V}$$

### Bits 7:0 – MAXCUR33V[7:0] Maximum Current for 3.3V

This field indicates the maximum current capability for 3.3V voltage. This value is meaningful only if V33VSUP is set to 1 in SDMMC\_CA0R. Reading MAXCUR33V at 0 means that the user must get information via another method.

$$I_{\max_{mA}} = 4 \times \text{MAXCURR33V}$$

## 60.10.37.SDMMC Force Event Register for Auto CMD Error Status

**Name:** SDMMC\_FERACES  
**Offset:** 0x50  
**Reset:** –  
**Property:** Write-only

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	CMDNI			ACMDIDX	ACMDEND	ACMDCRC	ACMDTEO	ACMD12NE
Access	W			W	W	W	W	W
Reset	–			–	–	–	–	–

### Bit 7 – CMDNI Force Event for Command Not Issued by Auto CMD12 Error

For test purposes, the user can write this bit to 1 to raise the CMDNI status flag in SDMMC\_ACESR. Writing this bit to 0 has no effect.

### Bit 4 – ACMDIDX Force Event for Auto CMD Index Error

For test purposes, the user can write this bit to 1 to raise the ACMDIDX status flag in SDMMC\_ACESR. Writing this bit to 0 has no effect.

### Bit 3 – ACMDEND Force Event for Auto CMD End Bit Error

For test purposes, the user can write this bit to 1 to raise the ACMDEND status flag in SDMMC\_ACESR. Writing this bit to 0 has no effect.

### Bit 2 – ACMDCRC Force Event for Auto CMD CRC Error

For test purposes, the user can write this bit to 1 to raise the ACMDCRC status flag in SDMMC\_ACESR. Writing this bit to 0 has no effect.

### Bit 1 – ACMDTEO Force Event for Auto CMD Timeout Error

For test purposes, the user can write this bit to 1 to raise the ACMDTEO status flag in SDMMC\_ACESR. Writing this bit to 0 has no effect.

### Bit 0 – ACMD12NE Force Event for Auto CMD12 Not Executed

For test purposes, the user can write this bit to 1 to raise the ACMD12NE status flag in SDMMC\_ACESR. Writing this bit to 0 has no effect.

## 60.10.38.SDMMC Force Event Register for Error Interrupt Status

**Name:** SDMMC\_FEREIS  
**Offset:** 0x52  
**Reset:** –  
**Property:** Write-only

Bit	15	14	13	12	11	10	9	8
				BOOTAE			ADMA	ACMD
Access				W			W	W
Reset				–			–	–

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 12 – BOOTAE** Force Event for Boot Acknowledge Error  
For test purposes, the user can write this bit to 1 to raise the BOOTAE status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 9 – ADMA** Force Event for ADMA Error  
For test purposes, the user can write this bit to 1 to raise the ADMA status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 8 – ACMD** Force Event for Auto CMD Error  
For test purposes, the user can write this bit to 1 to raise the ACMD status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 7 – CURLIM** Force Event for Current Limit Error  
For test purposes, the user can write this bit to 1 to raise the CURLIM status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 6 – DATEND** Force Event for Data End Bit Error  
For test purposes, the user can write this bit to 1 to raise the DATEND status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 5 – DATCRC** Force Event for Data CRC error  
For test purposes, the user can write this bit to 1 to raise the DATCRC status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 4 – DATTEO** Force Event for Data Timeout error  
For test purposes, the user can write this bit to 1 to raise the DATTEO status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 3 – CMDIDX** Force Event for Command Index Error  
For test purposes, the user can write this bit to 1 to raise the CMDIDX status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 2 – CMDEND** Force Event for Command End Bit Error  
For test purposes, the user can write this bit to 1 to raise the CDMEND status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 1 – CMDCRC** Force Event for Command CRC Error

For test purposes, the user can write this bit to 1 to raise the CMDCRC status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

**Bit 0 – CMDTEO** Force Event for Command Timeout Error

For test purposes, the user can write this bit to 1 to raise the CMDTEO status flag in SDMMC\_EISTR.  
Writing this bit to 0 has no effect.

## 60.10.39.SDMMC ADMA Error Status Register

**Name:** SDMMC\_AESR  
**Offset:** 0x54  
**Reset:** 0x00  
**Property:** Read-only

Bit	7	6	5	4	3	2	1	0
						LMIS	ERRST[1:0]	
Access						R	R	R
Reset						0	0	0

### Bit 2 – LMIS ADMA Length Mismatch Error

This error occurs in the following two cases:

- While Block Count Enable (BCEN) is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count (BLKCNT) and Transfer Block Size (BLKSIZE).
- The total data length cannot be divided by the Transfer Block Size (BLKSIZE).

Value	Description
0	No error
1	Error

### Bits 1:0 – ERRST[1:0] ADMA Error State

This field indicates the state of ADMA when an error has occurred during an ADMA data transfer. This field never reads 2 because ADMA never stops in this state.

Value	Name	Description
0	STOP	(Stop DMA) SDMMC_ASAR points to the descriptor following the error descriptor
1	FDS	(Fetch Descriptor) SDMMC_ASAR points to the error descriptor
2	–	(Not used)
3	TFR	(Transfer Data) SDMMC_ASAR points to the descriptor following the error descriptor

**60.10.40.SDMMC ADMA System Address Register 0**

**Name:** SDMMC\_ASAR0  
**Offset:** 0x58  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	ADMASA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ADMASA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	ADMASA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ADMASA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – ADMASA[31:0] ADMA System Address**

This field holds the byte address of the executing command of the descriptor table. The 32-bit address descriptor uses SDMMC\_ASAR. At the start of ADMA, the user must set the start address of the descriptor table. The ADMA increments this register address, which points to the next Descriptor line to be fetched.

When the ADMA Error (ADMA) status flag rises, this field holds a valid descriptor address depending on the ADMA Error State (ERRST). The user must program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores the lower 2 bits of this register and assumes it to be 0.

**60.10.41.SDMMC Preset Value Register**

**Name:** SDMMC\_PVRx  
**Offset:** 0x60 + x\*0x02 [x=0..3]  
**Reset:** 0x0000  
**Property:** Read/Write

One of the Preset Value registers is effective based on the selected bus speed mode. The table below defines the conditions to select one of the SDMMC\_PVRs.

**Table 60.5.** Preset Value Register Select Condition

Selected Bus Speed Mode	HSEN (SDMMC_HC1R)
Default Speed	0
High Speed	1

The table below shows the effective Preset Value Register according to the Selected Bus Speed mode.

**Table 60.6.** Preset Value Registers

SDMMC_PVRx	Selected Bus Speed Mode	Signal Voltage
SDMMC_PVR0	Initialization	3.3V
SDMMC_PVR1	Default Speed	3.3V
SDMMC_PVR2	High Speed	3.3V

When Preset Value Enable (PVALEN) in SDMMC\_HC2R is set to 1, SDCLK Frequency Select (SDCLKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC\_CCR are automatically set based on the Selected Bus Speed mode. This means that the user does not need to set these fields when preset is enabled. A Preset Value Register for Initialization (SDMMC\_PVR0) is not selected by Bus Speed mode. Before starting the initialization sequence, the user needs to set a clock preset value to SDCLKFSEL in SDMMC\_CCR. PVALEN can be set to 1 after the initialization is completed.

Bit	15	14	13	12	11	10	9	8
						CLKGSEL	SDCLKFSEL[9:8]	
Access						R/W	R/W	R/W
Reset						0	0	0
Bit	7	6	5	4	3	2	1	0
	SDCLKFSEL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 10 – CLKGSEL** Clock Generator Select  
 See CLKGSEL in [SDMMC\\_CCR](#).

**Bits 9:0 – SDCLKFSEL[9:0]** SDCLK Frequency Select  
 See SDCLKFSEL in [SDMMC\\_CCR](#).

60.10.42.SDMMC Slot Interrupt Status Register

**Name:** SDMMC\_SISR  
**Offset:** 0xFC  
**Reset:** 0x0000  
**Property:** Read-only

**Bits 1:0 – INTSSL[1:0]** Interrupt Signal for Each Slot  
These status bits indicate the logical OR of Interrupt Signals and Wake-up Signal for each SDMMC instance in the product (INTSSL[x] corresponds to SDMMCx instance in the product).

## 60.10.43.SDMMC Host Controller Version Register

**Name:** SDMMC\_HCVR  
**Offset:** 0xFE  
**Reset:** 0x1802  
**Property:** Read-only

Bit	15	14	13	12	11	10	9	8
	VVER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	1	0	0	0
Bit	7	6	5	4	3	2	1	0
	SVER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	1	0

### Bits 15:8 – VVER[7:0] Vendor Version Number

Reserved. Value subject to change. No functionality associated. This is the internal version of the module.

### Bits 7:0 – SVER[7:0] Specification Version Number

This status indicates the SD Host Controller Specification Version.

Value	Name
0	SD Host Specification Version 1.00
1	SD Host Specification Version 2.00, including the feature of the ADMA and Test Register
2	SD Host Specification Version 3.00

60.10.44.SDMMC Additional Present State Register

**Name:** SDMMC\_APSR  
**Offset:** 0x200  
**Reset:** –  
**Property:** Read-only

Register reset value:

Instance	Reset Value
SDMMC0, SDMMC1	0x0000000F

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					HDATLL[3:0]			
Access					R	R	R	R
Reset					–	–	–	–

**Bits 3:0 – HDATLL[3:0]** DAT[7:4] High Line Level  
This status is used to check the DAT[7:4] line level to recover from errors, and for debugging.

**60.10.45.SDMMC e.MMC Control 1 Register**

**Name:** SDMMC\_MC1R  
**Offset:** 0x204  
**Reset:** 0x00  
**Property:** Read/Write

Bit	7	6	5	4	3	2	1	0
			BOOTA	OPD	DDR		CMDTYP[1:0]	
Access			R/W	R/W	R/W		R/W	R/W
Reset			0	0	0		0	0

**Bit 5 – BOOTA** e.MMC Boot Acknowledge Enable

This bit must be set according to the value of BOOT\_ACK in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

When this bit is set to 1, the SDMMC waits for boot acknowledge pattern from the e.MMC before receiving boot data.

If the boot acknowledge pattern is wrong, the BOOTAE status flag rises in SDMMC\_EISTR if BOOTAE is set in SDMMC\_EISTER. An interrupt is generated if BOOTAE is set in SDMMC\_EISIER.

If the no boot acknowledge pattern is received, the DATTEO status flag rises in SDMMC\_EISTR if DATTEO is set in SDMMC\_EISTER. An interrupt is generated if DATTEO is set in SDMMC\_EISIER.

**Bit 4 – OPD** e.MMC Open Drain Mode

This bit sets the command line in open drain.

Value	Description
0	The command line is in push-pull.
1	The command line is in open drain.

**Bit 3 – DDR** e.MMC HSDDR Mode

This bit selects the High Speed DDR mode.

The clock divider (DIV) in SDMMC\_CCR must be set to a value different from 0 when DDR is 1.

Value	Description
0	High Speed DDR is not selected.
1	High Speed DDR is selected.

**Bits 1:0 – CMDTYP[1:0]** e.MMC Command Type

Value	Name	Description
0	NORMAL	The command is not an e.MMC specific command.
1	WAITIRQ	This bit must be set to 1 when the e.MMC is in Interrupt mode (CMD40). See “Interrupt Mode” in the “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”.
2	STREAM	This bit must be set to 1 in the case of Stream Read (CMD11) or Stream Write (CMD20). Only effective for e.MMC up to revision 4.41.
3	BOOT	Starts a Boot Operation mode at the next write to SDMMC_CR. Boot data are read directly from e.MMC device.

## 60.10.46.SDMMC e.MMC Control 2 Register

**Name:** SDMMC\_MC2R  
**Offset:** 0x205  
**Reset:** –  
**Property:** Write-only

Bit	7	6	5	4	3	2	1	0
							ABOOT	SRESP
Access							W	W
Reset							–	–

### Bit 1 – ABOOT e.MMC Abort Boot

This bit is used to exit from Boot mode. Writing this bit to 1 exits the Boot Operation mode. Writing 0 is ignored.

### Bit 0 – SRESP e.MMC Abort Wait IRQ

This bit is used to exit from the Interrupt mode. When this bit is written to 1, the SDMMC sends the CMD40 response automatically. This brings the e.MMC from Interrupt mode to the standard Data Transfer mode. Writing this bit to 0 is ignored.

This bit is only effective when CMD\_TYP in SDMMC\_MC1R is set to WAITIRQ.

60.10.47.SDMMC AHB Control Register

**Name:** SDMMC\_ACR  
**Offset:** 0x208  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bits 1:0 – BMAX[1:0]** AHB Maximum Burst  
This field selects the maximum burst size in case of DMA transfer.

Value	Name	Description
0	INCR16	The maximum burst size is INCR16.
1	INCR8	The maximum burst size is INCR8.
2	INCR4	The maximum burst size is INCR4.
3	SINGLE	Only SINGLE transfers are performed.

60.10.48.SDMMC Clock Control 2 Register

**Name:** SDMMC\_CC2R  
**Offset:** 0x20C  
**Reset:** 0x00000000  
**Property:** Read/Write

**Bit 0 – FSDCLKD** Force SDCLK Disabled

The user can choose to maintain the SDCLK during 8 SDCLK cycles after the end bit of the last data block in case of a read transaction, or after the end bit of the CRC status in case of a write transaction.

Value	Description
0	The SDCLK is forced and it cannot be stopped immediately after the transaction.
1	The SDCLK is not forced and it can be stopped immediately after the transaction.

## 60.10.49.SDMMC Capabilities Control Register

**Name:** SDMMC\_CACR  
**Offset:** 0x230  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	KEY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
								CAPWREN
Access								R/W
Reset								0

### Bits 15:8 – KEY[7:0] Key

Value	Name	Description
0x46	KEY	Writing any other value in this field aborts the write operation of the CAPWREN bit. Always reads as 0.

### Bit 0 – CAPWREN Capabilities Write Enable

This bit can only be written if the value of KEY corresponds to 0x46.

Value	Description
0	Capabilities registers (SDMMC_CA0R, SDMMC_CA1R and SDMMC_CA1R) cannot be written.
1	Capabilities registers (SDMMC_CA0R, SDMMC_CA1R and SDMMC_CA1R) can be written.

60.10.50.SDMMC Debug Register

**Name:** SDMMC\_DBGR  
**Offset:** 0x234  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								NIDBG
Access								R/W
Reset								0

**Bit 0 – NIDBG** Nonintrusive Debug  
0 (DISABLED): Reading the SDMMC\_BDPR via debugger increments the dual port RAM read pointer.  
1 (ENABLED): Reading the SDMMC\_BDPR via debugger does not increment the dual port RAM read pointer.

## 61. Controller Area Network (CAN)

### 61.1. Description

The CAN controller provides all the features required to implement the serial communication protocol CAN defined by Robert Bosch GmbH, the CAN specification as referred to by ISO/11898A (2.0 Part A and 2.0 Part B) for high speeds and ISO/11519-2 for low speeds. The CAN controller is able to handle all types of frames (Data, Remote, Error and Overload) and achieves a bitrate of 1 Mbit/s.

CAN controller accesses are made through configuration registers. 8 independent message objects (mailboxes) are implemented.

Any mailbox can be programmed as a reception buffer block (even non-consecutive buffers). For the reception of defined messages, one or several message objects can be masked without participating in the buffer feature. An interrupt is generated when the buffer is full. According to the mailbox configuration, the first message received can be locked in the CAN controller registers until the application acknowledges it, or this message can be discarded by new received messages.

Any mailbox can be programmed for transmission. Several transmission mailboxes can be enabled in the same time. A priority can be defined for each mailbox independently.

An internal 16-bit timer is used to stamp each received and sent message. This timer starts counting as soon as the CAN controller is enabled. This counter can be reset by the application or automatically after a reception in the last mailbox in Time-triggered mode.

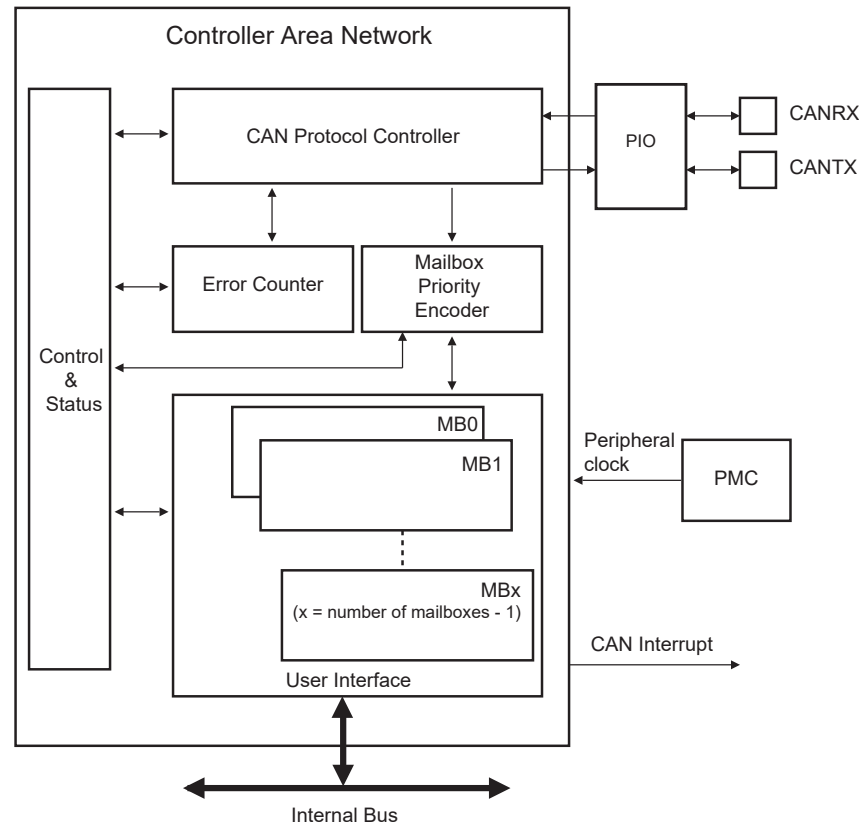

The CAN controller offers optimized features to support the Time-Triggered Communication (TTC) protocol.

### 61.2. Embedded Characteristics

- Fully Compliant with CAN 2.0 Part A and 2.0 Part B
- Bit Rates up to 1 Mbit/s
- 8 Object Oriented Mailboxes with the Following Properties:
  - CAN Specification 2.0 Part A or 2.0 Part B Programmable for Each Message
  - Object Configurable in Receive (with Overwrite or Not) or Transmit Modes
  - Independent 29-bit Identifier and Mask Defined for Each Mailbox
  - 32-bit Access to Data Registers for Each Mailbox Data Object
  - Uses a 16-bit Timestamp on Receive and Transmit Messages
  - Hardware Concatenation of ID Masked Bitfields To Speed Up Family ID Processing
- 16-bit Internal Timer for Timestamping and Network Synchronization
- Programmable Reception Buffer Length up to 8 Mailbox Objects
- Priority Management between Transmission Mailboxes
- Autobaud and Listening Mode
- Low-power Mode and Programmable Wake-up on Bus Activity or by the Application
- Data, Remote, Error and Overload Frame Handling
- Register Write Protection

61.3. Block Diagram

Figure 61.1. CAN Block Diagram

61.4. Application Block Diagram

Figure 61.2. CAN Application Block Diagram

61.5. I/O Lines Description

Table 61.1. I/O Lines Description

Name	Description	Type
CANRX	CAN Receive Serial Data	Input
CANTX	CAN Transmit Serial Data	Output

## 61.6. Product Dependencies

### 61.6.1. I/O Lines

The pins used for interfacing the CAN may be multiplexed with the PIO lines. The programmer must first program the PIO controller to assign the desired CAN pins to their peripheral function. If I/O lines of the CAN are not used by the application, they can be used for other purposes by the PIO Controller.

### 61.6.2. Power Management

The programmer must first enable the CAN clock in the Power Management Controller (PMC) before using the CAN.

A Low-power mode is defined for the CAN controller. If the application does not require CAN operations, the CAN clock can be stopped when not needed and be restarted later. Before stopping the clock, the CAN controller must be in Low-power mode to complete the current transfer. After restarting the clock, the application must disable the Low-power mode of the CAN controller.

### 61.6.3. Interrupt Sources

The CAN interrupt line is connected on one of the internal sources of the interrupt controller. Using the CAN interrupt requires the interrupt controller to be programmed first. Note that it is not recommended to use the CAN interrupt line in edge-sensitive mode.

## 61.7. CAN Controller Features

### 61.7.1. CAN Protocol Overview

The Controller Area Network (CAN) is a multi-host serial communication protocol that efficiently supports real-time control with a very high level of security with bit rates up to 1 Mbit/s.

The CAN protocol supports four different frame types:

- Data frames: They carry data from a transmitter node to the receiver nodes. The overall maximum data frame length is 108 bits for a standard frame and 128 bits for an extended frame.
- Remote frames: A destination node can request data from the source by sending a remote frame with an identifier that matches the identifier of the required data frame. The appropriate data source node then sends a data frame as a response to this node request.
- Error frames: An error frame is generated by any node that detects a bus error.
- Overload frames: They provide an extra delay between the preceding and the successive data frames or remote frames.

The CAN controller provides the CPU with full functionality of the CAN protocol V2.0 Part A and V2.0 Part B. It minimizes the CPU load in communication overhead. The Data Link Layer and part of the physical layer are automatically handled by the CAN controller itself.

The CPU reads or writes data or messages via the CAN controller mailboxes. An identifier is assigned to each mailbox. The CAN controller encapsulates or decodes data messages to build or to decode bus data frames. Remote frames, error frames and overload frames are automatically handled by the CAN controller under supervision of the software application.

### 61.7.2. Mailbox Organization

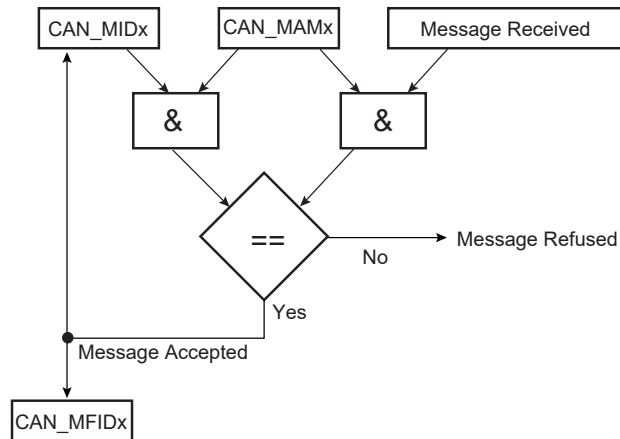

The CAN module has 8 buffers, also called channels or mailboxes. An identifier that corresponds to the CAN identifier is defined for each active mailbox. Message identifiers can match the standard frame identifier or the extended frame identifier. This identifier is defined for the first time during the CAN initialization, but can be dynamically reconfigured later so that the mailbox can handle a new message family. Several mailboxes can be configured with the same ID.

Each mailbox can be configured in Receive or in Transmit mode independently. The mailbox object type is defined in the MOT field of the Message Mode register (CAN\_MMRx).

### 61.7.2.1.Message Acceptance Procedure

If the MIDE field in the Message ID register (CAN\_MIDx) is set, the mailbox can handle the extended format identifier; otherwise, the mailbox handles the standard format identifier. Once a new message is received, its ID is masked with the Message Acceptance Mask register (CAN\_MAMx) value and compared with the CAN\_MIDx value. If accepted, the message ID is copied to CAN\_MIDx.

### Figure 61.3. Message Acceptance Procedure

If a mailbox is dedicated to receiving several messages (a family of messages) with different IDs, the acceptance mask defined in CAN\_MAMx must mask the variable part of the ID family. Once a message is received, the application must decode the masked bits in CAN\_MIDx. To speed up the decoding, masked bits are grouped in the Message Family ID register (CAN\_MFIDx).

For example, if the following message IDs are handled by the same mailbox:

ID0	101000100100010010000100	0	11	00b
ID1	101000100100010010000100	0	11	01b
ID2	101000100100010010000100	0	11	10b
ID3	101000100100010010000100	0	11	11b
ID4	101000100100010010000100	1	11	00b
ID5	101000100100010010000100	1	11	01b
ID6	101000100100010010000100	1	11	10b
ID7	101000100100010010000100	1	11	11b

The CAN\_MIDx and CAN\_MAMx of Mailbox x must be initialized to the corresponding values:

```
CAN_MIDx = 001 101000100100010010000100 x 11 xxb
CAN_MAMx = 001 111111111111111111111111 0 11 00b
```

If Mailbox x receives a message with ID6, then CAN\_MIDx and CAN\_MFIDx are set:

```
CAN_MIDx = 001 101000100100010010000100 1 11 10b  
CAN_MFIDx = 00000000000000000000000000000110b
```

If the application associates a handler for each message ID, it may define an array of pointers to functions:

```
void (*pHandler[8]) (void);
```

When a message is received, the corresponding handler can be invoked using CAN\_MFIDx and there is no need to check masked bits:

```
unsigned int MFID0_register;
MFID0_register = Get_CAN_MFID0_Register();
// Get_CAN_MFID0_Register() returns the value of the CAN_MFID0 register
pHandler[MFID0_register]();
```

### 61.7.2.2. Receive Mailbox

When the CAN module receives a message, it looks for the first available mailbox with the lowest number and compares the received message ID with the mailbox ID. If such a mailbox is found, then the message is stored in its data registers. Depending on the configuration, the mailbox is disabled as long as the message has not been acknowledged by the application (Receive only), or, if new messages with the same ID are received, then they overwrite the previous ones (Receive with Overwrite).

It is also possible to configure a mailbox in Consumer mode. In this mode, after each transfer request, a remote frame is automatically sent. The first answer received is stored in the corresponding mailbox data registers.

Several mailboxes can be chained to receive a buffer. They must be configured with the same ID in Receive mode, except for the last one, which can be configured in Receive with Overwrite mode. The last mailbox can be used to detect a buffer overflow.

**Table 61.2.** Receive Mailbox Objects

Object Type	Description
Receive	The first message received is stored in mailbox data registers. Data remain available until the next transfer request.
Receive with Overwrite	The last message received is stored in mailbox data register. The next message always overwrites the previous one. The application has to check whether a new message has not overwritten the current one while reading the data registers.
Consumer	A remote frame is sent by the mailbox. The answer received is stored in mailbox data register. This extends Receive mailbox features. Data remain available until the next transfer request.

### 61.7.2.3. Transmit Mailbox

When transmitting a message, the message length and data are written to the transmit mailbox with the correct identifier. For each transmit mailbox, a priority is assigned. The controller automatically sends the message with the highest priority first (set in the CAN\_MMRx.PRIOR field).

It is also possible to configure a mailbox in Producer mode. In this mode, when a remote frame is received, the mailbox data are sent automatically. By enabling this mode, a producer can be done using only one mailbox instead of two: one to detect the remote frame and one to send the answer.

**Table 61.3.** Transmit Mailbox Objects

Object Type	Description
Transmit	The message stored in the mailbox data registers will try to win the bus arbitration immediately or later according to the Time Management Unit configuration (see <a href="#">Time Management Unit</a> ). The application is notified that the message has been sent or aborted.
Producer	The message prepared in the mailbox data registers will be sent after receiving the next remote frame. This extends transmit mailbox features.

### 61.7.3. Time Management Unit

The CAN controller integrates a free-running 16-bit internal timer. The counter is driven by the bit clock of the CAN bus line. It is enabled when the CAN controller is enabled (CANEN set in the Mode register CAN\_MR). It is automatically cleared in the following cases:

- After a reset

- When the CAN controller Low-power mode is enabled (LPM bit set in CAN\_MR and SLEEP bit set in Status register CAN\_SR)
- After a reset of the CAN controller (CAN\_MR.CANEN)
- In Time-triggered mode, when a message is accepted by the last mailbox (rising edge of the MRDY signal in the Message Status register CAN\_MSR<sub>last\_mailbox\_number</sub>).

The application can also reset the internal timer by setting TIMRST in the Transfer Command register (CAN\_TCR). The current value of the internal timer is always accessible by reading the Timer register (CAN\_TIM).

When the timer rolls over from FFFFh to 0000h, the TOVF (Timer Overflow) signal in CAN\_SR is set. The CAN\_SR.TOVF bit is cleared by reading CAN\_SR. Depending on the corresponding interrupt mask in the Interrupt Mask register (CAN\_IMR), an interrupt is generated while TOVF is set.

In a CAN network, some CAN devices may have a larger counter. In this case, the application can also decide to freeze the internal counter when the timer reaches FFFFh and to wait for a restart condition from another device. This feature is enabled by setting the CAN\_MR.TIMFRZ bit. CAN\_TIM is frozen to the FFFFh value. A clear condition described above restarts the timer. A timer overflow (TOVF) interrupt is triggered.

To monitor the CAN bus activity, CAN\_TIM is copied to the Timestamp register (CAN\_TIMESTP) after each start of frame or end of frame and a TSTP interrupt is triggered. If the CAN\_MR.TEOF bit is set, the value is captured at each End Of Frame, else it is captured at each Start Of Frame. Depending on the corresponding mask in CAN\_IMR, an interrupt is generated while the CAN\_SR.TSTP bit is set. TSTP is cleared by reading CAN\_SR.

The time management unit can operate in one of the following two modes:

- Timestamping: the value of the internal timer is captured at each Start Of Frame or each End Of Frame
- Time-triggered: a mailbox transfer operation is triggered when the internal timer reaches the mailbox trigger.

Timestamping mode is enabled by clearing the CAN\_MR.TTM field. To enable the Time-triggered mode, set TTM.

#### 61.7.4. CAN 2.0 Standard Features

##### 61.7.4.1. CAN Bit Timing Configuration

All controllers on a CAN bus must have the same bit rate and bit length. At different clock frequencies of the individual controllers, the bit rate has to be adjusted by the time segments.

The CAN protocol specification partitions the nominal bit time into four different segments.

**Figure 61.4.** Partition of the CAN Bit Time

- SYNC SEG: SYNChronization Segment  
This part of the bit time is used to synchronize the various nodes on the bus. An edge is expected to lie within this segment. It is one TQ long.
- PROP SEG: PROPagation Segment

This part of the bit time is used to compensate for the physical delay times within the network. It is twice the sum of the signal's propagation time on the bus line, the input comparator delay, and the output driver delay. It is programmable to be 1,2,..., 8 TQ long.

This parameter is defined in the PROPAG field of the [CAN Baudrate Register](#).

- PHASE SEG1, PHASE SEG2: PHASE Segment 1 and 2

The Phase-Buffer-Segments are used to compensate for edge phase errors. These segments can be lengthened (PHASE SEG1) or shortened (PHASE SEG2) by resynchronization.

Phase Segment 1 is programmable to be 1, 2, ..., 8 TQ long.

Phase Segment 2 length has to be at least as long as the Information Processing Time (IPT) and may not be more than the length of Phase Segment 1.

These parameters are defined in the PHASE1 and PHASE2 fields of the [CAN Baudrate Register](#).

- TIME QUANTUM

The TIME QUANTUM (TQ) is a fixed unit of time derived from the peripheral clock period. The total number of TIME QUANTA in a bit time is programmable from 8 to 25.

- INFORMATION PROCESSING TIME

The Information Processing Time (IPT) is the time required for the logic to determine the bit level of a sampled bit. The IPT begins at the sample point, is measured in TQ and is fixed at two TQ for the CAN. Since Phase Segment 2 also begins at the sample point and is the last segment in the bit time, PHASE SEG2 shall not be less than the IPT.

- SAMPLE POINT

The SAMPLE POINT is the point in time at which the bus level is read and interpreted as the value of that respective bit. Its location is at the end of PHASE\_SEG1.

- SJW: ReSynchronization Jump Width

The ReSynchronization Jump Width defines the limit to the amount of lengthening or shortening of the phase segments.

SJW is programmable to be the minimum of PHASE SEG1 and four TQ.

If the SMP field in the Baudrate register (CAN\_BR) is set, then the incoming bit stream is sampled three times with a period of half a CAN clock period, centered on sample point.

In the CAN controller, the length of a bit on the CAN bus is determined by the parameters (BRP, PROPAG, PHASE1 and PHASE2).

$$t_{BIT} = t_{CSC} + t_{PRS} + t_{PHS1} + t_{PHS2}$$

The time quantum is calculated as follows:

$$t_{CSC} = (BRP+1)/t_{\text{peripheral clock}}$$

**Note:** The BRP field must be within the range [1, 0x7F], i.e., BRP = 0 is not authorized.

$$t_{PRS} = t_{CSC} \times (PROPAG+1)$$

$$t_{PHS1} = t_{CSC} \times (PHASE1+1)$$

$$t_{PHS2} = t_{CSC} \times (PHASE2+1)$$

To compensate for phase shifts between clock oscillators of different controllers on the bus, the CAN controller must resynchronize on any relevant signal edge of the current transmission. The resynchronization shortens or lengthens the bit time so that the position of the sample point is shifted with regard to the detected edge. The resynchronization jump width (SJW) defines the maximum of time by which a bit period may be shortened or lengthened by resynchronization.

$$t_{SJW} = t_{CSC} \times (SJW+1)$$

**Figure 61.5. CAN Bit Timing**

Example of bit timing determination for CAN baudrate of 500 kbit/s:

$f_{\text{Peripheral clock}} = 48 \text{ MHz}$

CAN baudrate = 500 kbit/s  $\Rightarrow$  bit time = 2  $\mu\text{s}$

Delay of the bus driver: 50 ns

Delay of the receiver: 30 ns

Delay of the bus line (20 m): 110 ns

The total number of time quanta in a bit time must be comprised between 8 and 25. If we fix the bit time to 16 time quanta:

$t_{CSC} = 1 \text{ time quanta} = \text{bit time} / 16 = 125 \text{ ns}$

$\Rightarrow \text{BRP} = (t_{CSC} \times f_{\text{peripheral clock}}) - 1 = 5$

The propagation segment time is equal to twice the sum of the signal's propagation time on the bus line, the receiver delay and the output driver delay:

$t_{PRS} = 2 * (50 + 30 + 110) \text{ ns} = 380 \text{ ns} = 3 t_{CSC}$

$\Rightarrow \text{PROPAG} = t_{PRS} / t_{CSC} - 1 = 2$

The remaining time for the two phase segments is:

$t_{PHS1} + t_{PHS2} = \text{bit time} - t_{CSC} - t_{PRS} = (16 - 1 - 3)t_{CSC}$

$t_{PHS1} + t_{PHS2} = 12 t_{CSC}$

Because this number is even, we choose  $t_{PHS2} = t_{PHS1}$  (else we would choose  $t_{PHS2} = t_{PHS1} + t_{CSC}$ ).

$t_{PHS1} = t_{PHS2} = (12/2) t_{CSC} = 6 t_{CSC}$

$\Rightarrow \text{PHASE1} = \text{PHASE2} = t_{PHS1} / t_{CSC} - 1 = 5$

The resynchronization jump width must comprise between one  $t_{CSC}$  and the minimum of four  $t_{CSC}$  and  $t_{PHS1}$ . We choose its maximum value:

$t_{SJW} = \text{Min}(4 t_{CSC}, t_{PHS1}) = 4 t_{CSC}$

$\Rightarrow \text{SJW} = t_{SJW} / t_{CSC} - 1 = 3$

Finally: CAN\_BR = 0x00053255

### 61.7.4.1.1.CAN Bus Synchronization

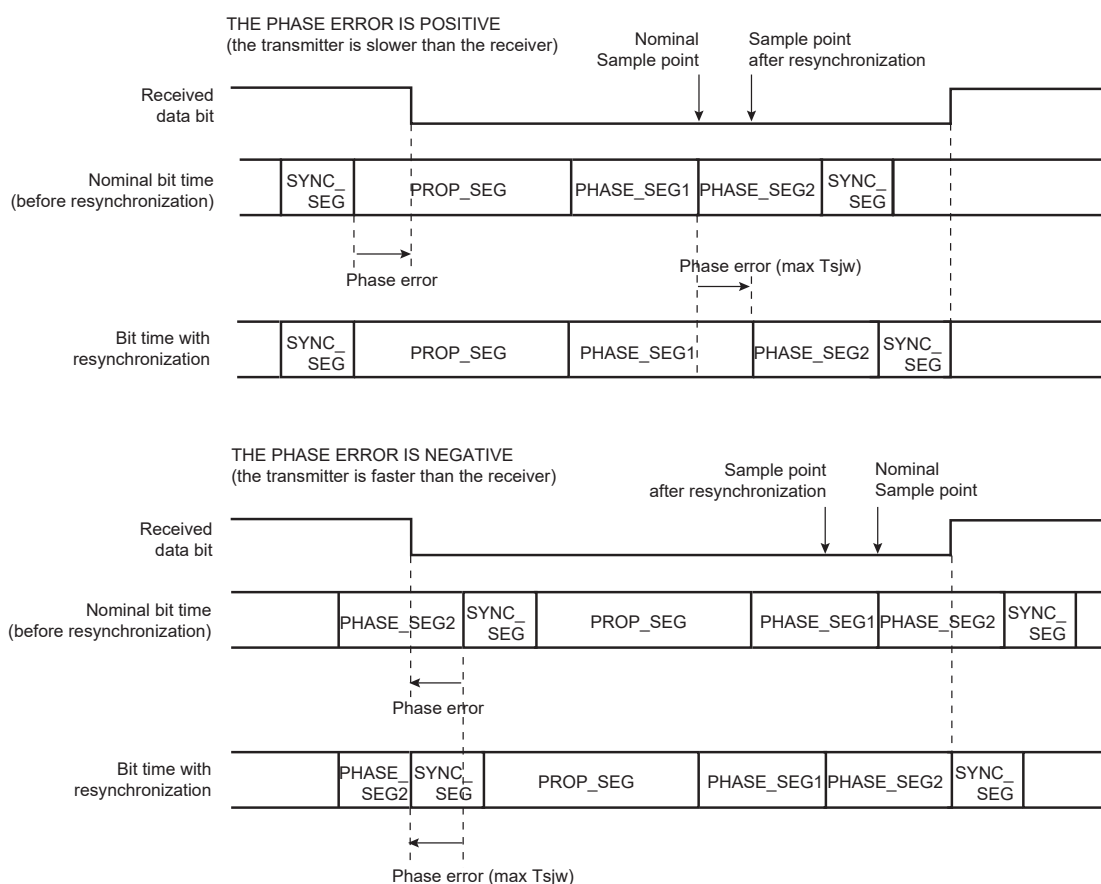

Two types of synchronization are distinguished: “hard synchronization” at the start of a frame and “resynchronization” inside a frame. After a hard synchronization, the bit time is restarted with the end of the SYNC\_SEG segment, regardless of the phase error. Resynchronization causes a reduction or increase in the bit time so that the position of the sample point is shifted with respect to the detected edge.

The effect of resynchronization is the same as that of hard synchronization when the magnitude of the phase error of the edge causing the resynchronization is less than or equal to the programmed value of the resynchronization jump width ( $t_{sjw}$ ).

When the magnitude of the phase error is larger than the resynchronization jump width and

- the phase error is positive, then PHASE\_SEG1 is lengthened by an amount equal to the resynchronization jump width.
- the phase error is negative, then PHASE\_SEG2 is shortened by an amount equal to the resynchronization jump width.

**Figure 61.6.** CAN Resynchronization

### 61.7.4.1.2.Autobaud Mode

The Autobaud feature is enabled by setting the CAN\_MR.ABM field. In this mode, the CAN controller is only listening to the line without acknowledging the received messages. It can not send any message. The errors flags are updated. The bit timing can be adjusted until no error occurs (good configuration found). In this mode, the error counters are frozen. To go back to the standard mode, clear ABM.

#### 61.7.4.2. Error Detection

There are five different error types that are not mutually exclusive. Each error concerns only specific fields of the CAN data frame (refer to the Bosch CAN specification for their correspondence):

- CRC error (CAN\_SR.CERR): with the CRC, the transmitter calculates a checksum for the CRC bit sequence from the Start of Frame bit until the end of the Data Field. This CRC sequence is transmitted in the CRC field of the Data or Remote Frame.
- Bit-stuffing error (CAN\_SR.SERR): if a node detects a sixth consecutive equal bit level during the bit-stuffing area of a frame, it generates an Error Frame starting with the next bit-time.
- Bit error (CAN\_SR.BERR): a bit error occurs if a transmitter sends a dominant bit but detects a recessive bit on the bus line, or if it sends a recessive bit but detects a dominant bit on the bus line. An error frame is generated and starts with the next bit time.
- Form Error (CAN\_SR.FERR): if a transmitter detects a dominant bit in one of the fix-formatted segments CRC Delimiter, ACK Delimiter or End of Frame, a form error has occurred and an error frame is generated.
- Acknowledgment error (CAN\_SR.AERR): the transmitter checks the Acknowledge Slot, which is transmitted by the transmitting node as a recessive bit, contains a dominant bit. If this is the case, at least one other node has received the frame correctly. If not, an Acknowledge Error has occurred and the transmitter will start in the next bit-time an Error Frame transmission.

##### 61.7.4.2.1. Fault Confinement

To distinguish between temporary and permanent failures, every CAN controller has two error counters: REC (Receive Error Counter) and TEC (Transmit Error Counter). The two counters are incremented upon detected errors and are decremented upon correct transmissions or receptions, respectively. Depending on the counter values, the state of the node changes: the initial state of the CAN controller is Error Active, meaning that the controller can send Error Active flags. The controller changes to the Error Passive state if there is an accumulation of errors. If the CAN controller fails or if there is an extreme accumulation of errors, there is a state transition to Bus Off.

**Figure 61.7.** Line Error Mode

An error active unit takes part in bus communication and sends an active error frame when the CAN controller detects an error.

An error passive unit cannot send an active error frame. It takes part in bus communication, but when an error is detected, a passive error frame is sent. Also, after a transmission, an error passive unit waits before initiating further transmission.

A bus off unit is not allowed to have any influence on the bus.

For fault confinement, two error counters (TEC and REC) are implemented. These counters are accessible via the Error Counter register (CAN\_ECR). The state of the CAN controller is automatically updated according to these counter values. If the CAN controller enters the Error Active state, then

the CAN\_SR.ERRA bit is set. The corresponding interrupt is pending while the interrupt is not masked in the CAN\_IMR. If the CAN controller enters Error Passive mode, then the CAN\_SR.ERRP bit is set and an interrupt remains pending while the CAN\_IMR.ERRP bit is set. If the CAN enters Bus Off mode, then the CAN\_SR.BOFF bit is set. As for ERRP and ERRP, an interrupt is pending while the CAN\_IMR.BOFF is set.

When one of the error counters values exceeds 96, an increased error rate is indicated to the controller through the WARN bit in CAN\_SR, but the node remains error active. The corresponding interrupt is pending while the interrupt is set in CAN\_IMR.

Refer to the Bosch CAN specification v2.0 for details on fault confinement.

#### 61.7.4.2. Error Interrupt Handler

ERRA, WARN, ERPP and BOFF (CAN\_SR) store the key transitions of the CAN bus status as defined in figure [Line Error Mode](#). The transitions depend on the TEC and REC (CAN\_ECR) values as described in [Fault Confinement](#).

These flags are latched to keep from triggering a spurious interrupt in case these bits are used as the source of an interrupt. Thus, these flags may not reflect the current status of the CAN bus.

The current CAN bus state can be determined by reading the TEC and REC fields in CAN\_ECR.

#### 61.7.4.3. Overload

The overload frame is provided to request a delay of the next data or remote frame by the receiver node ("Request overload frame") or to signal certain error conditions ("Reactive overload frame") related to the intermission field respectively.

Reactive overload frames are transmitted after detection of the following error conditions:

- Detection of a dominant bit during the first two bits of the intermission field
- Detection of a dominant bit in the last bit of EOF by a receiver, or detection of a dominant bit by a receiver or a transmitter at the last bit of an error or overload frame delimiter

The CAN controller can generate a request overload frame automatically after each message sent to one of the CAN controller mailboxes. This feature is enabled by setting the CAN\_MR.OVL bit.

Reactive overload frames are automatically handled by the CAN controller even if OVL is not set. An overload flag is generated in the same way as an error flag, but error counters do not increment.

#### 61.7.5. Low-Power Mode

In Low-power mode, the CAN controller cannot send or receive messages. All mailboxes are inactive.

In Low-power mode, the SLEEP signal in CAN\_SR is set; otherwise, the WAKEUP signal in CAN\_SR is set. These two bits are exclusive except after a CAN controller reset (WAKEUP and SLEEP are stuck at 0 after a reset). After power-up reset, the Low-power mode is disabled and the CAN\_SR.WAKEUP bit is set only after detection of 11 consecutive recessive bits on the bus.

##### 61.7.5.1. Enabling Low-Power Mode

A software application can enable Low-power mode by setting the LPM bit in the CAN\_MR global register. The CAN controller enters Low-power mode once all pending transmit messages are sent.

When the CAN controller enters Low-power mode, the SLEEP signal in CAN\_SR is set. Depending on the corresponding mask in CAN\_IMR, an interrupt is generated while SLEEP is set.

The SLEEP signal in CAN\_SR is automatically cleared once WAKEUP is set. The WAKEUP signal is automatically cleared once SLEEP is set.

Reception is disabled while the SLEEP signal is set to one in CAN\_SR. It is important to note that those messages with higher priority than the last message transmitted can be received between the LPM command and entry in Low-power mode.

Once in Low-power mode, the CAN controller clock can be switched off by programming the chip's Power Management Controller (PMC). The CAN controller drains only the static current.

Error counters are disabled while the SLEEP signal is set to one.

Thus, to enter Low-power mode, the software application must:

- set LPM field in the CAN\_MR,
- wait for SLEEP signal rising.

Now the CAN controller clock can be disabled. This is done by programming the Power Management Controller (PMC).

**Figure 61.8.** Enabling Low-Power Mode

#### 61.7.5.2. Disabling Low-Power Mode

The CAN controller can be awake after detecting a CAN bus activity. Bus activity detection is done by an external module that may be embedded in the chip. When it is notified of a CAN bus activity, the software application disables Low-power mode by programming the CAN controller.

To disable Low-power mode, the software application must:

- enable the CAN controller clock. This is done by programming the Power Management Controller (PMC).
- clear the CAN\_MR.LPM field.

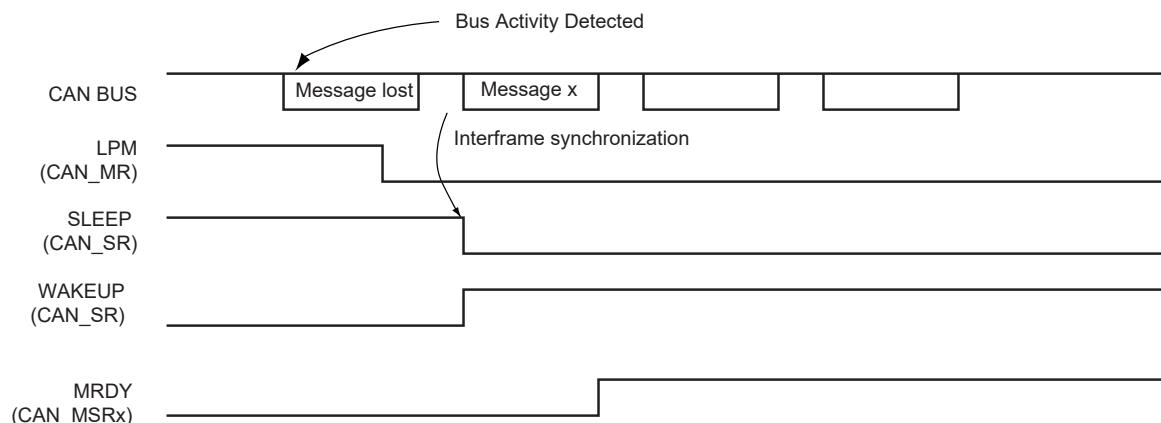

The CAN controller synchronizes itself with the bus activity by checking for eleven consecutive "recessive" bits. Once synchronized, the WAKEUP signal in CAN\_SR is set.

Depending on the corresponding mask in CAN\_IMR, an interrupt is generated while WAKEUP is set. The SLEEP signal in CAN\_SR is automatically cleared once WAKEUP is set. The WAKEUP signal is automatically cleared once SLEEP is set.

If no message is being sent on the bus, then the CAN controller is able to send a message eleven bit times after disabling Low-power mode.

If there is bus activity when Low-power mode is disabled, the CAN controller is synchronized with the bus activity in the next interframe. The previous message is lost (see the figure below).

**Figure 61.9.** Disabling Low-Power Mode

## 61.8. Functional Description

### 61.8.1. CAN Controller Initialization

After power-up reset, the CAN controller is disabled. The CAN controller clock must be activated by the Power Management Controller (PMC) and the CAN controller interrupt line must be enabled by the interrupt controller.

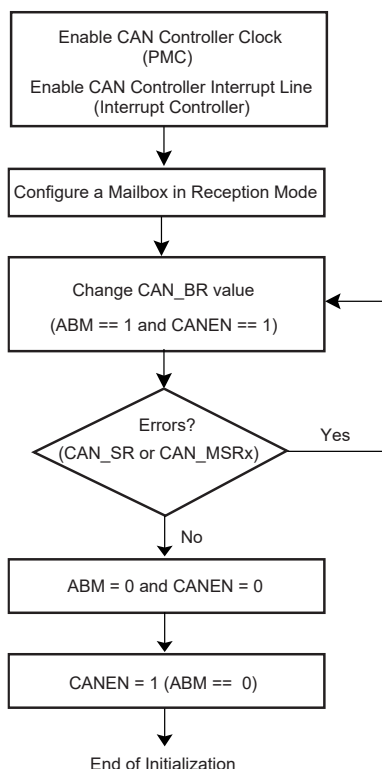

The CAN controller must be initialized with the CAN network parameters. CAN\_BR defines the sampling point in the bit time period. CAN\_BR must be set before the CAN controller is enabled.

The CAN controller is enabled by setting the CAN\_MR.CANEN bit. At this stage, the internal CAN controller state machine is reset, error counters are reset to 0, and error flags are reset to 0.

Once the CAN controller is enabled, bus synchronization is done automatically by scanning eleven recessive bits. The CAN\_SR.WAKEUP bit is automatically set to 1 when the CAN controller is synchronized (WAKEUP and SLEEP are stuck at 0 after a reset).

The CAN controller can start listening to the network in Autobaud mode. In this case, the error counters are locked and a mailbox may be configured in Receive mode. By scanning error flags, the CAN\_BR values synchronized with the network. Once no error has been detected, the application disables the Autobaud mode, clearing the CAN\_MR.ABM bit.

**Figure 61.10.** Possible Initialization Procedure

### 61.8.2. CAN Controller Interrupt Handling

Interrupts are of two types: message-object related interrupts and system interrupts that handle errors or system-related interrupt sources.

All interrupt sources can be masked by writing the corresponding field in the Interrupt Disable register (CAN\_IDR). They can be unmasked by writing to the Interrupt Enable register (CAN\_IER). After a power-up reset, all interrupt sources are disabled (masked). The current mask status can be checked by reading the Interrupt Mask register (CAN\_IMR).

CAN\_SR gives all interrupt source states.

The following events may initiate one of the two interrupts:

- Message object interrupt
  - Data registers in the mailbox object are available to the application. In Receive mode, a new message was received. In Transmit mode, a message was transmitted successfully.
  - A sent transmission was aborted.
- System interrupts
  - Bus Off: the CAN module enters the Bus Off state.
  - Error Passive: the CAN module enters Error Passive mode.
  - Error Active mode: the CAN module is neither in Error Passive mode nor in Bus Off mode.
  - Warn Limit: the CAN module is in Error Active mode, but at least one of its error counter value exceeds 96.
  - Wake-up: this interrupt is generated after a wake-up and a bus synchronization.
  - Sleep: this interrupt is generated after a Low-power mode enable once all pending messages in transmission have been sent.

- Internal Timer Counter Overflow: this interrupt is generated when the internal timer rolls over.
- Timestamp: this interrupt is generated after the reception or the transmission of a start of frame or an end of frame. The value of the internal counter is copied in CAN\_TIMESTP.

All interrupts are cleared by clearing the interrupt source except for the internal timer counter overflow interrupt and the timestamp interrupt. These interrupts are cleared by reading CAN\_SR.

### 61.8.3. CAN Controller Message Handling

#### 61.8.3.1. Receive Handling

Two modes are available to configure a mailbox to receive messages. In Receive mode, the first message received is stored in the mailbox data register. In Receive with Overwrite mode, the last message received is stored in the mailbox.

##### 61.8.3.1.1. Simple Receive Mailbox

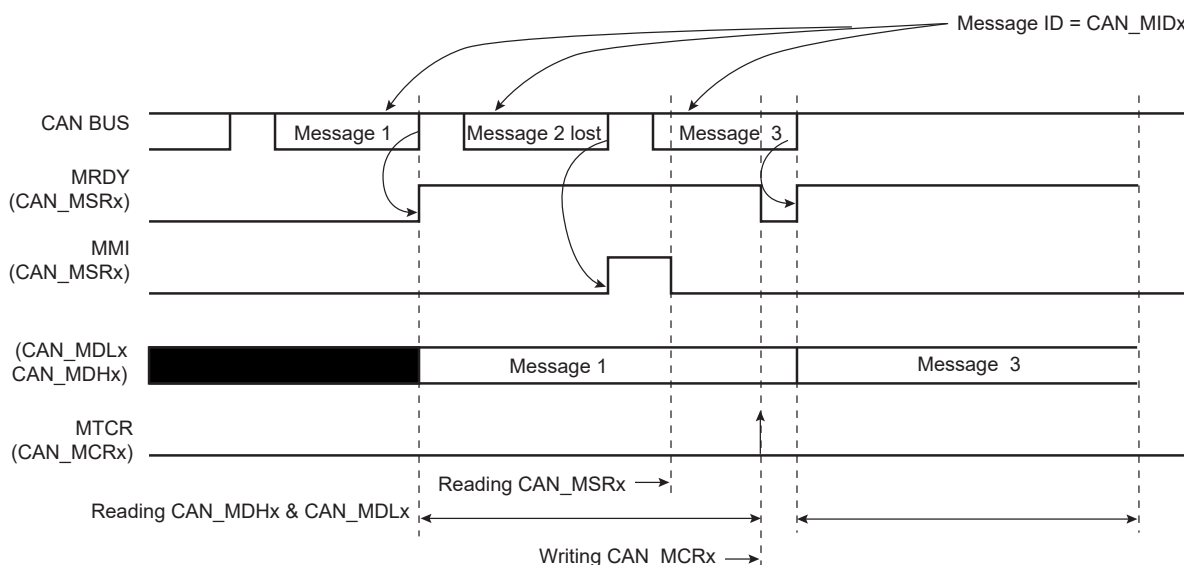

A mailbox is in Receive mode once the CAN\_MMRx.MOT field has been configured. Message ID and Message Acceptance Mask must be set before the Receive mode is enabled.

After Receive mode is enabled, the MRDY flag in CAN\_MSR is automatically cleared until the first message is received. When the first message has been accepted by the mailbox, the MRDY flag is set. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked depending on the mailbox flag in the CAN\_IMR global register.

Message data are stored in the mailbox data register until the software application notifies that data processing has ended. This is done by asking for a new transfer command, setting the MTCR flag in CAN\_MCRx. This automatically clears the MRDY signal.

The MMI flag in CAN\_MSRx notifies the software that a message has been lost by the mailbox. This flag is set when messages are received while CAN\_MSRx.MRDY is set. This flag is cleared by reading CAN\_MSRx. A receive mailbox prevents from overwriting the first message by new ones while MRDY flag is set in CAN\_MSRx. See the figure below.

**Figure 61.11.** Receive Mailbox

**Note:** In the case of Arm architecture, CAN\_MSRx, CAN\_MDLx, CAN\_MDHx can be read using an optimized ldm assembler instruction.

### 61.8.3.1.2. Receive with Overwrite Mailbox

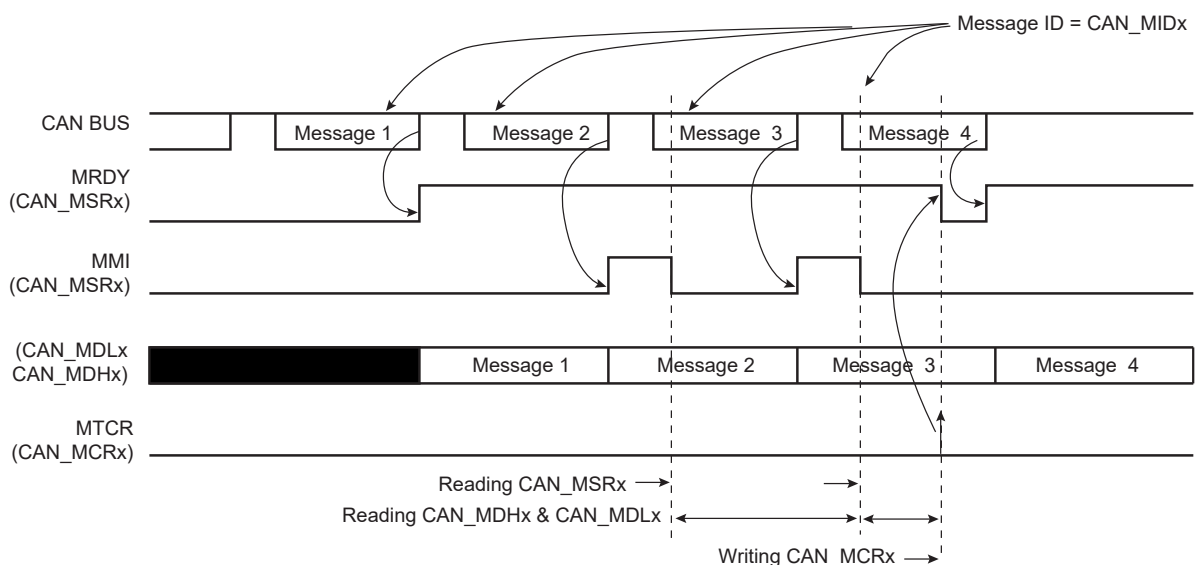

A mailbox is in Receive with Overwrite mode once the CAN\_MMRx.MOT field has been configured. Message ID and Message Acceptance masks must be set before Receive mode is enabled.

After Receive mode is enabled, the MRDY flag in CAN\_MSR is automatically cleared until the first message is received. When the first message has been accepted by the mailbox, the MRDY flag is set. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt is masked depending on the mailbox flag in the CAN\_IMR global register.

If a new message is received while the MRDY flag is set, this new message is stored in the mailbox data register, overwriting the previous message. The MMI flag in CAN\_MSRx notifies the software that a message has been dropped by the mailbox. This flag is cleared when reading CAN\_MSRx.

The CAN controller may store a new message in the CAN data registers while the application reads them. To check that CAN\_MDHx and CAN\_MDLx do not belong to different messages, the application must check the CAN\_MSRx.MMI bit before and after reading CAN\_MDHx and CAN\_MDLx. If the MMI flag is set again after the data registers have been read, the software application has to re-read CAN\_MDHx and CAN\_MDLx (see the figure below).

**Figure 61.12.** Receive with Overwrite Mailbox

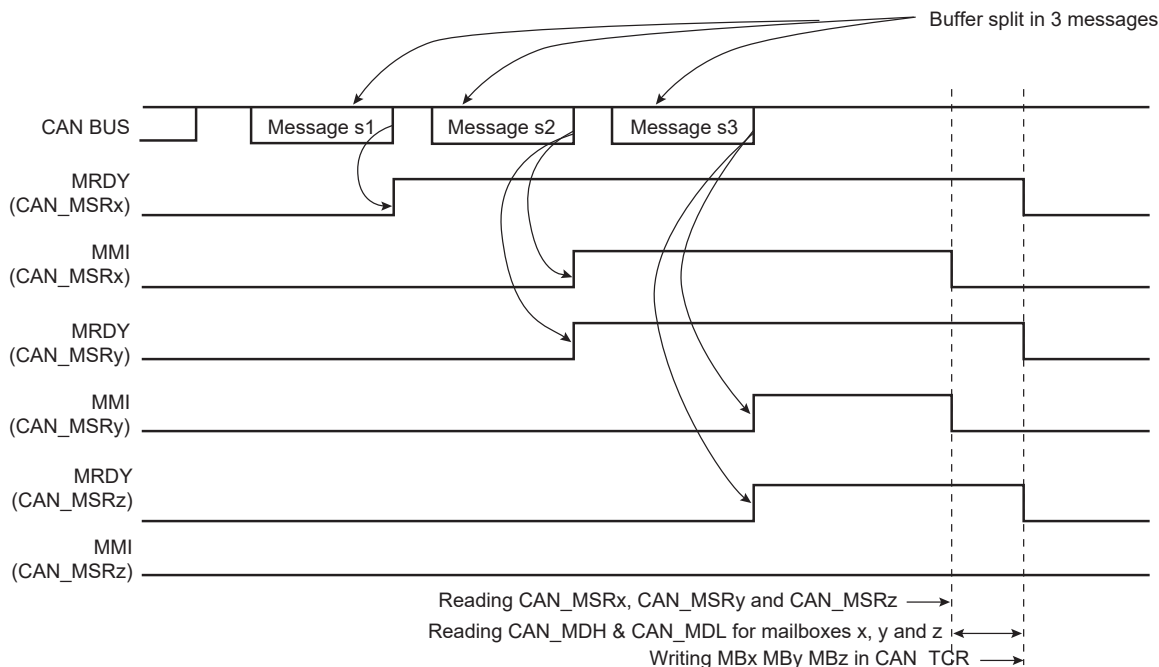

### 61.8.3.1.3. Chaining Mailboxes

Several mailboxes may be used to receive a buffer split into several messages with the same ID. In this case, the mailbox with the lowest number is serviced first. In the Receive and Receive with Overwrite modes, the CAN\_MMRx.PRIOR field has no effect. If Mailbox 0 and Mailbox 5 accept messages with the same ID, the first message is received by Mailbox 0 and the second message is received by Mailbox 5. Mailbox 0 must be configured in Receive mode (i.e., the first message received is considered) and Mailbox 5 must be configured in Receive with Overwrite mode. Mailbox 0 cannot be configured in Receive with Overwrite mode; otherwise, all messages are accepted by this mailbox and Mailbox 5 is never serviced.

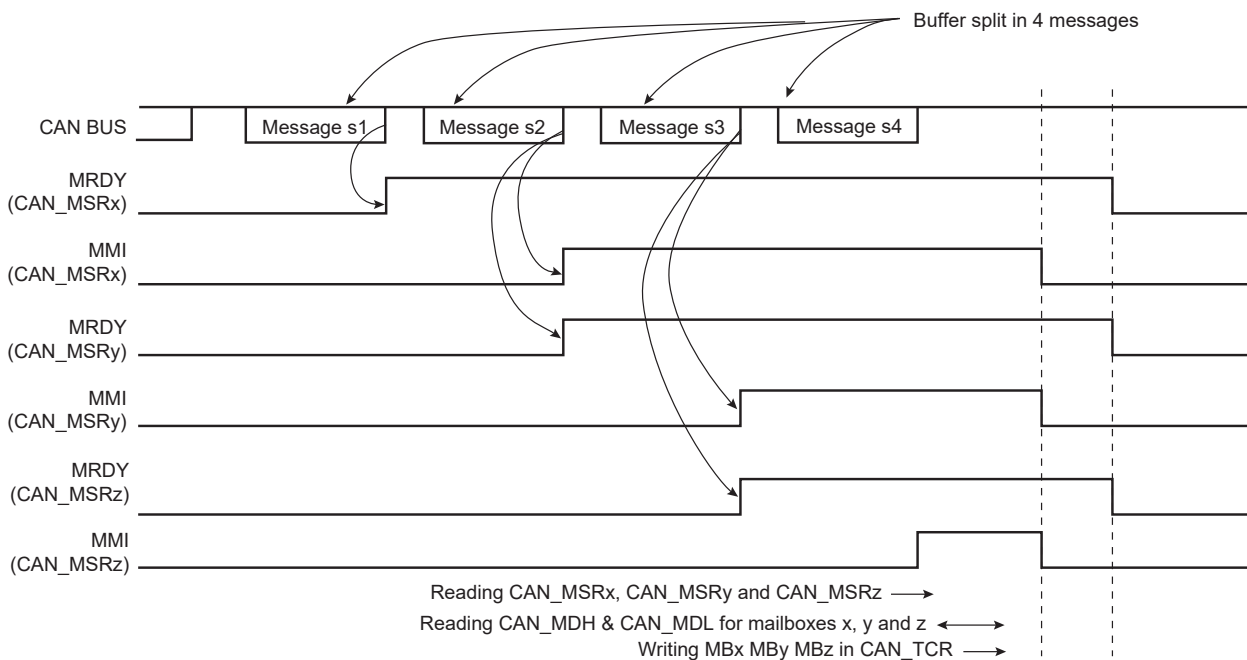

If several mailboxes are chained to receive a buffer split into several messages, all mailboxes except the last one (with the highest number) must be configured in Receive mode. The first message received is handled by the first mailbox, the second one is refused by the first mailbox and accepted by the second mailbox, the last message is accepted by the last mailbox and refused by previous ones (see the figure below).

**Figure 61.13.** Chaining Three Mailboxes to Receive a Buffer Split into Three Messages

If the number of mailboxes is not sufficient (the MMI flag of the last mailbox raises), the user must read each data received on the last mailbox in order to retrieve all the messages of the buffer split (see the figure below).

**Figure 61.14.** Chaining Three Mailboxes to Receive a Buffer Split into Four Messages

### 61.8.3.2. Transmission Handling

A mailbox is in Transmit mode once the CAN\_MMRx.MOT field has been configured. Message ID and Message Acceptance mask must be set before Receive mode is enabled.

After Transmit mode is enabled, the MRDY flag in CAN\_MSR is automatically set until the first command is sent. When the MRDY flag is set, the software application can prepare a message to be sent by writing to the CAN\_MDx registers. The message is sent once the software asks for a transfer command setting the MTCR bit and the message data length in CAN\_MCRx.

The MRDY flag remains at zero as long as the message has not been sent or aborted. It is important to note that no access to the mailbox data register is allowed while the MRDY flag is cleared. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked depending on the mailbox flag in the CAN\_IMR global register.

It is also possible to send a remote frame setting the MRTR bit instead of setting the MDLC field. The answer to the remote frame is handled by another reception mailbox. In this case, the device acts as a consumer but with the help of two mailboxes. It is possible to handle the remote frame emission and the answer reception using only one mailbox configured in Consumer mode. See [Remote Frame Handling](#).

Several messages can try to win the bus arbitration in the same time. The message with the highest priority is sent first. Several transfer request commands can be generated at the same time by setting CAN\_TCR.MBx bits. The priority is set in the CAN\_MMRx.PRIOR field. Priority 0 is the highest priority, priority 15 is the lowest priority. Thus it is possible to use a part of the message ID to set the PRIOR field. If two mailboxes have the same priority, the message of the mailbox with the lowest number is sent first. Thus if mailbox 0 and mailbox 5 have the same priority and have a message to send at the same time, then the message of the mailbox 0 is sent first.

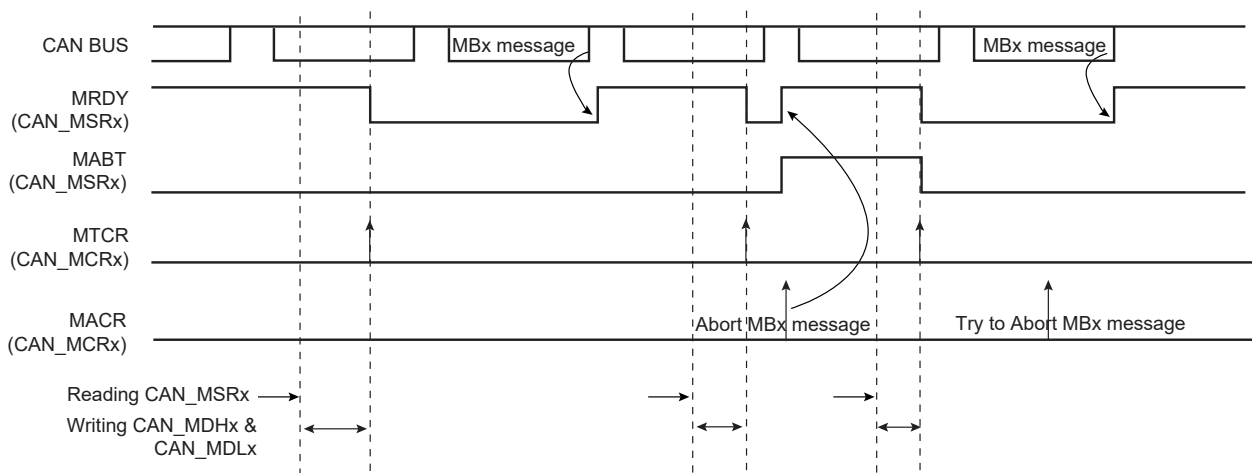

Setting the CAN\_MCRx.MACR bit aborts the transmission. Transmission for several mailboxes can be aborted by writing MBx fields in the Abort Command register (CAN\_ACR). If the message is being sent when the abort command is set, then the application is notified by the MRDY bit set and not by CAN\_MSRx.MABT. Otherwise, if the message has not been sent, then MRDY and MABT are set in CAN\_MSR.

When the bus arbitration is lost by a mailbox message, the CAN controller tries to win the next bus arbitration with the same message if this one still has the highest priority. Messages to be sent are re-tried automatically until they win the bus arbitration. This feature can be disabled by setting the CAN\_MR.DRPT bit. In this case if the message was not sent the first time it was transmitted to the CAN transceiver, it is automatically aborted. The MABT flag is set in CAN\_MSRx until the next transfer command.

The following figure shows three MBx message attempts being made (MRDY of MBx set to 0).

The first MBx message is sent, the second is aborted and the last one is trying to be aborted but too late because it has already been transmitted to the CAN transceiver.

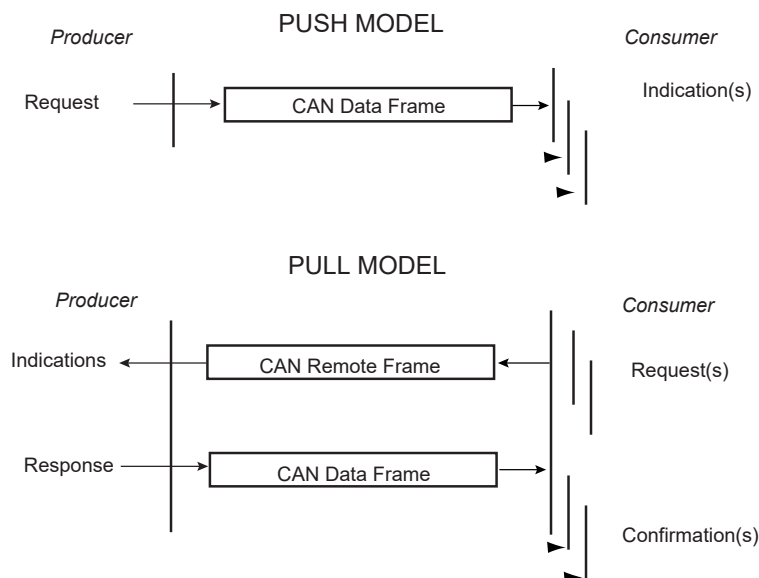

**Figure 61.15.** Transmitting Messages

### 61.8.3.3.Remote Frame Handling

The producer/consumer model is an efficient means to handle broadcast messages. The push model allows a producer to broadcast messages; the pull model allows a customer to request messages.

**Figure 61.16.** Producer/Consumer Model

In Pull mode, a consumer transmits a remote frame to the producer. When the producer receives a remote frame, it sends the answer accepted by one or many consumers. Using transmit and receive mailboxes, a consumer must dedicate two mailboxes, one in Transmit mode to send remote frames, and at least one in Receive mode to capture the producer's answer. The same structure is applicable to a producer: one reception mailbox is required to get the remote frame and one transmit mailbox to answer.

Mailboxes can be configured in Producer or Consumer mode. A lonely mailbox can handle the remote frame and the answer. With 8 mailboxes, the CAN controller can handle 8 independent producers/consumers.

#### 61.8.3.3.1.Producer Configuration

A mailbox is in Producer mode once the CAN\_MMRx.MOT field has been configured. Message ID and Message Acceptance masks must be set before Receive mode is enabled.

After Producer mode is enabled, the MRDY flag in CAN\_MSR is automatically set until the first transfer command. The software application prepares data to be sent by writing to the Message Data High (CAN\_MDHx) and Message Data Low (CAN\_MDLx) registers, then by setting the CAN\_MCRx.MTCR bit. Data is sent after the reception of a remote frame as soon as it wins the bus arbitration.

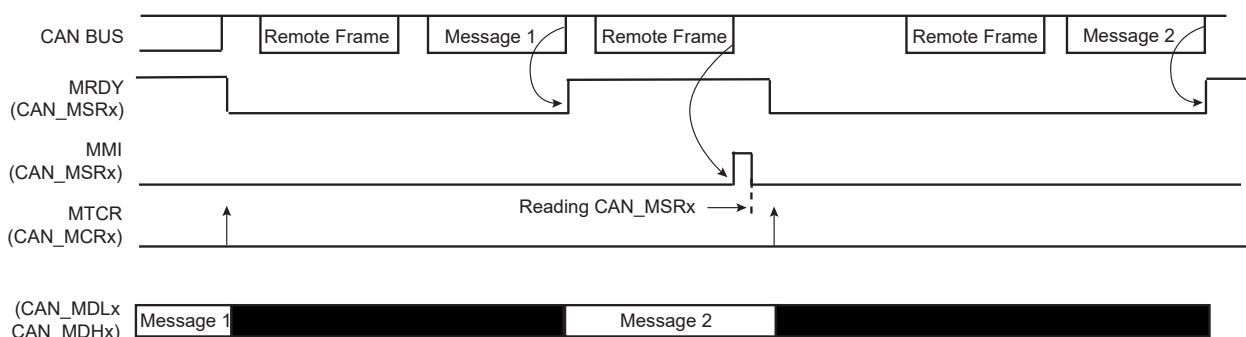

The MRDY flag remains at zero as long as the message has not been sent or aborted. No access to the mailbox data register can be done while the MRDY flag is cleared. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked according to the mailbox flag in the CAN\_IMR global register.

If a remote frame is received while no data are ready to be sent (signal MRDY set in CAN\_MSRx), then the MMI signal is set in CAN\_MSRx. This bit is cleared by reading CAN\_MSRx.

The CAN\_MSRx.MRTR field has no meaning. It is used only when using Receive and Receive with Overwrite modes.

After a remote frame has been received, the mailbox functions like a transmit mailbox. The message with the highest priority is sent first. The transmitted message may be aborted by setting the CAN\_MCR.MACR bit. See [Transmission Handling](#).

**Figure 61.17. Producer Handling**

### 61.8.3.3.2.Consumer Configuration

A mailbox is in Consumer mode once the CAN\_MMRx.MOT has been configured. Message ID and Message Acceptance masks must be set before Receive mode is enabled.

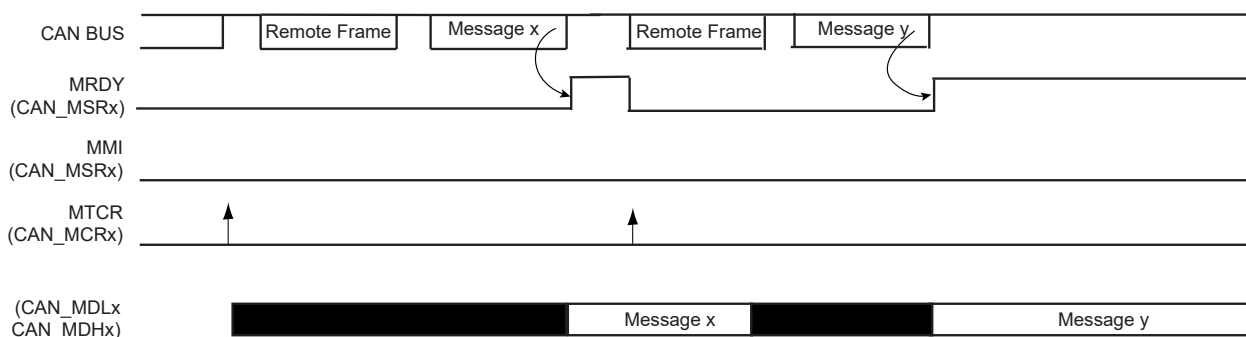

After Consumer mode is enabled, the MRDY flag in CAN\_MSR is automatically cleared until the first transfer request command. The software application sends a remote frame by setting the CAN\_MCRx.MTCR bit or the bit MBx in the global register CAN\_TCR. The application is notified of the answer by the MRDY flag set in CAN\_MSRx. The application can read the data contents in CAN\_MDHx and CAN\_MDLx. An interrupt is pending for the mailbox while the MRDY flag is set. This interrupt can be masked according to the mailbox flag in the CAN\_IMR global register.

The CAN\_MCRx.MRTR bit has no effect. This field is used only when using Transmit mode.

After a remote frame has been sent, the consumer mailbox functions as a reception mailbox. The first message received is stored in the mailbox data registers. If other messages intended for this mailbox have been sent while the MRDY flag is set in CAN\_MSRx, they will be lost. The application is notified by reading the CAN\_MSRx.MMI bit. The read operation automatically clears the MMI flag.

If several messages are answered by the Producer, the CAN controller may have one mailbox in consumer configuration, zero or several mailboxes in Receive mode and one mailbox in Receive with Overwrite mode. In this case, the consumer mailbox must have a lower number than the Receive with Overwrite mailbox. The transfer command can be triggered for all mailboxes at the same time by setting several CAN\_TCR.MBx fields.

**Figure 61.18. Consumer Handling**

### 61.8.4. CAN Controller Timing Modes

Using the free running 16-bit internal timer, the CAN controller can be set in one of the following timing modes:

- Timestamping: the value of the internal timer is captured at each Start Of Frame or each End Of Frame.
- Time-triggered: the mailbox transfer operation is triggered when the internal timer reaches the mailbox trigger.

Timestamping mode is enabled by clearing the CAN\_MR.TTM bit. Time-triggered mode is enabled by setting the CAN\_MR.TTM bit.

#### 61.8.4.1. Timestamping Mode

Each mailbox has its own timestamp value. Each time a message is sent or received by a mailbox, the 16-bit value MTIMESTAMP in CAN\_TIMESTAMP is transferred to the CAN\_MSRx.LSB bits. The value read in the CAN\_MSRx corresponds to the internal timer value at the Start Of Frame or the End Of Frame of the message handled by the mailbox.

**Figure 61.19.** Mailbox Timestamp

#### 61.8.4.2. Time-Triggered Mode

In Time-triggered mode, basic cycles can be split into several time windows. A basic cycle starts with a reference message. Each time a window is defined from the reference message, a transmit operation should occur within a predefined time window. A mailbox must not win the arbitration in a previous time window, and it must not be retried if the arbitration is lost in the time window.

**Figure 61.20.** Time-Triggered Principle

Time-triggered mode is enabled by setting the CAN\_MR.TTM bit. In Time-triggered mode, as in Timestamp mode, the CAN\_TIMESTAMP field captures the values of the internal counter, but the CAN\_MSRx.MTIMESTAMP fields are not active and are read at 0.

##### 61.8.4.2.1. Synchronization by a Reference Message

In Time-triggered mode, the internal timer counter is automatically reset when a new message is received in the last mailbox. This reset occurs after the reception of the End Of Frame on the rising edge of the MRDY signal in CAN\_MSRx. This allows synchronization of the internal timer counter with the reception of a reference message and the start of a new time window.

#### 61.8.4.2.2. Transmitting within a Time Window

A time mark is defined for each mailbox. It is defined in the 16-bit CAN\_MMRx.MTIMEMARK field. At each internal timer clock cycle, the value of CAN\_TIM is compared with each mailbox time mark. When the internal timer counter reaches the MTIMEMARK value, an internal timer event for the mailbox is generated for the mailbox.

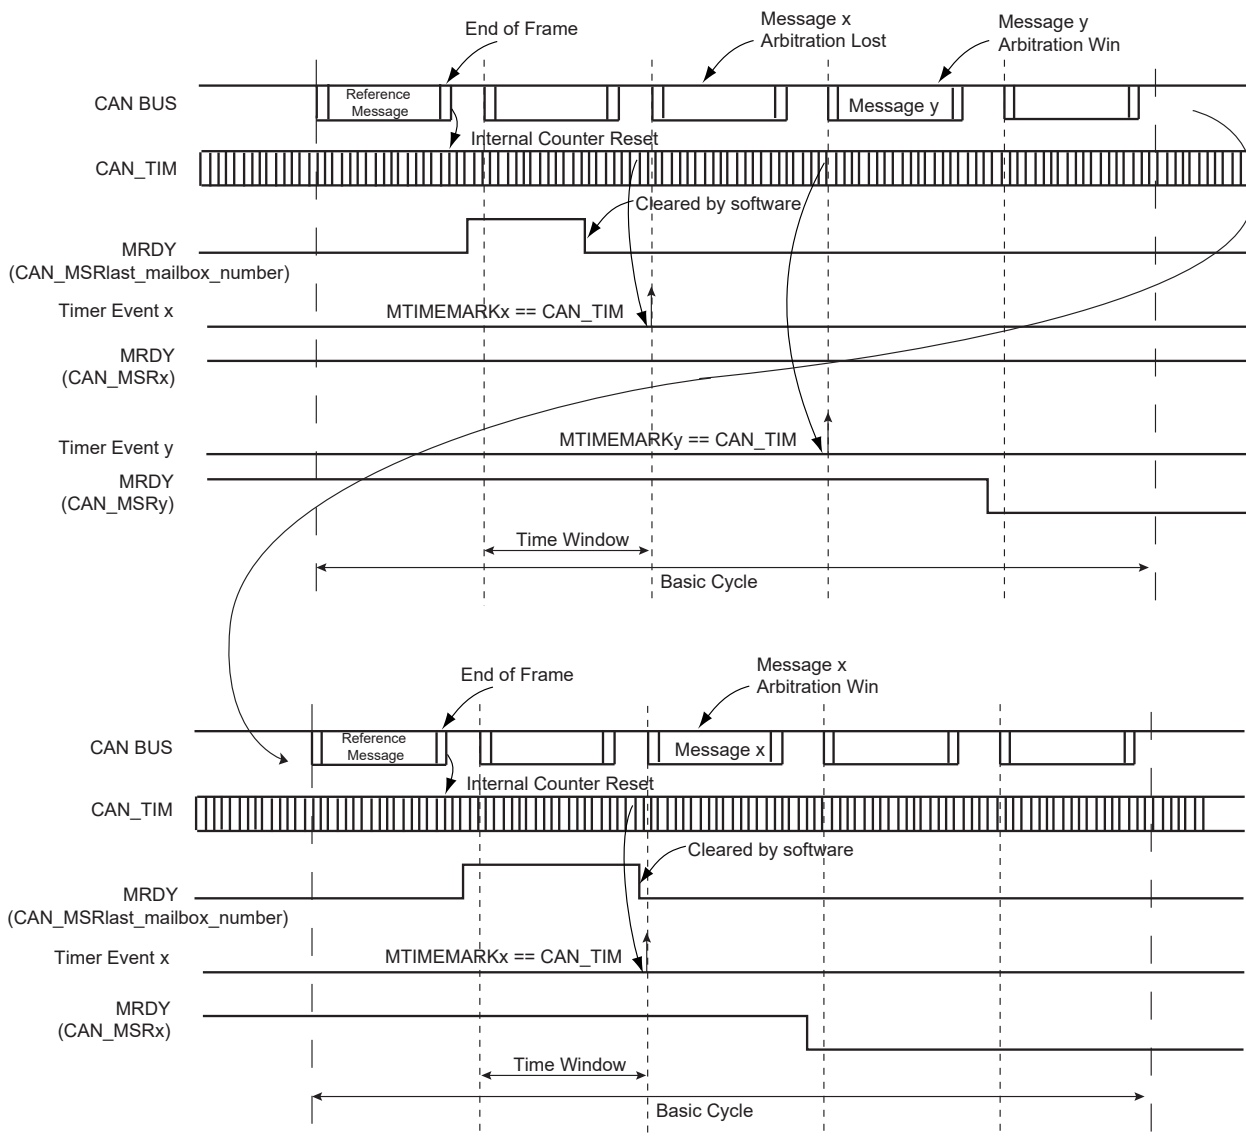

In Time-triggered mode, transmit operations are delayed until the internal timer event for the mailbox. The application prepares a message to be sent by setting CAN\_MCRx.MTCR. The message is not sent until the CAN\_TIM value is less than the MTIMEMARK value defined in CAN\_MMRx.

If the transmit operation is failed, i.e., the message loses the bus arbitration and the next transmit attempt is delayed until the next internal time trigger event. This prevents overlapping the next time window, but the message is still pending and is retried in the next time window when CAN\_TIM value equals the MTIMEMARK value. It is also possible to prevent a retry by setting the CAN\_MR.DRPT field.

#### 61.8.4.2.3. Freezing the Internal Timer Counter

The internal counter can be frozen by setting CAN\_MR.TIMFRZ. This prevents an unexpected roll-over when the counter reaches FFFFh. When this occurs, it automatically freezes until a new reset is issued, either due to a message received in the last mailbox or any other reset counter operations. The CAN\_SR.TOVF bit is set when the counter is frozen. TOVF is cleared by reading CAN\_SR. Depending on the corresponding interrupt mask in CAN\_IMR, an interrupt is generated when TOVF is set.

**Figure 61.21.** Time-Triggered Operations

#### 61.8.5. Register Write Protection

To prevent any single software error that may corrupt CAN behavior, the registers listed below can be write-protected by setting the WPEN bit in the [CAN Write Protection Mode Register](#) (CAN\_WPMR).

If a write access in a write-protected register is detected, then the WPVS flag in the [CAN Write Protection Status Register](#) (CAN\_WPSR) is set and the field WPVSR indicates in which register the write access has been attempted.

The WPVS flag is automatically reset after reading CAN\_WPSR.

The following registers can be write-protected:

- [CAN Mode Register](#)
- [CAN Baudrate Register](#)
- [CAN Message Mode Register](#)
- [CAN Message Acceptance Mask Register](#)
- [CAN Message ID Register](#)

## 61.9. Register Summary

**61.9.1. CAN Mode Register**

**Name:** CAN\_MR  
**Offset:** 0x0000  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [CAN Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
						RXSYNC[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	DRPT	TIMFRZ	TTM	TEOF	OVL	ABM	LPM	CANEN
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 26:24 – RXSYNC[2:0] Reception Synchronization Stage (not readable)**

This field allows configuration of the reception stage of the macrocell (for debug purposes only)

Value	Name	Description
0	DOUBLE_PP	Rx Signal with Double Synchro Stages (2 Positive Edges)
1	DOUBLE_PN	Rx Signal with Double Synchro Stages (One Positive Edge and One Negative Edge)
2	SINGLE_P	Rx Signal with Single Synchro Stage (Positive Edge)
3	NONE	Rx Signal with No Synchro Stage

**Bit 7 – DRPT Disable Repeat**

Value	Description
0	When a transmit mailbox loses the bus arbitration, the transfer request remains pending.
1	When a transmit mailbox loses the bus arbitration, the transfer request is automatically aborted. It automatically raises the MABT and MRDT flags in the corresponding CAN_MSRx.

**Bit 6 – TIMFRZ Enable Timer Freeze**

Value	Description
0	The internal timer continues to be incremented after it reached 0xFFFF.
1	The internal timer stops incrementing after reaching 0xFFFF. It is restarted after a timer reset. See <a href="#">Freezing the Internal Timer Counter</a> .

**Bit 5 – TTM Disable/Enable Time-triggered Mode**

Value	Description
0	Time-triggered mode is disabled.

Value	Description
1	Time-triggered mode is enabled.

#### Bit 4 – TEOF Timestamp messages at each end of Frame

Value	Description
0	The value of CAN_TIM is captured in the CAN_TIMESTP register at each Start Of Frame.
1	The value of CAN_TIM is captured in the CAN_TIMESTP register at each End Of Frame.

#### Bit 3 – OVL Disable/Enable Overload Frame

Value	Description
0	No overload frame is generated.
1	An overload frame is generated after each successful reception for mailboxes configured in Receive with/without Overwrite mode, Producer and Consumer.

#### Bit 2 – ABM Disable/Enable Autobaud/Listen mode

Value	Description
0	Disable Autobaud/Listen mode.
1	Enable Autobaud/Listen mode.

#### Bit 1 – LPM Disable/Enable Low-power Mode

The CAN controller enters Low-power mode once all pending messages have been transmitted.

Value	Description
0	Disable Low-power mode.
1	Enable Low-power mode.

#### Bit 0 – CANEN CAN Controller Enable

Value	Description
0	The CAN controller is disabled.
1	The CAN controller is enabled.

## 61.9.2. CAN Interrupt Enable Register

**Name:** CAN\_IER  
**Offset:** 0x0004  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
				BERR	FERR	AERR	SERR	CERR
Access				W	W	W	W	W
Reset				–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	TSTP	TOVF	WAKEUP	SLEEP	BOFF	ERRP	WARN	ERRA
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bit 28 – BERR Bit Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Bit Error interrupt.

### Bit 27 – FERR Form Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Form Error interrupt.

### Bit 26 – AERR Acknowledgment Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Acknowledgment Error interrupt.

### Bit 25 – SERR Stuffing Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Stuffing Error interrupt.

### Bit 24 – CERR CRC Error Interrupt Enable

Value	Description
0	No effect.
1	Enable CRC Error interrupt.

**Bit 23 – TSTP** TimeStamp Interrupt Enable

Value	Description
0	No effect.
1	Enable TSTP interrupt.

**Bit 22 – TOVF** Timer Overflow Interrupt Enable

Value	Description
0	No effect.
1	Enable TOVF interrupt.

**Bit 21 – WAKEUP** Wakeup Interrupt Enable

Value	Description
0	No effect.
1	Enable SLEEP interrupt.

**Bit 20 – SLEEP** Sleep Interrupt Enable

Value	Description
0	No effect.
1	Enable SLEEP interrupt.

**Bit 19 – BOFF** Bus Off Mode Interrupt Enable

Value	Description
0	No effect.
1	Enable BOFF interrupt.

**Bit 18 – ERRP** Error Passive Mode Interrupt Enable

Value	Description
0	No effect.
1	Enable ERRP interrupt.

**Bit 17 – WARN** Warning Limit Interrupt Enable

Value	Description
0	No effect.
1	Enable WARN interrupt.

**Bit 16 – ERRA** Error Active Mode Interrupt Enable

Value	Description
0	No effect.
1	Enable ERRA interrupt.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – MBx** Mailbox x Interrupt Enable

Value	Description
0	No effect.
1	Enable Mailbox x interrupt.

### 61.9.3. CAN Interrupt Disable Register

**Name:** CAN\_IDR  
**Offset:** 0x0008  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
				BERR	FERR	AERR	SERR	CERR
Access				W	W	W	W	W
Reset				–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	TSTP	TOVF	WAKEUP	SLEEP	BOFF	ERRP	WARN	ERRA
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bit 28 – BERR Bit Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Bit Error interrupt.

#### Bit 27 – FERR Form Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Form Error interrupt.

#### Bit 26 – AERR Acknowledgment Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Acknowledgment Error interrupt.

#### Bit 25 – SERR Stuffing Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Stuffing Error interrupt.

#### Bit 24 – CERR CRC Error Interrupt Disable

Value	Description
0	No effect.
1	Disable CRC Error interrupt.

### Bit 23 – TSTP TimeStamp Interrupt Disable

Value	Description
0	No effect.
1	Disable TSTP interrupt.

### Bit 22 – TOVF Timer Overflow Interrupt

Value	Description
0	No effect.
1	Disable TOVF interrupt.

### Bit 21 – WAKEUP Wakeup Interrupt Disable

Value	Description
0	No effect.
1	Disable WAKEUP interrupt.

### Bit 20 – SLEEP Sleep Interrupt Disable

Value	Description
0	No effect.
1	Disable SLEEP interrupt.

### Bit 19 – BOFF Bus Off Mode Interrupt Disable

Value	Description
0	No effect.
1	Disable BOFF interrupt.

### Bit 18 – ERRP Error Passive Mode Interrupt Disable

Value	Description
0	No effect.
1	Disable ERRP interrupt.

### Bit 17 – WARN Warning Limit Interrupt Disable

Value	Description
0	No effect.
1	Disable WARN interrupt.

### Bit 16 – ERRA Error Active Mode Interrupt Disable

Value	Description
0	No effect.
1	Disable ERRA interrupt.

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – MBx Mailbox x Interrupt Disable

Value	Description
0	No effect.
1	Disable Mailbox x interrupt.

## 61.9.4. CAN Interrupt Mask Register

**Name:** CAN\_IMR  
**Offset:** 0x000C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
				BERR	FERR	AERR	SERR	CERR
Access				R	R	R	R	R
Reset				0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	TSTP	TOVF	WAKEUP	SLEEP	BOFF	ERRP	WARN	ERRA
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bit 28 – BERR Bit Error Interrupt Mask

Value	Description
0	Bit Error interrupt is disabled.
1	Bit Error interrupt is enabled.

### Bit 27 – FERR Form Error Interrupt Mask

Value	Description
0	Form Error interrupt is disabled.
1	Form Error interrupt is enabled.

### Bit 26 – AERR Acknowledgment Error Interrupt Mask

Value	Description
0	Acknowledgment Error interrupt is disabled.
1	Acknowledgment Error interrupt is enabled.

### Bit 25 – SERR Stuffing Error Interrupt Mask

Value	Description
0	Bit Stuffing Error interrupt is disabled.
1	Bit Stuffing Error interrupt is enabled.

### Bit 24 – CERR CRC Error Interrupt Mask

Value	Description
0	CRC Error interrupt is disabled.
1	CRC Error interrupt is enabled.

### Bit 23 – TSTP Timestamp Interrupt Mask

Value	Description
0	TSTP interrupt is disabled.
1	TSTP interrupt is enabled.

### Bit 22 – TOVF Timer Overflow Interrupt Mask

Value	Description
0	TOVF interrupt is disabled.
1	TOVF interrupt is enabled.

### Bit 21 – WAKEUP Wakeup Interrupt Mask

Value	Description
0	WAKEUP interrupt is disabled.
1	WAKEUP interrupt is enabled.

### Bit 20 – SLEEP Sleep Interrupt Mask

Value	Description
0	SLEEP interrupt is disabled.
1	SLEEP interrupt is enabled.

### Bit 19 – BOFF Bus Off Mode Interrupt Mask

Value	Description
0	BOFF interrupt is disabled.
1	BOFF interrupt is enabled.

### Bit 18 – ERRP Error Passive Mode Interrupt Mask

Value	Description
0	ERRP interrupt is disabled.
1	ERRP interrupt is enabled.

### Bit 17 – WARN Warning Limit Interrupt Mask

Value	Description
0	Warning Limit interrupt is disabled.
1	Warning Limit interrupt is enabled.

### Bit 16 – ERRA Error Active Mode Interrupt Mask

Value	Description
0	ERRA interrupt is disabled.
1	ERRA interrupt is enabled.

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – MBx Mailbox x Interrupt Mask

Value	Description
0	Mailbox x interrupt is disabled.
1	Mailbox x interrupt is enabled.

**61.9.5. CAN Status Register**

**Name:** CAN\_SR  
**Offset:** 0x0010  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	OVLSY	TBSY	RBSY	BERR	FERR	AERR	SERR	CERR
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	TSTP	TOVF	WAKEUP	SLEEP	BOFF	ERRP	WARN	ERRA
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 31 – OVLSY** Overload busy

It is automatically reset when the bus is not transmitting an overload frame.

Value	Description
0	The CAN transmitter is not transmitting an overload frame.
1	The CAN transmitter is transmitting an overload frame.

**Bit 30 – TBSY** Transmitter Busy

Transmitter busy. This status bit is set by hardware while CAN transmitter is generating a frame (remote, data, overload or error frame). It is automatically reset when CAN is not transmitting.

Value	Description
0	The CAN transmitter is not transmitting a frame.
1	The CAN transmitter is transmitting a frame.

**Bit 29 – RBSY** Receiver Busy

Receiver busy. This status bit is set by hardware while CAN receiver is acquiring or monitoring a frame (remote, data, overload or error frame). It is automatically reset when CAN is not receiving.

Value	Description
0	The CAN receiver is not receiving a frame.
1	The CAN receiver is receiving a frame.

**Bit 28 – BERR** Bit Error (automatically cleared by reading CAN\_SR)

A bit error is set when the bit value monitored on the line is different from the bit value sent.

Value	Description
0	No bit error occurred during a previous transfer.

Value	Description
1	A bit error occurred during a previous transfer.

**Bit 27 – FERR** Form Error (automatically cleared by reading CAN\_SR)

A form error results from violations on one or more of the fixed form of the following bit fields:

Value	Description
0	No form error occurred during a previous transfer
1	A form error occurred during a previous transfer <ul style="list-style-type: none"> <li>– CRC delimiter</li> <li>– ACK delimiter</li> <li>– End of frame</li> <li>– Error delimiter</li> <li>– Overload delimiter</li> </ul>

**Bit 26 – AERR** Acknowledgment Error (automatically cleared by reading CAN\_SR)

An acknowledgment error is detected when no detection of the dominant bit in the acknowledge slot occurs.

Value	Description
0	No acknowledgment error occurred during a previous transfer.
1	An acknowledgment error occurred during a previous transfer.

**Bit 25 – SERR** Mailbox Stuffing Error (automatically cleared by reading CAN\_SR)

A form error results from the detection of more than five consecutive bit with the same polarity.

Value	Description
0	No stuffing error occurred during a previous transfer.
1	A stuffing error occurred during a previous transfer.

**Bit 24 – CERR** Mailbox CRC Error (automatically cleared by reading CAN\_SR)

A CRC error has been detected during last reception.

Value	Description
0	No CRC error occurred during a previous transfer.
1	A CRC error occurred during a previous transfer.

**Bit 23 – TSTP** Timestamp (automatically cleared by reading CAN\_SR)

Value	Description
0	No bus activity has been detected.
1	A start of frame or an end of frame has been detected (according to the CAN_MR.TEOF field).

**Bit 22 – TOVF** Timer Overflow (automatically cleared by reading CAN\_SR)

Value	Description
0	The timer has not rolled over FFFFh to 0000h.
1	The timer rolls over FFFFh to 0000h.

**Bit 21 – WAKEUP** CAN Controller is not in Low-power Mode

When a WAKEUP event occurs, the CAN controller is synchronized with the bus activity. Messages can be transmitted or received. The CAN controller clock must be available when a WAKEUP event occurs. This flag is automatically reset when the CAN controller enters Low-power mode.

Value	Description
0	The CAN controller is in Low-power mode.
1	The CAN controller is not in Low-power mode.

#### Bit 20 – SLEEP CAN Controller in Low-power Mode

This flag is automatically reset when Low-power mode is disabled

Value	Description
0	The CAN controller is not in Low-power mode.
1	The CAN controller is in Low-power mode.

#### Bit 19 – BOFF Bus Off Mode (automatically cleared by reading CAN\_SR)

This flag is set depending on the TEC counter value. A node is in Bus Off state when the TEC counter is greater or equal to 256 (decimal).

Value	Description
0	The CAN controller has not reached Bus Off mode.
1	The CAN controller has reached Bus Off mode since the last read of CAN_SR.
0	The CAN controller is not in Bus Off mode.
1	The CAN controller is in Bus Off mode.

#### Bit 18 – ERRP Error Passive Mode (automatically cleared by reading CAN\_SR)

This flag is set depending on TEC and REC counters values.

A node is in Error Passive state when the TEC counter is greater or equal to 128 (decimal) or when the REC counter is greater or equal to 128 (decimal).

Value	Description
0	The CAN controller has not reached Error Passive mode since the last read of CAN_SR.
1	The CAN controller has reached Error Passive mode since the last read of CAN_SR.
0	The CAN controller is not in Error Passive mode.
1	The CAN controller is in Error Passive mode.

#### Bit 17 – WARN Warning Limit (automatically cleared by reading CAN\_SR)

This flag is set depending on TEC and REC counter values. It is set when at least one of the counter values has reached a value greater or equal to 96.

Value	Description
0	The CAN controller Warning Limit has not been reached since the last read of CAN_SR.
1	The CAN controller Warning Limit has been reached since the last read of CAN_SR.
0	The CAN controller Warning Limit is not reached.
1	The CAN controller Warning Limit is reached.

#### Bit 16 – ERRA Error Active Mode (automatically cleared by reading CAN\_SR)

This flag is set depending on TEC and REC counter values. It is set when a node is neither in Error Passive mode nor in Bus Off mode.

Value	Description
0	The CAN controller has not reached Error Active mode since the last read of CAN_SR.
1	The CAN controller has reached Error Active mode since the last read of CAN_SR.
0	The CAN controller is not in Error Active mode.
1	The CAN controller is in Error Active mode.

#### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – MBx Mailbox x Event

An event corresponds to the MRDY or MABT bit in CAN\_MSRx.

Value	Description
0	No event occurred on Mailbox x.
1	An event occurred on Mailbox x.

## 61.9.6. CAN Baudrate Register

**Name:** CAN\_BR  
**Offset:** 0x0014  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [CAN Write Protection Mode Register](#).

Any modification on one of the CAN\_BR fields must be done while the CAN module is disabled.

To compute the different bit timings, see [CAN Bit Timing Configuration](#).

Bit	31	30	29	28	27	26	25	24
								SMP
Access								R/W
Reset								0
Bit	23	22	21	20	19	18	17	16
								BRP[6:0]
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
								SJW[1:0]
Access			R/W	R/W		R/W	R/W	R/W
Reset			0	0		0	0	0
Bit	7	6	5	4	3	2	1	0
								PHASE1[2:0]
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

### Bit 24 – SMP Sampling Mode

0 (ONCE): The incoming bit stream is sampled once at sample point.

1 (THREE): The incoming bit stream is sampled three times with a period of a peripheral clock, centered on sample point.

SMP Sampling mode is automatically disabled if BRP = 0.

### Bits 22:16 – BRP[6:0] Baudrate Prescaler

This field allows user to program the period of the CAN system clock to determine the individual bit timing.

$$t_{CSC} = (BRP + 1) / t_{\text{peripheral clock}}$$

The BRP field must be within the range [1, 0x7F], i.e., BRP = 0 is not authorized.

### Bits 13:12 – SJW[1:0] Re-synchronization Jump Width

To compensate for phase shifts between clock oscillators of different controllers on bus. The controller must re-synchronize on any relevant signal edge of the current transmission. The synchronization jump width defines the maximum of clock cycles a bit period may be shortened or lengthened by re-synchronization.

$$t_{SJW} = t_{CSC} \times (SJW + 1)$$

### Bits 10:8 – PROPAG[2:0] Programming Time Segment

This part of the bit time is used to compensate for the physical delay times within the network.

$$t_{PRS} = t_{CSC} \times (PROPAG + 1)$$

**Bits 6:4 – PHASE1[2:0]** Phase 1 Segment

This phase is used to compensate for edge phase error.

$$t_{PHS1} = t_{CSC} \times (PHASE1 + 1)$$

**Bits 2:0 – PHASE2[2:0]** Phase 2 Segment

This phase is used to compensate the edge phase error.

$$t_{PHS2} = t_{CSC} \times (PHASE2 + 1)$$

**Note:** PHASE2 value must be different from 0.

61.9.7. CAN Timer Register

**Name:** CAN\_TIM  
**Offset:** 0x0018  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	TIMER[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TIMER[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 15:0 – TIMER[15:0]** Timer  
This field represents the internal CAN controller 16-bit timer value.

### 61.9.8. CAN Timestamp Register

**Name:** CAN\_TIMESTP  
**Offset:** 0x001C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	MTIMESTAMP[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MTIMESTAMP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 15:0 – MTIMESTAMP[15:0] Timestamp

This field carries the value of the internal CAN controller 16-bit timer value at the start or end of frame.

If CAN\_MR.TEOF is cleared, the internal Timer Counter value is captured in the MTIMESTAMP field at each start of frame, else the value is captured at each end of frame. When the value is captured, the TSTP flag is set in CAN\_SR. If the TSTP mask in CAN\_IMR is set, an interrupt is generated while the TSTP flag is set. The TSTP flag is cleared by reading CAN\_SR.

**Note:** CAN\_TIMESTP is reset when the CAN is disabled then enabled via CAN\_MR.CANEN.

**61.9.9. CAN Error Counter Register**

**Name:** CAN\_ECR  
**Offset:** 0x0020  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
								TEC[8]
Access								R
Reset								0

Bit	23	22	21	20	19	18	17	16
								TEC[7:0]
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								REC[7:0]
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 24:16 – TEC[8:0] Transmit Error Counter**

When a transmitter sends an Error flag, TEC is increased by 8, except when:

- the transmitter is error passive and detects an acknowledgment error because of not detecting a dominant ACK and does not detect a dominant bit while sending its Passive Error flag,
- the transmitter sends an error because a stuff error occurred during arbitration and should have been recessive and has been sent as recessive but monitored as dominant.

When a transmitter detects a bit error while sending an Active Error or Overload flag, the TEC will be increased by 8.

Any node tolerates up to 7 consecutive dominant bits after sending an Active Error, Passive Error or Overload flag. After detecting the 14th consecutive dominant bit (in case of an Active Error or Overload flag) or after detecting the 8th consecutive dominant bit following a Passive Error flag, and after each sequence of additional eight consecutive dominant bits every transmitter increases its TEC by 8.

After a successful transmission the TEC is decreased by 1 unless it was already 0.

**Bits 7:0 – REC[7:0] Receive Error Counter**

When a receiver detects an error, REC will be increased by one, except when the detected error is a bit error while sending an Active Error or Overload flag.

When a receiver detects a dominant bit as the first bit after sending an Error flag, REC is increased by 8.

When a receiver detects a bit error while sending an Active Error flag, REC is increased by 8.

Any node tolerates up to 7 consecutive dominant bits after sending an Active Error, Passive Error or Overload flag. After detecting the 14th consecutive dominant bit (in case of an Active Error or Overload flag) or after detecting the 8th consecutive dominant bit following a Passive Error flag, and after each sequence of additional eight consecutive dominant bits, each receiver increases its REC by 8.

After successful reception of a message, REC is decreased by 1 if it was between 1 and 127. If REC was 0, it stays 0, and if it was greater than 127, then it is set to a value between 119 and 127.

## 61.9.10. CAN Transfer Command Register

**Name:** CAN\_TCR  
**Offset:** 0x0024  
**Reset:** –  
**Property:** Write-only

This register initializes several transfer requests at the same time.

Bit	31	30	29	28	27	26	25	24
	TIMRST							
Access	W							
Reset	–							

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bit 31 – TIMRST Timer Reset

Resets the internal timer counter. If the internal timer counter is frozen, this command automatically re-enables it. This command is useful in Time Triggered mode.

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – MBx Transfer Request for Mailbox x

This flag clears the MRDY and MABT flags in the corresponding CAN\_MSRx.

When several mailboxes are requested to be transmitted simultaneously, they are transmitted in turn, starting with the mailbox with the highest priority. If several mailboxes have the same priority, then the mailbox with the lowest number is sent first (i.e., MB0 will be transferred before MB1).

Mailbox Object Type	Description
Receive	Receives the next message
Receive with Overwrite	Triggers a new reception
Transmit	Sends data prepared in the mailbox as soon as possible
Consumer	Sends a remote frame
Producer	Sends data prepared in the mailbox after receiving a remote frame from a consumer

### 61.9.11. CAN Abort Command Register

**Name:** CAN\_ACR  
**Offset:** 0x0028  
**Reset:** –  
**Property:** Write-only

This register initializes several abort requests at the same time.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
	MB15	MB14	MB13	MB12	MB11	MB10	MB9	MB8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	MB7	MB6	MB5	MB4	MB3	MB2	MB1	MB0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – MBx** Abort Request for Mailbox x  
The CAN\_MCRx.MACR field can be set for each mailbox

Mailbox Object Type	Description
Receive	No action
Receive with overwrite	No action
Transmit	Cancels transfer request if the message has not been transmitted to the CAN transceiver
Consumer	Cancels the current transfer before the remote frame has been sent
Producer	Cancels the current transfer. The next remote frame is not serviced

## 61.9.12. CAN Write Protection Mode Register

**Name:** CAN\_WPMR  
**Offset:** 0x00E4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPEN
Access								R/W
Reset								0

### Bits 31:8 – WPKEY[23:0] Write Protection Key Password

Value	Name	Description
0x43414E	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0

### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x43414E ("CAN" written in ASCII)
1	Enables the write protection if WPKEY corresponds to 0x43414E ("CAN" written in ASCII)

### 61.9.13. CAN Write Protection Status Register

**Name:** CAN\_WPSR  
**Offset:** 0x00E8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

#### Bits 15:8 – WPVSR[7:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of CAN_WPSR.
1	A write protection violation has occurred since the last read of CAN_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

**61.9.14. CAN Message Mode Register**

**Name:** CAN\_MMRx  
**Offset:** 0x0200 + x\*0x20 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [CAN Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
						MOT[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MTIMEMARK[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 26:24 – MOT[2:0] Mailbox Object Type**

This field allows the user to define the type of the mailbox. All mailboxes are independently configurable. Five different types are possible for each mailbox.

Value	Name	Description
0	MB_DISABLED	The mailbox is disabled. This prevents receiving or transmitting any messages with this mailbox.
1	MB_RX	Reception mailbox. The mailbox is configured for reception. If a message is received while the mailbox data register is full, it is discarded.
2	MB_RX_OVERWRITE	Reception mailbox with overwrite. The mailbox is configured for reception. If a message is received while the mailbox is full, it overwrites the previous message.
3	MB_TX	Transmit mailbox. The mailbox is configured for transmission.
4	MB_CONSUMER	Consumer mailbox. The mailbox is configured for reception but behaves like a transmit mailbox, i.e., it sends a remote frame and waits for an answer.
5	MB_PRODUCER	Producer mailbox. The mailbox is configured for transmission but also behaves like a reception mailbox, i.e., it waits to receive a remote frame before sending its content.
6	–	Reserved

**Bits 19:16 – PRIOR[3:0] Mailbox Priority**

This field has no effect in Receive and Receive with Overwrite modes. In these modes, the mailbox with the lowest number is serviced first.

When several mailboxes try to transmit a message at the same time, the mailbox with the highest priority is serviced first. If several mailboxes have the same priority, the mailbox with the lowest number is serviced first (i.e., MBx0 is serviced before MBx 15 if they have the same priority).

**Bits 15:0 – MTIMEMARK[15:0]** Mailbox Timemark

This field is active in Time-triggered mode. Transmit operations are allowed when the internal timer counter reaches the Mailbox Timemark. See [Transmitting within a Time Window](#).  
In Timestamp mode, MTIMEMARK is set to 0.

**61.9.15. CAN Message Acceptance Mask Register**

**Name:** CAN\_MAMx  
**Offset:** 0x0204 + x\*0x20 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [CAN Write Protection Mode Register](#).

To prevent concurrent access with the internal CAN core, the application must disable the mailbox before writing to CAN\_MAMx registers.

Bit	31	30	29	28	27	26	25	24
			MIDE	MIDvA[10:6]

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 29 – MIDE** Identifier Version

Value	Description
0	Compares IDvA from the received frame with the CAN_MIDx register masked with CAN_MAMx register.
1	Compares IDvA and IDvB from the received frame with the CAN_MIDx register masked with CAN_MAMx register.

**Bits 28:18 – MIDvA[10:0]** Identifier for standard frame mode

Acceptance mask for corresponding field of the message IDvA register of the mailbox.

Value	Description
0	The corresponding message ID bit is not masked
1	The corresponding message ID bit is masked

**Bits 17:0 – MIDvB[17:0]** Complementary bits for identifier in extended frame mode

Acceptance mask for corresponding field of the message IDvB register of the mailbox.

Value	Description
0	The corresponding message ID bit is not masked
1	The corresponding message ID bit is masked

**61.9.16. CAN Message ID Register**

**Name:** CAN\_MIDx  
**Offset:** 0x0208 + x\*0x20 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [CAN Write Protection Mode Register](#).

To prevent concurrent access with the internal CAN core, the application must disable the mailbox before writing to CAN\_MIDx registers.

Bit	31	30	29	28	27	26	25	24
			MIDE	MIDvA[10:6]				
Access			R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

**Bit 29 – MIDE** Identifier Version

This bit allows the user to define the version of messages processed by the mailbox. If set, mailbox is dealing with version 2.0 Part B messages; otherwise, mailbox is dealing with version 2.0 Part A messages.

**Bits 28:18 – MIDvA[10:0]** Identifier for Standard Frame mode**Bits 17:0 – MIDvB[17:0]** Complementary bits for identifier in Extended Frame mode

If MIDE is cleared, MIDvB value is 0.

## 61.9.17. CAN Message Family ID Register

**Name:** CAN\_MFIDx  
**Offset:** 0x020C + x\*0x20 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
				MFID[28:24]				
Access				R/W	R/W	R/W	R/W	R/W
Reset				0	0	0	0	0
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
	MFID[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 28:0 – MFID[28:0] Family ID

This field contains the concatenation of CAN\_MIDx bits masked by the CAN\_MAMx register. This field is useful to speed up message ID decoding. The message acceptance procedure is described below.  
 Example:

```
CAN_MIDx = 0x305A4321
CAN_MAMx = 0x3FF0F0FF
CAN_MFIDx = 0x000000A3
```

## 61.9.18. CAN Message Status Register

**Name:** CAN\_MS Rx  
**Offset:** 0x0210 + x\*0x20 [x=0..7]  
**Reset:** 0  
**Property:** Read/Write

These register fields are updated each time a message transfer is received or aborted.

**WARNING** The MRTR and MDLC states depend partly on the mailbox object type.

Bit	31	30	29	28	27	26	25	24
								MMI
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16
	MRDY	MABT		MRTR	MDLC[3:0]			
Access	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	MTIMESTAMP[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MTIMESTAMP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bit 24 – MMI Mailbox Message Ignored (cleared by reading CAN\_MS Rx)

Mailbox Object Type	Description
Receive	Set when at least two messages intended for the mailbox have been sent. The first one is available in the mailbox data register. Others have been ignored. A mailbox with a lower priority may have accepted the message.
Receive with Overwrite	Set when at least two messages intended for the mailbox have been sent. The last one is available in the mailbox data register. Previous ones have been lost.
Transmit	Reserved
Consumer	A remote frame has been sent by the mailbox but several messages have been received. The first one is available in the mailbox data register. Others have been ignored. Another mailbox with a lower priority may have accepted the message.
Producer	A remote frame has been received, but no data are available to be sent.

Value	Description
0	No message has been ignored during the previous transfer.
1	At least one message has been ignored during the previous transfer.

### Bit 23 – MRDY Mailbox Ready (cleared by writing MTCR or MACR in CAN\_MCRx) An interrupt is triggered when MRDY is set.

Mailbox Object Type	Description
Receive	At least one message has been received since the last mailbox transfer order. Data from the first frame received can be read in the CAN_MDxx registers. After setting CAN_MMR.MOT, MRDY is reset to 0.
Receive with Overwrite	At least one frame has been received since the last mailbox transfer order. Data from the last frame received can be read in the CAN_MDxx registers. After setting CAN_MMR.MOT, MRDY is reset to 0.
Transmit	Mailbox data have been transmitted. After setting CAN_MMR.MOT, MRDY is reset to 1.
Consumer	At least one message has been received since the last mailbox transfer order. Data from the first message received can be read in the CAN_MDxx registers. After setting CAN_MMR.MOT, MRDY is reset to 0.
Producer	A remote frame has been received, mailbox data have been transmitted. After setting CAN_MMR.MOT, MRDY is reset to 1.

Value	Description
0	Mailbox data registers can not be read/written by the software application. CAN_MDx are locked by CAN_MDx.
1	Mailbox data registers can be read/written by the software application.

#### Bit 22 – MABT Mailbox Message Abort (cleared by writing MTCR or MACR in CAN\_MCRx)

An interrupt is triggered when MABT is set.

Mailbox Object Type	Description
Receive	Reserved
Receive with Overwrite	Reserved
Transmit	Previous transfer has been aborted
Consumer	The remote frame transfer request has been aborted.
Producer	The response to the remote frame transfer has been aborted.

Value	Description
0	The previous transfer is not aborted.
1	The previous transfer has been aborted.

#### Bit 20 – MRTR Mailbox Remote Transmission Request

Mailbox Object Type	Description
Receive	The first frame received has the RTR bit set.
Receive with Overwrite	The last frame received has the RTR bit set.
Transmit	Reserved
Consumer	Reserved. After setting CAN_MMR.MOT, MRTR is reset to 1.
Producer	Reserved. After setting the CAN_MMR.MOT, MRTR is reset to 0.

#### Bits 19:16 – MDLC[3:0] Mailbox Data Length Code

Mailbox Object Type	Description
Receive	Length of the first mailbox message received
Receive with Overwrite	Length of the last mailbox message received
Transmit	No action
Consumer	Length of the mailbox message received
Producer	Length of the mailbox message to be sent after the remote frame reception

#### Bits 15:0 – MTIMESTAMP[15:0] Timer Value

This field is updated only when time-triggered operations are disabled (CAN\_MR.TTM cleared). If the field CAN\_MR.TEOF is cleared, TIMESTAMP is the internal timer value at the start of frame of the last message received or sent by the mailbox. If TEOF is set, TIMESTAMP is the internal timer value at the end of frame of the last message received or sent by the mailbox. In Time-triggered mode, MTIMESTAMP is set to 0.

## 61.9.19. CAN Message Data Low Register

**Name:** CAN\_MDLx  
**Offset:** 0x0214 + x\*0x20 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	MDL[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	MDL[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MDL[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MDL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – MDL[31:0] Message Data Low Value

When CAN\_MSRx.MRDY is set, the lower 32 bits of a received message can be read or written by the software application. Otherwise, the MDL value is locked by the CAN controller to send/receive a new message.

In Receive with Overwrite, the CAN controller may modify the MDL value while the software application reads the MDHx and MDLx registers. To check that MDHx and MDLx do not belong to different messages, the application has to check CAN\_MSRx.MMI. In this mode, the software application must re-read CAN\_MDHx and CAN\_MDLx, while MMI is set.

Bytes are received/sent on the bus in the following order:

1. CAN\_MDL[7:0]
2. CAN\_MDL[15:8]
3. CAN\_MDL[23:16]
4. CAN\_MDL[31:24]
5. CAN\_MDH[7:0]
6. CAN\_MDH[15:8]
7. CAN\_MDH[23:16]
8. CAN\_MDH[31:24]

## 61.9.20. CAN Message Data High Register

**Name:** CAN\_MDHx  
**Offset:** 0x0218 + x\*0x20 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	MDH[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	MDH[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	MDH[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MDH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – MDH[31:0] Message Data High Value

When CAN\_MSRx.MRDY is set, the upper 32 bits of a received message are read or written by the software application. Otherwise, the MDH value is locked by the CAN controller to send/receive a new message.

In Receive with Overwrite, the CAN controller may modify the MDH value while the software application reads the MDHx and MDLx registers. To check that MDHx and MDLx do not belong to different messages, the application has to check CAN\_MSRx.MMI. In this mode, the software application must re-read CAN\_MDHx and CAN\_MDLx, while MMI is set.

Bytes are received/sent on the bus in the following order:

1. CAN\_MDL[7:0]
2. CAN\_MDL[15:8]
3. CAN\_MDL[23:16]
4. CAN\_MDL[31:24]
5. CAN\_MDH[7:0]
6. CAN\_MDH[15:8]
7. CAN\_MDH[23:16]
8. CAN\_MDH[31:24]

## 61.9.21. CAN Message Control Register

**Name:** CAN\_MCRx  
**Offset:** 0x021C + x\*0x20 [x=0..7]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access	MTCR	MACR		MRTR	MDLC[3:0]			
Reset	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

### Bit 23 – MTCR Mailbox Transfer Command

This flag clears the MRDY and MABT flags in CAN\_MSRx.

When several mailboxes are requested to be transmitted simultaneously, they are transmitted in turn. The mailbox with the highest priority is serviced first. If several mailboxes have the same priority, the mailbox with the lowest number is serviced first (i.e., MBx0 will be serviced before MBx15 if they have the same priority).

It is possible to set MTCR for several mailboxes at the same time by writing to CAN\_TCR.

Mailbox Object Type	Description
Receive	Allows the reception of the next message
Receive with Overwrite	Triggers a new reception
Transmit	Sends data prepared in the mailbox as soon as possible
Consumer	Sends a remote transmission frame
Producer	Sends data prepared in the mailbox after receiving a remote frame from a Consumer

### Bit 22 – MACR Abort Request for Mailbox x

This flag clears the MRDY and MABT flags in CAN\_MSRx.

It is possible to set the MACR field for several mailboxes at the same time, setting several bits to CAN\_ACR.

Mailbox Object Type	Description
Receive	No action
Receive with Overwrite	No action
Transmit	Cancels transfer request if the message has not been transmitted to the CAN transceiver
Consumer	Cancels the current transfer before the remote frame has been sent
Producer	Cancels the current transfer. The next remote frame will not be serviced

## Bit 20 – MRTR Mailbox Remote Transmission Request

Consumer situations can be handled automatically by setting the mailbox object type in Consumer. This requires only one mailbox.

It can also be handled using two mailboxes, one in reception, the other in transmission. The MRTR and the MTCR bits must be set at the same time.

Mailbox Object Type	Description
Receive	No action
Receive with Overwrite	No action
Transmit	Sets the RTR bit in the sent frame
Consumer	No action, the RTR bit in the sent frame is set automatically
Producer	No action

## Bits 19:16 – MDLC[3:0] Mailbox Data Length Code

Mailbox Object Type	Description
Receive	No action
Receive with Overwrite	No action
Transmit	Length of the mailbox message
Consumer	No action
Producer	Length of the mailbox message to be sent after the remote frame reception

## 62. Timer Counter (TC)

### 62.1. Description

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has two global registers which act upon all TC channels:

- Block Control register (TC\_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode register (TC\_BMR)—defines the external clock inputs for each channel, allowing them to be chained

### 62.2. Embedded Characteristics

- Total of Six Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse width modulation
  - Up/down capabilities
  - Quadrature decoder with real time filtering reports
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Interrupt Line
- Read of the Capture Registers by the DMAC
- Register Write Protection
- Safety/Security Reports

## 62.3. Block Diagram

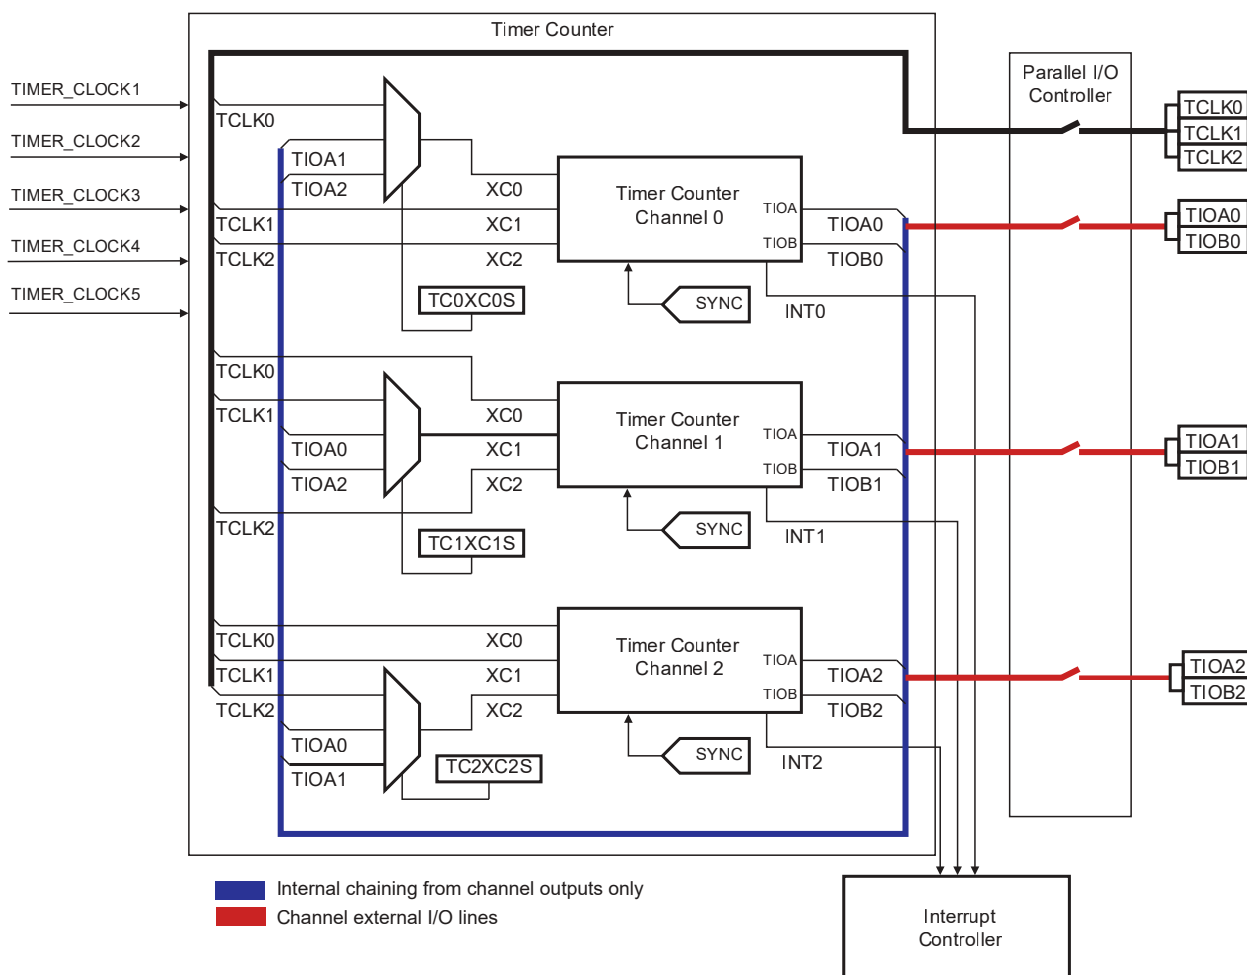

**Table 62.1.** Timer Counter Clock Assignment

Name	Definition
TIMER_CLOCK1	GCLK [17], GLCK[45]
TIMER_CLOCK2	MCK/8
TIMER_CLOCK3	MCK/32
TIMER_CLOCK4	MCK/128
TIMER_CLOCK5 <sup>(1)</sup>	MD_SLCK

**Note:**

1. The GCLK [TC\_ID] frequency must be at least three times lower than peripheral clock frequency.

**Figure 62.1.** TC Block Diagram

**Notes:**

1. The above figure provides pin names of a first instance of a Timer Counter module (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TCLK3-TCLK5", "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external I/O pins of a second Timer Counter module (i.e., instance TC1).
2. QDEC connections are detailed in [Figure 62.17](#).

**Table 62.2.** Channel Signal Description

Signal Name	Description
XC0, XC1, XC2	Channel clock source that can be connected to TIOAx, TIOBx, TCLKx
TIMER_CLOCK1-5	Channel clock source from system clocks
TIOAx	Capture mode: Timer Counter input Waveform mode: Timer Counter output
TIOBx	Capture mode: Timer Counter input Waveform mode: Timer Counter input/output
INT	Interrupt signal output (internal signal)
SYNC	Synchronization input signal (from Configuration register)

## 62.4. Pin List

**Table 62.3.** Pin List

Pin Name	Description	Type
TCLK0-TCLK2	External clock input	Input
TIOA0-TIOA2	I/O line A	I/O
TIOB0-TIOB2	I/O line B	I/O

**Note:** This table provides pin names of a first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TCLK3-TCLK5", "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external I/O pins of a second Timer Counter block (i.e., instance TC1).

## 62.5. Product Dependencies

### 62.5.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

### 62.5.2. Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock.

### 62.5.3. Interrupt Sources

The TC has an interrupt line connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

### 62.5.4. Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. See [Synchronization with PWM](#) and refer to the implementation of the Pulse Width Modulation (PWM) in this product.

## 62.6. Functional Description

### 62.6.1. Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in [Register Summary](#).

### 62.6.2. 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value  $2^{32}-1$  and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC\_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC\_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

### 62.6.3. Clock Selection

Input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining<sup>(1)</sup> by programming the Block Mode register (TC\_BMR). See the figure [Clock Chaining Selection](#).

Each channel can independently select a source for its counter<sup>(2)</sup>:

- Signals from other channels: XC0, XC1 or XC2
- Signals from the system: GCLK [17], GLCK[45], MCK/8, MCK/32, MCK/128, MD\_SLCK

This selection is made by the TCCLKS bits in the Channel Mode register (TC\_CMRx).

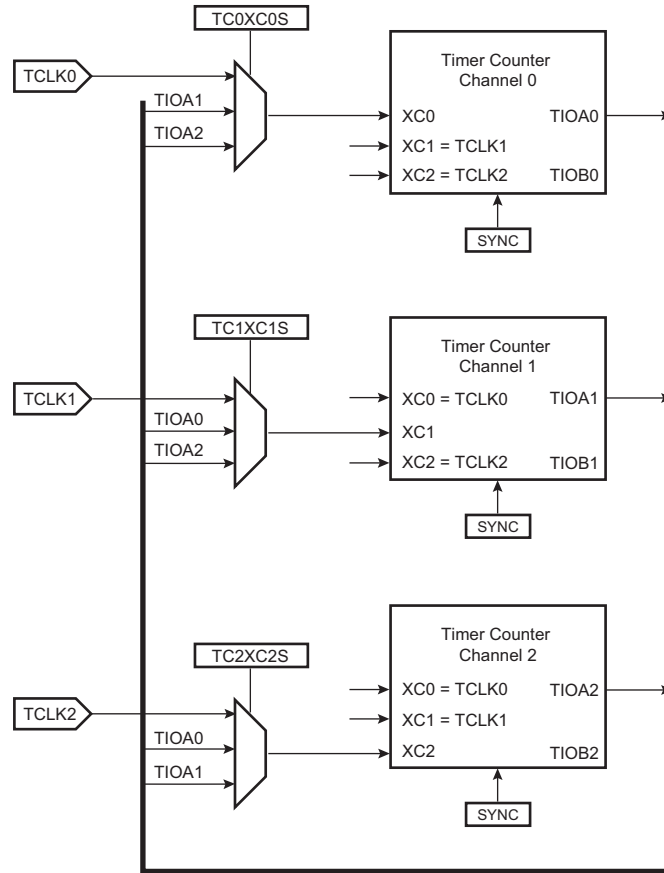

The selected clock can be inverted with TC\_CMRx.CLKI. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC\_CMRx defines this signal (none, XC0, XC1, XC2). See the figure [Clock Selection](#).

#### Notes:

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
  - Configure TIOx outputs to 1 or 0 by writing the required value to TC\_CMRx.ASWTRG.
  - Bit TC\_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK [TC\_ID] is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

**Figure 62.2.** Clock Chaining Selection

**Note:** The above figure provides pin names of a first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TCLK3-TCLK5", "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external I/O pins of a second Timer Counter block (i.e., instance TC1).

Figure 62.3. Clock Selection

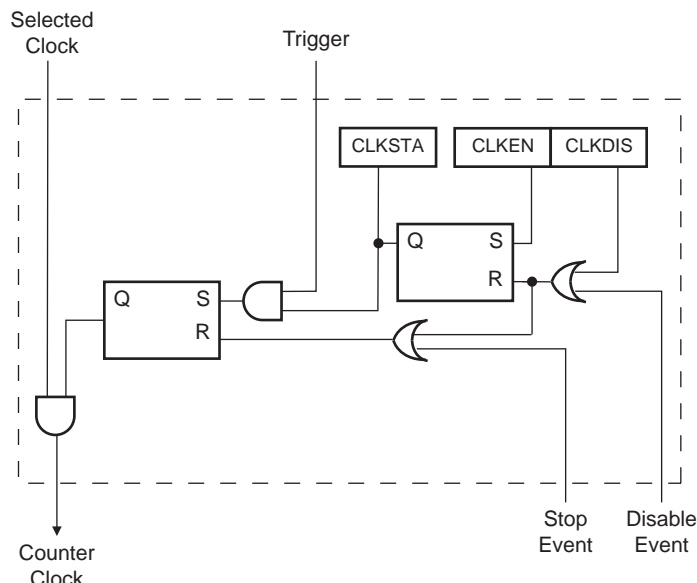

#### 62.6.4. Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped, as shown in the following figure.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the Channel Control register (TC\_CCR). In Capture mode it can be disabled by an RB load event if TC\_CMRx.LDBDIS is set to '1'. In Waveform mode, it can be disabled by an RC Compare event if TC\_CMRx.CPCDIS is set to '1'. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC\_CCR can reenale the clock. When the clock is enabled, TC\_SR.CLKSTA is set.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts the clock. The clock can be stopped by an RB load event in Capture mode (TC\_CMRx.LDBSTOP = 1) or an RC compare event in Waveform mode (TC\_CMRx.CPCSTOP = 1). The start and the stop commands are effective only if the clock is enabled.

**Figure 62.4.** Clock Control

### 62.6.5. Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with TC\_CMRx.WAVE.

In Capture mode, TIOAx and TIOBx are configured as inputs.

In Waveform mode, TIOAx is always configured to be an output and TIOBx is an output if it is not selected to be the external trigger.

### 62.6.6. Trigger Events

An input trigger event resets the internal counter value and starts the counter clock. Three types of trigger are common to both modes, and an external trigger is available to each mode (Capture or Waveform).

Regardless of the input trigger event used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger event, especially when a low frequency signal is selected as the clock.

The following input trigger events are common to both modes:

- Software trigger: Each channel has a software trigger, available by setting TC\_CCR.SWTRG.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC\_BCR with SYNC set.
- Compare RC trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC\_CMRx.CPCTRG is set.

The timer channel can also be configured to be triggered by an external event.

In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx.

In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC\_CMRx.ENETRIG.

If an external trigger event is used, the duration of the pulses must be longer than the peripheral clock period to be detected.

### 62.6.7. Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETR<sub>G</sub> bit in the TC\_CM<sub>R</sub> selects TIOA<sub>x</sub> or TIOB<sub>x</sub> input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGED<sub>G</sub> field in TC\_CM<sub>R</sub>) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGED<sub>G</sub> = 0 (none), the external trigger is disabled.

**Figure 62.5.** Capture Mode

### 62.6.8. Capture Mode

Capture mode is entered by clearing TC\_CM<sub>R</sub>.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOA<sub>x</sub> and TIOB<sub>x</sub> signals which are considered as inputs.

The figure [Capture Mode](#) shows the configuration of the TC channel when programmed in Capture mode.

### 62.6.9. Capture Registers A and B

Registers A and B (TC\_RA and TC\_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC\_CMRx.LDRA defines the TIOAx selected edge for the loading of TC\_RA, and TC\_CMRx.LDRB defines the TIOAx selected edge for the loading of TC\_RB.

The subsampling ratio defined by TC\_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC\_RA is loaded only if it has not been loaded since the last trigger or if TC\_RB has been loaded since the last loading of TC\_RA.

TC\_RB is loaded only if TC\_RA has been loaded since the last trigger or the last loading of TC\_RB.

Loading TC\_RA or TC\_RB before the read of the last value loaded sets TC\_SR.LOVRS. In this case, the old value is overwritten.

When DMA is used, the Register AB (TC\_RAB) address must be configured as source address of the transfer. TC\_RAB provides the next unread value from TC\_RA and TC\_RB. It may be read by the DMA after a request has been triggered upon loading TC\_RA or TC\_RB.

### 62.6.10. Transferring Timer Values with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC\_RA and TC\_RB can be loaded in the system memory without processor intervention.

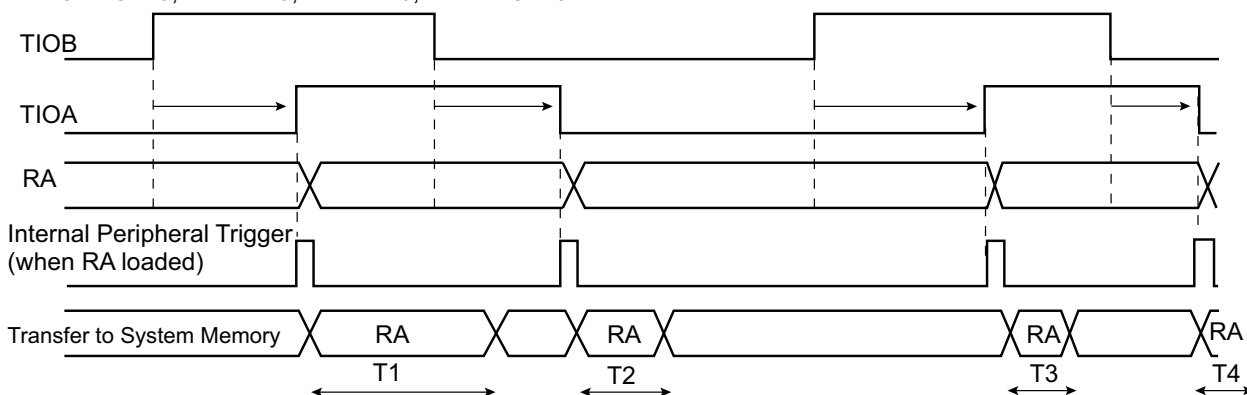

**Figure 62.6.** Example of Transfer with DMAC in Capture Mode

ETRGDGD = 1, LDRA = 1, LDRB = 2, ABETR = 0

T1, T2, T3, T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

ETRGDGD = 3, LDRA = 3, LDRB = 0, ABETR = 0

T1, T2, T3, T4 = System Bus load dependent ( $t_{min} = 8$  Peripheral Clocks)

### 62.6.11. Waveform Mode

Waveform mode is entered by setting the TC\_CM Rx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC\_CM Rx).

The figure [Waveform Mode](#) shows the configuration of the TC channel when programmed in Waveform operating mode.

### 62.6.12. Waveform Selection

Depending on the WAVSEL parameter in TC\_CM Rx, the behavior of TC\_CV varies.

With any selection, TC\_RA, TC\_RB and TC\_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

Figure 62.7. Waveform Mode

#### 62.6.12.1. WAVSEL = 00

When WAVSEL = 00, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  has been reached, the value of TC\_CV is reset. Incrementation of TC\_CV starts again and the cycle continues.

An external event trigger or a software trigger can reset the value of TC\_CV. It is important to note that the trigger may occur at any time.

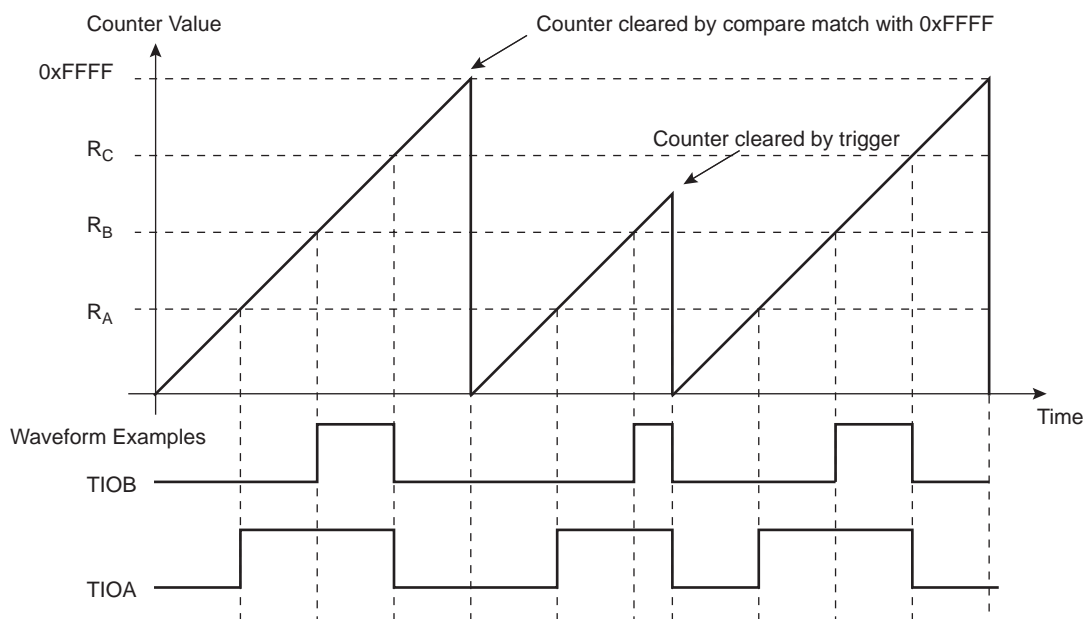

See the following figures.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 62.8. WAVSEL = 00 without Trigger**

**Figure 62.9. WAVSEL = 00 with Trigger**

#### 62.6.12.2. WAVSEL = 10

When WAVSEL = 10, the value of TC\_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC\_CV has been reset, it is then incremented and so on.

It is important to note that TC\_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

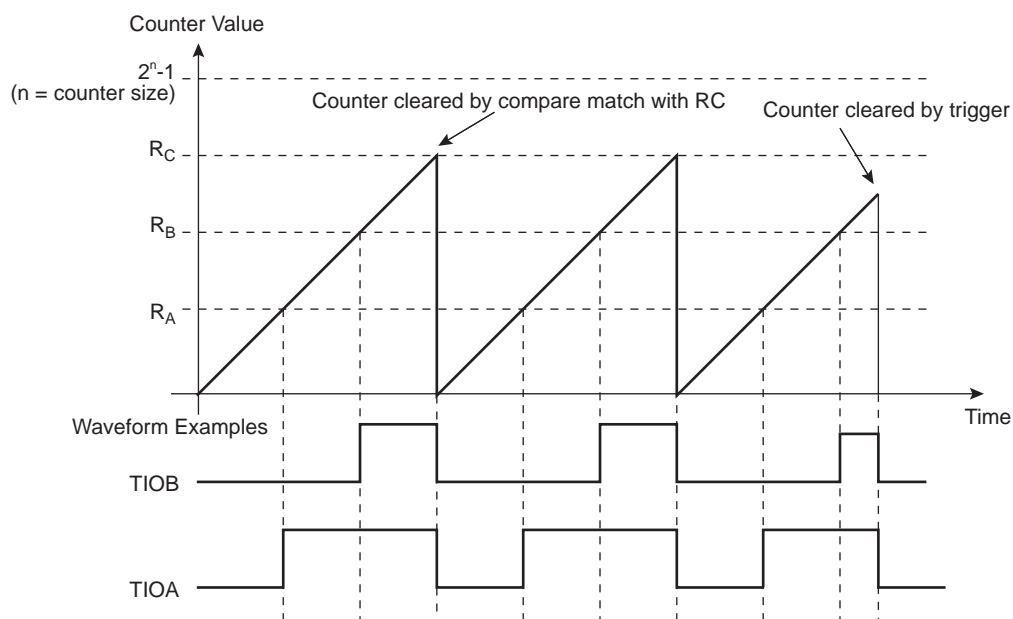

See the following figures.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC\_CMR) and/or disable the counter clock (CPCDIS = 1 in TC\_CMR).

**Figure 62.10.** WAVSEL = 10 without Trigger

**Figure 62.11.** WAVSEL = 10 with Trigger

### 62.6.12.3. WAVSEL = 01

When WAVSEL = 01, the value of TC\_CV is incremented from 0 to  $2^{32}-1$ . Once  $2^{32}-1$  is reached, the value of TC\_CV is decremented to 0, then reincremented to  $2^{32}-1$  and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

See the following figures.

RC Compare cannot be programmed to generate a trigger in this configuration.

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 62.12.** WAVSEL = 01 without Trigger

**Figure 62.13.** WAVSEL = 01 with Trigger

#### 62.6.12.4. WAVSEL = 11

When WAVSEL = 11, the value of TC\_CV is incremented from 0 to RC. Once RC is reached, the value of TC\_CV is decremented to 0, then reincremented to RC and so on.

A trigger such as an external event or a software trigger can modify TC\_CV at any time. If a trigger occurs while TC\_CV is incrementing, TC\_CV then decrements. If a trigger is received while TC\_CV is decrementing, TC\_CV then increments.

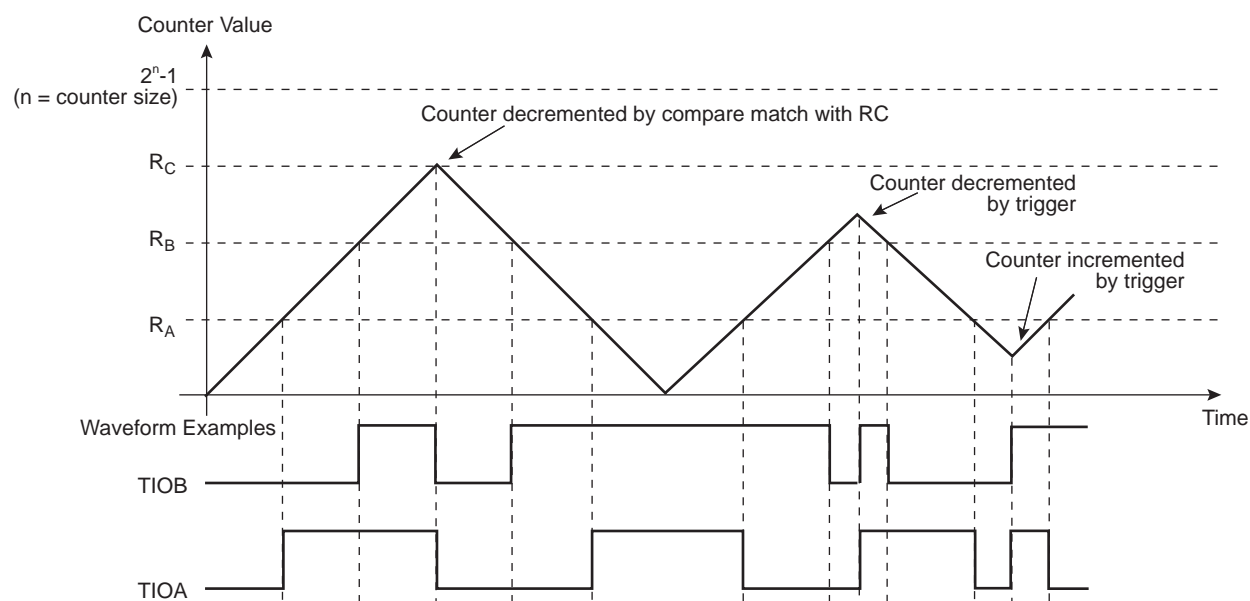

See the following figures.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

**Figure 62.14.** WAVSEL = 11 without Trigger

**Figure 62.15.** WAVSEL = 11 with Trigger

### 62.6.13. External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC\_CMR.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC\_CMR.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

When an external event is defined, it can be used as a trigger by setting TC\_CMR.ENETRIG.

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

#### 62.6.14. Synchronization with PWM

The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.

PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC\_EMR) fields TRIGSRCA and TRIGSRCB (see [TC\\_EMRx](#)).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

**Figure 62.16.** Synchronization with PWM

**Note:** This figure provides pin names of the first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external IO pins of a second Timer Counter block (i.e., instance TC1).

#### 62.6.15. Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

The following events control TIOAx and TIOBx:

- Software trigger
- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC\_CMRR.

## 62.6.16. Quadrature Decoder

### 62.6.16.1. Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (see the following figure).

When writing a '0' to TC\_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC\_CMRR.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

In Speed mode, position cannot be measured but revolution can be measured.

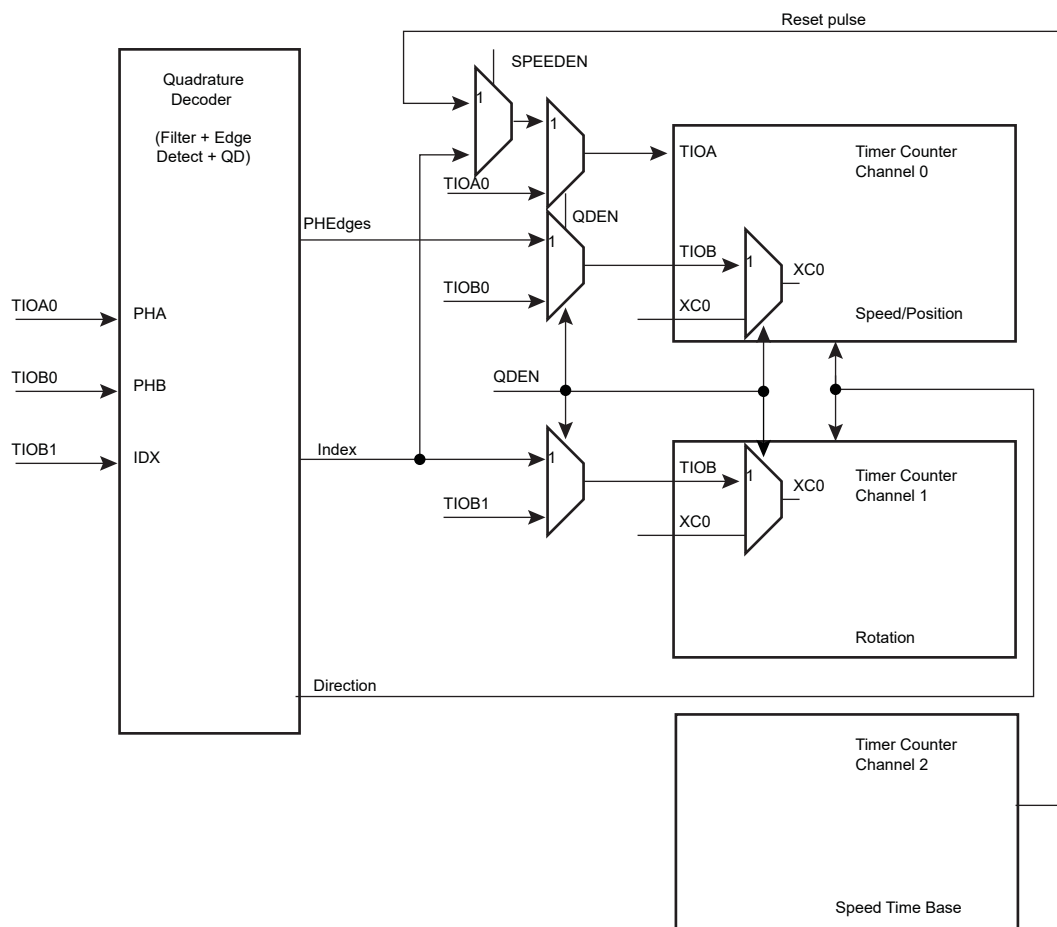

Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC\_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC\_SRx.CPCS.

**Figure 62.17.** Predefined Connection of the Quadrature Decoder with Timer Counters

**Note:** This figure provides pin names of the first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external IO pins of a second Timer Counter block (i.e., instance TC1).

#### 62.6.16.2. Input Preprocessing

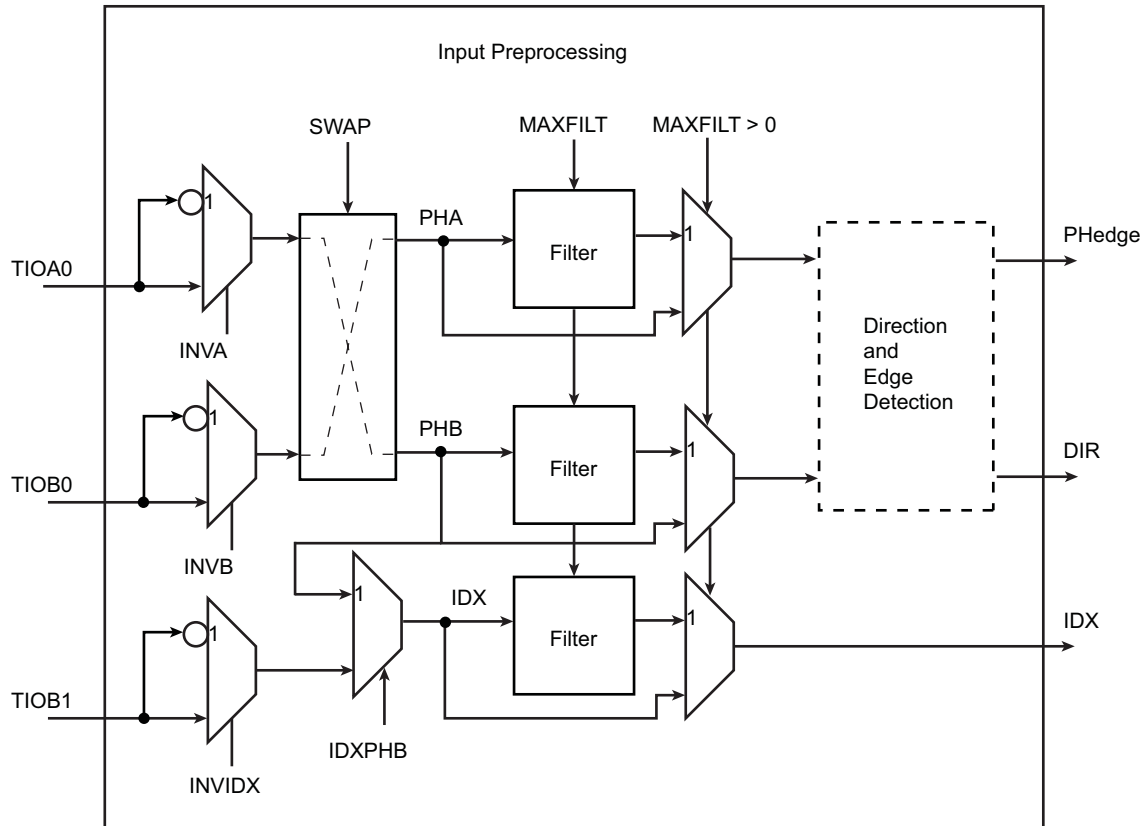

Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.

Each input can be negated and swapping PHA, PHB is also configurable.

TC\_BMR. MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  are not passed to downstream logic.

The value of  $(MAXFILT + 1) \times t_{\text{peripheral clock}}$  must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

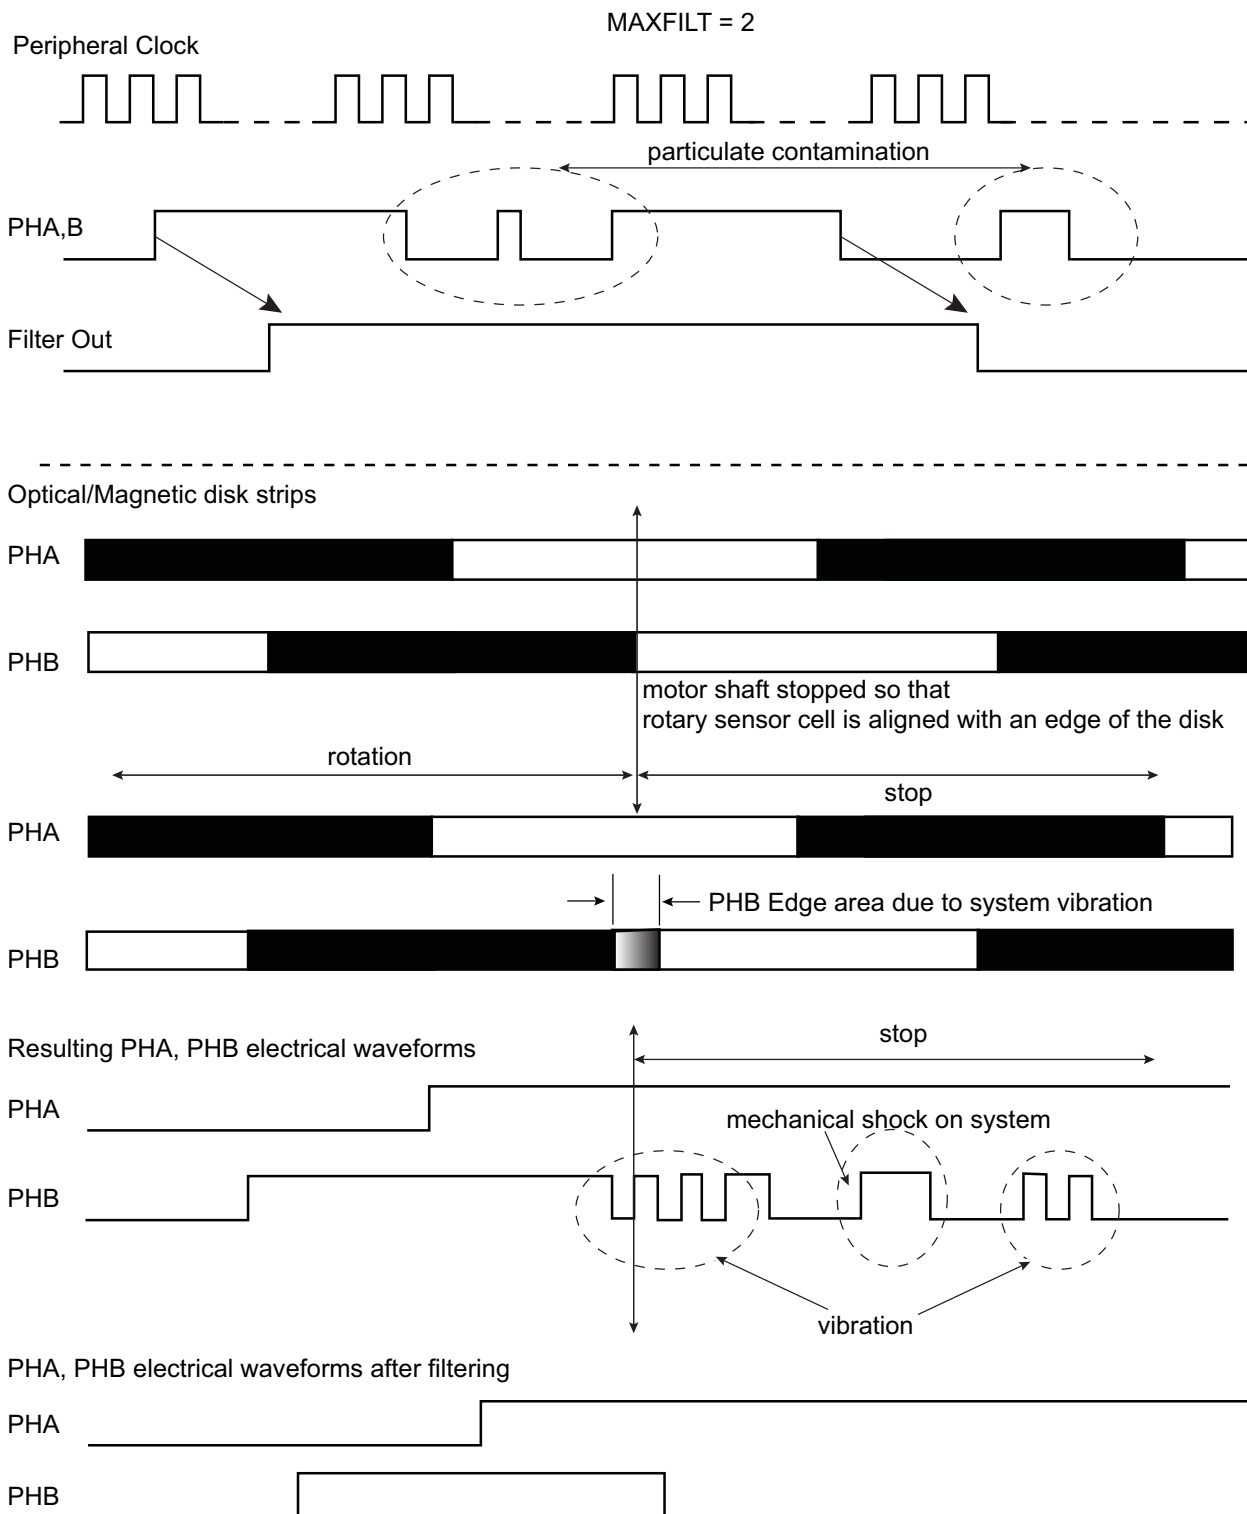

**Figure 62.18.** Input Stage

Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

**Figure 62.19.** Filtering Examples

### 62.6.16.3. Direction Status and Change Detection

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.

The direction status can be directly read at anytime in the TC\_QISR. The polarity of the direction flag status depends on the configuration written in TC\_BMR. INVA, INVB, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC\_QISR and can generate an interrupt.

The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. See the following figure for waveforms.

**Figure 62.20.** Rotation Change Detection

The direction change detection is disabled when TC\_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC\_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns. After being filtered, there is no reason to have two edges closer than  $(TC\_BMR.MAXFILT + 1) \times t_{\text{peripheral clock}}$  ns under normal mode of operation.

**Figure 62.21.** Quadrature Error Detection

MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

#### 62.6.16.4. Position and Rotation Measurement

When TC\_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC\_RC0.RC and the TC\_CMR.CPCTRG bit is written to '1'. The position measurement can be read in the TC\_CV0 register and the rotation measurement can be read in the TC\_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC\_CMR0.WAVE = 0). 'Rising edge' must be selected as the External Trigger Edge (TC\_CMR.ETRGDGE = 0x01) and 'TIOAx' must be selected as the External Trigger (TC\_CMR.ABETRG = 0x1). The process must be started by configuring TC\_CCR.CLKEN and TC\_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC\_CV0 register.

Therefore, the accurate position can be read on both TC\_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC\_QISR.

### 62.6.16.5.Speed Measurement

When TC\_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC\_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC\_CM2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC\_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC\_CM0). TC\_CM0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC\_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC\_CCR.

The speed can be read on field RA in TC\_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

### 62.6.16.6.Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC\_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC\_SR0.CPCS flag is enabled as a source of the interrupt by writing a '1' to TC\_IER0.CPCS.

The TC\_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (ex: if the nominal count per revolution is 1024, then TC\_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC\_SR0.CPCS=1, and the interrupt line is asserted if TC\_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC\_QISR.DIRCHG=0.

### 62.6.16.7.Detecting a Badly Located Index

The digital filter reduces effects of dust, scratches or contamination on the index line. If the contamination creates a pulse surpassing the filter capacity (in particular at low speed), this can be interpreted as an index pulse, even if it is badly placed.

An on-the-fly detection of a badly-placed index is enabled when TC\_BMR.BIDXCE=1. TC\_RC0.RC must be written with the nominal number of counts per revolution provided by the rotary encoder + 2. For example, if the nominal count per revolution is 1024, then TC\_RC0.RC=1026. This margin of 2 eliminates potential noise.

If the pulse is processed while the current value of the counter (TC\_CV0) is outside the value programmed in TC\_RC0.RC  $\pm 2$ , the TC\_SR0.LDRAS flag is written to '1' and the location of the pulse is written in TC\_RA0.

This detection circuitry does not prevent a rotary encoder integrity check before use.

### 62.6.16.8.Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsolicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

A contamination exists on a phase line if  $TC\_SR.CPCS = 1$  and  $TC\_QISR.DIRCHG = 1$  when there is no solicited change of direction.

#### 62.6.16.9. Report of Filtered Pulses due to Contamination/Dust

When the digital filter removes pulses created by contamination/dust, a report is provided in the [TC QDEC Interrupt Status Register](#). A separate flag is provided for each line (PHA, PHB, Index) and one flag is provided when a missing pulse is corrected (a '1' must be written to  $TC\_BMR.AUTOC$ ). If  $TC\_QISR.FPHA=1$ , a pulse has been filtered on PHA line. If  $TC\_QISR.FPHB=1$ , a pulse has been filtered on PHB line. If  $TC\_QISR.FIDX=1$ , a pulse has been filtered on Index line. If  $TC\_QISR.FMP=1$ , a missing pulse has been corrected by the missing pulse detection logic.

The on-the-fly detection and associated flags can be used to anticipate further effects of contamination/dust, in particular if the flag is written to '1' when the rotary encoder speed is high. This may cause abnormal behavior when the rotary encoder slows down if the abnormal pulse is no longer filtered (surpassing digital filter capabilities).

This detection circuitry does not prevent rotary encoder integrity check before use.

#### 62.6.17. 2-bit Gray Up/Down Counter for Stepper Motor

Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding  $TIOAx$ ,  $TIOBx$  outputs by means of  $TC\_SMMRx.GCEN$ .

Up or Down count can be defined by writing  $TC\_SMMRx.DOWN$ .

It is mandatory to configure the channel in Waveform mode in the  $TC\_CMR$ .

The period of the counters can be programmed in  $TC\_RCx$ .

**Figure 62.22.** 2-bit Gray Up/Down Counter

#### 62.6.18. Register Write Protection

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the  $WPEN$  bit,  $WPITEN$  (Write Protection Interrupt Enable), and/or  $WPCREN$  (Write Protection Control Enable) in the [TC Write Protection Mode Register](#) ( $TC\_WPMR$ ).

If a write access to the protected registers is detected, the  $WPVS$  flag in the "TC Safety Status Register" ( $TC\_SSRx$ ) is set and the field  $WPVSRC$  indicates the register in which the write access has been attempted.

The Timer Counter clock of the first channel must be enabled to access  $TC\_WPMR$ .

The following registers can be write-protected when  $WPEN$  is set:

- [TC Block Mode Register](#)
- [TC Channel Mode Register Capture Mode](#)
- [TC Channel Mode Register Waveform Mode](#)

- [TC Stepper Motor Mode Register](#)
- [TC Register A](#)
- [TC Register B](#)
- [TC Register C](#)
- [TC Extended Mode Register](#)

The following registers can be write-protected when WPITEN is set:

- [TC Interrupt Enable Register](#)
- [TC Interrupt Disable Register](#)
- [TC QDEC Interrupt Enable Register](#)
- [TC QDEC Interrupt Disable Register](#)

The following register can be write-protected when WPCREN is set:

- [TC Channel Control Register](#)
- [TC Block Control Register](#)

### 62.6.19. Security and Safety Analysis and Reports

Several type of checks are performed when a TC channel is enabled.

The peripheral clock of the TC is monitored by a specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the TDES. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag TC\_SSRx.CGD is set, an abnormal condition occurred on the internal clock net. This flag is not set under normal operating conditions.

The internal counter of a TC channel is also monitored and if an abnormal state is detected, the flag TC\_SSRx.SEQE is set. This flag cannot be set under normal operating conditions.

The software accesses to the TC are monitored and if an incorrect access is performed, the flag TC\_SSRx.SWE is set. The type of incorrect/abnormal software access is reported in TC\_SSRx.SWETYP (see [TC\\_CSRx](#) for details). As an example, when the TC channel is configured in Capture mode, reading TC\_RAx when TC\_SRx.LDRAS=0 asserts the SWE flags. TC\_SSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE, WPVS are automatically cleared when TC\_SSRx is read.

If one of these flags is set, the flag TC\_SRx.SECE is set and triggers an interrupt if the TC\_IMRx.SECE bit is '1'. SECE is cleared by reading TC\_SRx.

## 62.7. Register Summary

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0
0x00	TC_CCR0	31:24

### 62.7.1. TC Channel Control Register

**Name:** TC\_CCRx  
**Offset:** 0x00 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8

Bit	7	6	5	4	3	2	1	0
						SWTRG	CLKDIS	CLKEN
Access						W	W	W
Reset						–	–	–

#### Bit 2 – SWTRG Software Trigger Command

Value	Description
0	No effect.
1	A software trigger is performed: the counter is reset and the clock is started.

#### Bit 1 – CLKDIS Counter Clock Disable Command

Value	Description
0	No effect.
1	Disables the clock.

#### Bit 0 – CLKEN Counter Clock Enable Command

Value	Description
0	No effect.
1	Enables the clock if CLKDIS is not 1.

**62.7.2. TC Channel Mode Register: Capture Mode**

**Name:** TC\_CMRx (CAPTURE MODE)  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can be written only if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access

Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Bits 22:20 – SBSMPLR[2:0] Loading Edge Subsampling Ratio**

Value	Name	Description
0	ONE	Load a Capture register each selected edge.
1	HALF	Load a Capture register every 2 selected edges.
2	FOURTH	Load a Capture register every 4 selected edges.
3	EIGHTH	Load a Capture register every 8 selected edges.
4	SIXTEENTH	Load a Capture register every 16 selected edges.

**Bits 19:18 – LDRB[1:0] RB Loading Edge Selection**

Value	Name	Description
0	NONE	None
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

**Bits 17:16 – LDRA[1:0] RA Loading Edge Selection**

Value	Name	Description
0	NONE	None
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

**Bit 15 – WAVE Waveform Mode**

Value	Description
0	Capture mode is enabled.
1	Capture mode is disabled (Waveform mode is enabled).

#### Bit 14 – CPCTRG RC Compare Trigger Enable

Value	Description
0	RC Compare has no effect on the counter and its clock.
1	RC Compare resets the counter and starts the counter clock.

#### Bit 10 – ABETRG TIOAx or TIOBx External Trigger Selection

Value	Description
0	TIOBx is used as an external trigger.
1	TIOAx is used as an external trigger.

#### Bits 9:8 – ETRGEDG[1:0] External Trigger Edge Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

#### Bit 7 – LDBDIS Counter Clock Disable with RB Loading

Value	Description
0	Counter clock is not disabled when RB loading occurs.
1	Counter clock is disabled when RB loading occurs.

#### Bit 6 – LDBSTOP Counter Clock Stopped with RB Loading

Value	Description
0	Counter clock is not stopped when RB loading occurs.
1	Counter clock is stopped when RB loading occurs.

#### Bits 5:4 – BURST[1:0] Burst Signal Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

#### Bit 3 – CLKI Clock Invert

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

#### Bits 2:0 – TCCLKS[2:0] Clock Selection

To operate at maximum peripheral clock frequency, see [TC\\_EMRx](#).

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK [17], GLCK[45] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal MCK/8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal MCK/32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal MCK/128 clock signal (from PMC)
4	TIMER_CLOCK5	Clock selected: internal MD_SLCK clock signal (from PMC)

Value	Name	Description
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

**62.7.3. TC Channel Mode Register: Waveform Mode**

**Name:** TC\_CMRx (WAVEFORM MODE)  
**Offset:** 0x04 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

3	TOGGLE	Toggle

#### Bit 15 – WAVE Waveform Mode

Value	Description
0	Waveform mode is disabled (Capture mode is enabled).
1	Waveform mode is enabled.

#### Bits 14:13 – WAVSEL[1:0] Waveform Selection

Value	Name	Description
0	UP	UP mode without automatic trigger on RC Compare
1	UPDOWN	UPDOWN mode without automatic trigger on RC Compare
2	UP_RC	UP mode with automatic trigger on RC Compare
3	UPDOWN_RC	UPDOWN mode with automatic trigger on RC Compare

#### Bit 12 – ENETRГ External Event Trigger Enable

Whatever the value programmed in ENETRГ, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

Value	Description
0	The external event has no effect on the counter and its clock.
1	The external event resets the counter and starts the counter clock.

### Bits 11:10 – EEVT[1:0] External Event Selection

Signal selected as external event.

Value	Name	Description	TIOB Direction
0	TIOB	TIOB	Input
1	XC0	XC0	Output
2	XC1	XC1	Output
3	XC2	XC2	Output

**Note:** If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

### Bits 9:8 – EEVTEDG[1:0] External Event Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

### Bit 7 – CPCDIS Counter Clock Disable with RC Compare

Value	Description
0	Counter clock is not disabled when counter reaches RC.
1	Counter clock is disabled when counter reaches RC.

### Bit 6 – CPCSTOP Counter Clock Stopped with RC Compare

Value	Description
0	Counter clock is not stopped when counter reaches RC.
1	Counter clock is stopped when counter reaches RC.

### Bits 5:4 – BURST[1:0] Burst Signal Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

### Bit 3 – CLKI Clock Invert

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

### Bits 2:0 – TCCLKS[2:0] Clock Selection

To operate at maximum peripheral clock frequency, see [TC\\_EMRx](#).

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK [17], GLCK[45] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal MCK/8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal MCK/32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal MCK/128 clock signal (from PMC)
4	TIMER_CLOCK5	Clock selected: internal MD_SLCK clock signal (from PMC)
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

62.7.4. TC Stepper Motor Mode Register

**Name:** TC\_SMMRx  
**Offset:** 0x08 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** R/W

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit 1 – DOWN Down Count

Value	Description
0	Up counter.
1	Down counter.

Bit 0 – GCEN Gray Count Enable

Value	Description
0	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x.
1	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter.

## 62.7.5. TC Register AB

**Name:** TC\_RABx  
**Offset:** 0x0C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

### Bits 31:0 – RAB[31:0] Register A or Register B

RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.

When DMA is used, the RAB register address must be configured as source address of the transfer.

## 62.7.6. TC Counter Value Register

**Name:** TC\_CVx  
**Offset:** 0x10 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	CV[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CV[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CV[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – CV[31:0] Counter Value

CV contains the counter value in real time.

#### Important:

For 16-bit channels, the CV field size is limited to register bits 15:0.

## 62.7.7. TC Register A

**Name:** TC\_RAx  
**Offset:** 0x14 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – RA[31:0] Register A

RA contains the Register A value in real time.

## 62.7.8. TC Register B

**Name:** TC\_RBx  
**Offset:** 0x18 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register has access Read-only if TC\_CMRx.WAVE = 0, Read/Write if TC\_CMRx.WAVE = 1.  
This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RB[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RB[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RB[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RB[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:0 – RB[31:0]** Register B  
RB contains the Register B value in real time.

## 62.7.9. TC Register C

**Name:** TC\_RCx  
**Offset:** 0x1C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	RC[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	RC[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	RC[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	RC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – RC[31:0] Register C

RC contains the Register C value in real time.

## 62.7.10. TC Interrupt Status Register

**Name:** TC\_SRx  
**Offset:** 0x20 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access						MTIOB	MTIOA	CLKSTA
Reset						R	R	R
						0	0	0
Bit	15	14	13	12	11	10	9	8
Access								SECE
Reset								R
								0
Bit	7	6	5	4	3	2	1	0
Access	ETRGS	LDRBS	LDRAS	CPCS	CPBS	CPAS	LOVRS	COVFS
Reset	R	R	R	R	R	R	R	R
	0	0	0	0	0	0	0	0

### Bit 18 – MTIOB TIOBx Mirror

Value	Description
0	TIOBx is low. If TC_CM Rx.WAVE = 0, TIOBx pin is low. If TC_CM Rx.WAVE = 1, TIOBx is driven low.
1	TIOBx is high. If TC_CM Rx.WAVE = 0, TIOBx pin is high. If TC_CM Rx.WAVE = 1, TIOBx is driven high.

### Bit 17 – MTIOA TIOAx Mirror

Value	Description
0	TIOAx is low. If TC_CM Rx.WAVE = 0, TIOAx pin is low. If TC_CM Rx.WAVE = 1, TIOAx is driven low.
1	TIOAx is high. If TC_CM Rx.WAVE = 0, TIOAx pin is high. If TC_CM Rx.WAVE = 1, TIOAx is driven high.

### Bit 16 – CLKSTA Clock Enabling Status

Value	Description
0	The clock is disabled.
1	The clock is enabled.

### Bit 8 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	No security or safety event occurred.
1	One or more safety or security event occurred since the last read of TC_SRx. For details on the event, see <a href="#">TC_SSRx</a> .

### Bit 7 – ETRGS External Trigger Status (cleared on read)

Value	Description
0	External trigger has not occurred since the last read of the Status register.

Value	Description
1	External trigger has occurred since the last read of the Status register.

#### Bit 6 – LDRBS RB Loading Status (cleared on read)

Value	Description
0	RB Load has not occurred since the last read of the Status register or TC_CM Rx.WAVE = 1.
1	RB Load has occurred since the last read of the Status register, if TC_CM Rx.WAVE = 0.

#### Bit 5 – LDRAS RA Loading Status (cleared on read)

Value	Description
0	RA Load has not occurred since the last read of the Status register or TC_CM Rx.WAVE = 1.
1	RA Load has occurred since the last read of the Status register, if TC_CM Rx.WAVE = 0.

#### Bit 4 – CPCS RC Compare Status (cleared on read)

Value	Description
0	RC Compare has not occurred since the last read of the Status register.
1	RC Compare has occurred since the last read of the Status register.

#### Bit 3 – CPBS RB Compare Status (cleared on read)

Value	Description
0	RB Compare has not occurred since the last read of the Status register or TC_CM Rx.WAVE = 0.
1	RB Compare has occurred since the last read of the Status register, if TC_CM Rx.WAVE = 1.

#### Bit 2 – CPAS RA Compare Status (cleared on read)

Value	Description
0	RA Compare has not occurred since the last read of the Status register or TC_CM Rx.WAVE = 0.
1	RA Compare has occurred since the last read of the Status register, if TC_CM Rx.WAVE = 1.

#### Bit 1 – LOVRS Load Overrun Status (cleared on read)

Value	Description
0	Load overrun has not occurred since the last read of the Status register or TC_CM Rx.WAVE = 1.
1	RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status register, if TC_CM Rx.WAVE = 0.

#### Bit 0 – COVFS Counter Overflow Status (cleared on read)

Value	Description
0	No counter overflow has occurred since the last read of the Status register.
1	A counter overflow has occurred since the last read of the Status register.

**62.7.11. TC Interrupt Enable Register**

**Name:** TC\_IERx  
**Offset:** 0x24 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access						SECE		
Reset						W		
Bit	7	6	5	4	3	2	1	0
Access	ETRGS	LDRBS	LDRAS	CPCS	CPBS	CPAS	LOVRS	COVFS
Reset	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 10 – SECE** Security and/or Safety Event Interrupt Enable

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

## 62.7.12. TC Interrupt Disable Register

**Name:** TC\_IDRx  
**Offset:** 0x28 + x\*0x40 [x=0..2]  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

						SECE		
Access						W		
Reset						–		
Bit	7	6	5	4	3	2	1	0
	ETRGS	LDRBS	LDRAS	CPCS	CPBS	CPAS	LOVRS	COVFS
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 10 – SECE** Security and/or Safety Event Interrupt Disable

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

### 62.7.13. TC Interrupt Mask Register

**Name:** TC\_IMRx  
**Offset:** 0x2C + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is not enabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
						SECE		
Access						R		
Reset						0		
Bit	7	6	5	4	3	2	1	0
	ETRGS	LDRBS	LDRAS	CPCS	CPBS	CPAS	LOVRS	COVFS
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 10 – SECE** Security and/or Safety Event Interrupt Mask

**Bit 7 – ETRGS** External Trigger

**Bit 6 – LDRBS** RB Loading

**Bit 5 – LDRAS** RA Loading

**Bit 4 – CPCS** RC Compare

**Bit 3 – CPBS** RB Compare

**Bit 2 – CPAS** RA Compare

**Bit 1 – LOVRS** Load Overrun

**Bit 0 – COVFS** Counter Overflow

## 62.7.14. TC Extended Mode Register

**Name:** TC\_EMRx  
**Offset:** 0x30 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								NODIVCLK
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
			TRIGSRCB[1:0]				TRIGSRCA[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

### Bit 8 – NODIVCLK No Divided Clock

Value	Description
0	The selected clock is defined by field TCCLKS in TC_CMRx.
1	The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect.

### Bits 5:4 – TRIGSRCB[1:0] Trigger Source for Input B

Value	Name	Description
0	EXTERNAL_TIOBx	The trigger/capture input B is driven by external pin TIOBx
1	PWMx	For all channels: The trigger/capture input B is driven internally by the comparator output (see <a href="#">Synchronization with PWM</a> ) of the PWMx.

### Bits 1:0 – TRIGSRCA[1:0] Trigger Source for Input A

Value	Name	Description
0	EXTERNAL_TIOAx	The trigger/capture input A is driven by external pin TIOAx
1	PWMx	The trigger/capture input A is driven internally by PWMx.

## 62.7.15. TC Channel Status Register

**Name:** TC\_CSRx  
**Offset:** 0x34 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The flags in this register are a copy of the similar flags in the TC\_SRx register. Reading the TC\_CSRx does not perform a clear-on-read of TC\_SRx flags.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						MTIOB	MTIOA	CLKSTA
Access						R	R	R
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

### Bit 18 – MTIOB TIOBx Mirror

Value	Description
0	TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.
1	TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx is high. If TC_CMRx.WAVE = 1, TIOBx is driven high.

### Bit 17 – MTIOA TIOAx Mirror

Value	Description
0	TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.
1	TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx is high. If TC_CMRx.WAVE = 1, TIOAx is driven high.

### Bit 16 – CLKSTA Clock Enabling Status

Value	Description
0	Clock is disabled.
1	Clock is enabled.

## 62.7.16. TC Safety Status Register

**Name:** TC\_SSRx  
**Offset:** 0x38 + x\*0x40 [x=0..2]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0

Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

### Bit 31 – ECLASS Software Error Class

Value	Name	Description
0	WARNING	An abnormal access that does not have any impact.
1	ERROR	An abnormal access that may have an impact.

### Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	TC Channel x is enabled and a write-only register has been read (Warning).
1	WRITE_RO	TC Channel x is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address of the TC (Warning).
3	W_RARB_CAPT	TC_RAx or TC_RBx are written while channel is enabled and configured in capture mode (Error).

### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source (cleared on read)

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

### Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of TC_SSRx.
1	A software error has occurred since the last read of TC_SSRx. The field SWETYP details the type of software error encountered.

### Bit 2 – SEQE Internal Sequencer Error (cleared on read)

Value	Description
0	No internal counter error has occurred since the last read of TC_SSRx. In normal operating conditions, SEQE is cleared.
1	An internal counter error has occurred since the last read of TC_SSRx. This flag can be set only under abnormal operating conditions resulting in clock glitch, etc. The detection is enabled if TC_CSRx.CLKSTA=1, TC_CMRx.WAVE=1, TC_CMRx.CPCTRG=1 and flag is set if TC_CVx > TC_RCx.

**Bit 1 – CGD** Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring has not been corrupted since the last read of TC_SSRx.
1	The clock monitoring has been corrupted since the last read of TC_SSRx. This flag can be set under abnormal operating conditions.

**Bit 0 – WPVS** Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of TC_SSRx.
1	A write protection violation has occurred since the last read of TC_SSRx. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

62.7.17. TC Block Control Register

**Name:** TC\_BCR  
**Offset:** 0xC0  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCREN bit is cleared in the [TC Write Protection Mode Register](#).

Bit 0 – SYNC Synchro Command

Value	Description
0	No effect.
1	Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels.

**62.7.18. TC Block Mode Register**

**Name:** TC\_BMR  
**Offset:** 0xC4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [TC Write Protection Mode Register](#).

The External Clock Signal x Selection (TCxXCxS) bit field mentions pin names of the first Timer Counter module (TC0). For any subsequent instances, the signal numbering increments. For example, "TCLK3-TCLK5", "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external I/O pins of the second Timer Counter module (TC1).

Bit	31	30	29	28	27	26	25	24
							MAXFILT[5:4]	
Access							R/W	R/W
Reset							0	0
Bit	23	22	21	20	19	18	17	16
	MAXFILT[3:0]						IDXPHB	SWAP
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0
Bit	15	14	13	12	11	10	9	8
	INVIDX	INVB	INVA	EDGPHA	QDTRANS	SPEEDEN	POSEN	QDEN
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
			TC2XC2S[1:0]		TC1XC1S[1:0]		TC0XC0S[1:0]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

**Bits 25:20 – MAXFILT[5:0] Maximum Filter**

Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see [Input Preprocessing](#).

Value	Description
1–63	Defines the filtering capabilities.

**Bit 17 – IDXPHB Index Pin is PHB Pin**

Value	Description
0	IDX pin of the rotary sensor must drive TIOA1.
1	IDX pin of the rotary sensor must drive TIOB0.

**Bit 16 – SWAP Swap PHA and PHB**

Value	Description
0	No swap between PHA and PHB.
1	Swap PHA and PHB internally, prior to driving the QDEC.

**Bit 15 – INVIDX Inverted Index**

Value	Description
0	IDX (TIOA1) is directly driving the QDEC.

Value	Description
1	IDX is inverted before driving the QDEC.

#### Bit 14 – INVB Inverted PHB

Value	Description
0	PHB (TIOB0) is directly driving the QDEC.
1	PHB is inverted before driving the QDEC.

#### Bit 13 – INVA Inverted PHA

Value	Description
0	PHA (TIOA0) is directly driving the QDEC.
1	PHA is inverted before driving the QDEC.

#### Bit 12 – EDGPHA Edge on PHA Count Mode

Value	Description
0	Edges are detected on PHA only.
1	Edges are detected on both PHA and PHB.

#### Bit 11 – QDTRANS Quadrature Decoding Transparent

Value	Description
0	Full quadrature decoding logic is active (direction change detected).
1	Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed.

#### Bit 10 – SPEEDEN Speed Enabled

Value	Description
0	Disabled.
1	Enables the speed measure on channel 0, the time base being provided by channel 2.

#### Bit 9 – POSEN Position Enabled

Value	Description
0	Disable position.
1	Enables the position measure on channel 0 and 1.

#### Bit 8 – QDEN Quadrature Decoder Enabled

Quadrature decoding (direction change) can be disabled using QDTRANS bit.  
One of the POSEN or SPEEDEN bits must be also enabled.

Value	Description
0	Disabled.
1	Enables the QDEC (filter, edge detection and quadrature decoding).

#### Bits 5:4 – TC2XC2S[1:0] External Clock Signal 2 (XC2) Selection

See [Clock Selection](#) for more details.

Value	Name	Description
0	TCLK2	Signal connected to XC2: TCLK2
1	–	Reserved
2	TIOA0	Signal connected to XC2: internal TIOA0 for chaining
3	TIOA1	Signal connected to XC2: internal TIOA1 for chaining

#### Bits 3:2 – TC1XC1S[1:0] External Clock Signal 1 (XC1) Selection

See [Clock Selection](#) for more details.

Value	Name	Description
0	TCLK1	Signal connected to XC1: TCLK1
1	–	Reserved
2	TIOA0	Signal connected to XC1: internal TIOA0 for chaining
3	TIOA2	Signal connected to XC1: internal TIOA2 for chaining

**Bits 1:0 – TC0XC0S[1:0]** External Clock Signal 0 (XC0) Selection  
See [Clock Selection](#) for more details.

Value	Name	Description
0	TCLK0	Signal connected to XC0: TCLK0
1	–	Reserved
2	TIOA1	Signal connected to XC0: internal TIOA1 for chaining
3	TIOA2	Signal connected to XC0: internal TIOA2 for chaining

## 62.7.19. TC QDEC Interrupt Enable Register

**Name:** TC\_QIER  
**Offset:** 0xC8  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	FMP	FIDX	FPHB	FPHA		QERR	DIRCHG	IDX
Access	W	W	W	W		W	W	W
Reset	–	–	–	–		–	–	–

### Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	No effect.
1	Enables the interrupt when phase A or phase B has a corrected missing pulse.

### Bit 6 – FIDX Filtered Index Line

Value	Description
0	No effect.
1	Enables the interrupt when index line has a filtered contamination.

### Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	No effect.
1	Enables the interrupt when phase B line has a filtered contamination.

### Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	No effect.
1	Enables the interrupt when phase A line has a filtered contamination.

### Bit 2 – QERR Quadrature Error

Value	Description
0	No effect.
1	Enables the interrupt when a quadrature error occurs on PHA, PHB.

#### Bit 1 – DIRCHG Direction Change

Value	Description
0	No effect.
1	Enables the interrupt when a change on rotation direction is detected.

#### Bit 0 – IDX Index

Value	Description
0	No effect.
1	Enables the interrupt when a rising edge occurs on IDX input.

## 62.7.20. TC QDEC Interrupt Disable Register

**Name:** TC\_QIDR  
**Offset:** 0xCC  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [TC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access	W	W	W	W		W	W	W
Reset	–	–	–	–		–	–	–

### Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	No effect.
1	Disables the interrupt when phase A or phase B has a corrected missing pulse.

### Bit 6 – FIDX Filtered Index Line

Value	Description
0	No effect.
1	Disables the interrupt when index line has a filtered contamination.

### Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	No effect.
1	Disables the interrupt when phase B line has a filtered contamination.

### Bit 4 – FPFA Filtered Phase A Line

Value	Description
0	No effect.
1	Disables the interrupt when phase A line has a filtered contamination.

### Bit 2 – QERR Quadrature Error

Value	Description
0	No effect.
1	Disables the interrupt when a quadrature error occurs on PHA, PHB.

#### Bit 1 – DIRCHG Direction Change

Value	Description
0	No effect.
1	Disables the interrupt when a change on rotation direction is detected.

#### Bit 0 – IDX Index

Value	Description
0	No effect.
1	Disables the interrupt when a rising edge occurs on IDX input.

## 62.7.21. TC QDEC Interrupt Mask Register

**Name:** TC\_QIMR  
**Offset:** 0xD0  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
	FMP	FIDX	FPHB	FPHA		QERR	DIRCHG	IDX
Access	R	R	R	R		R	R	R
Reset	0	0	0	0		0	0	0

### Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	The interrupt on auto-corrected missing pulse is disabled.
1	The interrupt on auto-corrected missing pulse is enabled.

### Bit 6 – FIDX Filtered Index Line

Value	Description
0	The interrupt on index line filtered contamination is disabled.
1	The interrupt on index line filtered contamination is enabled.

### Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	The interrupt on phase B line filtered contamination is disabled.
1	The interrupt on phase B line filtered contamination is enabled.

### Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	The interrupt on phase A line filtered contamination is disabled.
1	The interrupt on phase A line filtered contamination is enabled.

### Bit 2 – QERR Quadrature Error

Value	Description
0	The interrupt on quadrature error is disabled.
1	The interrupt on quadrature error is enabled.

### Bit 1 – DIRCHG Direction Change

Value	Description
0	The interrupt on rotation direction change is disabled.
1	The interrupt on rotation direction change is enabled.

### Bit 0 – IDX Index

Value	Description
0	The interrupt on IDX input is disabled.
1	The interrupt on IDX input is enabled.

## 62.7.22. TC QDEC Interrupt Status Register

**Name:** TC\_QISR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								DIR
Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
	FMP	FIDX	FPHB	FPHA		QERR	DIRCHG	IDX
Access	R	R	R	R		R	R	R
Reset	0	0	0	0		0	0	0

**Bit 8 – DIR** Direction  
Returns an image of the current rotation direction.

**Bit 7 – FMP** Filtered Missing Pulse

Value	Description
0	No correction of missing pulse on phase A or B lines occurred since the last read of TC_QISR.
1	A correction of missing pulse on phase A or B lines occurred since the last read of TC_QISR.

**Bit 6 – FIDX** Filtered Index Line

Value	Description
0	No filtered contamination on index line since the last read of TC_QISR.
1	A contamination has been successfully on index line since the last read of TC_QISR.

**Bit 5 – FPHB** Filtered Phase B Line

Value	Description
0	No filtered contamination on phase B line since the last read of TC_QISR.
1	A contamination has been successfully on phase B line since the last read of TC_QISR.

**Bit 4 – FPFA** Filtered Phase A Line

Value	Description
0	No filtered contamination on phase A line since the last read of TC_QISR.
1	A contamination has been successfully on phase A line since the last read of TC_QISR.

**Bit 2 – QERR** Quadrature Error

Value	Description
0	No quadrature error since the last read of TC_QISR.
1	A quadrature error occurred since the last read of TC_QISR.

#### Bit 1 – DIRCHG Direction Change

Value	Description
0	No change on rotation direction since the last read of TC_QISR.
1	The rotation direction changed since the last read of TC_QISR.

#### Bit 0 – IDX Index

Value	Description
0	No Index input change since the last read of TC_QISR.
1	The IDX input has changed since the last read of TC_QISR.

62.7.23. TC QDEC Status Register

**Name:** TC\_QSR  
**Offset:** 0xDC  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** The flag in this register is a copy of the similar flag in the TC\_QISR register. Reading the TC\_QSR does not perform a clear-on-read of TC\_QISR flags.

**Bit 8 – DIR** Direction  
Returns an image of the current rotation direction.

**62.7.24. TC Write Protection Mode Register**

**Name:** TC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				FIRSTE		WPCREN	WPITEN	WPEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

**Bits 31:8 – WPKEY[23:0] Write Protection Key**

Value	Name	Description
0x54494D	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

**Bit 4 – FIRSTE** First Error Report Enable

Value	Description
0	The last write protection violation source is reported in TC_SSRx.WPVSR and the last software control error type is reported in TC_SSRx.SWETYP. The TC_SRx.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in TC_SSRx.WPVSR and only the first software control error type is reported in TC_SSRx.SWETYP. The TC_SRx.SECE flag is set at the first error occurrence within a series.

**Bit 2 – WPCREN** Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x54494D ("TIM" in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x54494D ("TIM" in ASCII).

**Bit 1 – WPITEN** Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x54494D ("TIM" in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x54494D ("TIM" in ASCII).

**Bit 0 – WPEN** Write Protection Enable

The Timer Counter clock of the first channel must be enabled to access this register.

See [Register Write Protection](#) for a list of registers that can be write-protected and Timer Counter clock conditions.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x54494D ("TIM" in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x54494D ("TIM" in ASCII).

## 63. Pulse Width Modulation Controller (PWM)

### 63.1. Description

The Pulse Width Modulation Controller (PWM) controls several channels independently. Each channel controls one square output waveform. Characteristics of the output waveform such as period, duty cycle and polarity are configurable through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock.

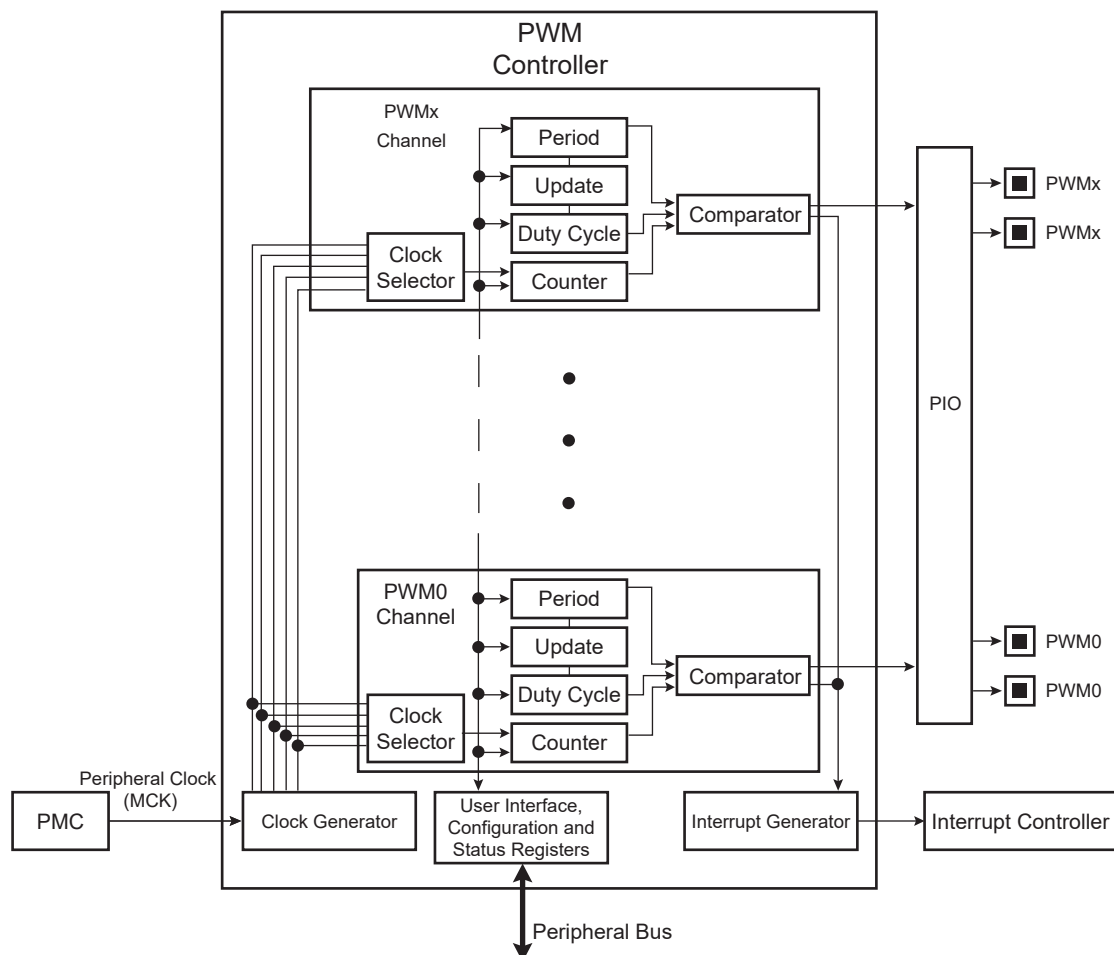

Channels can be synchronized, to generate non overlapped waveforms. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period or the duty cycle.

### 63.2. Embedded Characteristics

- 4 Channels
- One 16-bit Counter Per Channel
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n Counter Providing Eleven Clocks
  - Two Independent Linear Dividers Working on Modulo n Counter Outputs
- Independent Channels
  - Independent Enable Disable Command for Each Channel
  - Independent Clock Selection for Each Channel
  - Independent Period and Duty Cycle for Each Channel
  - Double Buffering of Period or Duty Cycle for Each Channel
  - Programmable Selection of The Output Waveform Polarity for Each Channel
  - Programmable Center or Left Aligned Output Waveform for Each Channel Block Diagram

## 63.3. Block Diagram

Figure 63.1. PWM Block Diagram

## 63.4. I/O Lines Description

Each channel outputs one waveform on one external I/O line.

Table 63.1. I/O Line Description

Name	Description	Type
PWMx	PWM Waveform Output for channel x	Output

## 63.5. Product Dependencies

### 63.5.1. I/O Lines

The pins used for interfacing the PWM controller may be multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM controller are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines will be assigned to PWM outputs.

### 63.5.2. Power Management

The PWM controller is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM controller will resume its operations where it left off.

All the PWM registers except the Channel Duty Cycle (PWM\_CDTYx) and Channel Period (PWM\_CPRDx) registers can be read without the PWM peripheral clock enabled. All the registers can be written without the peripheral clock enabled.

### 63.5.3. Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first. Note that it is not recommended to use the PWM interrupt line in Edge Sensitive mode.

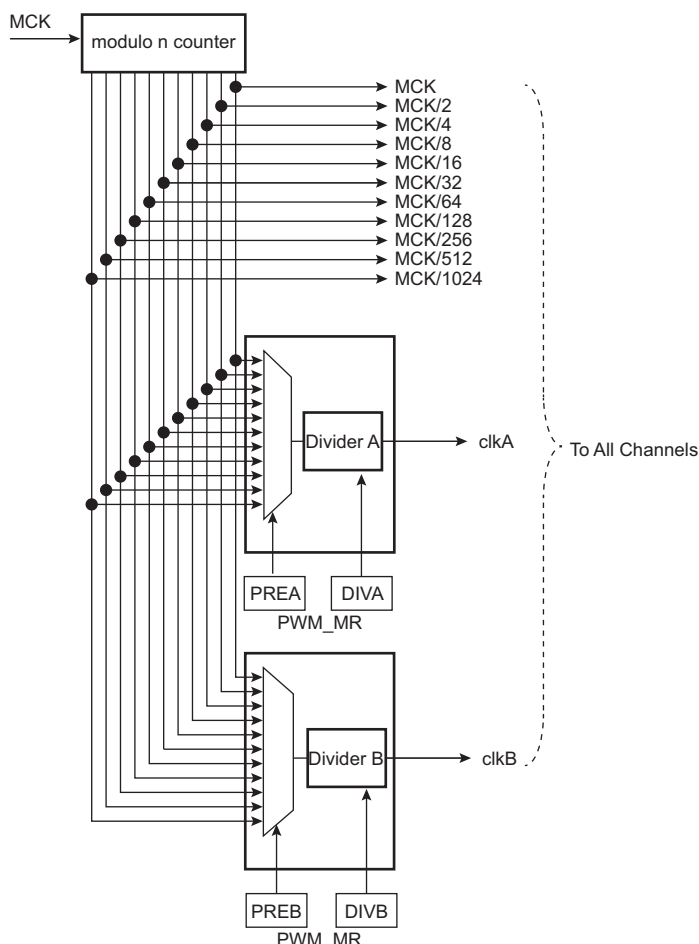

## 63.6. Functional Description

The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the system clock, MCK, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

### 63.6.1. PWM Clock Generator

Figure 63.2. Functional View of the Clock Generator

Before using the PWM controller, the programmer must first enable the PWM clock in the Power Management Controller (PMC).

The PWM peripheral clock, MCK, is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided in three blocks:

- a modulo n counter which provides 11 clocks:  $f_{MCK}$ ,  $f_{MCK}/2$ ,  $f_{MCK}/4$ ,  $f_{MCK}/8$ ,  $f_{MCK}/16$ ,  $f_{MCK}/32$ ,  $f_{MCK}/64$ ,  $f_{MCK}/128$ ,  $f_{MCK}/256$ ,  $f_{MCK}/512$ ,  $f_{MCK}/1024$
- two linear dividers (1, 1/2, 1/3,... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the Mode register (PWM\_MR). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value in PWM\_MR.

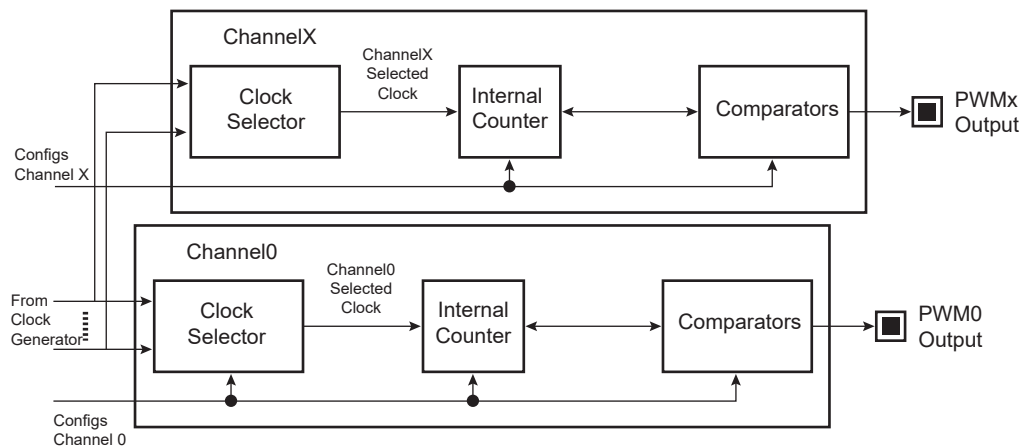

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) in PWM\_MR are set to 0. This implies that after reset clkA (clkB) are turned off.

At reset, all clocks provided by the modulo n counter are turned off except clock "clk". This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

## 63.6.2. PWM Channel

### 63.6.2.1.Channel Processing Overview

Figure 63.3. Channel Processing Overview

Each of the 4 channels is composed of three blocks:

- A clock selector which selects one of the clocks provided by the clock generator described in the section "PWM Clock Generator".
- An internal counter clocked by the output of the clock selector. This internal counter is incremented or decremented according to the channel configuration and comparators events. The size of the internal counter is 16 bits.
- A comparator used to generate events according to the internal counter value. It also computes the PWMx output waveform according to the configuration.

### 63.6.2.2.Waveform Properties

The different properties of output waveforms are:

- the **internal clock selection**. The internal channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the Channel Mode register (PWM\_CMRx) This field is reset at 0.
- **the waveform period**. This channel parameter is defined in the PWM\_CPRDx.CPRD field.
  - If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:
    - By using the peripheral clock (MCK) divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024), the resulting period formula will be:

$$\frac{(X \times \text{CPRD})}{\text{MCK}}$$

- By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(X \times \text{CPRD} \times \text{DIVA})}{\text{MCK}} \text{ or } \frac{(X \times \text{CPRD} \times \text{DIVB})}{\text{MCK}}$$

- If the waveform is center-aligned then the output waveform period depends on the counter source clock and can be calculated:
  - By using the peripheral clock divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula will be:

$$\frac{(2 \times X \times \text{CPRD})}{\text{MCK}}$$

- By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVA})}{\text{MCK}} \text{ or } \frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{\text{MCK}}$$

- **the waveform duty cycle.** This channel parameter is defined in the PWM\_CDTYx.CDTY field. If the waveform is left-aligned, then:

$$\text{duty cycle} = \frac{(\text{PWM\_period} - (\text{CDTY} \times \text{SRC\_period}))}{\text{PWM\_period}}$$

If the waveform is center-aligned, then:

$$\text{duty cycle} = \frac{\left( \left( \frac{\text{PWM\_period}}{2} \right) - (\text{CDTY} \times \text{SRC\_period}) \right)}{\left( \frac{\text{PWM\_period}}{2} \right)}$$

where:

"PWM\_period" is the PWM output period and "SRC\_period" is the PWM source clock period. "SRC\_period" depends on the peripheral clock period and on PWM\_CMRx.CPRE, PWM\_CLK.(PREA, PREB, DIVA, DIVB), PWM\_CPRDx.CPRD and PWM\_CMRx.CPRE as per previous formulas.

- **the waveform polarity.** At the beginning of the period, the signal can be at high or low level. This property is defined in the PWM\_CMRx.CPOL field. By default the signal starts by a low level.
- **the waveform alignment.** The output waveform can be left or center-aligned. Center-aligned waveforms can be used to generate non overlapped waveforms. This property is defined in the PWM\_CMRx.CALG field. The default mode is left-aligned.

**Figure 63.4.** Non Overlapped Center-aligned Waveforms

**Note:** See the figure below for a detailed description of center-aligned waveforms.

When center-aligned, the internal channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left-aligned, the internal channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

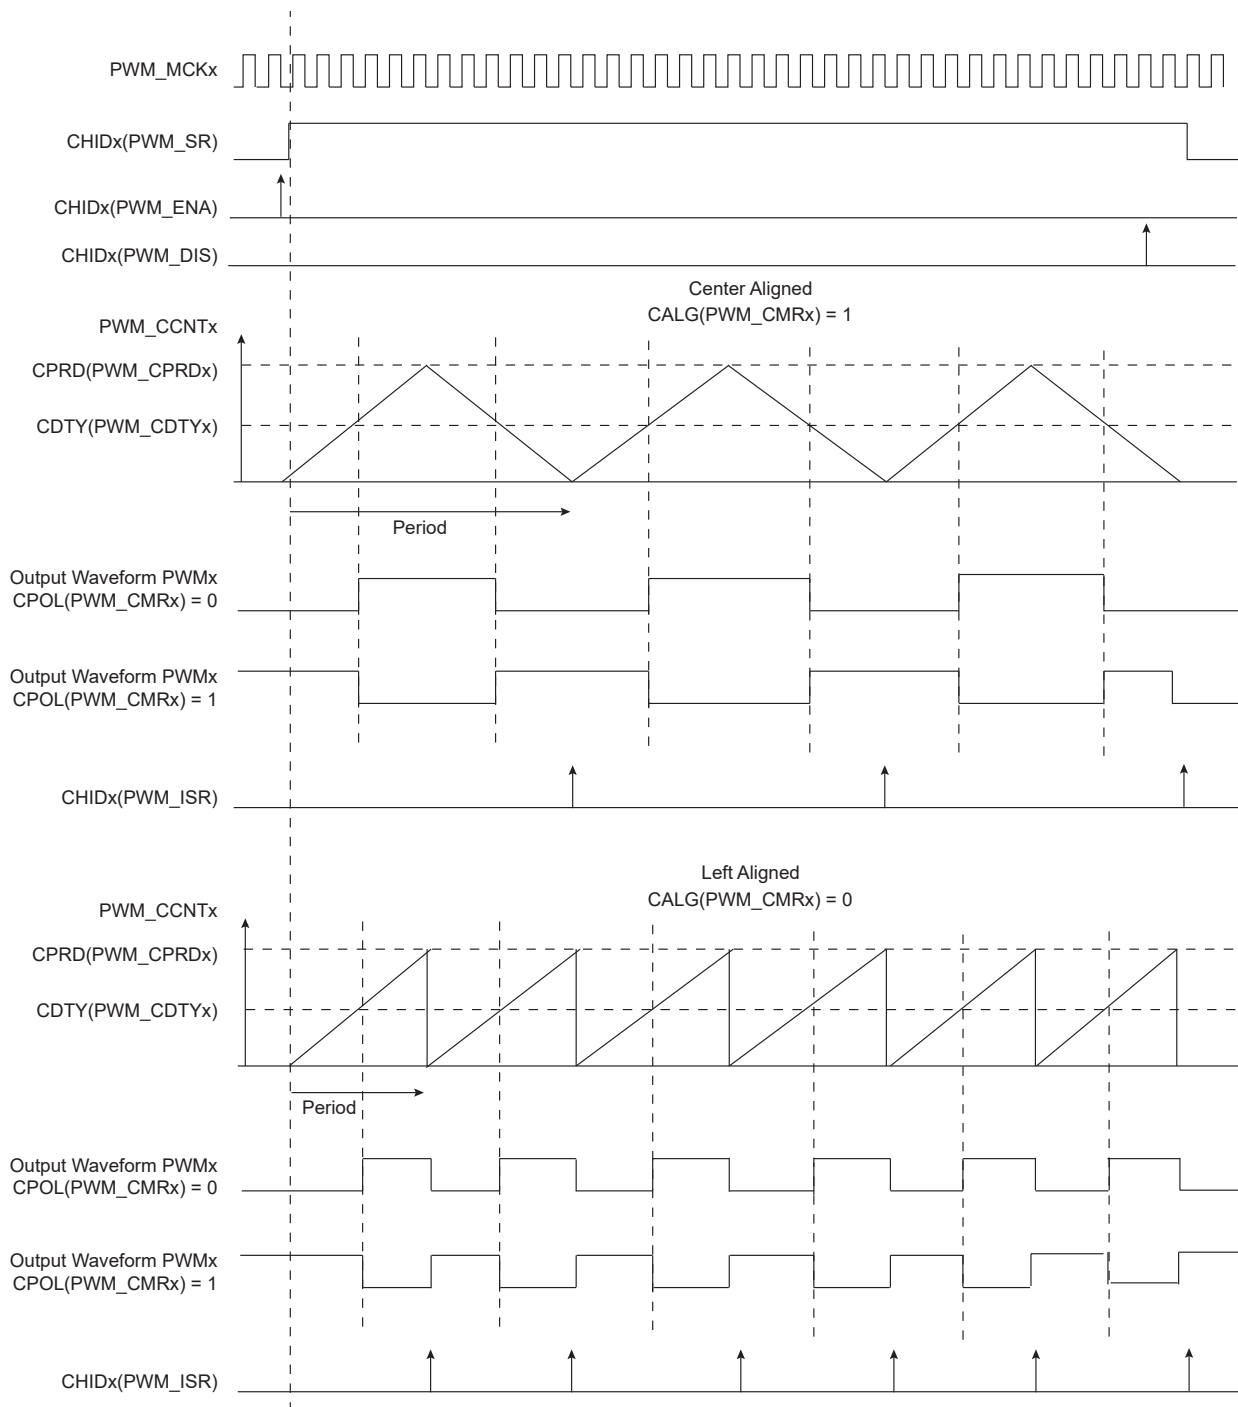

- $CDTY = CPRD$  and  $CPOL = 0$
- $CDTY = 0$  and  $CPOL = 1$

Waveforms are fixed at 1 (once the channel is enabled) when:

- $CDTY = 0$  and  $CPOL = 0$
- $CDTY = CPRD$  and  $CPOL = 1$

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level. Changes on channel polarity are not taken into account while the channel is enabled.

**Figure 63.5. Waveform Properties**

### 63.6.3. PWM Controller Operations

#### 63.6.3.1. Initialization

Before enabling the output channel, this channel must have been configured by the software application:

- Configuration of the clock generator if DIVA and DIVB are required
- Selection of the clock for each channel (PWM\_CMRx.CPRE)

- Configuration of the waveform alignment for each channel (PWM\_CMRx.CALG)
- Configuration of the period for each channel (PWM\_CPRDx.CPRD). Writing in PWM\_CPRDx is possible while the channel is disabled. After validation of the channel, the user must use the Channel Update register (PWM\_CUPDx) to update PWM\_CPRDx as explained below.
- Configuration of the duty cycle for each channel (PWM\_CDTYx.CDTY). Writing in PWM\_CDTYx is possible while the channel is disabled. After validation of the channel, the user must use PWM\_CUPDx to update PWM\_CDTYx as explained below.
- Configuration of the output waveform polarity for each channel (PWM\_CMRx.CPOL)
- Enable Interrupts (set CHIDx in the Interrupt Enable register (PWM\_IER))
- Enable the PWM channel (set CHIDx in the Enable register (PWM\_ENA))

It is possible to synchronize different channels by enabling them at the same time by means of simultaneously setting several CHIDx bits in PWM\_ENA.

- In such a situation, all channels may have the same clock selector configuration and the same period specified.

### 63.6.3.2.Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the Channel Period register (PWM\_CPRDx) and the Channel Duty Cycle register (PWM\_CDTYx) can help the user in choosing. The event number written in PWM\_CPRDx gives the PWM accuracy. The Duty Cycle quantum cannot be lower than  $1/\text{PWM\_CPRDx}$  value. The higher the value of PWM\_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM\_CPRDx, the user is able to set a value between 1 up to 14 in PWM\_CDTYx. The resulting duty cycle quantum cannot be lower than  $1/15$  of the PWM period.

### 63.6.3.3.Changing the Duty Cycle or the Period

It is possible to modulate the output waveform duty cycle or period.

To prevent unexpected output waveform, the user must use PWM\_CUPDx to change waveform parameters while the channel is still enabled. The user can write a new period value or duty cycle value in PWM\_CUPDx. This register holds the new value until the end of the current cycle and updates the value for the next cycle. Depending on the PWM\_CMRx.CPD field, PWM\_CUPDx either updates PWM\_CPRDx or PWM\_CDTYx. Note that even if the update register is used, the period must not be smaller than the duty cycle.

**Figure 63.6.** Synchronized Period or Duty Cycle Update

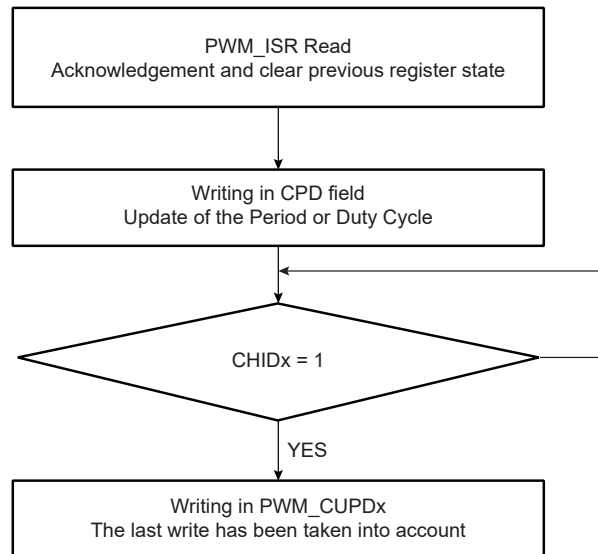

To prevent overwriting the PWM\_CUPDx by software, the user can use status events in order to synchronize his software. Two methods are possible. In both, the user must enable the dedicated interrupt in PWM\_IER at PWM controller level.

The first method (polling method) consists of reading the relevant status bit in the Interrupt Status register (PWM\_ISR) according to the enabled channel(s). See the figure below.

The second method uses an Interrupt Service Routine associated with the PWM channel.

**Note:** Reading PWM\_ISR automatically clears the CHIDx flags.

**Figure 63.7.** Polling Method

**Note:** Polarity and alignment can be modified only when the channel is disabled.

## 63.7. Register Summary

0111	MCKDIV128	Peripheral clock divided by 128
1000	MCKDIV256	Peripheral clock divided by 256
1001	MCKDIV512	Peripheral clock divided by 512
1010	MCKDIV1024	Peripheral clock divided by 1024
Other	-	Reserved

#### Bits 7:0 – DIVA[7:0] CLKA Divide Factor

Value	Name	Description
0	CLK_OFF	The CLKA internal source clock is turned off. The PWMx output is stuck when PWM_CM Rx.CPRE=CLKA.
1	CLK_DIV1	CLKA is the clock selected by PREA.
2–255	-	CLKA is the clock selected by PREA, divided by the DIVA factor.

63.7.2. PWM Enable Register

**Name:** PWM\_ENA  
**Offset:** 0x04  
**Reset:** –  
**Property:** Write-only

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Enable PWM output for channel x.

63.7.3. PWM Disable Register

**Name:** PWM\_DIS  
**Offset:** 0x08  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					W	W	W	W
Reset					–	–	–	–

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Disable PWM output for channel x.

63.7.4. PWM Status Register

**Name:** PWM\_SR  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					R	R	R	R
Reset					0	0	0	0

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	PWM output for channel x is disabled.
1	PWM output for channel x is enabled.

63.7.5. PWM Interrupt Enable Register

**Name:** PWM\_IER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Enable interrupt for PWM channel x.

63.7.6. PWM Interrupt Disable Register

**Name:** PWM\_IDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Disable interrupt for PWM channel x.

63.7.7. PWM Interrupt Mask Register

**Name:** PWM\_IMR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	Interrupt for PWM channel x is disabled.
1	Interrupt for PWM channel x is enabled.

63.7.8. PWM Interrupt Status Register

**Name:** PWM\_ISR  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** Reading PWM\_ISR automatically clears the CHIDx flags.

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No new channel period has been achieved since the last read of PWM_ISR.
1	At least one new channel period has been achieved since the last read of PWM_ISR.

### 63.7.9. PWM Channel Mode Register x

**Name:** PWM\_CMRx  
**Offset:** 0x0200 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
						CPD	CPOL	CALG
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
						CPRE[3:0]		
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

#### Bit 10 – CPD Channel Update Period

Value	Description
0	Writing to PWM_CUPDx will modify the duty cycle at the next period start event.
1	Writing to PWM_CUPDx will modify the period at the next period start event.

#### Bit 9 – CPOL Channel Polarity

Value	Description
0	The output waveform starts at a low level.
1	The output waveform starts at a high level.

#### Bit 8 – CALG Channel Alignment

Value	Description
0	The period is left-aligned.
1	The period is center-aligned.

#### Bits 3:0 – CPRE[3:0] Channel Prescaler

Value	Name	Description
0000	MCK	Peripheral clock
0001	MCKDIV2	Peripheral clock divided by 2
0010	MCKDIV4	Peripheral clock divided by 4
0011	MCKDIV8	Peripheral clock divided by 8
0100	MCKDIV16	Peripheral clock divided by 16
0101	MCKDIV32	Peripheral clock divided by 32
0110	MCKDIV64	Peripheral clock divided by 64

Value	Name	Description
0111	MCKDIV128	Peripheral clock divided by 128
1000	MCKDIV256	Peripheral clock divided by 256
1001	MCKDIV512	Peripheral clock divided by 512
1010	MCKDIV1024	Peripheral clock divided by 1024
1011	CLKA	Clock A
1100	CLKB	Clock B
Other	-	Reserved

### 63.7.10. PWM Channel Duty Cycle Register x

**Name:** PWM\_CDTYx  
**Offset:** 0x0204 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (internal channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
	CDTY[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CDTY[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CDTY[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CDTY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – CDTY[31:0] Channel Duty Cycle

Defines the waveform duty cycle. This value must be defined between 0 and CPRD (PWM\_CPRx).

### 63.7.11. PWM Channel Period Register

**Name:** PWM\_CPRDx  
**Offset:** 0x0208 + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read/Write

Only the first 16 bits (internal channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
	CPRD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CPRD[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CPRD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CPRD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – CPRD[31:0] Channel Period

If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:

– By using the peripheral clock (MCK) divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula will be:

$$\frac{(X \times \text{CPRD})}{\text{MCK}}$$

– By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(\text{CPRD} \times \text{DIVA})}{\text{MCK}} \text{ or } \frac{(\text{CPRD} \times \text{DIVB})}{\text{MCK}}$$

If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:

– By using the peripheral clock divided by an X given prescaler value (with X being 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula will be:

$$\frac{(2 \times X \times \text{CPRD})}{\text{MCK}}$$

– By using a peripheral clock divided by one of both DIVA or DIVB divider, the formula becomes, respectively:

$$\frac{(2 \times \text{CPRD} \times \text{DIVA})}{\text{MCK}} \text{ or } \frac{(2 \times \text{CPRD} \times \text{DIVB})}{\text{MCK}}$$

### 63.7.12. PWM Channel Counter Register x

**Name:** PWM\_CCNTx  
**Offset:** 0x020C + x\*0x20 [x=0..3]  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	CNT[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	CNT[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	CNT[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CNT[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – CNT[31:0] Channel Counter Register

Internal counter value. This register is reset when:

- the channel is enabled (PWM\_ENA.CHIDx = 1)
- the counter reaches CPRD value defined in PWM\_CPRDx if the waveform is left aligned.

### 63.7.13. PWM Channel Update Register x

**Name:** PWM\_CUPDx  
**Offset:** 0x0210 + x\*0x20 [x=0..3]  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
	CUPD[31:24]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	23	22	21	20	19	18	17	16
	CUPD[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	15	14	13	12	11	10	9	8
	CUPD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–
Bit	7	6	5	4	3	2	1	0
	CUPD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

#### Bits 31:0 – CUPD[31:0] Channel Update Register

This register acts as a double buffer for the period or the duty cycle. This prevents an unexpected waveform when modifying the waveform period or duty cycle.

Only the first 16 bits (internal channel counter size) are significant.

When PWM\_CMRx.CPD = 0, the duty cycle (CDTY of PWM\_CDTYx) is updated with the CUPD value at the beginning of the next period.

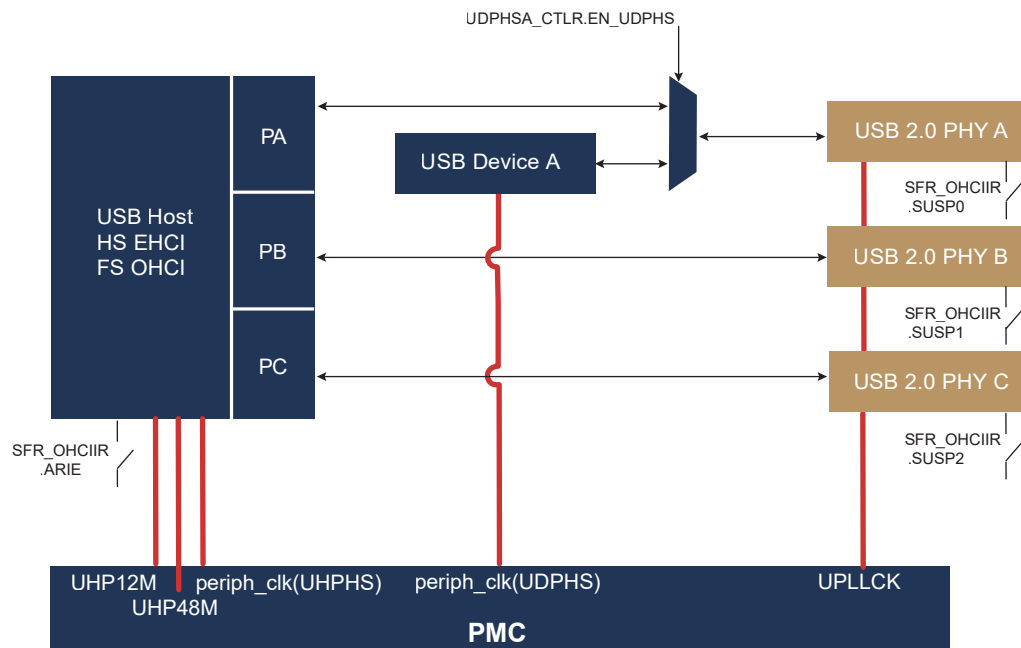

When PWM\_CMRx.CPD = 1, the period (CPRD of PWM\_CPRDx) is updated with the CUPD value at the beginning of the next period.

# USB Subsystem

## 64. Overview

### 64.1. Block Diagram

Figure 64.1. USB Subsystem Block Diagram

### 64.2. Components

- 1x high-speed host (EHCI) and one full-speed host (OHCI) with three ports (PA, PB and PC) (UHPHS)
- 1x high-speed device shared with PA and PB (UDPHS)
- 3x USB 2.0 PHYs

### 64.3. Product Dependencies

#### 64.3.1. Clocks

To generate USB frequencies with high accuracy, the device embeds a dedicated USB PLL (UPLL).

#### 64.3.2. Interrupts

Refer to the table [Peripheral Identifiers](#).

#### 64.3.3. Reset

USB peripherals are connected to the processor and peripherals reset line.

#### 64.3.4. I/Os

USB I/Os are dedicated I/Os powered by VDDIN33/GND.

#### 64.4. Special Functions in SFR

- SFR\_OHCIICR.SUSPx controls suspend for each port. These bits must be set to reduce power consumption on VDDIN33 in Low-power mode.
- SFR\_OHCIICR.ARIE enables the OHCI asynchronous resume interrupt.
- SFR\_OHCIISR.RISx indicates the Port Resume status for each port.

## 65. USB Device High Speed Port (UDPHS)

### 65.1. Description

The USB Device High Speed Port (UDPHS) is compliant with the Universal Serial Bus (USB), rev 2.0 High Speed device specification.

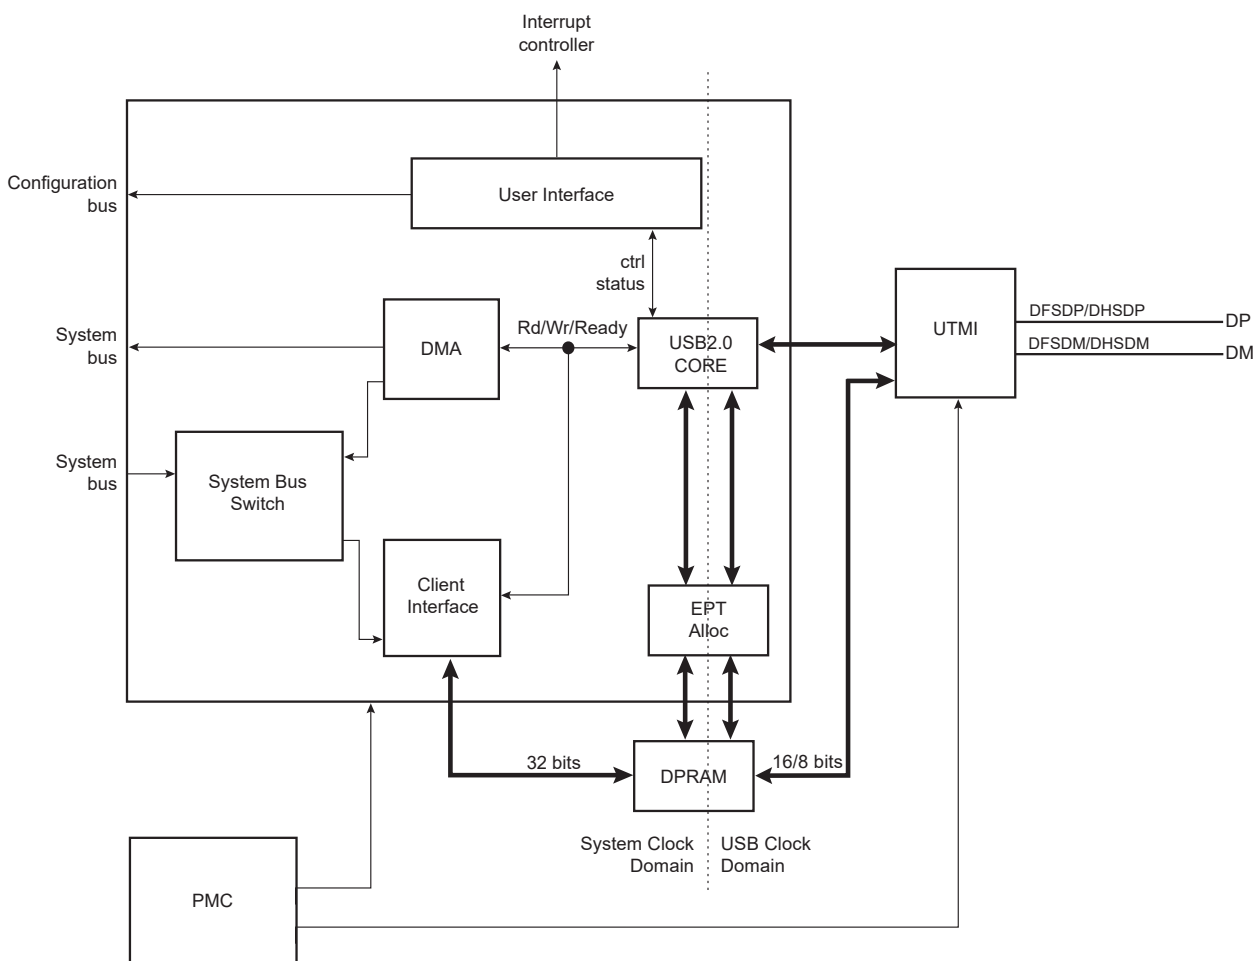

Each endpoint can be configured in one of several USB transfer types. It can be associated with one, two or three banks of a Dual-port RAM used to store the current data payload. If two or three banks are used, one DPR bank is read or written by the processor, while the other is read or written by the USB device peripheral. This feature is mandatory for isochronous endpoints.

### 65.2. Embedded Characteristics

- 1 High-Speed Device
- 1 UTMI Transceiver Shared Between Host and Device
- USB v2.0 High Speed (480 Mbits/s) Compliant
- 7 Endpoints up to 1024 Bytes
- Embedded Dual-port RAM for Endpoints
- Suspend/Resume Logic (Command of UTMI)
- Up to Three Memory Banks for Endpoints (Not for Control Endpoint)
- 16448 bytes of DPRAM

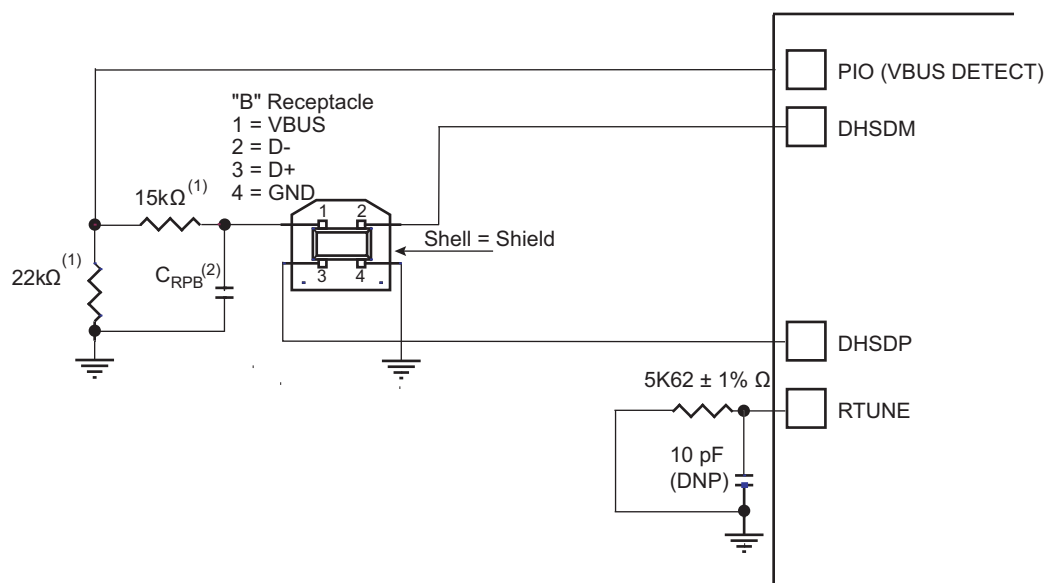

## 65.3. Block Diagram

Figure 65.1. UDPHS Block Diagram

## 65.4. Typical Connection

Figure 65.2. Board Schematic

### Notes:

1. The values shown on the 22 kΩ and 15 kΩ resistors are only valid with 3.3V-supplied PIOs.
2.  $C_{RPB}$ : Upstream Facing Port Bypass Capacitance of 1 μF to 10 μF (refer to “DC Electrical Characteristics” in Universal Serial Bus Specification Rev. 2)
3. 10 pF capacitor on VBG is a provision and may not be populated.

## 65.5. Product Dependencies

### 65.5.1. Power Management

The UDPHS is not continuously clocked.

To use the UDPHS, the programmer must first enable the UDPHS clock in the Power Management Controller (PMC). Then, UTMI (PLL and transceiver) must be enabled by first enabling the bandgap, then the voltage regulator in PMC.

However, if the application does not require UDPHS operations, the UDPHS clock can be stopped when not needed and restarted later.

### 65.5.2. Interrupt Sources

The UDPHS interrupt line is connected on one of the internal sources of the interrupt controller. Using the UDPHS interrupt requires the interrupt controller to be programmed first.

## 65.6. Functional Description

### 65.6.1. UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

**Figure 65.3.** USB Selection

### 65.6.2. USB V2.0 High Speed Device Port Introduction

The USB V2.0 High Speed Device Port provides communication services between host and attached USB devices. Each device is offered with a collection of communication flows (pipes) associated with each endpoint. Software on the host communicates with a USB Device through a set of communication flows.

### 65.6.3. USB V2.0 High Speed Transfer Types

A communication flow is carried over one of four transfer types defined by the USB device.

A device provides several logical communication pipes with the host. To each logical pipe is associated an endpoint. Transfer through a pipe belongs to one of the four transfer types:

- **Control Transfers:** Used to configure a device at attach time and can be used for other device-specific purposes, including control of other pipes on the device.
- **Bulk Data Transfers:** Generated or consumed in relatively large burst quantities and have wide dynamic latitude in transmission constraints.
- **Interrupt Data Transfers:** Used for timely but reliable delivery of data, for example, characters or coordinates with human-perceptible echo or feedback response characteristics.
- **Isochronous Data Transfers:** Occupy a prenegotiated amount of USB bandwidth with a prenegotiated delivery latency. (Also called streaming real time transfers.)

As indicated below, transfers are sequential events carried out on the USB bus.

Endpoints must be configured according to the transfer type they handle.

**Table 65.1.** USB Communication Flow

Transfer	Direction	Bandwidth	Endpoint Size	Error Detection	Retrying
Control	Bidirectional	Not ensured	8, 16, 32, 64	Yes	Automatic
Isochronous	Unidirectional	Ensured	8–1024	Yes	No
Interrupt	Unidirectional	Not ensured	8–1024	Yes	Yes
Bulk	Unidirectional	Not ensured	8–512	Yes	Yes

### 65.6.4. USB Transfer Event Definitions

A transfer is composed of one or several transactions as shown in the table below.

**Table 65.2.** USB Transfer Events

Transfer		Transaction
Direction	Type	
CONTROL (bidirectional)	Control Transfer <sup>(1)</sup>	<ul style="list-style-type: none"> <li>• Setup transaction → Data IN transactions → Status OUT transaction</li> <li>• Setup transaction → Data OUT transactions → Status IN transaction</li> <li>• Setup transaction → Status IN transaction</li> </ul>

.....continued

Transfer		Transaction
Direction	Type	
IN (device toward host)	Bulk IN Transfer	• Data IN transaction → Data IN transaction
	Interrupt IN Transfer	• Data IN transaction → Data IN transaction
	Isochronous IN Transfer <sup>(2)</sup>	• Data IN transaction → Data IN transaction
OUT (host toward device)	Bulk OUT Transfer	• Data OUT transaction → Data OUT transaction
	Interrupt OUT Transfer	• Data OUT transaction → Data OUT transaction
	Isochronous OUT Transfer <sup>(2)</sup>	• Data OUT transaction → Data OUT transaction

**Notes:**

1. Control transfer must use endpoints with one bank and can be aborted using a stall handshake.
2. Isochronous transfers must use endpoints configured with two or three banks.

An endpoint handles all transactions related to the type of transfer for which it has been configured.

**Table 65.3.** UDPHS Endpoint Description

Endpoint #	Mnemonic	Nb Banks	DMA	High Bandwidth	Max. Endpoint Size	Endpoint Type
0	EPT_0	1	N	N	64	Control
1	EPT_1	2	Y	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
2	EPT_2	2	Y	N	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
3	EPT_3	3	Y	Y	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
4	EPT_4	3	Y	Y	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
5	EPT_5	3	Y	Y	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt
6	EPT_6	3	Y	Y	1024	Ctrl/Bulk/Iso <sup>(1)</sup> /Interrupt

**Note:**

1. In Isochronous (Iso) mode, it is preferable that the high bandwidth capability is available.

The size of the internal DPRAM is 16448 bytes, covering the memory need for the endpoints, hence enabling static allocation of the memory for all endpoints.

Suspend and resume are automatically detected by the UDPHS device, which notifies the processor by raising an interrupt.

**65.6.5. USB V2.0 High Speed BUS Transactions**

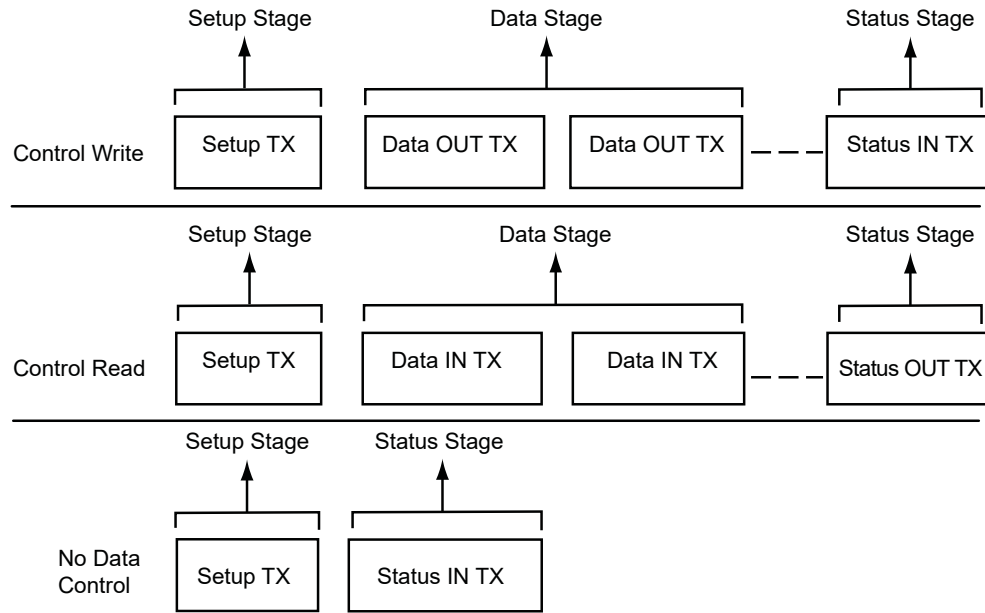

Each transfer results in one or more transactions over the USB bus.

Five types of transaction flow across the bus in packets:

1. Setup Transaction
2. Data IN Transaction
3. Data OUT Transaction
4. Status IN Transaction
5. Status OUT Transaction

A status IN or OUT transaction is identical to a data IN or OUT transaction.

**Figure 65.4.** Control Read and Write Sequences

#### 65.6.6. Endpoint Configuration

The endpoint 0 is always a control endpoint, it must be programmed and active in order to be enabled when the End Of Reset interrupt occurs.

To configure the endpoints:

- Fill the configuration register (UDPHS\_EPTCFG) with the endpoint size, direction (IN or OUT), type (CTRL, Bulk, IT, ISO) and the number of banks.
- Fill the number of transactions (NB\_TRANS) for isochronous endpoints.

**Note:** For control endpoints the direction has no effect.

- Verify that the EPT\_MAPD flag is set. This flag is set if the endpoint size and the number of banks are correct for this endpoint.
- Configure the endpoint control flags and enable them in UDPHS\_EPTCTLENBx as described in [UDPHS\\_EPTCTLDISx](#).

Control endpoints can generate interrupts and use only 1 bank.

All endpoints (except endpoint 0) can be configured either as Bulk, Interrupt or Isochronous. See the table [USB Transfer Events](#).

The maximum packet size they can accept corresponds to the maximum endpoint size.

**Note:** The endpoint size of 1024 is reserved for isochronous endpoints.

The application has access to the physical block of DPR reserved for the endpoint through a 64-Kbyte logical address space.

The physical block of DPR reserved for the endpoint is remapped all along the 64-Kbyte logical address space. The application can write a 64-Kbyte buffer linearly.

**Figure 65.5.** Logical Address Space for DPR Access

Configuration examples of [UDPHS\\_EPTCTLDISx](#) for Bulk IN endpoint type follow below.

- With DMA
  - AUTO\_VALID: Automatically validate the packet and switch to the next bank.
  - EPT\_ENABL: Enable endpoint.
- Without DMA:
  - TXRDY: An interrupt is generated after each transmission.
  - EPT\_ENABL: Enable endpoint.

Configuration examples of Bulk OUT endpoint type follow below.

- With DMA
  - AUTO\_VALID: Automatically validate the packet and switch to the next bank.
  - EPT\_ENABL: Enable endpoint.
- Without DMA
  - RXRDY\_TXKL: An interrupt is sent after a new packet has been stored in the endpoint FIFO.
  - EPT\_ENABL: Enable endpoint.

### 65.6.7. DPRAM Management

Endpoints can be configured in any order.

Disabling an endpoint, by writing a one to the Endpoint Disable bit in the UDPHS Endpoint Control Disable Register (UDPHS\_EPTCTLDISx.EPT\_DISABL), does not reset its configuration:

- Endpoint Banks (UDPHS\_EPTCFGx.BK\_NUMBER)
- Endpoint Size (UDPHS\_EPTCFGx.EPT\_SIZE)
- Endpoint Direction (UDPHS\_EPTCFGx.EPT\_DIR)
- Endpoint Type (UDPHS\_EPTCFGx.EPT\_TYPE)

**Notes:**

1. There is no way the data of the endpoint 0 can be lost (except if it is de-allocated) as the memory allocation and de-allocation may affect only higher endpoints.
2. Deactivating then reactivating the same endpoint with the same configuration only modifies temporarily the controller DPRAM pointer and size for this endpoint. Nothing changes in the DPRAM, higher endpoints seem not to have been moved and their data is preserved as far as nothing has been written or received into them while changing the allocation state of the first endpoint.
3. When the user writes a value different from zero to the UDPHS\_EPTCFGx.BK\_NUMBER field, the Endpoint Mapped bit (UDPHS\_EPTCFGx.EPT\_MAPD) is set only if the configured size and number of banks are correct as compared to the endpoint maximal allowed values and to the maximal FIFO size (i.e., the DPRAM size). The UDPHS\_EPTCFGx.EPT\_MAPD value does not consider memory allocation conflicts.

### 65.6.8. Transfer With DMA

USB packets of any length may be transferred when required by the UDPHS device. These transfers always feature sequential addressing.

Packet data system bus bursts may be locked on a DMA buffer basis for drastic overall system bus bandwidth performance boost with paged memories. These clock-cycle consuming memory row (or bank) changes will then likely not occur, or occur only once instead of several times, during a single big USB packet DMA transfer in case another system bus host addresses the memory. The locked bursts result in up to 128-word single-cycle unbroken system bus bursts for bulk endpoints and 256-word single-cycle unbroken bursts for isochronous endpoints.

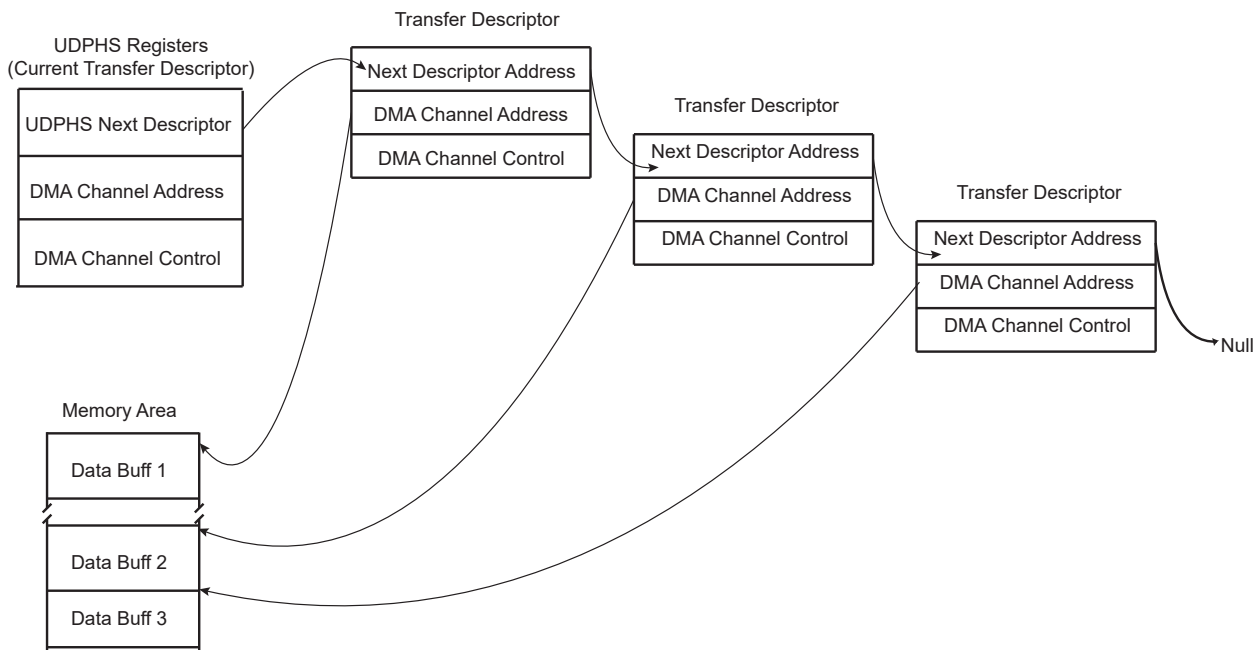

This maximum burst length is then controlled by the lowest programmed USB endpoint size (EPT\_SIZE field in the UDPHS\_EPTCFGx register) and DMA Size (BUFF\_LENGTH field in the UDPHS\_DMACONTROLx register).

The USB 2.0 device average throughput may be up to nearly 60 Mbyte/s. Its internal client average access latency decreases as burst length increases due to the 0 wait-state side effect of unchanged endpoints. If at least 0 wait-state word burst capability is also provided by the external DMA system bus clients, each of both DMA system busses need less than 50% bandwidth allocation for full USB 2.0 bandwidth usage at 30 MHz, and less than 25% at 60 MHz.

The UDPHS DMA Channel Transfer Descriptor is described in the section [UDPHS DMA Channel Transfer Descriptor](#).

**Note:** When debugging, make sure to address the DMA to an SRAM address even if a remap is done.

**Figure 65.6.** Example of DMA Chained List

### 65.6.9. Transfer Without DMA

**Important:** If the DMA is not to be used, it is necessary to disable it, otherwise it can be enabled by previous versions of software without warning. If this occurred, the DMA could process data before an interrupt without the user's knowledge.

The recommended means to disable DMA are as follows:

```
// Reset IP UDPHS
BASE_UDPHS->UDPHS_CTRL &= ~UDPHS_EN_UDPHS;
BASE_UDPHS->UDPHS_CTRL |= UDPHS_EN_UDPHS; //
With OR without DMA !!!
for( i=1; i<=DMA_CHANNEL_NBR; i++ )
// RESET endpoint canal DMA:
// DMA stop channel command
BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Disable endpoint
BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLDIS |= 0xFFFFFFFF;
// Reset endpoint config
BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLCFG = 0;
// Reset DMA channel (Buff count and Control field)
BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0x02; // NON
STOP command
// Reset DMA channel 0 (STOP)
BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Clear DMA channel status (read the register for clear it)
BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS =
BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS;
}
```

### 65.6.10. Handling Transactions with USB V2.0 Device Peripheral

#### 65.6.10.1. Setup Transaction

The setup packet is valid in the DPR while RX\_SETUP is set. Once RX\_SETUP is cleared by the application, the UDPHS accepts the next packets sent over the device endpoint.

When a valid setup packet is accepted by the UDPHS:

- The UDPHS device automatically acknowledges the setup packet (sends an ACK response)
- Payload data is written in the endpoint
- Sets the RX\_SETUP interrupt
- The BYTE\_COUNT field in the UDPHS\_EPTSTAx register is updated

An endpoint interrupt is generated while RX\_SETUP in the UDPHS\_EPTSTAx register is not cleared. This interrupt is carried out to the microcontroller if interrupts are enabled for this endpoint.

Thus, firmware must detect RX\_SETUP polling UDPHS\_EPTSTAx or catching an interrupt, read the setup packet in the FIFO, then clear the RX\_SETUP bit in the UDPHS\_EPTCLRSTA register to acknowledge the setup stage.

If STALL\_SNT was set to 1, then this bit is automatically reset when a setup token is detected by the device. Then, the device still accepts the setup stage (see [STALL](#)).

#### 65.6.10.2.NYET

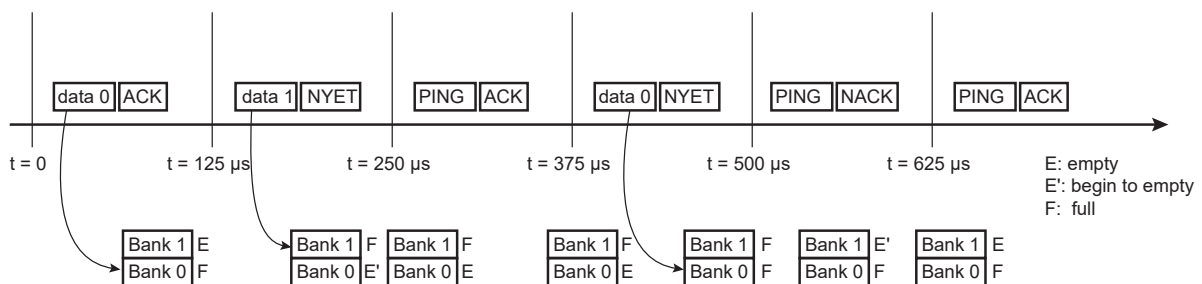

NYET is a High Speed only handshake. It is returned by a High Speed endpoint as part of the PING protocol.

High Speed devices must support an improved NAK mechanism for Bulk OUT and control endpoints (except setup stage). This mechanism allows the device to tell the host whether it has sufficient endpoint space for the next OUT transfer (refer to USB 2.0 spec 8.5.1 NAK Limiting via Ping Flow Control).

The NYET/ACK response to a High Speed Bulk OUT transfer and the PING response are automatically handled by hardware in the UDPHS\_EPTCTLx register (except when the user wants to force a NAK response by using the NYET\_DIS bit).

If the endpoint responds instead to the OUT/DATA transaction with an NYET handshake, this means that the endpoint accepted the data but does not have room for another data payload. The host controller must return to using a PING token until the endpoint indicates it has space available.

**Figure 65.7.** NYET Example with Two Endpoint Banks

#### 65.6.10.3.Data IN

- Bulk IN or Interrupt IN

Data IN packets are sent by the device during the data or the status stage of a control transfer or during an (interrupt/bulk/isochronous) IN transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

There are three ways for an application to transfer a buffer in several packets over the USB:

- packet by packet (see [Bulk IN or Interrupt IN: Sending a Packet Under Application Control \(Device to Host\)](#) below)
- 64 Kbytes (see [Bulk IN or Interrupt IN: Sending a Packet Under Application Control \(Device to Host\)](#) below)
- DMA (see [Bulk IN or Interrupt IN: Sending a Buffer Using DMA \(Device to Host\)](#) below)

- Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)

The application can write one or several banks.

A simple algorithm can be used by the application to send packets regardless of the number of banks associated to the endpoint.

Algorithm description for each packet:

- The application waits for the TXRDY flag to be cleared in the UDPHS\_EPTSTAx register before it can perform a write access to the DPR.
- The application writes one USB packet of data in the DPR through the 64 Kbytes endpoint logical memory window.
- The application sets TXRDY flag in the UDPHS\_EPTSETSTAx register.

The application is notified that it is possible to write a new packet to the DPR by the TXRDY interrupt. This interrupt can be enabled or masked by setting the TXRDY bit in the UDPHS\_EPTCTLENB/UDPHS\_EPTCTLDIS register.

Algorithm description to fill several packets:

Using the previous algorithm, the application is interrupted for each packet. It is possible to reduce the application overhead by writing linearly several banks at the same time. The AUTO\_VALID bit in the UDPHS\_EPTCTLx must be set by writing the AUTO\_VALID bit in the UDPHS\_EPTCTLENBx register.

The auto-valid-bank mechanism allows the transfer of data (IN and OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY\_TXKL bit) is done by hardware.

- The application checks the BUSY\_BANK\_STA field in the UDPHS\_EPTSTAx register. The application must wait that at least one bank is free.
- The application writes a number of bytes inferior to the number of free DPR banks for the endpoint. Each time the application writes the last byte of a bank, the TXRDY signal is automatically set by the UDPHS.
- If the last packet is incomplete (i.e., the last byte of the bank has not been written) the application must set the TXRDY bit in the UDPHS\_EPTSETSTAx register.

The application is notified that all banks are free, so that it is possible to write another burst of packets by the BUSY\_BANK interrupt. This interrupt can be enabled or masked by setting the BUSY\_BANK flag in the UDPHS\_EPTCTLENB and UDPHS\_EPTCTLDIS registers.

This algorithm must not be used for isochronous transfer. In this case, the ping-pong mechanism does not operate.

A Zero Length Packet can be sent by setting just the TXRDY flag in the UDPHS\_EPTSETSTAx register.

- Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host)

The UDPHS integrates a DMA host controller. This DMA controller can be used to transfer a buffer from the memory to the DPR or from the DPR to the processor memory under the UDPHS control. The DMA can be used for all transfer types except control transfer.

Example DMA configuration:

- 1. Program UDPHS\_DMAADDRESS x with the address of the buffer that should be transferred.
- 2. Enable the interrupt of the DMA in UDPHS\_IEN.
- 3. Program UDPHS\_DMACONTROLx:
  - Size of buffer to send: size of the buffer to be sent to the host.
  - END\_B\_EN: the endpoint can validate the packet (according to the values programmed in the AUTO\_VALID and SHRT\_PCKT fields of UDPHS\_EPTCTLx) (see [UDPHS\\_EPTCTLDISx](#) and the figure [Autovalid with DMA](#)).

- END\_BUFFIT: generate an interrupt when the BUFF\_COUNT field in the UDPHS DMA Channel Status register (UDPHS\_DMASTATUSx) reaches 0.
- CHANN\_ENB: run and stop at end of buffer.

The auto-valid-bank mechanism allows the transfer of data (IN & OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear RXRDY\_TXKL) is done by hardware.

A transfer descriptor can be used. Instead of programming the register directly, a descriptor should be programmed and the address of this descriptor is then given to UDPHS\_DMANXTDSC to be processed after setting the LDNXT\_DSC field (Load Next Descriptor Now) in UDPHS\_DMACONTROLx register.

The structure that defines this transfer descriptor must be aligned.

Each buffer to be transferred must be described by a DMA Transfer descriptor (see [UDPHS DMA Channel Transfer Descriptor](#)). Transfer descriptors are chained. Before executing transfer of the buffer, the UDPHS may fetch a new transfer descriptor from the memory address pointed by the UDPHS\_DMANXTDSCx register. Once the transfer is complete, the transfer status is updated in the UDPHS\_DMASTATUSx register.

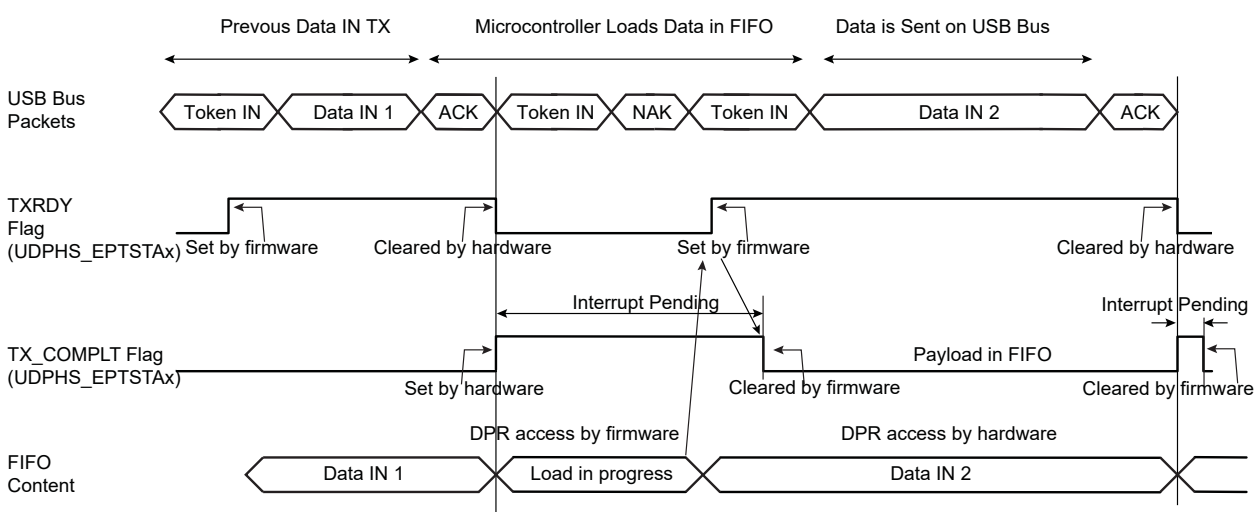

To chain a new transfer descriptor with the current DMA transfer, the DMA channel must be stopped. To do so, INTDIS\_DMA and TXRDY may be set in the UDPHS\_EPTCTLENBx register. It is also possible for the application to wait for the completion of all transfers. In this case the LDNXT\_DSC bit in the last transfer descriptor UDPHS\_DMACONTROLx register must be set to 0 and the CHANN\_ENB bit set to 1.

Then the application can chain a new transfer descriptor.

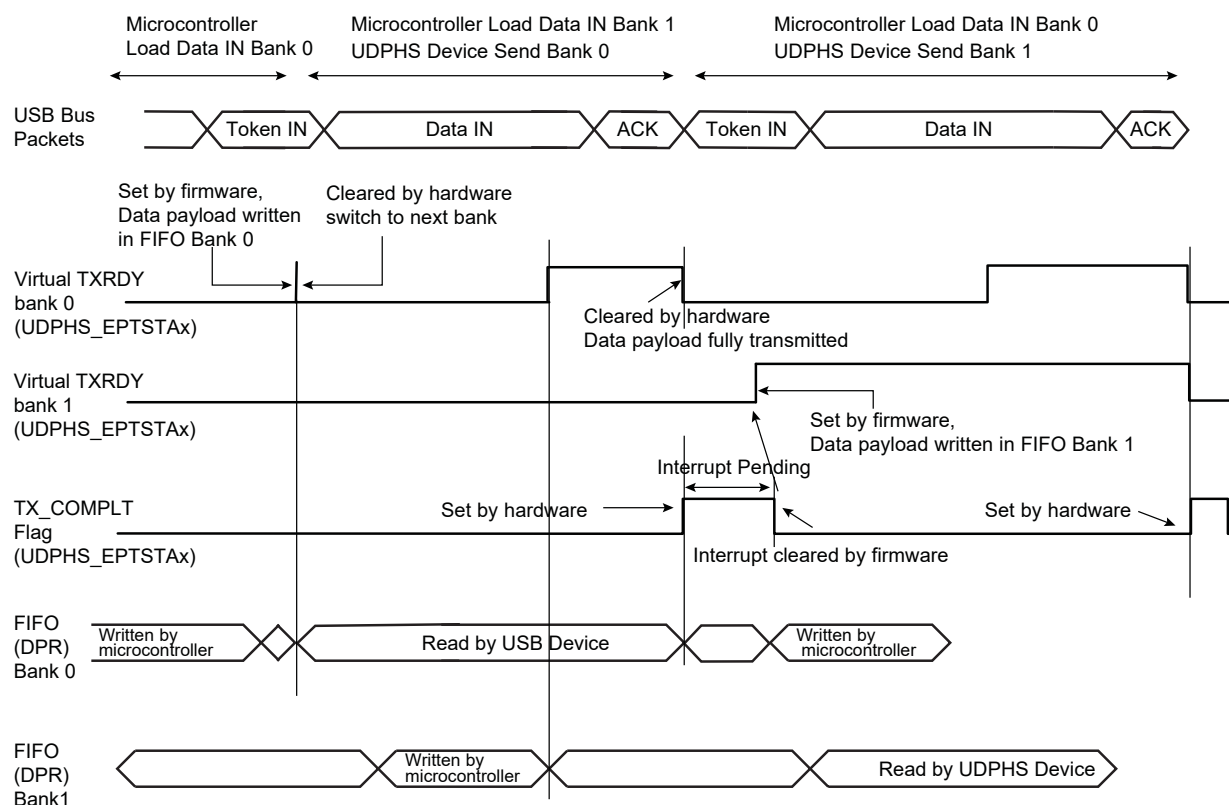

The INTDIS\_DMA can be used to stop the current DMA transfer if an enabled interrupt is triggered. This can be used to stop DMA transfers in case of errors.

The application can be notified at the end of any buffer transfer (via UDPHS\_DMACONTROLx.ENB\_BUFFIT).

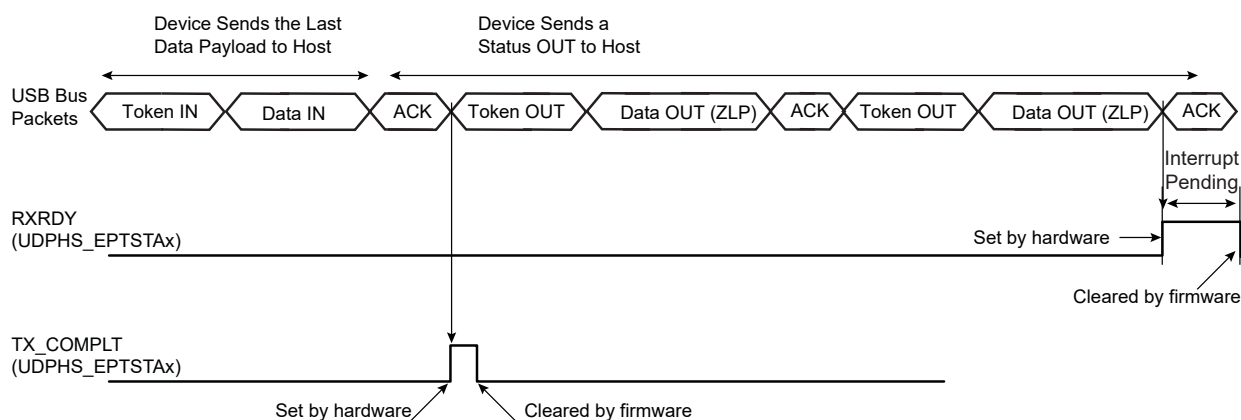

**Figure 65.8.** Data IN Transfer for Endpoint with One Bank

**Figure 65.9.** Data IN Transfer for Endpoint with Two Banks

**Figure 65.10.** Data IN Followed By Status OUT Transfer at the End of a Control Transfer

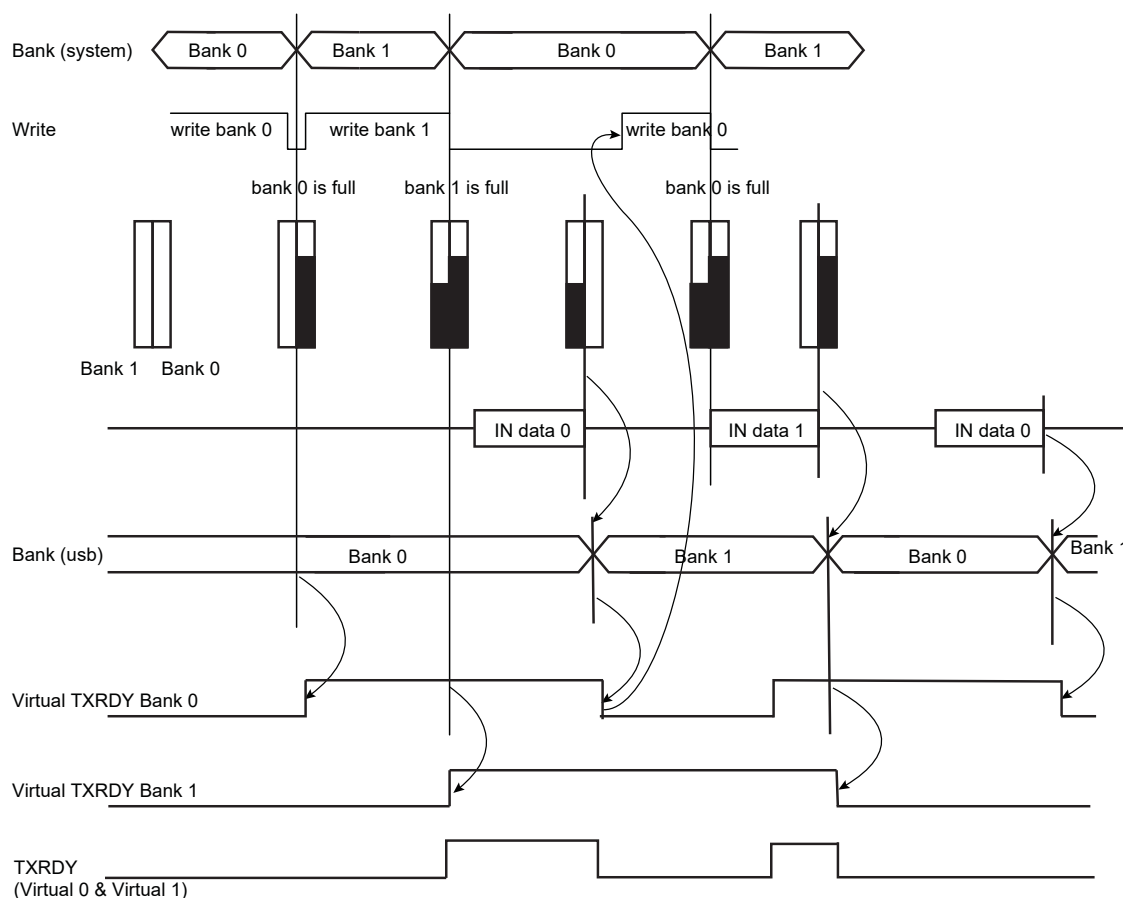

**Note:** A NAK handshake is always generated at the first status stage token.

**Figure 65.11.** Data OUT Followed by Status IN Transfer

**Note:** Before proceeding to the status stage, the software should determine that there is no risk of extra data from the host (data stage). If not certain (non-predictable data stage length), then the software should wait for a NAK-IN interrupt before proceeding to the status stage. This precaution should be taken to avoid collision in the FIFO.

**Figure 65.12.** Autovalid with DMA

**Note:** In the illustration above, Autovalid validates a bank as full, although this might not be the case, in order to continue processing data and to send to DMA.

- Isochronous IN

Isochronous-IN is used to transmit a stream of data whose timing is implied by the delivery rate. Isochronous transfer provides periodic, continuous communication between host and device.

It ensures bandwidth and low latencies appropriate for telephony, audio, video, etc.

If the endpoint is not available (TXRDY\_TRER = 0), then the device does not answer the host. An ERR\_FL\_ISO interrupt is generated in the UDPHS\_EPTSTAx register and, once enabled, sent to the CPU.

The STALL\_SNT command bit is not used for an ISO-IN endpoint.

- High Bandwidth Isochronous Endpoint Handling: IN Example

For high bandwidth isochronous endpoints, the DMA can be programmed with the number of transactions (UDPHS\_DMACONTROLx.BUFF\_LENGTH) and the system should provide the required number of packets per microframe, otherwise, the host will notice a sequencing problem.

A response should be made to the first token IN recognized inside a microframe under the following conditions:

- If at least one bank has been validated, the correct DATAx corresponding to the programmed Number Of Transactions per Microframe (NB\_TRANS) should be answered. In case of a subsequent missed or corrupted token IN inside the microframe, the USB 2.0 Core available data bank(s) that should normally have been transmitted during that microframe shall be flushed at its end. If this flush occurs, an error condition is flagged (UDPHS\_EPTSTAx.ERR\_FLUSH is set).
- If no bank is validated yet, the default DATA0 ZLP is answered and underflow is flagged (UDPHS\_EPTSTAx.ERR\_FL\_ISO is set). Then, no data bank is flushed at the microframe end.
- If no data bank has been validated at the time when a response should be made for the second transaction of NB\_TRANS = 3 transactions microframe, a DATA1 ZLP is answered and underflow is flagged (UDPHS\_EPTSTAx.ERR\_FL\_ISO is set). If and only if remaining untransmitted banks for that microframe are available at its end, they are flushed and an error condition is flagged (UDPHS\_EPTSTAx.ERR\_FLUSH is set).
- If no data bank has been validated at the time when a response should be made for the last programmed transaction of a microframe, a DATA0 ZLP is answered and underflow is flagged (UDPHS\_EPTSTAx.ERR\_FL\_ISO is set). If and only if the remaining untransmitted data bank for that microframe is available at its end, it is flushed and an error condition is flagged (UDPHS\_EPTSTAx.ERR\_FLUSH is set).

If at the end of a microframe no valid token IN has been recognized, no data bank is flushed and no error condition is reported.

At the end of a microframe in which at least one data bank has been transmitted, if less than NB\_TRANS banks have been validated for that microframe, an error condition is flagged (UDPHS\_EPTSTAx.ERR\_TRANS is set).

Error cases (in UDPHS EPTSTAx):

- ERR\_FL\_ISO: There was no data to transmit inside a microframe, so a ZLP is answered by default.
- ERR\_FLUSH: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of transactions actually validated (TXRDY\_TRER) and likewise with the NB\_TRANS programmed.
- ERR\_TRANS: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of programmed NB\_TRANS transactions and the packets not requested were not validated.
- ERR\_FL\_ISO + ERR\_FLUSH: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs.

- **ERR\_FL\_ISO + ERR\_TRANS:** At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs and the data can be discarded at the microframe end.
- **ERR\_FLUSH + ERR\_TRANS:** The first token IN has been answered and it was the only one received, a second bank has been validated but not the third, whereas NB\_TRANS was waiting for three transactions.
- **ERR\_FL\_ISO + ERR\_FLUSH + ERR\_TRANS:** The first token IN has been treated, the data for the second Token IN was not available in time, but the second bank has been validated before the end of the microframe. The third bank has not been validated, but three transactions have been set in NB\_TRANS.

#### 65.6.10.4.Data OUT

- **Bulk OUT or Interrupt OUT**  
Like data IN, data OUT packets are sent by the host during the data or the status stage of control transfer or during an interrupt/bulk/isochronous OUT transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.

- **Bulk OUT or Interrupt OUT: Receiving a Packet Under Application Control (Host to Device)**

##### Algorithm Description for Each Packet:

- The application enables an interrupt on RXRDY\_TXKL.
- When an interrupt on RXRDY\_TXKL is received, the application knows that UDPHS\_EPTSTAx register BYTE\_COUNT bytes have been received.
- The application reads the BYTE\_COUNT bytes from the endpoint.
- The application clears RXRDY\_TXKL.

**Note:** If the application does not know the size of the transfer, it may not be a good option to use AUTO\_VALID. Because if a zero-length-packet is received, the RXRDY\_TXKL is automatically cleared by the AUTO\_VALID hardware and if the endpoint interrupt is triggered, the software will not find its originating flag when reading the UDPHS\_EPTSTAx register.

##### Algorithm to Fill Several Packets

- The application enables the interrupts of BUSY\_BANK and AUTO\_VALID.
- When a BUSY\_BANK interrupt is received, the application knows that all banks available for the endpoint have been filled. Thus, the application can read all banks available.

If the application does not know the size of the receive buffer, instead of using the BUSY\_BANK interrupt, the application must use RXRDY\_TXKL.

- **Bulk OUT or Interrupt OUT: Sending a Buffer Using DMA (Host To Device)**

To use the DMA setting, the AUTO\_VALID field is mandatory.

See [Bulk IN or Interrupt IN: Sending a Buffer Using DMA \(Device to Host\)](#) for more information.

DMA Configuration Example:

1. First program UDPHS\_DMAADDRESSx with the address of the buffer that should be transferred.
2. Enable the interrupt of the DMA in the Interrupt Enable register (UDPHS\_IEN).
3. Program the DMA Channelx Control Register:
  - Size of buffer to be sent.
  - END\_B\_EN: Can be used for OUT packet truncation (discarding of unbuffered packet data) at the end of DMA buffer.
  - END\_BUFFERIT: Generate an interrupt when UDPHS\_DMASTATUSx.BUFF\_COUNT reaches 0.
  - END\_TR\_EN: End of transfer enable, the UDPHS device can put an end to the current DMA transfer, in case of a short packet.

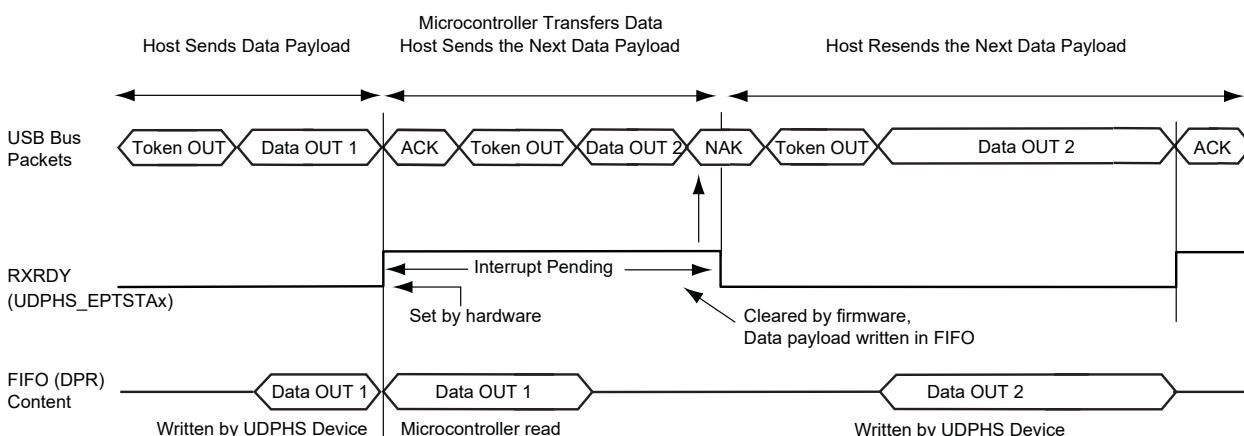

- END\_TR\_IT: End of transfer interrupt enable, an interrupt is sent after the last USB packet has been transferred by the DMA, if the USB transfer ended with a short packet. (Beneficial when the receive size is unknown.)
- CHANN\_ENB: Run and stop at end of buffer.

For OUT transfer, the bank will be automatically cleared by hardware when the application has read all the bytes in the bank (the bank is empty).

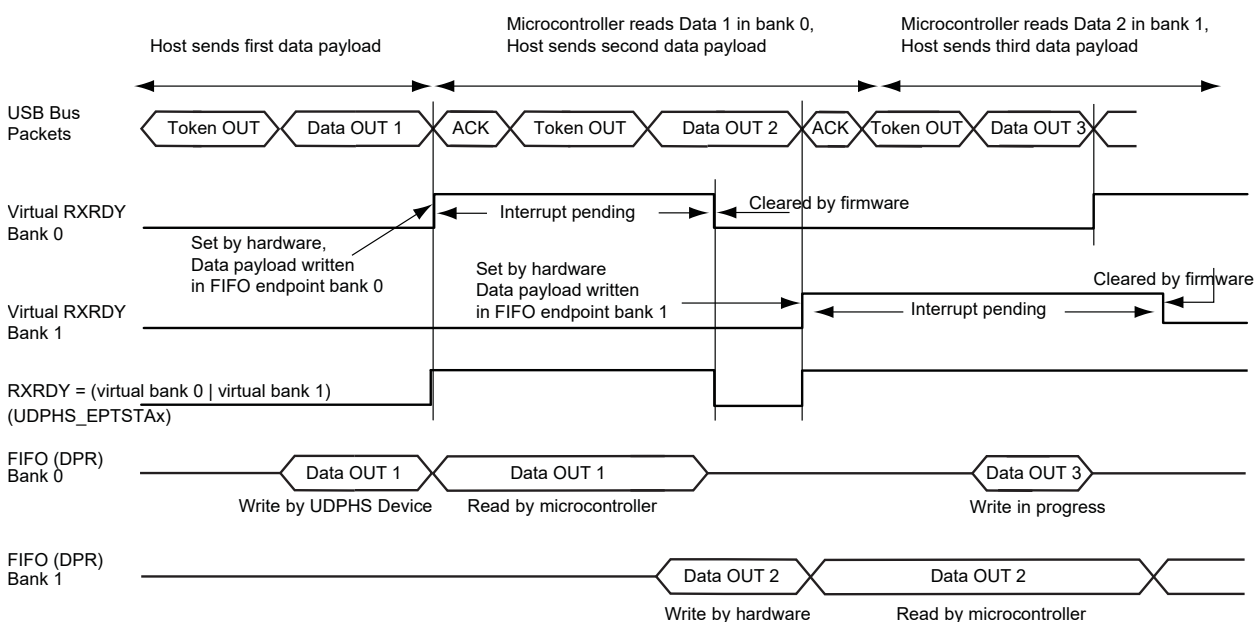

#### Notes:

1. When a zero-length-packet is received, UDPHS\_EPTSTAx.RXRDY\_TXKL is cleared automatically by AUTO\_VALID, and the application knows of the end of buffer by the presence of the END\_TR\_IT.
2. If the host sends a zero-length packet, and the endpoint is free, then the device sends an ACK. No data is written in the endpoint, the RXRDY\_TXKL interrupt is generated, and the UDPHS\_EPTSTAx.BYTE\_COUNT field is null.

**Figure 65.13.** Data OUT Transfer for Endpoint with One Bank

**Figure 65.14.** Data OUT Transfer for an Endpoint with Two Banks

- High Bandwidth Isochronous Endpoint OUT

USB 2.0 supports individual High Speed isochronous endpoints that require data rates up to 192 Mb/s (24 MB/s): 3x1024 data bytes per microframe.

To support such a rate, two or three banks may be used to buffer the three consecutive data packets. The microcontroller (or the DMA) should be able to empty the banks very rapidly (at least 24 MB/s on average).

NB\_TRANS field in UDPHS\_EPTCFGx register = Number Of Transactions per Microframe.

If NB\_TRANS > 1 then it is High Bandwidth.

Example:

- If NB\_TRANS = 3, the sequence should be either one of the following:
  - MData0
  - MData0/Data1
  - MData0/Data1/Data2
- If NB\_TRANS = 2, the sequence should be either one of the following:
  - MData0
  - MData0/Data1
- If NB\_TRANS = 1, the sequence should be:
  - Data0

**Figure 65.15.** Bank Management, Example of Three Transactions per Microframe

- Isochronous Endpoint Handling: OUT Example  
The user can ascertain the bank status (free or busy), and the toggle sequencing of the data packet for each bank with the UDPHS\_EPTSTAx register in the three fields as follows:
  - TOGGLESQ\_STA: PID of the data stored in the current bank.
  - CURBK: Number of the bank currently being accessed by the microcontroller.
  - BUSY\_BANK\_STA: Number of busy bank.

This is particularly useful in case of a missing data packet.

If the inter-packet delay between the OUT token and the Data is greater than the USB standard, then the ISO-OUT transaction is ignored. (Payload data is not written, no interrupt is generated to the CPU.)

If there is a data CRC (Cyclic Redundancy Check) error, the payload is, none the less, written in the endpoint. The UDPHS\_EPTSTAx.ERR\_CRC\_NTR flag is set.

If the endpoint is already full, the packet is not written in the DPRAM. The UDPHS\_EPTSTAx.ERR\_FL\_ISO flag is set.

If the payload data is greater than the maximum size of the endpoint, then the ERR\_OVFLW flag is set. It is the task of the CPU to manage this error. The data packet is written in the endpoint (except the extra data).

If the host sends a Zero Length Packet, and the endpoint is free, no data is written in the endpoint, the RXRDY\_TXKL flag is set, and the UDPHS\_EPTSTAx.BYTE\_COUNT field is null.

The FRCESTALL command bit is unused for an isochronous endpoint.

Otherwise, payload data is written in the endpoint, the RXRDY\_TXKL interrupt is generated and BYTE\_COUNT is updated.

#### 65.6.10.5. STALL

STALL is returned by a function in response to an IN token or after the data phase of an OUT or in response to a PING transaction. STALL indicates that a function is unable to transmit or receive data, or that a control pipe request is not supported.

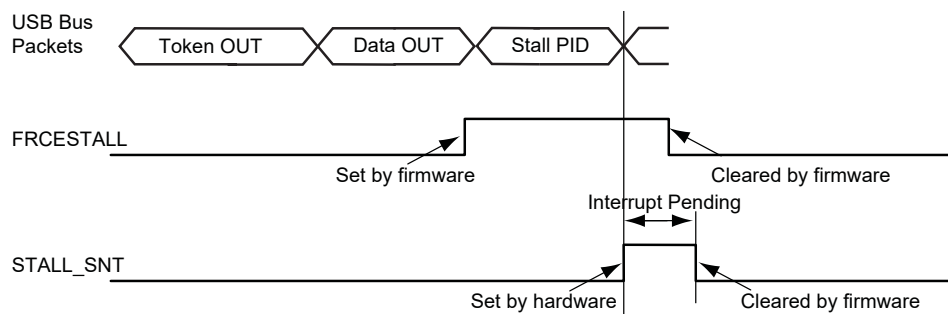

- OUT

To stall an endpoint, set the FRCESTALL bit in UDPHS\_EPTSETSTAx register and after the STALL\_SNT flag has been set, set the TOGGLE\_SEG bit in the UDPHS\_EPTCLRSTAx register.

- IN

Set the FRCESTALL bit in UDPHS\_EPTSETSTAx register.

**Figure 65.16.** Stall Handshake Data OUT Transfer

**Figure 65.17.** Stall Handshake Data IN Transfer

#### 65.6.11. Speed Identification

The high speed reset is managed by hardware.

At the connection, the host makes a reset which could be a classic reset (full speed) or a high speed reset.

At the end of the reset process (full or high), the ENDRESET interrupt is generated.

Then the CPU should read the SPEED bit in UDPHS\_INTSTAx to ascertain the speed mode of the device.

### 65.6.12. USB V2.0 High Speed Global Interrupt

Interrupts are defined in [UDPHS\\_IEN](#) and in [UDPHS\\_INTSTA](#) (Interrupt Status register).

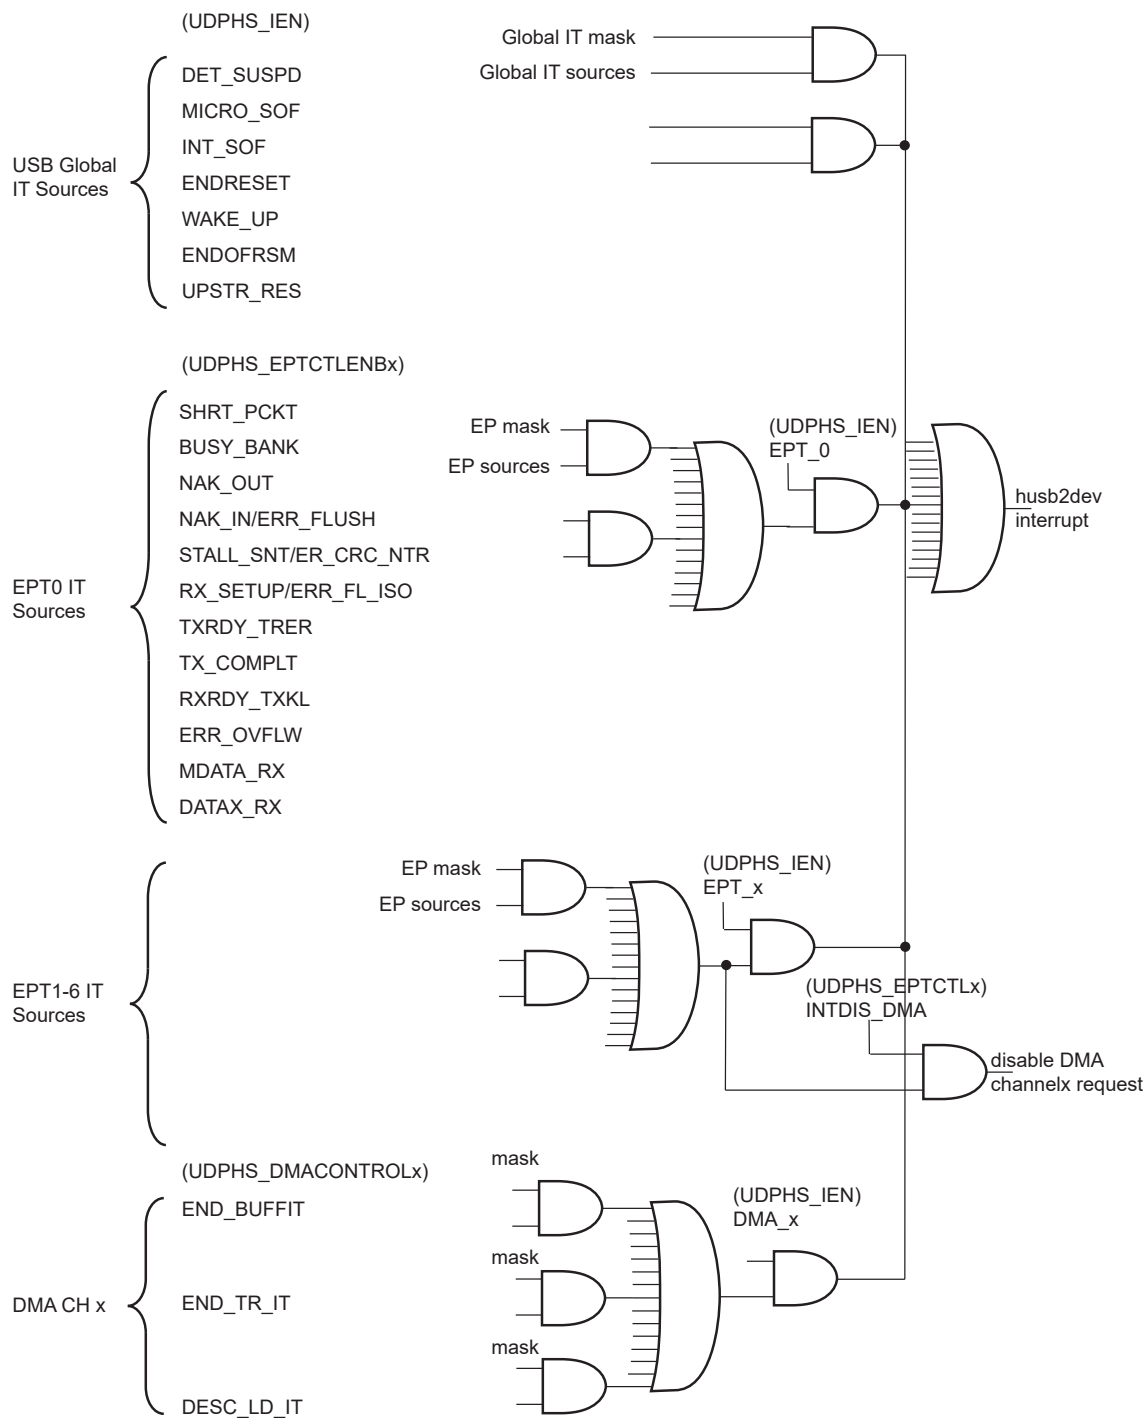

### 65.6.13. Endpoint Interrupts

Interrupts are enabled in [UDPHS\\_IEN](#) and individually masked in [UDPHS\\_EPTCTLENBx](#).

**Table 65.4.** Endpoint Interrupt Source Masks

Acronym	Description
SHRT_PCKT	Short packet interrupt
BUSY_BANK	Busy bank interrupt
NAK_OUT	NAKOUT interrupt
NAK_IN/ERR_FLUSH	NAKIN/error flush interrupt
STALL_SNT/ERR_CRC_NTR	Stall sent/CRC error/number of transaction error interrupt
RX_SETUP/ERR_FL_ISO	Received SETUP/error flow interrupt
TXRDY_TRER	TX packet read/transaction error interrupt
TX_COMPLT	Transmitted IN data complete interrupt
RXRDY_TXKL	Received OUT data interrupt
ERR_OVFLW	Overflow error interrupt
MDATA_RX	MDATA interrupt
DATA_X_RX	DATAx interrupt

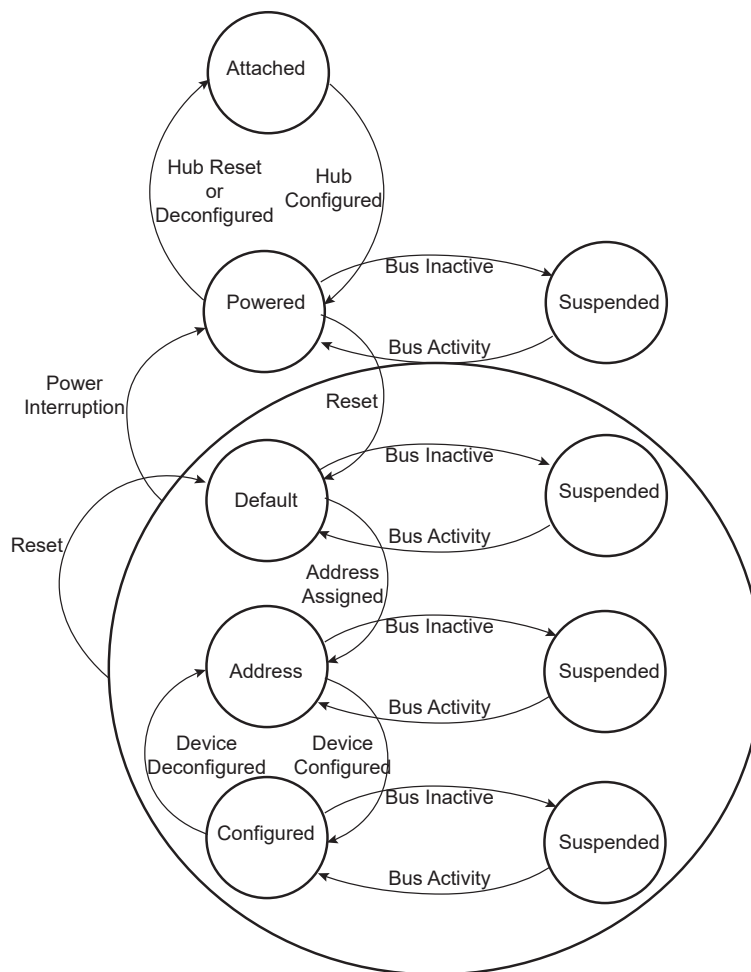

**Figure 65.18.** UDPHS Interrupt Control Interface

## 65.6.14. Power Modes

### 65.6.14.1. Controlling Device States

A USB device has several possible states. Refer to Chapter 9 (USB Device Framework) of the Universal Serial Bus Specification, Rev 2.0.

**Figure 65.19.** UDPHS Device State Diagram

Movement from one state to another depends on the USB bus state or on standard requests sent through control transactions via the default endpoint (endpoint 0).

After a period of bus inactivity, the USB device enters Suspend mode. Accepting Suspend/Resume requests from the USB host is mandatory. Constraints in Suspend mode are very strict for bus-powered applications; devices may not consume more than 500  $\mu$ A on the USB bus.

While in Suspend mode, the host may wake up a device by sending a resume signal (bus activity) or a USB device may send a wake-up request to the host (waking up a PC by moving a USB mouse, for example).

The wake-up feature is not mandatory for all devices and must be negotiated with the host.

#### 65.6.14.2. Not Powered State

Self powered devices can detect 5V VBUS using a PIO. When the device is not connected to a host, device power consumption can be reduced by the DETACH bit in UDPHS\_CTRL. Disabling the transceiver is automatically done. HSDM, HSDP, FSDP and FSDM lines are tied to GND pulldowns integrated in the hub downstream ports.

#### 65.6.14.3. Entering Attached State

When no device is connected, the USB FSDP and FSDM signals are tied to GND by 15 K $\Omega$  pulldowns integrated in the hub downstream ports. When a device is attached to an hub downstream port, the device connects a 1.5 K $\Omega$  pullup on FSDP. The USB bus line goes into IDLE state, FSDP is pulled up by the device 1.5 K $\Omega$  resistor to 3.3V and FSDM is pulled down by the 15 K $\Omega$  resistor to GND of the host.

After pullup connection, the device enters the powered state. The transceiver remains disabled until bus activity is detected.

In case of low power consumption need, the device can be stopped. When the device detects the VBUS, the software must enable the USB transceiver by enabling the EN\_UDPHS bit in UDPHS\_CTRL register.

The software can detach the pullup by setting DETACH bit in UDPHS\_CTRL register.

#### 65.6.14.4.From Powered State to Default State (Reset)

After its connection to a USB host, the USB device waits for an end-of-bus reset. The unmasked flag ENDRESET is set in the UDPHS\_IEN register and an interrupt is triggered.

Once the ENDRESET interrupt has been triggered, the device enters Default State. In this state, the UDPHS software must:

- Enable the default endpoint, setting the EPT\_ENABL flag in the UDPHS\_EPTCTLENB[0] register and, optionally, enabling the interrupt for endpoint 0 by writing 1 in EPT\_0 of the UDPHS\_IEN register. The enumeration then begins by a control transfer.
- Configure the Interrupt Mask Register which has been reset by the USB reset detection
- Enable the transceiver.

In this state, the EN\_UDPHS bit in UDPHS\_CTRL register must be enabled.

#### 65.6.14.5.From Default State to Address State (Address Assigned)

After a Set Address standard device request, the USB host peripheral enters the address state.

**WARNING** Before the device enters address state, it must achieve the Status IN transaction of the control transfer, i.e., the UDPHS device sets its new address once the TX\_COMPLT flag in the UDPHS\_EPTCTL[0] register has been received and cleared.

To move to address state, the driver software sets the DEV\_ADDR field and the FADDR\_EN flag in the UDPHS\_CTRL register.

#### 65.6.14.6.From Address State to Configured State (Device Configured)

Once a valid Set Configuration standard request has been received and acknowledged, the device enables endpoints corresponding to the current configuration. This is done by setting the BK\_NUMBER, EPT\_TYPE, EPT\_DIR and EPT\_SIZE fields in the UDPHS\_EPTCFGx registers and enabling them by setting the EPT\_ENABL flag in the UDPHS\_EPTCTLENBx registers, and, optionally, enabling corresponding interrupts in the UDPHS\_IEN register.

#### 65.6.14.7.Entering Suspend State (Bus Activity)

When a Suspend (no bus activity on the USB bus) is detected, the DET\_SUSPD signal in the UDPHS\_STA register is set. This triggers an interrupt if the corresponding bit is set in the UDPHS\_IEN register. This flag is cleared by writing to the UDPHS\_CLRINT register. Then the device enters Suspend mode.

In this state bus powered devices must drain less than 500  $\mu$ A from the 5V VBUS. As an example, the microcontroller switches to slow clock, disables the PLL and main oscillator, and goes into Idle mode. It may also switch off other devices on the board.

The UDPHS device peripheral clocks can be switched off. Resume event is asynchronously detected.

#### 65.6.14.8.Receiving a Host Resume

In Suspend mode, a resume event on the USB bus line is detected asynchronously, transceiver and clocks disabled (however, the pullup should not be removed).

Once the resume is detected on the bus, the signal WAKE\_UP in the UDPHS\_INTSTA is set. It may generate an interrupt if the corresponding bit in the UDPHS\_IEN register is set. This interrupt may be used to wake up the core, enable PLL and main oscillators and configure clocks.

#### 65.6.14.9. Sending an External Resume

In Suspend State it is possible to wake up the host by sending an external resume.

The device waits at least 5 ms after being entered in Suspend State before sending an external resume.

The device must force a K state from 1 to 15 ms to resume the host.

#### 65.6.15. Test Mode

A device must support the TEST\_MODE feature when in the Default, Address or Configured High Speed device states.

TEST\_MODE can be:

- Test\_J
- Test\_K
- Test\_Packet
- Test\_SEO\_NAK

(See [UDPHS Test Register](#) for definitions of each test mode.)

```
const char test_packet_buffer[] = {
0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, // JKJKJKJK * 9
0xAA, 0xAA, 0xAA, 0xAA, 0xAA, 0xAA, 0xAA, 0xAA, 0xAA, 0xAA, // JKKKJJJK * 8
0xEE, 0xEE, 0xEE, 0xEE, 0xEE, 0xEE, 0xEE, 0xEE, 0xEE, 0xEE, // JKKKJJJK * 8
0xFE, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, 0xFF, // JJJJJJJJKKKKKK * 8
0x7F, 0xBF, 0xDF, 0xEF, 0xF7, 0xFB, 0xFD, 0x7E, // JJJJJJJJK * 8
0xFC, 0x7E, 0xBF, 0xDF, 0xEF, 0xF7, 0xFB, 0xFD, 0x7E, // {JKKKKKKK * 10}, JK
};
```

### 65.7. Register Summary

**Notes:** The registers below have two modes: Control, Bulk, Interrupt Endpoints mode and Isochronous Endpoints mode. In this register summary, both modes are displayed at the same offset.

- UDPHS\_EPTCTLENB
- UDPHS\_EPTCTLDIS
- UDPHS\_EPTCTL
- UDPHS\_EPTSETSTA
- UDPHS\_EPTCLRSTA
- UDPHS\_EPTSTA

Access	FADDR_EN	DEV_ADDR[6:0]						
Reset	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
	0	0	0	0	0	0	0	0

**Bit 11 – PULLD\_DIS** Pulldown Disable (cleared upon USB reset)

When set, there is no pulldown on DP & DM. (DM Pulldown = DP Pulldown = 0).

**Note:** If the DETACH bit is also set, device DP & DM are left in High Impedance state.

See description of bit “DETACH”.

DETACH	PULLD_DIS	DP	DM	Condition
0	0	Pullup	Pulldown	Not recommended
0	1	Pullup	High impedance state	VBUS present
1	0	Pulldown	Pulldown	No VBUS
1	1	High Impedance state	High Impedance state	VBUS present & software disconnect

**Bit 10 – REWAKEUP** Send Remote Wake-Up (cleared upon USB reset)

An Upstream Resume is sent only after the UDPHS bus has been in Suspend state for at least 5 ms. This bit is automatically cleared by hardware at the end of the Upstream Resume.

Value	Description
0	Remote Wake-Up is disabled (read), or this bit has no effect (write).
1	Remote Wake-Up is enabled (read), or this bit forces an external interrupt on the UDPHS controller for Remote Wake-Up purposes.

**Bit 9 – DETACH** Detach Command

See description of bit “PULL\_DIS”.

Value	Description
0	UDPHS is attached (read), or this bit pulls up the DP line (attach command) (write).
1	UDPHS is detached, UTMI transceiver is suspended (read), or this bit simulates a detach on the UDPHS line and forces the UTMI transceiver into Suspend state (Suspend M = 0) (write).

### Bit 8 – EN\_UDPHS UDPHS Enable

Value	Description
0	UDPHS is disabled (read), or this bit disables and resets the UDPHS controller (write). Switch the UHPHS to UTMI.
1	UDPHS is enabled (read), or this bit enables the UDPHS controller (write). Switch the UDPHS to UTMI.

### Bit 7 – FADDR\_EN Function Address Enable (cleared upon USB reset)

Value	Description
0	The device is not in Address state (read), or only the default function address is used (write).
1	The device is in Address state (read), or this bit is set by the device firmware after a successful status phase of a SET_ADDRESS transaction (write). When set, the only address accepted by the UDPHS controller is the one stored in the UDPHS Address field. It will not be cleared afterwards by the device firmware. It is cleared by hardware on hardware reset, or when UDPHS bus reset is received.

### Bits 6:0 – DEV\_ADDR[6:0] UDPHS Address (cleared upon USB reset)

This field contains the default address (0) after power-up or UDPHS bus reset (read), or it is written with the value set by a SET\_ADDRESS request received by the device firmware (write).

## 65.7.2. UDPHS Frame Number Register

**Name:** UDPHS\_FNUM  
**Offset:** 0x04  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	FNUM_ERR							
Access	R							
Reset	0							
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
			FRAME_NUMBER[10:5]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	FRAME_NUMBER[4:0]					MICRO_FRAME_NUM[2:0]		
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bit 31 – FNUM\_ERR Frame Number CRC Error (cleared upon USB reset)

This bit is set by hardware when a corrupted Frame Number in Start of Frame packet (or Micro SOF) is received.

This bit and the INT\_SOF (or MICRO\_SOF) interrupt are updated at the same time.

### Bits 13:3 – FRAME\_NUMBER[10:0] Frame Number as defined in the Packet Field Formats (cleared upon USB reset)

This field is provided in the last received SOF packet (see UDPHS\_IEN.INT\_SOF).

### Bits 2:0 – MICRO\_FRAME\_NUM[2:0] Microframe Number (cleared upon USB reset)

Number of the received microframe (0 to 7) in one frame. This field is reset at the beginning of each new frame (1 ms).

One microframe is received each 125 microseconds (1 ms/8).

**65.7.3. UDPHS Interrupt Enable Register**

**Name:** UDPHS\_IEN  
**Offset:** 0x10  
**Reset:** 0x00000010  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
		DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access		R/W	R/W	R/W	R/W	R/W	R/W	
Reset		0	0	0	0	0	0	

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
		EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	1	0	0	0	

**Bits 25, 26, 27, 28, 29, 30 – DMA\_x** DMA Channel x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this channel.
1	Enable the interrupts for this channel.

**Bits 8, 9, 10, 11, 12, 13, 14 – EPT\_x** Endpoint x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this endpoint.
1	Enable the interrupts for this endpoint.

**Bit 7 – UPSTR\_RES** Upstream Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Upstream Resume Interrupt.
1	Enable Upstream Resume Interrupt.

**Bit 6 – ENDOFRSM** End Of Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Resume Interrupt.
1	Enable Resume Interrupt.

**Bit 5 – WAKE\_UP** Wake Up CPU Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Wake-up CPU Interrupt.
1	Enable Wake-up CPU Interrupt.

**Bit 4 – ENDRESET** End Of Reset Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable End Of Reset Interrupt.
1	Enable End Of Reset Interrupt. Automatically enabled after USB reset.

**Bit 3 – INT\_SOF** SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable SOF Interrupt.
1	Enable SOF Interrupt.

**Bit 2 – MICRO\_SOF** Micro-SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Micro-SOF Interrupt.
1	Enable Micro-SOF Interrupt.

**Bit 1 – DET\_SUSPD** Suspend Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Suspend Interrupt.
1	Enable Suspend Interrupt.

**65.7.4. UDPHS Interrupt Status Register**

**Name:** UDPHS\_INTSTA  
**Offset:** 0x14  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
		DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access		R	R	R	R	R	R	
Reset		0	0	0	0	0	0

Access								
Reset								

Bit	15	14	13	12	11	10	9	8
		EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	SPEED
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bits 25, 26, 27, 28, 29, 30 – DMA\_x DMA Channel x Interrupt**

Value	Description
0	Reset when the UDPHS_DMASTATUSx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the DMA Channelx and this endpoint interrupt is enabled by the DMA_x bit in UDPHS_IEN.

**Bits 8, 9, 10, 11, 12, 13, 14 – EPT\_x Endpoint x Interrupt (cleared upon USB reset)**

Value	Description
0	Reset when the UDPHS_EPTSTAx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the UDPHS_EPTSTAx register and this endpoint interrupt is enabled by the EPT_x bit in UDPHS_IEN.

**Bit 7 – UPSTR\_RES Upstream Resume Interrupt**

Value	Description
0	Cleared by setting the UPSTR_RES bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is sending a resume signal called “upstream resume”. This triggers a UDPHS interrupt when the UPSTR_RES bit is set in UDPHS_IEN.

**Bit 6 – ENDOFRSM End Of Resume Interrupt**

Value	Description
0	Cleared by setting the ENDOFRSM bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller detects a good end of resume signal initiated by the host. This triggers a UDPHS interrupt when the ENDOFRSM bit is set in UDPHS_IEN.

**Bit 5 – WAKE\_UP Wake Up CPU Interrupt**

Value	Description
0	Cleared by setting the WAKE_UP bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is in SUSPEND state and is re-activated by a filtered non-idle signal from the UDPHS line (not by an upstream resume). This triggers a UDPHS interrupt when the WAKE_UP bit is set in UDPHS_IEN register. When receiving this interrupt, the user has to enable the device controller clock prior to operation. <b>Note:</b> this interrupt is generated even if the device controller clock is disabled.

**Bit 4 – ENDRESET** End Of Reset Interrupt

Value	Description
0	Cleared by setting the ENDRESET bit in UDPHS_CLRINT.
1	Set by hardware when an End Of Reset has been detected by the UDPHS controller. This triggers a UDPHS interrupt when the ENDRESET bit is set in UDPHS_IEN.

**Bit 3 – INT\_SOF** Start Of Frame Interrupt

**Note:** The Micro Start Of Frame Interrupt (MICRO\_SOF), and the Start Of Frame Interrupt (INT\_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the INT_SOF bit in UDPHS_CLRINT.
1	Set by hardware when an UDPHS Start Of Frame PID (SOF) has been detected (every 1 ms) or synthesized by UDPHS. This triggers a UDPHS interrupt when the INT_SOF bit is set in UDPHS_IEN register. In case of detected SOF, in High Speed mode, the MICRO_FRAME_NUMBER field is cleared in UDPHS_FNUM register and the FRAME_NUMBER field is updated.

**Bit 2 – MICRO\_SOF** Micro Start Of Frame Interrupt

**Note:** The Micro Start Of Frame Interrupt (MICRO\_SOF), and the Start Of Frame Interrupt (INT\_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the MICRO_SOF bit in UDPHS_CLRINT register.
1	Set by hardware when an UDPHS micro start of frame PID (SOF) has been detected (every 125 us) or synthesized by UDPHS. This triggers a UDPHS interrupt when the MICRO_SOF bit is set in UDPHS_IEN. In case of detected SOF, the MICRO_FRAME_NUM field in UDPHS_FNUM register is incremented and the FRAME_NUMBER field does not change.

**Bit 1 – DET\_SUSPD** Suspend Interrupt

Value	Description
0	Cleared by setting the DET_SUSPD bit in UDPHS_CLRINT register.
1	Set by hardware when a UDPHS Suspend (Idle bus for three frame periods, a J state for 3 ms) is detected. This triggers a UDPHS interrupt when the DET_SUSPD bit is set in UDPHS_IEN register.

**Bit 0 – SPEED** Speed Status

Value	Description
0	Reset by hardware when the hardware is in Full Speed mode.
1	Set by hardware when the hardware is in High Speed mode.

### 65.7.5. UDPHS Clear Interrupt Register

**Name:** UDPHS\_CLRINT  
**Offset:** 0x18  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access	W	W	W	W	W	W	W	
Reset	–	–	–	–	–	–	–	

#### Bit 7 – UPSTR\_RES Upstream Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the UPSTR_RES bit in UDPHS_INTSTA.

#### Bit 6 – ENDOFRSM End Of Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDOFRSM bit in UDPHS_INTSTA.

#### Bit 5 – WAKE\_UP Wake Up CPU Interrupt Clear

Value	Description
0	No effect.
1	Clear the WAKE_UP bit in UDPHS_INTSTA.

#### Bit 4 – ENDRESET End Of Reset Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDRESET bit in UDPHS_INTSTA.

#### Bit 3 – INT\_SOF Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the INT_SOF bit in UDPHS_INTSTA.

## Bit 2 – MICRO\_SOF Micro Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the MICRO_SOF bit in UDPHS_INTSTA.

## Bit 1 – DET\_SUSPD Suspend Interrupt Clear

Value	Description
0	No effect.
1	Clear the DET_SUSPD bit in UDPHS_INTSTA.

## 65.7.6. UDPHS Endpoints Reset Register

**Name:** UDPHS\_EPTRST  
**Offset:** 0x1C  
**Reset:** –  
**Property:** Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access		W	W	W	W	W	W	W
Reset		–	–	–	–	–	–	–

### Bits 0, 1, 2, 3, 4, 5, 6 – EPT\_x Endpoint x Reset

Setting this bit clears all bits in Endpoint Status register (UDPHS\_EPTSTAx ), except the TOGGLESQ\_STA field.

Value	Description
0	No effect.
1	Reset the Endpointx state.

**65.7.7. UDPHS Test Register**

**Name:** UDPHS\_TST  
**Offset:** 0xE0  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access			OPMODE2	TST_PKT	TST_K	TST_J	SPEED_CFG[1:0]	
Reset			R/W	R/W	R/W	R/W	R/W	R/W
			0	0	0	0	0	0

**Bit 5 – OPMODE2 OpMode2**

**Note:** For the Test mode, Test\_SE0\_NAK (refer to Universal Serial Bus Specification, Revision 2.0: 7.1.20, Test Mode Support). Force the device in High Speed mode, and configure a bulk-type endpoint. Do not fill this endpoint for sending NAK to the host.

Upon command, a port's transceiver must enter the High Speed Receive mode and remain in that mode until the exit action is taken. This enables the testing of output impedance, low level output voltage and loading characteristics. In addition, while in this mode, upstream facing ports (and only upstream facing ports) must respond to any IN token packet with a NAK handshake (only if the packet CRC is determined to be correct) within the normal allowed device response time. This enables testing of the device squelch level circuitry and, additionally, provides a general purpose stimulus/response test for basic functional testing.

Value	Description
0	No effect.
1	Set to force the OpMode signal (UTMI interface) to "10", to disable the bit-stuffing and the NRZI encoding.

**Bit 4 – TST\_PKT Test Packet Mode**

Value	Description
0	No effect.
1	Set to repetitively transmit the packet stored in the current bank. This enables the testing of rise and fall times, eye patterns, jitter, and any other dynamic waveform specifications.

**Bit 3 – TST\_K Test K Mode**

Value	Description
0	No effect.
1	Set to send the K state on the UDPHS line. This enables the testing of the high output drive level on the D- line.

## Bit 2 – TST\_J Test J Mode

Value	Description
0	No effect.
1	Set to send the J state on the UDPHS line. This enables the testing of the high output drive level on the D+ line.

## Bits 1:0 – SPEED\_CFG[1:0] Speed Configuration

Value	Name	Description
0	NORMAL	Normal mode: The macro is in Full Speed mode, ready to make a High Speed identification, if the host supports it and then to automatically switch to High Speed mode.
1	–	Reserved
2	HIGH_SPEED	Force High Speed: Set this value to force the hardware to work in High Speed mode. Only for debug or test purpose.
3	FULL_SPEED	Force Full Speed: Set this value to force the hardware to work only in Full Speed mode. In this configuration, the macro will not respond to a High Speed reset handshake.

**65.7.8. UDPHS Endpoint Configuration Register**

**Name:** UDPHS\_EPTCFGx  
**Offset:** 0x0100 + x\*0x20 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	EPT_MAPD							
Access	R/W							
Reset	0							
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							NB_TRANS[1:0]	
Access							R/W	R/W
Reset							0	0
Bit	7	6	5	4	3	2	1	0
	BK_NUMBER[1:0]		EPT_TYPE[1:0]		EPT_DIR	EPT_SIZE[2:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bit 31 – EPT\_MAPD** Endpoint Mapped (cleared upon USB reset)

Value	Description
0	The user should reprogram the register with correct values.
1	Set by hardware when the endpoint size (EPT_SIZE) and the number of banks (BK_NUMBER) are correct regarding: <ul style="list-style-type: none"> <li>– The max endpoint size for this endpoint</li> <li>– The number of allowed banks for this endpoint</li> </ul>

**Bits 9:8 – NB\_TRANS[1:0]** Number Of Transactions per Microframe (cleared upon USB reset)

The number of transactions per microframe is set by software.

**Note:** Meaningful for high bandwidth isochronous endpoint only.

**Bits 7:6 – BK\_NUMBER[1:0]** Number of Banks (cleared upon USB reset)

Set this field according to the endpoint's number of banks (see [Endpoint Configuration](#)).

Value	Name	Description
0	0	Zero bank, the endpoint is not mapped in memory
1	1	One bank (bank 0)
2	2	Double bank (Ping-Pong: bank0/bank1)
3	3	Triple bank (bank0/bank1/bank2)

**Bits 5:4 – EPT\_TYPE[1:0]** Endpoint Type (cleared upon USB reset)

Set this field according to the endpoint type (see [Endpoint Configuration](#)).

(Endpoint 0 should always be configured as control).

Value	Name	Description
0	CTRL8	Control endpoint

Value	Name	Description
1	ISO	Isochronous endpoint
2	BULK	Bulk endpoint
3	INT	Interrupt endpoint

**Bit 3 – EPT\_DIR** Endpoint Direction (cleared upon USB reset)

For Control endpoints this bit has no effect and should be left at zero.

Value	Description
0	Clear this bit to configure OUT direction for Bulk, Interrupt and Isochronous endpoints.
1	Set this bit to configure IN direction for Bulk, Interrupt and Isochronous endpoints.

**Bits 2:0 – EPT\_SIZE[2:0]** Endpoint Size (cleared upon USB reset)

Set this field according to the endpoint size in bytes (see [Endpoint Configuration](#)). Note that 1024 bytes is only for isochronous endpoints.

Value	Name	Description
0	8	8 bytes
1	16	16 bytes
2	32	32 bytes
3	64	64 bytes
4	128	128 bytes
5	256	256 bytes
6	512	512 bytes
7	1024	1024 bytes

**65.7.9. UDPHS Endpoint Control Enable Register (Control, Bulk, Interrupt Endpoints) (Default Mode)****Name:** UDPHS\_EPTCTLENBx (DEFAULT\_MODE)**Offset:** 0x0104 + n\*0x20 [n=0..6]**Reset:** –**Property:** Write-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x0, 0x2 or 0x3.

For additional information, see [UDPHS\\_EPTCTLx](#).

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT							
Access	W							
Reset	–							
Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
				NYET_DIS	INTDIS_DMA		AUTO_VALID	EPT_ENABL
Access				W	W		W	W
Reset				–	–		–	–

**Bit 31 – SHRT\_PCKT** Short Packet Send/Short Packet Interrupt Enable

For IN endpoints: Ensures short packet at end of DMA Transfer if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTOVALID bits are also set.

For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

**Bit 18 – BUSY\_BANK** Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

**Bit 15 – NAK\_OUT** NAKOUT Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKOUT Interrupt.

**Bit 14 – NAK\_IN** NAKIN Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKIN Interrupt.

**Bit 13 – STALL\_SNT** Stall Sent Interrupt Enable

Value	Description
0	No effect.
1	Enable Stall Sent Interrupt.

**Bit 12 – RX\_SETUP** Received SETUP

Value	Description
0	No effect.
1	Enable RX_SETUP Interrupt.

**Bit 11 – TXRDY** TX Packet Ready Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

**Bit 4 – NYET\_DIS** NYET Disable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

**Bit 3 – INTDIS\_DMA** Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

**Bit 0 – EPT\_ENABL** Endpoint Enable

Value	Description
0	No effect.
1	Enable endpoint according to the device configuration.

### 65.7.10. UDPHS Endpoint Control Enable Register (Isochronous Endpoints)

**Name:** UDPHS\_EPTCTLENBx  
**Offset:** 0x0104 + x\*0x20 [x=0..6]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x1.

For additional information, see [UDPHS\\_EPTCTLx](#).

Bit	31	30	29	28	27	26	25	24

Reset	–	–			–		–	–

#### Bit 31 – SHRT\_PCKT Short Packet Send/Short Packet Interrupt Enable

For IN endpoints: Ensures short packet at end of DMA Transfer if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTOVALID bits are also set.  
For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

#### Bit 18 – BUSY\_BANK Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

#### Bit 14 – ERR\_FLUSH Bank Flush Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Bank Flush Error Interrupt.

#### Bit 13 – ERR\_CRC\_NTR ISO CRC Error/Number of Transaction Error Interrupt Enable

Value	Description
0	No effect.

Value	Description
1	Enable Error CRC ISO/Error Number of Transaction Interrupt.

**Bit 12 – ERR\_FL\_ISO** Error Flow Interrupt Enable

Value	Description
0	No effect.
1	Enable Error Flow ISO Interrupt.

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

**Bit 7 – MDATA\_RX** MDATA Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable MDATA Interrupt.

**Bit 6 – DATA\_RX** DATAx Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable DATAx Interrupt.

**Bit 3 – INTDIS\_DMA** Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

**Bit 0 – EPT\_ENABL** Endpoint Enable

Value	Description
0	No effect.
1	Enable endpoint according to the device configuration.

### 65.7.11. UDPHS Endpoint Control Disable Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

**Name:** UDPHS\_EPTCTLDISx (DEFAULT\_MODE)

**Offset:** 0x0108 + n\*0x20 [n=0..6]

**Reset:** –

**Property:** Write-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x0, 0x2 or 0x3.

For additional information, see [UDPHS\\_EPTCTLx](#).

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT							
Access	W							
Reset	–							

Bit	23	22	21	20	19	18	17	16
						BUSY_BANK		
Access						W

Reset				–	–		–	–

#### Bit 31 – SHRT\_PCKT Short Packet Interrupt Disable

For IN endpoints: Never automatically add a zero length packet at end of DMA transfer.

For OUT endpoints, the configuration is:

Value	Description
0	No effect.
1	Disable Short Packet Interrupt.

#### Bit 18 – BUSY\_BANK Busy Bank Interrupt Disable

Value	Description
0	No effect.
1	Disable Busy Bank Interrupt.

#### Bit 15 – NAK\_OUT NAKOUT Interrupt Disable

Value	Description
0	No effect.
1	Disable NAKOUT Interrupt.

#### Bit 14 – NAK\_IN NAKIN Interrupt Disable

Value	Description
0	No effect.
1	Disable NAKIN Interrupt.

**Bit 13 – STALL\_SNT** Stall Sent Interrupt Disable

Value	Description
0	No effect.
1	Disable Stall Sent Interrupt.

**Bit 12 – RX\_SETUP** Received SETUP Interrupt Disable

Value	Description
0	No effect.
1	Disable RX_SETUP Interrupt.

**Bit 11 – TXRDY** TX Packet Ready Interrupt Disable

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

**Bit 4 – NYET\_DIS** NYET Enable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Let the hardware handle the handshake response for the High Speed Bulk OUT transfer.

**Bit 3 – INTDIS\_DMA** Interrupts Disable DMA

Value	Description
0	No effect.
1	Disable the “Interrupts Disable DMA”.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

**Bit 0 – EPT\_DISABL** Endpoint Disable

Value	Description
0	No effect.
1	Disable endpoint.

**65.7.12. UDPHS Endpoint Control Disable Register (Isochronous Endpoint)**

**Name:** UDPHS\_EPTCTLDISx  
**Offset:** 0x0108 + x\*0x20 [x=0..6]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x1.

For additional information, see [UDPHS\\_EPTCTLx](#).

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT

Access	W	W			W		W	W
Reset	–	–			–		–	–

**Bit 31 – SHRT\_PCKT** Short Packet Interrupt Disable

For IN endpoints: Never automatically add a zero length packet at end of DMA transfer.

For OUT endpoints:

Value	Description
0	No effect.
1	Disable Short Packet Interrupt.

**Bit 18 – BUSY\_BANK** Busy Bank Interrupt Disable

Value	Description
0	No effect.
1	Disable Busy Bank Interrupt.

**Bit 14 – ERR\_FLUSH** bank flush error Interrupt Disable

Value	Description
0	No effect.
1	Disable Bank Flush Error Interrupt.

**Bit 13 – ERR\_CRC\_NTR** ISO CRC Error/Number of Transaction Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Error CRC ISO/Error Number of Transaction Interrupt.

**Bit 12 – ERR\_FL\_ISO** Error Flow Interrupt Disable

Value	Description
0	No effect.
1	Disable Error Flow ISO Interrupt.

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error Interrupt Disable

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

**Bit 7 – MDATA\_RX** MDATA Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable MDATA Interrupt.

**Bit 6 – DATA\_RX** DATAx Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable DATAx Interrupt.

**Bit 3 – INTDIS\_DMA** Interrupts Disable DMA

Value	Description
0	No effect.
1	Disable the “Interrupts Disable DMA”.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

**Bit 0 – EPT\_DISABL** Endpoint Disable

Value	Description
0	No effect.
1	Disable endpoint.

### 65.7.13. UDPHS Endpoint Control Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

**Name:** UDPHS\_EPTCTLx (DEFAULT\_MODE)  
**Offset:** 0x010C + n\*0x20 [n=0..6]  
**Reset:** 0x00000000  
**Property:** Read-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x0, 0x2 or 0x3.

The reset value for UDPHS\_EPTCTL0 is 0x00000001.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT							
Access	R							
Reset	0							
Bit	23	22	21	20	19	18	17	16
						BUSY_BANK		
Access						R		
Reset						0		
Bit	15	14	13	12	11	10	9	8
	NAK_OUT	NAK_IN	STALL_SNT	RX_SETUP	TXRDY	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
				NYET_DIS	INTDIS_DMA		AUTO_VALID	EPT_ENABL
Access				R	R		R	R
Reset				0	0		0	0

#### Bit 31 – SHRT\_PCKT Short Packet Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: sends an Interrupt when a Short Packet has been received.

For IN endpoints: a Short Packet transmission is ensured upon end of the DMA Transfer, thus signaling a BULK or INTERRUPT end of transfer, but only if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTO\_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

#### Bit 18 – BUSY\_BANK Busy Bank Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: an interrupt is sent when all banks are busy.

For IN endpoints: an interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

#### Bit 15 – NAK\_OUT NAKOUT Interrupt Enabled (cleared upon USB reset)

Value	Description
0	NAKOUT Interrupt is masked.
1	NAKOUT Interrupt is enabled.

#### Bit 14 – NAK\_IN NAKIN Interrupt Enabled (cleared upon USB reset)

Value	Description
0	NAKIN Interrupt is masked.
1	NAKIN Interrupt is enabled.

**Bit 13 – STALL\_SNT** Stall Sent Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Stall Sent Interrupt is masked.
1	Stall Sent Interrupt is enabled.

**Bit 12 – RX\_SETUP** Received SETUP Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received SETUP is masked.
1	Received SETUP is enabled.

**Bit 11 – TXRDY** TX Packet Ready Interrupt Enabled (cleared upon USB reset)

Interrupt source is active as long as the corresponding UDPHS\_EPTSTAx register TXRDY flag remains low. If there are no more banks available for transmitting after the software has set UDPHS\_EPTSTAx/TXRDY for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS\_EPTSTAx/TXRDY hardware clear.

Value	Description
0	TX Packet Ready Interrupt is masked.
1	TX Packet Ready Interrupt is enabled.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

**Bit 4 – NYET\_DIS** NYET Disable (Only for High Speed Bulk OUT Endpoints) (cleared upon USB reset)

**Note:** According to the Universal Serial Bus Specification, Rev 2.0 (8.5.1.1 NAK Responses to OUT/DATA During PING Protocol), a NAK response to an HS Bulk OUT transfer is expected to be an unusual occurrence.

Value	Description
0	Lets the hardware handle the handshake response for the High Speed Bulk OUT transfer.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

**Bit 3 – INTDIS\_DMA** Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS\_IEN register EPT\_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

If the exception raised is not associated to a new system bank packet (NAK\_IN, NAK\_OUT, etc.), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.

This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Enabled (Not for CONTROL Endpoints) (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

**For IN Transfer:**

If this bit is set, the UDPHS\_EPTSTAx register TXRDY bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set.

The user may still set the UDPHS\_EPTSTAx register TXRDY bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

**For OUT Transfer:**

If this bit is set, the UDPHS\_EPTSTAx register RXRDY\_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set, for example to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS\_EPTSTAx register RXRDY\_TXKL bit, for example, after completing a DMA buffer by software if UDPHS\_DMACONTROLx register END\_B\_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

**Bit 0 – EPT\_ENABL** Endpoint Enable (cleared upon USB reset)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

## 65.7.14. UDPHS Endpoint Control Register (Isochronous Endpoint)

**Name:** UDPHS\_EPTCTLx  
**Offset:** 0x010C + x\*0x20 [x=0..6]  
**Reset:** 0x00000000  
**Property:** Read-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x1.

The reset value for UDPHS\_EPTCTL0 is 0x00000001.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT							
Access	R							
Reset	0							
Bit	23	22	21	20	19	18	17	16
						BUSY_BANK		
Access						R		
Reset						0		
Bit	15	14	13	12	11	10	9	8
		ERR_FLUSH	ERR_CRC_NT	ERR_FL_ISO	TXRDY_TRER	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	MDATA_RX	DATA_X_RX			INTDIS_DMA		AUTO_VALID	EPT_ENABL
Access	R	R			R		R	R
Reset	0	0			0		0	0

### Bit 31 – SHRT\_PCKT Short Packet Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: Send an Interrupt when a Short Packet has been received.

For IN endpoints: A Short Packet transmission is ensured upon end of the DMA Transfer, thus signaling an end of isochronous (micro-)frame data, but only if the UDPHS\_DMACONTROLx register END\_B\_EN and UDPHS\_EPTCTLx register AUTO\_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

### Bit 18 – BUSY\_BANK Busy Bank Interrupt Enabled (cleared upon USB reset)

For OUT endpoints: An interrupt is sent when all banks are busy.

For IN endpoints: An interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

### Bit 14 – ERR\_FLUSH Bank Flush Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Bank Flush Error Interrupt is masked.
1	Bank Flush Error Interrupt is enabled.

**Bit 13 – ERR\_CRC\_NTR** ISO CRC Error/Number of Transaction Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	ISO CRC error/number of Transaction Error Interrupt is masked.
1	ISO CRC error/number of Transaction Error Interrupt is enabled.

**Bit 12 – ERR\_FL\_ISO** Error Flow Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Error Flow Interrupt is masked.
1	Error Flow Interrupt is enabled.

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error Interrupt Enabled (cleared upon USB reset)

Interrupt source is active as long as the corresponding UDPHS\_EPTSTAx register TXRDY\_TRER flag remains low. If there are no more banks available for transmitting after the software has set UDPHS\_EPTSTAx/TXRDY\_TRER for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS\_EPTSTAx/TXRDY\_TRER hardware clear.

Value	Description
0	TX Packet Ready/Transaction Error Interrupt is masked.
1	TX Packet Ready/Transaction Error Interrupt is enabled.

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

**Bit 9 – RXRDY\_TXKL** Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

**Bit 8 – ERR\_OVFLW** Overflow Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

**Bit 7 – MDATA\_RX** MDATA Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.
1	Send an interrupt when an MDATA packet has been received and so at least one packet of the microframe data payload has been received.

**Bit 6 – DATAX\_RX** DATAx Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.

Value	Description
1	Send an interrupt when a DATA2, DATA1 or DATA0 packet has been received meaning the whole microframe data payload has been received.

**Bit 3 – INTDIS\_DMA** Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS\_IEN register EPT\_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.

If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).

If the exception raised is not associated to a new system bank packet (ex: ERR\_FL\_ISO), then the request cancellation may happen at any time and may immediately stop the current DMA transfer. This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet, or to perform buffer truncation on ERR\_FL\_ISO interrupt for adaptive rate.

**Bit 1 – AUTO\_VALID** Packet Auto-Valid Enabled (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.

**For IN Transfer:**

If this bit is set, the UDPHS\_EPTSTAx register TXRDY\_TRER bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set. The user may still set the UDPHS\_EPTSTAx register TXRDY\_TRER bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.

**For OUT Transfer:**

If this bit is set, the UDPHS\_EPTSTAx register RXRDY\_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS\_DMACONTROLx register END\_B\_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.

The user may still clear the UDPHS\_EPTSTAx register RXRDY\_TXKL bit, for example, after completing a DMA buffer by software if UDPHS\_DMACONTROLx register END\_B\_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

**Bit 0 – EPT\_ENABL** Endpoint Enable (cleared upon USB reset)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

## 65.7.15. UDPHS Endpoint Set Status Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

**Name:** UDPHS\_EPTSETSTAx (DEFAULT\_MODE)  
**Offset:** 0x0114 + n\*0x20 [n=0..6]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x0, 0x2 or 0x3.

For additional information, see [UDPHS\\_EPTSTAx](#).

### Bit 11 – TXRDY TX Packet Ready Set

Value	Description
0	No effect.
1	Set this bit after a packet has been written into the endpoint FIFO for IN data transfers <ul style="list-style-type: none"> <li>– This flag is used to generate a Data IN transaction (device to host).</li> <li>– Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY is cleared.</li> <li>– Transfer to the FIFO is done by writing in the “Buffer Address” register.</li> <li>– Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY to one.</li> <li>– UDPHS bus transactions can start.</li> <li>– TXCOMP is set once the data payload has been received by the host.</li> <li>– Data should be written into the endpoint FIFO only after this bit has been cleared.</li> <li>– Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet.</li> </ul>

### Bit 9 – RXRDY\_TXKL KILL Bank Set (for IN Endpoint)

Value	Description
0	No effect.
1	Kill the last written bank.

# **Bit 5 – FRCESTALL** Stall Handshake Request Set

Refer to chapters 8.4.5 (Handshake Packets) and 9.4.5 (Get Status) of the Universal Serial Bus Specification, Rev 2.0 for more information on the STALL handshake.

Value	Description
0	No effect.
1	Set this bit to request a STALL answer to the host for the next handshake

## 65.7.16. UDPHS Endpoint Set Status Register (Isochronous Endpoint)

**Name:** UDPHS\_EPTSETSTAx  
**Offset:** 0x0114 + x\*0x20 [x=0..6]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x1.

For additional information, see [UDPHS\\_EPTSTAx](#).

### Bit 15 – NAK\_OUT NAKOUT Clear

Value	Description
0	No effect.
1	Clear the NAK_OUT flag of UDPHS_EPTSTAx.

### Bit 14 – NAK\_IN NAKIN Clear

Value	Description
0	No effect.
1	Clear the NAK_IN flags of UDPHS_EPTSTAx.

### Bit 13 – STALL\_SNT Stall Sent Clear

Value	Description
0	No effect.
1	Clear the STALL_SNT flags of UDPHS_EPTSTAx.

### Bit 12 – RX\_SETUP Received SETUP Clear

Value	Description
0	No effect.
1	Clear the RX_SETUP flags of UDPHS_EPTSTAx.

### Bit 10 – TX\_COMPLT Transmitted IN Data Complete Clear

Value	Description
0	No effect.
1	Clear the TX_COMPLT flag of UDPHS_EPTSTAx.

#### Bit 9 – RXRDY\_TXKL Received OUT Data Clear

Value	Description
0	No effect.
1	Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx.

#### Bit 6 – TOGGLESQ Data Toggle Clear

For OUT endpoints, the next received packet should be a DATA0.  
For IN endpoints, the next packet will be sent with a DATA0 PID.

Value	Description
0	No effect.
1	Clear the PID data of the current bank

#### Bit 5 – FRCESTALL Stall Handshake Request Clear

Value	Description
0	No effect.
1	Clear the STALL request. The next packets from host will not be STALLED.

### 65.7.18. UDPHS Endpoint Clear Status Register (Isochronous Endpoint)

**Name:** UDPHS\_EPTCLRSTAx  
**Offset:** 0x0118 + x\*0x20 [x=0..6]  
**Reset:** –  
**Property:** Write-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x1.

For additional information, see [UDPHS\\_EPTSTAx](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
		ERR_FLUSH	ERR_CRC_NTR	ERR_FL_ISO		TX_COMPLT	RXRDY_TXKL	
Access		W	W	W		W	W	
Reset		–	–	–		–	–	

Bit	7	6	5	4	3	2	1	0
		TOGGLESQ						
Access		W						
Reset		–						

#### Bit 14 – ERR\_FLUSH Bank Flush Error Clear

Value	Description
0	No effect.
1	Clear the ERR_FLUSH flags of UDPHS_EPTSTAx.

#### Bit 13 – ERR\_CRC\_NTR Number of Transaction Error Clear

Value	Description
0	No effect.
1	Clear the ERR_CRC_NTR flags of UDPHS_EPTSTAx.

#### Bit 12 – ERR\_FL\_ISO Error Flow Clear

Value	Description
0	No effect.
1	Clear the ERR_FL_ISO flags of UDPHS_EPTSTAx.

#### Bit 10 – TX\_COMPLT Transmitted IN Data Complete Clear

Value	Description
0	No effect.
1	Clear the TX_COMPLT flag of UDPHS_EPTSTAx.

#### Bit 9 – RXRDY\_TXKL Received OUT Data Clear

Value	Description
0	No effect.
1	Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx.

#### Bit 6 – **TOGGLESQ** Data Toggle Clear

For OUT endpoints, the next received packet should be a DATA0.  
For IN endpoints, the next packet will be sent with a DATA0 PID.

Value	Description
0	No effect.
1	Clear the PID data of the current bank

### 65.7.19. UDPHS Endpoint Status Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

**Name:** UDPHS\_EPTSTAx (DEFAULT\_MODE)

**Offset:** 0x011C + n\*0x20 [n=0..6]

**Reset:** 0x00000040

**Property:** Read-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x0, 0x2 or 0x3.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT	BYTE_COUNT[10:4]						
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BYTE_COUNT[3:0]				BUSY_BANK_STA[1:0]		CURBK_CTLDIR[1:0]	
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	NAK_OUT	NAK_IN	STALL_SNT	RX_SETUP	TXRDY	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TOGGLESQ_STA[1:0]		FRCESTALL					
Access	R	R	R					
Reset	0	1	0					

#### Bit 31 – SHRT\_PCKT Short Packet (cleared upon USB reset)

An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS\_EPTCFGx register EPT\_Size.

This bit is updated at the same time as the BYTE\_COUNT field.

It is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

#### Bits 30:20 – BYTE\_COUNT[10:0] UDPHS Byte Count (cleared upon USB reset)

Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer). It is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY\_TXKL flag clear with the next bank, and at TXRDY flag set with the next bank.

This field is reset by UDPHS\_EPTRST.EPT\_x.

#### Bits 19:18 – BUSY\_BANK\_STA[1:0] Busy Bank Number (cleared upon USB reset)

These bits are set by hardware to indicate the number of busy banks.

IN endpoint: Indicates the number of busy banks filled by the user, ready for IN transfer.

OUT endpoint: Indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

**Bits 17:16 – CURBK\_CTLDIR[1:0]** Current Bank/Control Direction (cleared upon USB reset)

**Control Direction (for Control endpoint only):**

0: A Control Write is requested by the Host.

1: A Control Read is requested by the Host.

**Notes:**

1. Corresponds to the the 7th bit of the bmRequestType (Byte 0 of the Setup Data).
2. Updated after receiving new setup data.

**Current Bank (not relevant for Control endpoint):**

- Set by hardware to indicate the number of the current bank.
- Reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).
- The current bank is updated each time the user:
  - Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
  - Clears the received OUT data bit to access the next bank.

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

**Bit 15 – NAK\_OUT** NAK OUT (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an OUT or PING request from the Host.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by EPT\_CTL\_DISx (disable endpoint).

**Bit 14 – NAK\_IN** NAK IN (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an IN request from the Host.

This bit is cleared by software.

**Bit 13 – STALL\_SNT** Stall Sent (cleared upon USB reset)

For Control, Bulk and Interrupt endpoints.

This bit is set by hardware after a STALL handshake has been sent as requested by the UDPHS\_EPTSTAx register FRCESTALL bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 12 – RX\_SETUP** Received SETUP (cleared upon USB reset)

For Control endpoint only.

This bit is set by hardware when a valid SETUP packet has been received from the host.

It is cleared by the device firmware after reading the SETUP data from the endpoint FIFO.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 11 – TXRDY** TX Packet Ready (cleared upon USB reset)

This bit is cleared by hardware after the host has acknowledged the packet.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register TXRDY bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete (cleared upon USB reset)

This bit is set by hardware after an IN packet has been accepted (ACK'ed) by the host.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 9 – RXRDY\_TXKL** Received OUT Data/KILL Bank (cleared upon USB reset)

**Received OUT Data (for OUT endpoint or Control endpoint):**

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register RXRDY\_TXKL bit.
- This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**KILL Bank (for IN endpoint):**

- The bank is really cleared or the bank is sent, BUSY\_BANK\_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX\_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.

**Note:** "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX\_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

**Bit 8 – ERR\_OVFLW** Overflow Error (cleared upon USB reset)

This bit is set by hardware when a new too-long packet is received.

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.

This bit is updated at the same time as the BYTE\_COUNT field.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bits 7:6 – TOGGLESQ\_STA[1:0]** Toggle Sequencing (cleared upon USB reset)

In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

This field is reset to DATA1 by the UDPHS\_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS\_EPTCTLDISx (disable endpoint).

Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- CONTROL and OUT endpoints: Set by hardware to indicate the PID data of the current bank.

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Reserved for High Bandwidth Isochronous Endpoint

Value	Name	Description
3	MDATA	Reserved for High Bandwidth Isochronous Endpoint

**Bit 5 – FRCESTALL** Stall Handshake Request (cleared upon USB reset)  
This bit is reset by hardware upon received SETUP.

Value	Description
0	No effect.
1	If set a STALL answer will be done to the host for the next handshake.

**65.7.20. UDPHS Endpoint Status Register (Isochronous Endpoint)**

**Name:** UDPHS\_EPTSTAx  
**Offset:** 0x011C + x\*0x20 [x=0..6]  
**Reset:** 0x00000040  
**Property:** Read-only

This register view is relevant only if UDPHS\_EPTCFGx.EPT\_TYPE = 0x1.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT	BYTE_COUNT[10:4]						
Access	R	R	R	R	R	R	R	R

			R					
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TOGGLESQ_STA[1:0]							
Access	R	R						
Reset	0	1						

**Bit 31 – SHRT\_PCKT** Short Packet (cleared upon USB reset)

An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS\_EPTCFGx register EPT\_Size.

This bit is updated at the same time as the BYTE\_COUNT field.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bits 30:20 – BYTE\_COUNT[10:0]** UDPHS Byte Count (cleared upon USB reset)

Byte count of a received data packet.

This field is incremented after each write into the endpoint (to prepare an IN transfer).

This field is decremented after each reading into the endpoint (OUT transfer).

This field is also updated at RXRDY\_TXKL flag clear with the next bank.

This field is also updated at TXRDY\_TRER flag set with the next bank.

This field is reset by EPT\_x of UDPHS\_EPTRST register.

**Bits 19:18 – BUSY\_BANK\_STA[1:0]** Busy Bank Number (cleared upon USB reset)

These bits are set by hardware to indicate the number of busy banks.

IN endpoint: It indicates the number of busy banks filled by the user, ready for IN transfer.

OUT endpoint: It indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

**Bits 17:16 – CURBK[1:0]** Current Bank (cleared upon USB reset)

These bits are set by hardware to indicate the number of the current bank.  
The current bank is updated each time the user:

- Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
- Clears the received OUT data bit to access the next bank.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

**Bit 14 – ERR\_FLUSH** Bank Flush Error (cleared upon USB reset)

For High Bandwidth Isochronous IN endpoints.

This bit is set when flushing unsent banks at the end of a microframe.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by EPT\_CTL\_DISx (disable endpoint).

**Bit 13 – ERR\_CRC\_NTR** CRC ISO Error/Number of Transaction Error (cleared upon USB reset)

**CRC ISO Error (for Isochronous OUT endpoints) (Read-only):**

This bit is set by hardware if the last received data is corrupted (CRC error on data).

This bit is updated by hardware when new data is received (Received OUT Data bit).

**Number of Transaction Error (for High Bandwidth Isochronous IN endpoints):**

This bit is set at the end of a microframe in which at least one data bank has been transmitted, if less than the number of transactions per micro-frame banks (UDPHS\_EPTCFGx register NB\_TRANS) have been validated for transmission inside this microframe.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 12 – ERR\_FL\_ISO** Error Flow (cleared upon USB reset)

This bit is set by hardware when a transaction error occurs.

- Isochronous IN transaction is missed, the micro has no time to fill the endpoint (underflow).
- Isochronous OUT data is dropped because the bank is busy (overflow).

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 11 – TXRDY\_TRER** TX Packet Ready/Transaction Error (cleared upon USB reset)

**TX Packet Ready**

This bit is cleared by hardware, as soon as the packet has been sent.

For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.

Hardware clear of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register TXRDY\_TRER bit.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Transaction Error (for high bandwidth isochronous OUT endpoints) (Read-Only):**

This bit is set by hardware when a transaction error occurs inside one microframe.

If one toggle sequencing problem occurs among the n-transactions (n = 1, 2 or 3) inside a microframe, then this bit is still set as long as the current bank contains one “bad” n-transaction (see CURBK field description). As soon as the current bank is relative to a new “good” n-transactions, then this bit is reset.

**Notes:**

1. A transaction error occurs when the toggle sequencing does not comply with the Universal Serial Bus Specification, Rev 2.0 (5.9.2 High Bandwidth Isochronous endpoints) (Bad PID, missing data, etc.)
2. When a transaction error occurs, the user may empty all the “bad” transactions by clearing the Received OUT Data flag (RXRDY\_TXKL).

If this bit is reset, then the user should consider that a new n-transaction is coming.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 10 – TX\_COMPLT** Transmitted IN Data Complete (cleared upon USB reset)

This bit is set by hardware after an IN packet has been sent.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint), and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bit 9 – RXRDY\_TXKL** Received OUT Data/KILL Bank (cleared upon USB reset)

**Received OUT Data (for OUT endpoint or Control endpoint):**

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS\_EPTCTLx register RXRDY\_TXKL bit.
- This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**KILL Bank (for IN endpoint):**

- The bank is really cleared or the bank is sent, BUSY\_BANK\_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX\_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.

**Note:** “Kill a packet” may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX\_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

**Bit 8 – ERR\_OVFLW** Overflow Error (cleared upon USB reset)

This bit is set by hardware when a new too-long packet is received.

Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.

This bit is updated at the same time as the BYTE\_COUNT field.

This bit is reset by UDPHS\_EPTRST register EPT\_x (reset endpoint) and by UDPHS\_EPTCTLDISx (disable endpoint).

**Bits 7:6 – TOGGLESQ\_STA[1:0]** Toggle Sequencing (cleared upon USB reset)

In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).

This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

For High Bandwidth Isochronous Out endpoint, it is recommended to check the UDPHS\_EPTSTAx/ TXRDY\_TRER bit to know if the toggle sequencing is correct or not.

This field is reset to DATA1 by the UDPHS\_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS\_EPTCTLDISx (disable endpoint).

Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- OUT endpoint: Set by hardware to indicate the PID data of the current bank:

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Data2 (only for High Bandwidth Isochronous Endpoint)
3	MData	MData (only for High Bandwidth Isochronous Endpoint)

### 65.7.21. UDPHS DMA Channel Transfer Descriptor

The DMA channel transfer descriptor is loaded from the memory. Be careful with the alignment of this buffer. The structure of the DMA channel transfer descriptor is defined by three parameters as described below:

- Offset 0:
  - The address must be aligned: 0xXXXX0
  - Next Descriptor Address Register: UDPHS\_DMANXTDSCx
- Offset 4:
  - The address must be aligned: 0xXXXX4
  - DMA Channelx Address Register: UDPHS\_DMAADDRESSx
- Offset 8:
  - The address must be aligned: 0xXXXX8
  - DMA Channelx Control Register: UDPHS\_DMACONTROLx

To use the DMA channel transfer descriptor, fill the structures with the correct value (as described in the following pages). Then write directly in UDPHS\_DMANXTDSCx the address of the descriptor to be used first. Then write '1' in the LDNXT\_DSC bit of UDPHS\_DMACONTROLx (load next channel transfer descriptor). The descriptor is automatically loaded upon Endpointx request for packet transfer.

## 65.7.22. UDPHS DMA Next Descriptor Address Register

**Name:** UDPHS\_DMANXTDSCx  
**Offset:** 0x0310 + (x-1)\*0x10 [x=1..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	NXT_DSC_ADD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

### Bits 31:0 – NXT\_DSC\_ADD[31:0] Next Descriptor Address

This field points to the next channel descriptor to be processed. This channel descriptor must be aligned, so bits 0 to 3 of the address must be equal to zero.

### 65.7.23. UDPHS DMA Channel Address Register

**Name:** UDPHS\_DMAADDRESSx  
**Offset:** 0x0314 + (x-1)\*0x10 [x=1..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – BUFF\_ADD[31:0] Buffer Address

This field determines the system bus starting address of a DMA channel transfer.

Channel start and end addresses may be aligned on any byte boundary.

The firmware may write this field only when the UDPHS\_DMASTATUS.CHANN\_ENB bit is clear.

This field is updated at the end of the address phase of the current access to the system bus. It is incrementing of the access byte width. The access width is 4 bytes (or less) at packet start or end, if the start or end address is not aligned on a word boundary.

The packet start address is either the channel start address or the next channel address to be accessed in the channel buffer.

The packet end address is either the channel end address or the latest channel address accessed in the channel buffer.

The channel start address is written by software or loaded from the descriptor, whereas the channel end address is either determined by the end of buffer or the UDPHS device, USB end of transfer if the UDPHS\_DMACONTROL.END\_TR\_EN bit is set.

## 65.7.24. UDPHS DMA Channel Control Register

**Name:** UDPHS\_DMACONTROLx  
**Offset:** 0x0318 + (x-1)\*0x10 [x=1..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

Bits [31:2] are only writable when issuing a channel Control Command other than “Stop Now”.

For reliability it is highly recommended to wait for both UDPHS\_DMASTATUS.CHAN\_ACT and CHAN\_ENB flags at 0, thus ensuring the channel has been stopped before issuing a command other than “Stop Now”.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 31:16 – BUFF\_LENGTH[15:0] Buffer Byte Length (Write-only)

This field determines the number of bytes to be transferred until end of buffer. The maximum channel transfer size (64 Kbytes) is reached when this field is 0 (default value). If the transfer size is unknown, this field should be set to 0, but the transfer end may occur earlier under UDPHS device control.

When this field is written, the UDPHS\_DMASTATUS.BUFF\_COUNT field is updated with the write value.

### Bit 7 – BURST\_LCK Burst Lock Enable

Value	Description
0	The DMA never locks bus access.
1	USB packets system data bursts are locked for maximum optimization of the bus bandwidth usage and maximization of fly-by system bus burst duration.

### Bit 6 – DESC\_LD\_IT Descriptor Loaded Interrupt Enable

Value	Description
0	UDPHS_DMASTATUS.DESC_LDST rising will not trigger any interrupt.
1	An interrupt is generated when a descriptor has been loaded from the bus.

### Bit 5 – END\_BUFFIT End of Buffer Interrupt Enable

Value	Description
0	UDPHS_DMASTATUS.END_BF_ST rising will not trigger any interrupt.
1	An interrupt is generated when the UDPHS_DMASTATUS.BUFF_COUNT reaches zero.

**Bit 4 – END\_TR\_IT** End of Transfer Interrupt Enable

Value	Description
0	UDPHS device initiated buffer transfer completion will not trigger any interrupt at UDPHS_STATUS.END_TR_ST rising.
1	An interrupt is sent after the buffer transfer is complete, if the UDPHS device has ended the buffer transfer. Use when the receive size is unknown.

**Bit 3 – END\_B\_EN** End of Buffer Enable (Control)

Value	Description
0	DMA Buffer End has no impact on USB packet transfer.
1	Endpoint can validate the packet (according to the values programmed in the UDPHS_EPTCTL.AUTO_VALID and SHRT_PCKT fields) at DMA Buffer End, i.e., when the UDPHS_DMASTATUS.BUFF_COUNT reaches 0.  This is mainly for short packet IN validation initiated by the DMA reaching end of buffer, but could be used for OUT packet truncation (discarding of unwanted packet data) at the end of DMA buffer.

**Bit 2 – END\_TR\_EN** End of Transfer Enable (Control)

Used for OUT transfers only.

Value	Description
0	USB end of transfer is ignored.
1	UDPHS device can put an end to the current buffer transfer.  When set, a BULK or INTERRUPT short packet or the last packet of an ISOCHRONOUS (micro) frame (DATAx) will close the current buffer and the UDPHS_DMASTATUS.END_TR_ST flag will be raised.  This is intended for UDPHS non-prenegotiated end of transfer (BULK or INTERRUPT) or ISOCHRONOUS microframe data buffer closure.

**Bit 1 – LDNXT\_DSC** Load Next Channel Transfer Descriptor Enable (Command)

If the CHANN\_ENB bit is cleared, the next descriptor is immediately loaded upon transfer request.  
DMA Channel Control Command Summary:

LDNXT_DSC	CHANN_ENB	Description
0	0	Stop now
0	1	Run and stop at end of buffer
1	0	Load next descriptor now
1	1	Run and link at end of buffer

Value	Description
0	No channel register is loaded after the end of the channel transfer.
1	The channel controller loads the next descriptor after the end of the current transfer, i.e., when the UDPHS_DMASTATUS.CHANN_ENB bit is reset.

**Bit 0 – CHANN\_ENB** (Channel Enable Command)

Value	Description
0	<p>DMA channel is disabled at and no transfer will occur upon request. This bit is also cleared by hardware when the channel source bus is disabled at end of buffer.</p> <p>If the UDPHS_DMACONTROL.LDNXT_DSC bit has been cleared by descriptor loading, the firmware will have to set the corresponding CHANN_ENB bit to start the described transfer, if needed.</p> <p>If the LDNXT_DSC bit is cleared, the channel is frozen and the channel registers may then be read and/or written reliably as soon as both UDPHS_DMASTATUS.CHANN_ENB and CHANN_ACT flags read as 0.</p> <p>If a channel request is currently serviced when this bit is cleared, the DMA FIFO buffer is drained until it is empty, then the UDPHS_DMASTATUS.CHANN_ENB bit is cleared.</p> <p>If the LDNXT_DSC bit is set at or after this bit clearing, then the currently loaded descriptor is skipped (no data transfer occurs) and the next descriptor is immediately loaded.</p>
1	<p>The UDPHS_DMASTATUS.CHANN_ENB bit will be set, thus enabling DMA channel data transfer. Then, any pending request will start the transfer. This may be used to start or resume any requested transfer.</p>

**65.7.25. UDPHS DMA Channel Status Register**

**Name:** UDPHS\_DMASTATUSx  
**Offset:** 0x031C + (x-1)\*0x10 [x=1..6]  
**Reset:** 0x00000000  
**Property:** Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	BUFF_COUNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	BUFF_COUNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
		DESC_LDST	END_BF_ST	END_TR_ST			CHANN_ACT	CHANN_ENB
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

**Bits 31:16 – BUFF\_COUNT[15:0] Buffer Byte Count**

This field determines the current number of bytes still to be transferred for this buffer. It is decremented from the source system bus access byte width at the end of this bus address phase. The access byte width is 4 by default, or less, at DMA start or end, if the start or end address is not aligned on a word boundary.

At the end of buffer, the DMA accesses the UDPHS device only for the number of bytes needed to complete it.

This field value is reliable (stable) only if the channel has been stopped or frozen (the UDPHS\_EPTCTLx.NT\_DIS\_DMA bit is used to disable the channel request) and the channel is no longer active (CHANN\_ACT flag is 0).

**Note:** For OUT endpoints, if the receive buffer byte length (BUFF\_LENGTH) has been defaulted to zero because the USB transfer length is unknown, the actual buffer byte length received is 0x10000-BUFF\_COUNT.

**Bit 6 – DESC\_LDST Descriptor Loaded Status**

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when a descriptor has been loaded from the system bus.

**Bit 5 – END\_BF\_ST End of Channel Buffer Status**

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.

Value	Description
1	Set by hardware when the BUFF_COUNT countdown reaches zero.

#### Bit 4 – END\_TR\_ST End of Channel Transfer Status

Valid until the CHANN\_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when the last packet transfer is complete, if the UDPHS device has ended the transfer.

#### Bit 1 – CHANN\_ACT Channel Active Status

When a packet transfer is ended, this bit is automatically reset.

When a packet transfer cannot be completed due to an END\_BF\_ST, this flag stays set during the next channel descriptor load (if any) and potentially until UDPHS packet transfer completion, if allowed by the new descriptor.

Value	Description
0	The DMA channel is no longer trying to source the packet data.
1	The DMA channel is currently trying to source packet data, i.e., selected as the highest-priority requesting channel.

#### Bit 0 – CHANN\_ENB Channel Enable Status

When any transfer is ended either due to an elapsed byte count or a UDPHS device initiated transfer end, this bit is automatically reset.

This bit is normally set or cleared by writing into the UDPHS\_DMACONTROLx.CHANN\_ENB bit either by software or descriptor loading.

If a channel request is currently serviced when the CHANN\_ENB bit is cleared, the DMA FIFO buffer is drained until it is empty, then this status bit is cleared.

Value	Description
0	The DMA channel no longer transfers data, and may load the next descriptor if the UDPHS_DMACONTROLx.LDNXT_DSC bit is set.
1	The DMA channel is currently enabled and transfers data upon request.

## 66. USB Host High Speed Port (UHPHS)

### 66.1. Description

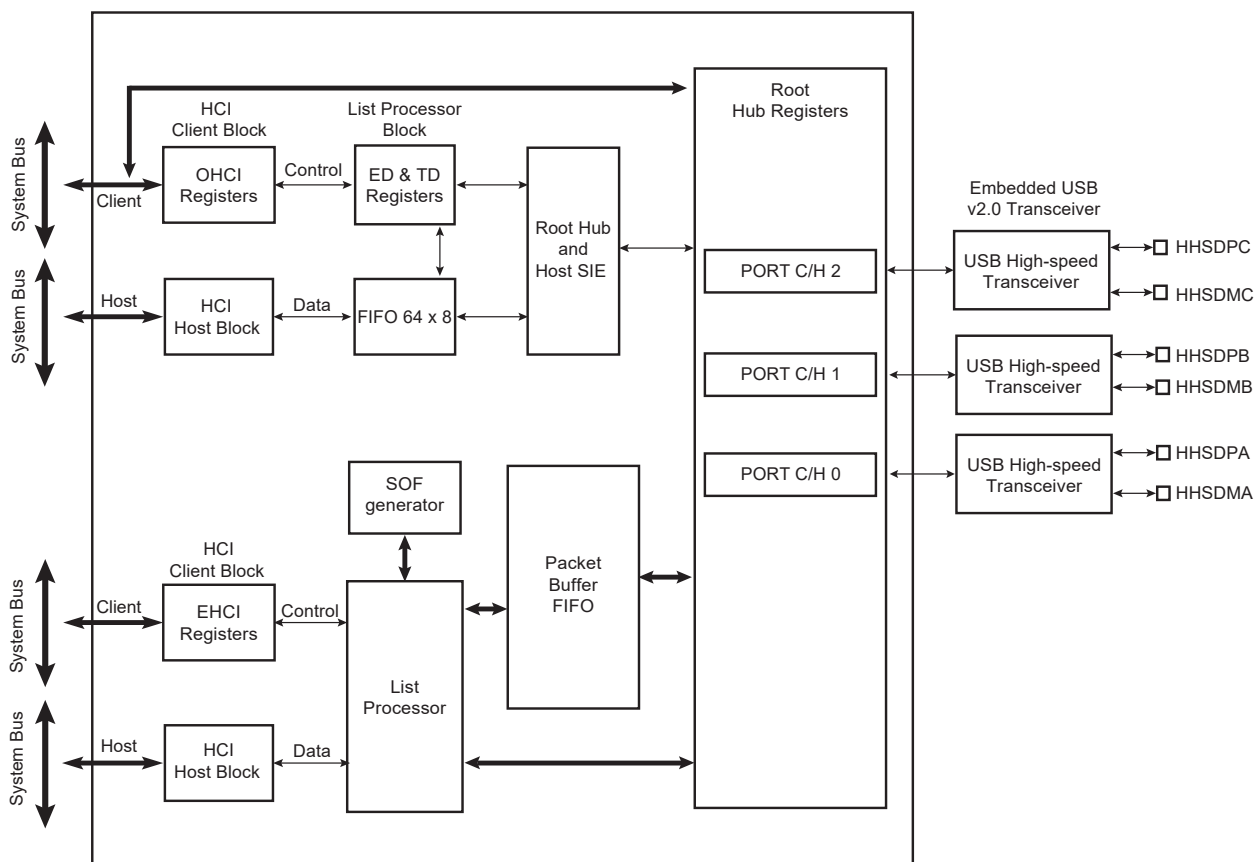

The USB Host High Speed Port (UHPHS) interfaces the USB with the host application. It handles Open HCI protocol (Open Host Controller Interface) as well as Enhanced HCI protocol (Enhanced Host Controller Interface).

### 66.2. Embedded Characteristics

- Compliant with Enhanced HCI Rev 1.0 Specification
  - Compliant with USB V2.0 High-speed Specification
  - Supports high-speed 480 Mbps
- Compliant with Open HCI Rev 1.0 Specification
  - Compliant with USB V2.0 Full-speed and Low-speed Specification
  - Supports both low-speed 1.5 Mbps and full-speed 12 Mbps USB devices
- Root Hub Integrated with 2 Downstream USB HS Ports and 1 FS Port
- Embedded USB Transceivers
- Supports Power Management
- 3 Hosts (A, B, and C) High Speed (EHCI), Port A shared with UHPHS

## 66.3. Block Diagram

Figure 66.1. UHPHS Block Diagram

Access to the USB host operational registers is achieved through the system bus client interface. The Open HCI host controller and Enhanced HCI host controller initialize host DMA transfers through the system bus host interface as follows:

- Fetches endpoint descriptors and transfer descriptors
- Accesses endpoint data from system memory
- Accesses HC communication area
- Writes status and retires transfer descriptor

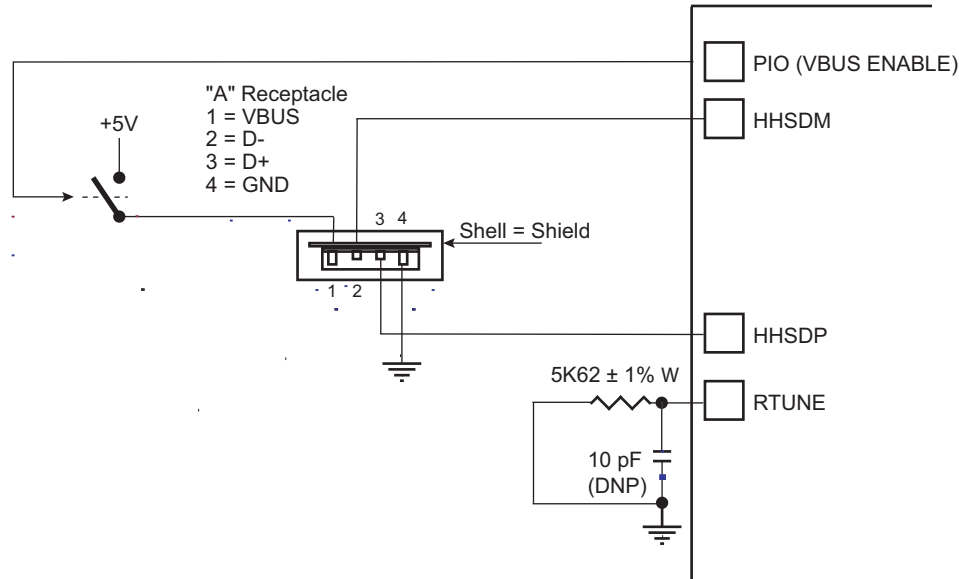

Memory access errors (abort, misalignment) lead to an “Unrecoverable Error” indicated by the corresponding flag in the host controller operational registers.

The USB root hub is integrated in the USB host. Several USB downstream ports are available. The number of downstream ports can be determined by the software driver reading the root hub’s operational registers. Device connection is automatically detected by the USB host port logic.

USB physical transceivers are integrated in the product and driven by the root hub’s ports.

## 66.4. Typical Connection

Figure 66.2. Board Schematic to Interface UHP High-speed Host Controller

## 66.5. Product Dependencies

### 66.5.1. I/O Lines

HHSDPs and HHSDMs are not controlled by any PIO controllers. The embedded USB High Speed physical transceivers are controlled by the USB host controller.

One transceiver is shared with the USB High Speed Device (port A). The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

In the case the port A is driven by the USB High Speed Device, the output signals are DHSDP and DHSDM. The transceiver is automatically selected for Device operation once the USB High Speed Device is enabled.

In the case the port A is driven by the USB High Speed Host, the output signals are HHSDPA and HHSDMA.

### 66.5.2. Power Management

The system embeds three transceivers.

The USB Host High Speed requires a 480 MHz clock for the embedded High-speed transceivers. This clock (UPLLCK) is provided by the UTMI PLL.

In case power consumption is saved by stopping the UTMI PLL, high-speed operations are not possible. Nevertheless, OHCI Full-speed operations remain possible by selecting PLLACK as the input clock of OHCI.

The High-speed transceiver returns a 30 MHz clock to the USB Host controller.

The USB Host controller requires 48 MHz and 12 MHz clocks for OHCI full-speed operations. These clocks must be generated by a PLL with a correct accuracy of +/-0.25% using the USBDIV field.

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

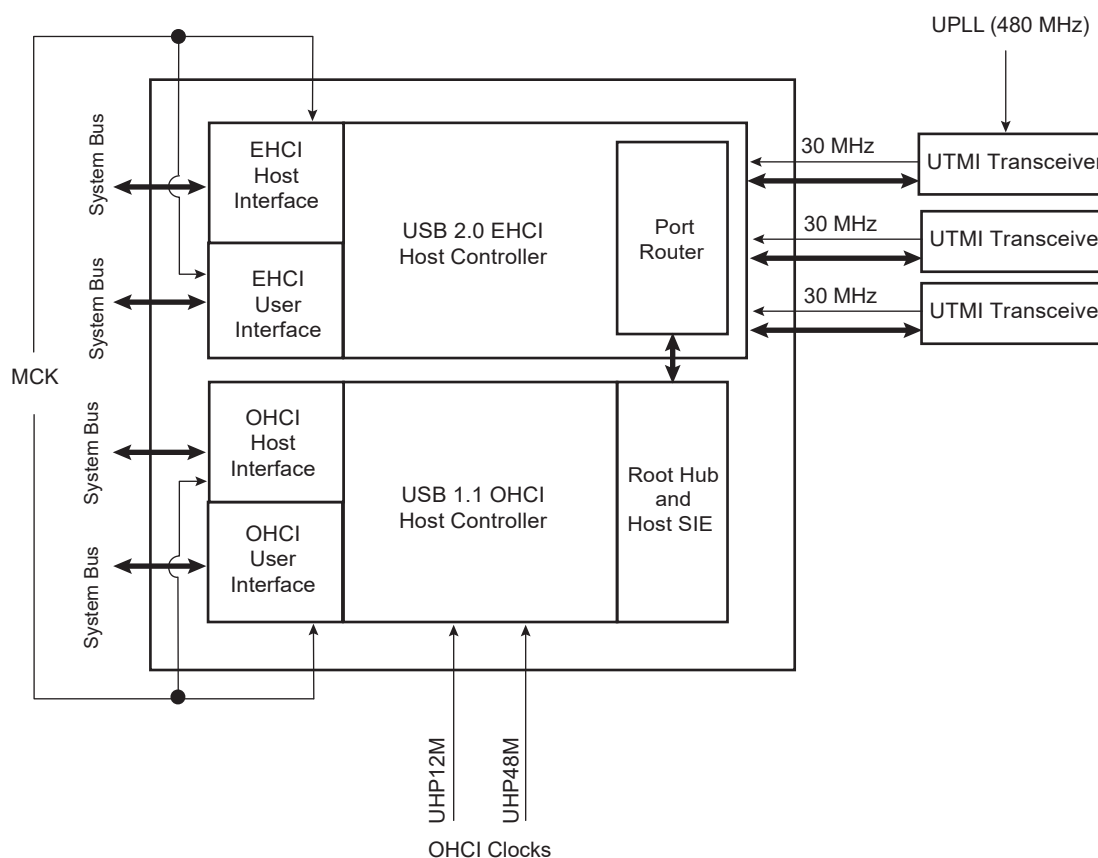

For High-speed operations, the user has to perform the following:

- Enable UPHS peripheral clock in the PMC.
- Start the UPLL with a 480 MHz output frequency following the recommendation provided in section "USB Clock Controller" in chapter "Power Management Controller (PMC)".
- Select UPLLCK as Input clock of OHCI part (USBS bit in PMC\_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC\_USB register. USBDIV must be 9 (division by 10) if UPLLCK is selected.
- Enable OHCI clocks with UHP bit in PMC\_SCER.

For OHCI Full-speed operations only, the user can use the PLLA, and in this case has to perform the following:

- Enable UPHS peripheral clock in the PMC.
- Select PLLACK as Input clock of OHCI part (USBS bit in PMC\_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC\_USB register. USBDIV value is to be calculated according to the PLLACK value and USB Full-speed accuracy.
- Enable the OHCI clocks with UHP bit in PMC\_SCER.

**Figure 66.3.** UHP Clock Trees

### 66.5.3. Interrupt Sources

The USB host interface has an interrupt line connected to the interrupt controller.

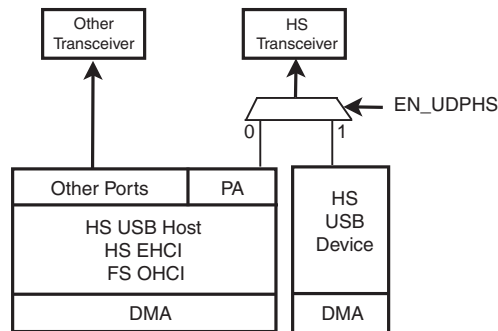

Handling USB host interrupts requires programming the interrupt controller before configuring the UHPHS.

## 66.6. Functional Description

### 66.6.1. UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB device is controlled by the UDPHS enable bit (EN\_UDPHS) located in the UDPHS\_CTRL register.

Figure 66.4. USB Selection

### 66.6.2. EHCI

The USB Host Port controller is fully compliant with the Enhanced HCI specification. The USB Host Port User Interface (registers description) can be found in the Enhanced HCI Rev 1.0 Specification available on [www.usb.org](http://www.usb.org)

### 66.6.3. OHCI

The USB Host Port integrates a root hub and transceivers on downstream ports. It provides several Full-speed half-duplex serial communication ports at a baud rate of 12 Mbps. Up to 127 USB devices (printer, camera, mouse, keyboard, disk, etc.) and the USB hub can be connected to the USB host in the USB “tiered star” topology.

The USB Host Port controller is fully compliant with the Open HCI specification. The USB Host Port User Interface (registers description) can be found in the Open HCI Rev 1.0 Specification available on [www.usb.org](http://www.usb.org).

All standard class devices are automatically detected and available to the user’s application. As an example, integrating an HID (Human Interface Device) class driver provides a plug & play feature for all USB keyboards and mice.

## 66.7. Register Summary

The Enhanced USB Host Controller contains two sets of software-accessible hardware registers: memory-mapped Host Controller Registers and optional PCI configuration registers. Note that the PCI configuration registers are only needed for PCI devices that implement the Host Controller.

- **Memory-mapped USB Host Controller Registers**—This block of registers is memory-mapped into non-cacheable memory. This memory space must begin on a DWord (32-bit) boundary. This register space is divided into two sections: a set of read-only capability registers and a set of read/write operational registers. The table below describes each register space.

**Note:** Host controllers are not required to support exclusive-access mechanisms (such as PCI LOCK) for accesses to the memory-mapped register space. Therefore, if software attempts exclusive-access mechanisms to the host controller memory-mapped register space, the results are undefined.

- **PCI Configuration Registers (for PCI devices)**—In addition to the normal PCI header, power management, and device-specific registers, two registers are needed in the PCI configuration space to support USB. The normal PCI header and device-specific registers are beyond the scope of this document (the UPHPS\_CLASSC register is shown in this document). Note that HCD does not interact with the PCI configuration space. This space is used only by the PCI enumerator to identify the USB Host Controller, and assign the appropriate system resources.

The table below summarizes the enhanced interface register sets.

Offset	Register Set	Explanation
0 to N-1	Capability Registers	The capability registers specify the limits, restrictions, and capabilities of a host controller implementation. These values are used as parameters to the host controller driver.
N to N+M-1	Operational Registers	The operational registers are used by system software to control and monitor the operational state of the host controller.

**Note:** Software must not modify reserved bits in Read/Write registers.

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

### 66.7.1. UHPHS Host Controller Capability Register

**Name:** UHPHS\_HCCAPBASE  
**Offset:** 0x00  
**Reset:** 0x01000010  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	HCIVERSION[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	1
Bit	23	22	21	20	19	18	17	16
	HCIVERSION[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
	CAPLENGTH[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	0	0	0	0

#### Bits 31:16 – HCIVERSION[15:0] Host Controller Interface Version Number

This is a two-byte field containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this field represents the major revision and the least significant byte the minor revision.

#### Bits 7:0 – CAPLENGTH[7:0] Capability Registers Length

This field is used as an offset to add to the register base to find the beginning of the Operational Register Space.

## 66.7.2. UHPHS Host Controller Structural Parameters Register

**Name:** UHPHS\_HCSPARAMS  
**Offset:** 0x04  
**Reset:** 0x00001303  
**Property:** Read-only

These fields define structural parameters: number of downstream ports, etc.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								P_INDICATOR
Reset								0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
Access				PPC				
Reset				0	0	0	1	1

### Bits 23:20 – N\_DP[3:0] Debug Port Number

Optional. This register identifies which of the host controller ports is the debug port. The value is the port number (1-based) of the debug port. A non-zero value in this field indicates the presence of a debug port. The value in this register must not be greater than N\_PORTS.

### Bit 16 – P\_INDICATOR Port Indicators

This bit indicates whether the ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. See [UHPHS Port Status and Control Register](#) for a definition of the port indicator control field.

### Bits 15:12 – N\_CC[3:0] Number of Companion Controllers

This field indicates the number of companion controllers associated with this USB 2.0 host controller.

A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports.

A value larger than zero in this field indicates there are companion USB 1.1 host controller(s).

Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.

### Bits 11:8 – N\_PCC[3:0] Number of Ports per Companion Controller

This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software.

For example, if N\_PORTS has a value of 6 and N\_CC has a value of 2, then N\_PCC could have a value of 3. The convention is that the first N\_PCC ports are assumed to be routed to companion controller

1, the next N\_PCC ports to companion controller 2, etc. In the previous example, the N\_PCC could have been 4, where the first four are routed to companion controller 1 and the last two are routed to companion controller 2.

The number in this field must be consistent with N\_PORTS and N\_CC.

**Bit 4 – PPC** Port Power Control

This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the ports do not have port power switches. The value of this field affects the functionality of the Port Power field in each port status and control register (see [UHPHS Port Status and Control Register](#)).

**Bits 3:0 – N\_PORTS[3:0]** Number of Ports

This field specifies the number of physical downstream ports implemented on this host controller.

The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1 to 15.

A zero in this field is undefined.

### 66.7.3. UPHS Host Controller Capability Parameters Register

**Name:** UPHS\_HCCPARAMS  
**Offset:** 0x08  
**Reset:** 0x00000026  
**Property:** Read-only

These fields define capability parameters: Multiple Mode control (time-base bit functionality), addressing capability, etc.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	EECP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	IST[3:0]					ASPC	PFLF	AC
Access	R	R	R	R		R	R	R
Reset	0	0	1	0		1	1	0

#### Bits 15:8 – EECP[7:0] EHCI Extended Capabilities Pointer

Indicates the existence of a capabilities list. A value of 0 indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in the PCI configuration space of the first EHCI extended capability. The pointer value must be 64 or greater if implemented to maintain the consistency of the PCI header defined for this class of device.

#### Bits 7:4 – IST[3:0] Isochronous Scheduling Threshold

Indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is 0, the value of the least significant three bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set to 1, the host software assumes the host controller may cache an isochronous data structure for an entire frame.

#### Bit 2 – ASPC Asynchronous Schedule Park Capability

The park capability can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the UPHS\_USBCMD register.

Value	Description
0	Host controller does not supports the park feature for high-speed queue.
1	Host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule.

#### Bit 1 – PFLF Programmable Frame List Flag

Value	Description
0	System software must use a frame list length of 1024 elements with this host controller. The UHPHS_USBCMD register Frame List Size field is a read-only register and must be set to 0.
1	System software can specify and use a smaller frame list and configure the host controller via the UHPHS_USBCMD register Frame List Size field. The frame list must always be aligned on a 4-Kbyte page boundary. This requirement ensures that the frame list is always physically contiguous.

**Bit 0 – AC 64-bit Addressing Capability**

This field documents the addressing range capability of this implementation. The value of this field determines whether software should use 32-bit or 64-bit data structures.

This information is not tightly coupled with the UHPHS\_USBBASE address register mapping control. The 64-bit Addressing Capability bit indicates whether the host controller can generate 64-bit addresses as a host. The UHPHS\_USBBASE register indicates the host controller only needs to decode 32-bit addresses as a client.

Value	Description
0	Data structures using 32-bit address memory pointers
1	Data structures using 64-bit address memory pointers

**66.7.4. UPHPS USB Command Register**

**Name:** UPHPS\_USBCMD  
**Offset:** 0x10  
**Reset:** 0x00080B00  
**Property:** Read/Write

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	ITC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	1	0	0	0
Bit	15	14	13	12	11	10	9	8
					ASPME		ASPMC[1:0]	
Access					R-R/W		R-R/W	R-R/W
Reset					1		1	1
Bit	7	6	5	4	3	2	1	0
	LHCR	IAAD	ASE	PSE	FLS[1:0]		HCRESET	RS
Access	R/W	R/W	R/W	R/W	R-R/W	R-R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 23:16 – ITC[7:0] Interrupt Threshold Control**

This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined.

Value	Maximum Interrupt Interval
0	Reserved
1	1 microframe
2	2 microframes
4	4 microframes
8	8 microframes (1 ms)
16	16 microframes (2 ms)
32	32 microframes (4 ms)
64	64 microframes (8 ms)

Any other value in this register yields undefined results.

Software modifications to this field while HCHLT=0 results in undefined behavior.

**Bit 11 – ASPME Asynchronous Schedule Park Mode Enable (optional)**

If the Asynchronous Park Capability bit in the UPHPS\_HCCPARAMS register is set to 1, then this bit is set to 1 and is Read/Write. Otherwise the bit must be 0 and is read-only.

Value	Description
0	Park mode is enabled.
1	Park mode is disabled.

**Bits 9:8 – ASPMC[1:0] Asynchronous Schedule Park Mode Count (optional)**

If the Asynchronous Park Capability bit in the UHPHS\_HCCPARAMS register is set to 1, then this field defaults to 3 and is read/write. Otherwise it defaults to 0 and is read-only. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1 to 3. Software must not write a 0 to this bit when Park Mode Enable is set to 1 as this will result in undefined behavior.

**Bit 7 – LHCR Light Host Controller Reset (optional)**

This control bit is not required. If implemented, it allows the driver to reset the EHCI controller without affecting the state of the ports or the relationship to the companion host controllers. For example, the UHPHS\_PORTSC registers should not be reset to their default values and the CF bit setting should not go to 0 (retaining port ownership relationships).

A host software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for host software to re-initialize the host controller. A host software read of this bit as 1 indicates the Light Host Controller Reset has not yet completed.

If not implemented, a read of this field will always return a 0.

**Bit 6 – IAAD Interrupt on Async Advance Doorbell**

This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the UHPHS\_USBSTS register. If the Interrupt on Async Advance Enable bit in the UHPHS\_USBINTR register is set to 1, then the host controller will assert an interrupt at the next interrupt threshold.

The host controller sets this bit to 0 after it has set the Interrupt on Async Advance status bit in the UHPHS\_USBSTS register to 1.

Software should not write a 1 to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.

**Bit 5 – ASE Asynchronous Schedule Enable**

This bit controls whether the host controller skips processing the Asynchronous Schedule.

Value	Description
0	Do not process the Asynchronous Schedule.
1	Use the UHPHS_ASYNCLISTADDR register to access the Asynchronous Schedule.

**Bit 4 – PSE Periodic Schedule Enable**

This bit controls whether the host controller skips processing the Periodic Schedule.

Value	Description
0	Do not process the Periodic Schedule.
1	Use the UHPHS_PERIODICLISTBASE register to access the Periodic Schedule.

**Bits 3:2 – FLS[1:0] Frame List Size**

This field is read-only with one exception: it is read/write if the Programmable Frame List flag, in the UHPHS\_HCCPARAMS register, is set to 1. This field specifies the size of the frame list. The size of the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index.

Value	Description
0	1024 elements (4096 bytes).
1	512 elements (2048 bytes).
2	256 elements (1024 bytes), for resource-constrained environments.
3	Reserved.

**Bit 1 – HCRESET** Host Controller Reset

This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset.

When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports.

PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines, are set to their initial values. Port ownership reverts to the companion host controller(s) with side effects. Software must reinitialize the host controller in order to return the host controller to an operational state.

This bit is set to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this register.

Software must not set this bit to 1 when HCHLT in the UHPHS\_USBSTS register is 0. Attempting to reset an actively running host controller results in undefined behavior.

**Bit 0 – RS** Run/Stop

The Host Controller must halt within 16 microframes after software clears the bit RS. The HCHLT bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write 1 to this field unless the host controller is in the halted state (i.e., HCHLT in the UHPHS\_USBSTS register is 1). Doing so yields undefined results.

Value	Description
0	Host Controller completes the current and any actively pipelined transactions on the USB and then halts.
1	Host Controller proceeds with execution of the schedule.

## 66.7.5. UHPHS USB Status Register

**Name:** UHPHS\_USBSTS  
**Offset:** 0x14  
**Reset:** 0x00001000  
**Property:** Read/Write

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to 0 in this register by writing a 1 to it.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
			IAA	HSE	FLR	PCD	USBERRINT	USBINT
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

### Bit 15 – ASS Asynchronous Schedule Status

The bit reports the current real status of the Asynchronous Schedule.

The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the UHPHS\_USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled or disabled.

Value	Description
0	Asynchronous Schedule is disabled.
1	Asynchronous Schedule is enabled.

### Bit 14 – PSS Periodic Schedule Status

The bit reports the current real status of the Periodic Schedule. If this bit is set to 0, then the status of the Periodic Schedule is disabled. If this bit is set to 1, then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the UHPHS\_USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled or disabled.

### Bit 13 – RCM Reclamation

This is a read-only status bit used to detect any empty asynchronous schedule.

**Bit 12 – HCHLT** HCHalted

This bit is 0 whenever the Run/Stop bit is 1. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (following an internal error, for example).

**Bit 5 – IAA** Interrupt on Async Advance (Cleared on write)

System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing 1 to the Interrupt on the Async Advance Doorbell bit in the UHPHS\_USBCMD register. This status bit indicates the assertion of that interrupt source.

**Bit 4 – HSE** Host System Error (Cleared on write)

The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Host Abort, and PCI Target Abort. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.

**Bit 3 – FLR** Frame List Rollover (Cleared on write)

The Host Controller sets this bit to 1 when the Frame List Index (see [UHPHS USB Frame Index Register](#)) rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the UHPHS\_USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX[13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to 1 every time FRINDEX[12] toggles.

**Bit 2 – PCD** Port Change Detect (Cleared on write)

The Host Controller sets this bit to 1 when any port for which the Port Owner bit is set to 0 (see [UHPHS Port Status and Control Register](#)) has a change bit transition from 0 to 1 or a Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to 1 after system software has relinquished ownership of a connected port by writing 1 to a port's Port Owner bit. This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force Port Resume, Overcurrent Change, Enable/Disable Change and Connect Status Change).

**Bit 1 – USBERRINT** USB Error Interrupt (Cleared on write)

The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (error counter underflow, for example). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set.

**Bit 0 – USBINT** USB Interrupt (Cleared on write)

The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set. The Host Controller also sets this bit to 1 when a short packet is detected (the actual number of bytes received was less than the expected number of bytes).

**66.7.6. UHPHS USB Interrupt Enable Register**

**Name:** UHPHS\_USBINTR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read/Write

This register enables and disables reporting of the corresponding interrupt to the software. When a bit is set and the corresponding interrupt is active, an interrupt is generated to the host. Interrupt sources that are disabled in this register still appear in the UHPHS\_USBSTS to allow the software to poll for events.

For all bits, 1=Enabled, 0=Disabled.

Bit	31	30	29	28	27	26	25	24
Access

Reset			0	0	0	0	0	0

**Bit 5 – IAAE** Interrupt on Async Advance Enable

The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit UHPHS\_USBSTS.

**Bit 4 – HSEE** Host System Error Enable

The interrupt is acknowledged by software clearing the Host System Error bit in UHPHS\_USBSTS.

**Bit 3 – FLRE** Frame List Rollover Enable

The interrupt is acknowledged by software clearing the Frame List Rollover in UHPHS\_USBSTS.

**Bit 2 – PCIE** Port Change Interrupt Enable

The interrupt is acknowledged by software clearing the Port Change Detect bit in UHPHS\_USBSTS.

**Bit 1 – USBEIE** USB Error Interrupt Enable

The interrupt is acknowledged by software clearing the USBERRINT in UHPHS\_USBSTS.

**Bit 0 – USBIE** USB Interrupt Enable

The interrupt is acknowledged by software clearing the USBINT in UHPHS\_USBSTS.

### 66.7.7. UHPHS USB Frame Index Register

**Name:** UHPHS\_FRINDEX  
**Offset:** 0x1C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is used by the host controller to index into the periodic frame list. The register updates every 125  $\mu$ s (once each microframe). Bits [N:3] are used to select a particular entry in the Periodic Frame List during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by system software in the Frame List Size field in the UHPHS\_USBCMD register).

This register must be written as a DWord. Byte writes produce undefined results. This register cannot be written unless the Host Controller is in the Halted state as indicated by the HCHLT bit (UHPHS\_USBSTS register). A write to this register while the Run/Stop bit is set to 1 (UHPHS\_USBCMD register) produces undefined results. Writes to this register also affect the SOF value.

#### Bits 13:0 – FI[13:0] Frame Index

The value in this register increments at the end of each time frame (microframe, for example). Bits [N:3] are used for the Frame List current index. This means that each location of the frame list is accessed eight times (frames or microframes) before moving to the next index. The following illustrates values of N based on the value of FLS (Frame List Size) in the UHPHS\_USBCMD register.

UHPHS_USBCMD.FLS	Number Elements	N
0	1024	12
1	512	11
2	256	10
3	Reserved	-

The SOF frame number value for the bus SOF token is derived or alternatively managed from this register. The value of FRINDEX must be 125  $\mu$ s (1 microframe) ahead of the SOF token value. The SOF value may be implemented as an 11-bit shadow register. For this discussion, this shadow register is 11 bits and is named SOFV. SOFV updates every eight microframes (1 millisecond). An

example implementation to achieve this behavior is to increment SOFV each time the FRINDEX[2:0] increments from 0 to 1.

Software must use the value of FRINDEX to derive the current microframe number, both for high-speed isochronous scheduling purposes and to provide the “get microframe number” function required for client drivers. Therefore, the value of FRINDEX and the value of SOFV must be kept consistent if chip is reset or software writes to FRINDEX. Writes to FRINDEX must also write-through FRINDEX[13:3] to SOFV[10:0]. In order to keep the update as simple as possible, software should never write a FRINDEX value where the three least significant bits are 7 or 0.

## 66.7.8. UHPHS Periodic Frame List Base Address Register

**Name:** UHPHS\_PERIODICLISTBASE  
**Offset:** 0x24  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (UHPHS\_FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. This register must be written as a DWord. Byte writes produce undefined results.

Bit	31	30	29	28	27	26	25	24
	BA[19:12]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0				
Bit	7	6	5	4	3	2	1	0
Access								
Reset								

### Bits 31:12 – BA[19:0] Base Address (Low)

These bits correspond to memory address signals [31:12], respectively.

## 66.7.9. UHPHS Asynchronous List Address Register

**Name:** UHPHS\_ASYNC\_LIST\_ADDR  
**Offset:** 0x28  
**Reset:** 0x00000000  
**Property:** Read/Write

This 32-bit register contains the address of the next asynchronous queue head to be executed. Bits [4:0] of this register cannot be modified by system software and will always return a zero when read. The memory structure referenced by this physical memory pointer is assumed to be 32-byte (cache line) aligned. This register must be written as a DWord. Byte writes produce undefined results.

Bit	31	30	29	28	27	26	25	24
	LPL[26:19]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0
	LPL[2:0]							
Access	R/W	R/W	R/W					
Reset	0	0	0					

### Bits 31:5 – LPL[26:0] Link Pointer Low

These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (QH).

## 66.7.10. UPHS Configure Flag Register

**Name:** UPHS\_CONFIGFLAG  
**Offset:** 0x50  
**Reset:** 0x00000000  
**Property:** Read/Write

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16

Access								
Reset								
Bit	7	6	5	4	3	2	1	0
								CF
Access								R/W
Reset								0

### Bit 0 – CF Configure Flag

Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below.

Value	Description
0	Port routing control logic default-routes each port to an implementation-dependent classic host controller (default value).
1	Port routing control logic default-routes all ports to this host controller.

**66.7.11. UPHS Port Status and Control Register**

**Name:** UPHS\_PORTSCx  
**Offset:** 0x54 + x\*0x04 [x=0..2]  
**Reset:** 0x00003000  
**Property:** Read/Write

The number of port registers is documented in the UPHS\_HCSPARAMS register. Software uses this information as an input parameter to determine how many ports need to be serviced. All ports have the structure defined below.

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset. The initial conditions of a port are:

- No device connected
- Port disabled

If the port has port power control, software cannot change the state of the port until after it applies power to the port by setting port power to a 1. Software must not attempt to change the state of the port until after power is stable on the port. The host is required to have power stable to the port within 20 milliseconds of the 0 to 1 transition.

**Notes:**

1. When a device is attached, the port state transitions to the connected state and system software will process this as with any status change notification.
2. If a port is being used as the Debug Port, then the port may report device connected and enabled when the Configured Flag is set to 0.

Reset	0	0	0	0	0	0	0	0

**Bit 22 – WKOC\_E** Wake on Overcurrent Enable

This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to overcurrent conditions as wake-up events.
1	Enables the port to be sensitive to overcurrent conditions as wake-up events.

### Bit 21 – WKDSCNNT\_E Wake on Disconnect Enable

This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device disconnects as wake-up events.
1	Enables the port to be sensitive to device disconnects as wake-up events.

### Bit 20 – WKCNNT\_E Wake on Connect Enable

This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device connects as wake-up events.
1	Enables the port to be sensitive to device connects as wake-up events.

### Bits 19:16 – PTC[3:0] Port Test Control

When this field is set to 0, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value.

Test mode bits are encoded as follows (6 to 15 are reserved):

Value	Test Mode
0	Test mode not enabled
1	Test J_STATE
2	Test K_STATE
3	Test SE0_NAK
4	Test Packet
5	Test FORCE_ENABLE

Refer to the USB Specification Revision 2.0, Chapter 7, for details on each test mode.

### Bits 15:14 – PIC[1:0] Port Indicator Control

Writing to these bits has no effect if the P\_INDICATOR bit in the UPHPS\_HCSPARAMS register is set to 0. If the P\_INDICATOR bit is set to 1, then the bits are encoded as follows:

Value	Meaning
0	Port indicators are off
1	Amber
2	Green
3	Undefined

Refer to the USB Specification Revision 2.0 for a description of how these bits are to be used.

This field is 0 if Port Power is 0.

### Bit 13 – PO Port Owner

System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes 1 to this bit when the attached device is not a high-speed device. A 1 in this bit means that a companion host controller owns and controls the port.

Value	Description
0	This bit unconditionally goes to a 0 when the bit UPHPS_CONFIGFLAG.CF makes a 0 to 1 transition.
1	This bit unconditionally goes to 1 whenever the bit UPHPS_CONFIGFLAG.CF=0.

### Bit 12 – PP Port Power

The function of this bit depends on the value of the Port Power Control (PPC) field in the UPHPS\_HCSPARAMS register. When host controller has port power control switches (PPC=0), PP is in read-only mode:

Value	Description
1	Each port is hard-wired to power.

When host controller has port power control switches (PPC=1), PP is in read/write mode:

Value	Description
0	Host port power switch is off. When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.
1	Host port power switch is on. When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.

When an overcurrent condition is detected on a powered port and PPC is set to 1, the PP bit in each affected port may be transitioned by the host controller from 1 to 0 (removing power from the port).

### Bits 11:10 – LS[1:0] Line Status

These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is 0 and the current connect status bit is set to 1.

This value of this field is undefined if Port Power is 0.

Value	Name	Description
0	SE0	Not a low-speed device, perform EHCI reset
1	K-STATE	Low-speed device, release ownership of port
2	J-STATE	Not a low-speed device, perform EHCI reset
3	Undefined	Not a low-speed device, perform EHCI reset

### Bit 8 – PR Port Reset

When software writes a 1 to this bit (from 0), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a 0 to this bit to terminate the bus reset sequence. Software must keep this bit set to 1 long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes.

**Note:** When software writes this bit to 1, it must also write 0 to the Port Enable bit.

When software writes a 0 to this bit, there may be a delay before the bit status changes to 0. The bit status will not read as 0 until after the reset has completed. If the port is in High-Speed mode after reset is complete, the host controller will automatically enable this port (set the Port Enable bit to 1, for example). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from 1 to 0. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2 ms of software writing this bit to 0.

The HCHLT bit in the UPHPS\_USBSTS register should be set to 0 before software attempts to use this bit. The host controller may hold Port Reset asserted to 1 when the HCHLT bit is 1.

This field is 0 if Port Power is 0.

Value	Description
0	Port is not in Reset.
1	Port is in Reset.

### Bit 7 – SUS Suspend

Value	Description
0	Port not in Suspend state.
1	Port in Suspend state.

**Note:**

Port Enabled Bit and Suspend bit of this register define the port states as follows:

Bits [Port Enabled, Suspend]	Port State
0X	Disable
10	Enable
11	Suspend

When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB.

A write of 0 to this bit is ignored by the host controller. The host controller will unconditionally set this bit to 0 when:

- Software sets the Force Port Resume bit to 0 (from 1).
- Software sets the Port Reset bit to 1 (from 0).

If host software sets this bit to 1 when the port is not enabled (i.e., Port Enabled bit set to 0), the results are undefined.

This field is 0 if Port Power is set to 0.

**Bit 6 – FPR** Force Port Resume

This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are set to 1) and software transitions this bit to 1, then the effects on the bus are undefined.

Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to 1 because a J-to-K transition is detected, the Port Change Detect bit in the UPHPS\_USBSTS register is also set to 1. If software sets this bit to 1, the host controller must not set the Port Change Detect bit.

Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains set to 1. Software must appropriately time the Resume and set this bit to 0 when the appropriate amount of time has elapsed. Writing a 0 (from 1) causes the port to return to High-Speed mode (forcing the bus below the port into a high-speed idle). This bit will remain set to 1 until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to 0.

This field is 0 if Port Power is 0.

Value	Description
0	No resume (K-state) detected/driven on port.
1	Resume detected/driven on port.

**Bit 5 – OCC** Overcurrent Change (Cleared on write)

Software clears this bit by writing 1.

Value	Description
0	No change to Overcurrent Active.
1	Changes to Overcurrent Active.

**Bit 4 – OCA** Overcurrent Active

This bit will automatically transition from 1 to 0 when the overcurrent condition is removed.

Value	Description
0	This port does not have an overcurrent condition.
1	This port currently has an overcurrent condition.

**Bit 3 – PEDC** Port Enable/Disable Change (Cleared on write)

For the root hub, this bit gets set to 1 only when a port is disabled due to the appropriate conditions existing at the EOF2 point (refer to Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it.  
This field is 0 if Port Power bit is 0.

Value	Description
0	No change in port enabled/disabled status.
1	Port enabled/disabled status has changed.

**Bit 2 – PED** Port Enabled/Disabled

Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this field. The host controller will only set this bit to 1 when the reset sequence determines that the attached device is a high-speed device.

Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.  
When the port is disabled (0b), downstream propagation of data is blocked on this port, except for reset.

This field is 0 if Port Power bit is 0.

Value	Description
0	Disable.
1	Enable.

**Bit 1 – CSC** Connect Status Change (Cleared on write)

Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit (i.e., the bit remains set). Software sets this bit to 0 by writing a 1 to it.

This field is 0 if Port Power bit is 0.

Value	Description
0	No change.
1	Change in Current Connect Status.

**Bit 0 – CCS** Current Connect Status

This value reflects the current state of the port, and may not correspond directly to the event that caused the CSC bit to be 1.

This bit is 0 if Port Power is 0.

Value	Description
0	No device is present.
1	Device is present on port.

## 66.7.12. EHCI: REG06 - AHB Error Status

**Name:** UPHPS\_INSNREG06  
**Offset:** 0xA8  
**Reset:** 0x00000000  
**Property:** Read/Write

Control and Status Register, used to read the UTMI registers from the signals below.

Bit	31	30	29	28	27	26	25	24
	AHB_ERR							
Access	R/W							
Reset	0							
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					HBURST[2:0]			Nb_Burst[4]
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	Nb_Burst[3:0]				Nb_Success_Burst[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bit 31 – AHB\_ERR AHB Error

System bus error was encountered and erroneous burst characteristics are captured. To clear this field the application must write a 0.

EHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and an error occurs, 4 is written to INSNREG06[8:4].
- When INCR8 and an error occurs, 8 is written to INSNREG06[8:4].
- When INCR16 and an error occurs, 16 is written to INSNREG06[8:4].
- Other values except 4, 8, and 16 are not written to INSNREG06[8:4].

OHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and error occurs, 4 is written to INSNREG06[8:4].
- Other values except 4 are not written to INSNREG06[8:4].

### Bits 11:9 – HBURST[2:0] Burst Value

Value of the control phase at which the AHB error occurred.

This field applies to enabled incremental bursts only.

### Bits 8:4 – Nb\_Burst[4:0] Number of Bursts

Number of beats expected in the burst at which the AHB error occurred. Valid values are 0 to 16.

This field applies to enabled incremental bursts only.

**Bits 3:0 – Nb\_Success\_Burst[3:0]** Number of Successful Bursts  
Number of successfully completed beats in the current burst before the AHB error occurred.  
This field applies to enabled incremental bursts only.

### 66.7.13. EHCI: REG07 - AHB Host Error Address

**Name:** UPHPS\_INSNREG07  
**Offset:** 0xAC  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	AHB_ADDR[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	AHB_ADDR[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	AHB_ADDR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	AHB_ADDR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 31:0 – AHB\_ADDR[31:0] AHB Address

System bus address of the control phase at which the system bus error occurred.

## 67. Analog-to-Digital Controller (ADC)

### 67.1. Description

The ADC is based on a 12-bit Analog-to-Digital Converter (ADC) managed by an ADC Controller providing enhanced resolution up to 16 bits. See the [Block Diagram](#). It also integrates a 12-to-1 analog multiplexer, making possible the analog-to-digital conversions of 12 analog lines. The conversions extend from the voltage on pin ADVREFN to the voltage carried on pin ADVREFP.

Conversion results are reported in a common register for all channels, as well as in a channel-dedicated register.

The 13-bit, 14-bit, 15-bit and 16-bit resolution modes are obtained by averaging multiple samples to decrease quantization noise. For the 13-bit mode, 4 samples are used, which gives a real sample rate of 1/4 of the actual sample frequency. For the 14-bit mode, 16 samples are used, giving a real sample rate of 1/16 of the actual sample frequency. For the 15-bit and 16-bit modes, respectively 64 and 256 samples are used, giving a real sample rate of respectively 1/64 and 1/256 of the actual sample frequency. This arrangement allows conversion speed to be traded off against for better accuracy.

The software trigger, external trigger on rising edge of the ADTRG pin or internal triggers from Timer Counter output(s) are configurable.

The comparison circuitry allows automatic detection of values below a threshold, higher than a threshold, in a given range or outside the range, thresholds and ranges being fully configurable.

The ADC Controller internal fault output is directly connected to the PWM fault input. This input can be asserted by means of comparison circuitry to immediately put the PWM output in a safe state (pure combinational path).

The ADC also integrates a Sleep mode and a conversion sequencer and connects with a DMA channel. These features reduce both power consumption and processor intervention.

This ADC has a selectable single-ended, pseudo-differential or fully differential input.

This ADC Controller includes a Resistive Touchscreen Controller. It supports 4-wire and 5-wire technologies.

### 67.2. Embedded Characteristics

- 12-bit Resolution with Enhanced Mode up to 16 bits
- 1 MSps Conversion Rate
- Digital Averaging Function providing Enhanced Resolution Mode up to 16 bits
- Wide Range of Power Supply Operation
- Selectable Single-Ended, Pseudo-Differential or Differential Input Voltage
- Digital correction of offset and gain errors
- Resistive 4-wire and 5-wire Touchscreen Controller
  - Position and pressure measurement for 4-wire screens
  - Position measurement for 5-wire screens
  - Average of up to 8 measures for noise filtering
- Programmable Pen Detection Sensitivity
- Integrated Multiplexer Offering Up to 12 Independent Analog Inputs
- Individual Enable and Disable of Each Channel
- Hardware or Software Trigger from:

- External trigger pin
- Timer counter outputs (corresponding TIOA trigger)
- ADC internal trigger counter
- Trigger on pen contact detection
- PWM event line
- Drive of PWM Fault Input
- DMA Support
- Two Sleep Modes (Automatic Wake-Up on Trigger)
  - Lowest power consumption (voltage reference off between conversions)
  - Fast wake-up time response on trigger event (voltage reference on between conversions)
- Channel Sequence Customizing
- Automatic Window Comparison of Converted Values
- Register Write Protection

## 67.3. Block Diagram

Figure 67.1. ADC Block Diagram

## 67.4. Signal Description

Table 67.1. ADC Pin Description

Pin Name	Description
VDDANA	Analog power supply

.....continued

Pin Name	Description
GNDANA	Analog ground supply
ADVREFP	Reference voltage
ADVREFN	Reference voltage
AD[11:0]	Analog input channels
ADTRG	External trigger

## 67.5. Product Dependencies

### 67.5.1. Power Management

The ADC Controller is not continuously clocked. The programmer must first enable the ADC Controller peripheral clock in the Power Management Controller (PMC) before using the ADC Controller. However, if the application does not require ADC operations, the ADC Controller clock can be stopped when not needed and restarted when necessary. Configuring the ADC Controller does not require the ADC Controller clock to be enabled.

### 67.5.2. Interrupt Sources

The ADC interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the ADC interrupt requires the interrupt controller to be programmed first.

### 67.5.3. I/O Lines

The digital inputs ADx and ADTRG are multiplexed with digital functions on the I/O lines.

ADx inputs are selected as inputs of the ADCC when writing a one in the corresponding ADC\_CHER.CHx bit and the associated I/O is automatically turned in Analog mode.

### 67.5.4. Hardware Triggers

The ADC can use internal signals to start conversions. See the ADC\_MR.TRGSEL field description in [ADC\\_MR](#) for exact wiring of internal triggers.

### 67.5.5. Fault Output

The ADC Controller has the FAULT output connected to the FAULT input of PWM. See [Fault Event](#) and section “Pulse Width Modulation Controller (PWM)”.

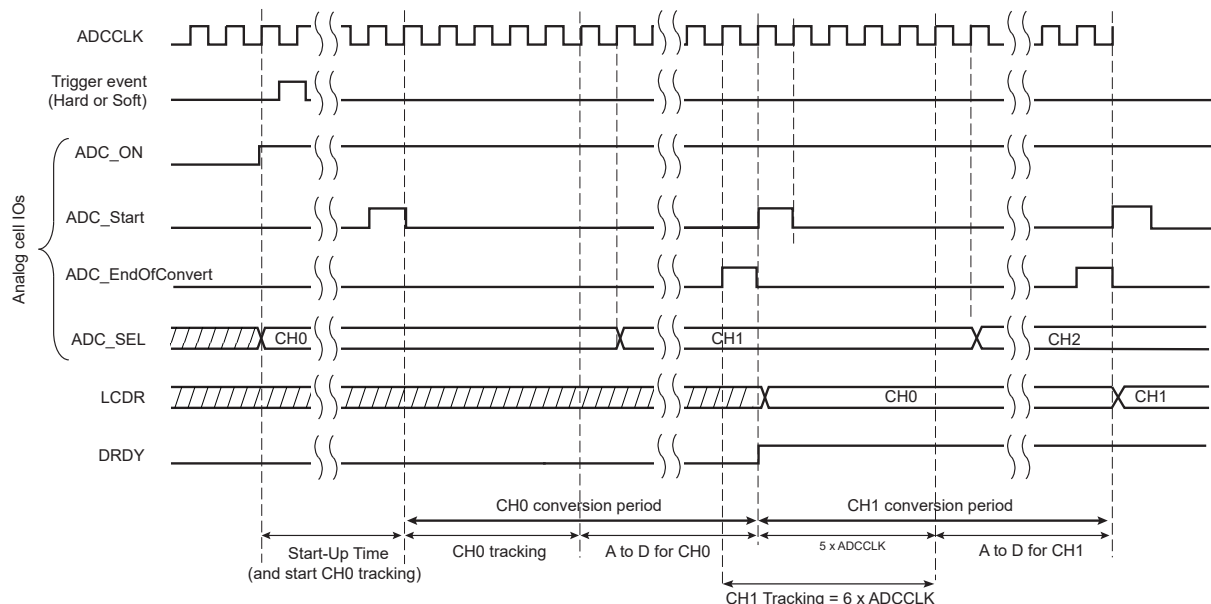

## 67.6. Functional Description

### 67.6.1. Analog-to-Digital Conversion

Once the programmed start-up time (ADC\_MR.STARTUP) has elapsed, ADC conversions are sequenced by three operating times:

- Tracking time—the time for the ADC to charge its input sampling capacitor to the input voltage. When several channels are converted consecutively, the inherent tracking time is 6 ADC clock cycles. However, the tracking time can be increased using the TRACKTIM field in the Mode register (ADC\_MR) and the TRACKX4 bit in the Extended Mode register (ADC\_EMR).
- ADC inherent conversion time—the time for the ADC to convert the sampled analog voltage. This time is constant and is defined from start of conversion to end of conversion.
- Channel conversion period—the effective time between the end of the current channel conversion and the end of the next channel conversion.

**Figure 67.2.** Sequence of Consecutive ADC Conversions with TRACKTIM = 0

**Figure 67.3.** Sequence of Consecutive ADC Conversions with TRACKTIM = 4 and TRACK4X = 1

## 67.6.2. ADC Clock

The ADC uses the ADC clock (ADCCLK) to perform conversions. The ADC clock frequency is selected in the ADC\_MR.PRESCAL.

To generate the ADC clock, the prescaler has two clock sources: the peripheral clock and the GCLK clock. This clock source is selected using the SRCCLK bit in the Extended Mode register (ADC\_EMR).

If GCLK is selected as a source clock, the ADC clock frequency is independent of the processor/bus clock. At reset, the peripheral clock is selected.

If ADC\_EMR.SRCCLK is cleared, the prescaler clock (presc\_clk) is driven by peripheral\_clock. If ADC\_EMR.SRCCLK is set, the prescaler clock is driven by GCLK. The ADC clock frequency is between  $f_{\text{presc\_clk}}/2$ , if PRESICAL is 0, and  $f_{\text{presc\_clk}}/512$ , if PRESICAL is set to 255 (0xFF).

PRESICAL must be programmed to provide the ADC clock frequency parameter provided in the "Electrical Characteristics" section.

### 67.6.3. ADC Reference Voltage

The voltage reference input of the ADC is the ADVREFP pin and the negative reference voltage is ADVREFN. Refer to the section “Electrical Characteristics”.

### 67.6.4. Conversion Resolution

The ADC has a native resolution of 12 bits.

The ADC Controller provides enhanced resolution up to 16 bits by means of digital averaging.

If ADTRG is asynchronous to the ADC peripheral clock, the internal resynchronization introduces a jitter of 1 peripheral clock. This jitter may reduce the resolution of the converted signal.

The same applies when using the independent clock (ADC\_MR.SRCCLK = 1), if the provided clock is asynchronous to ADC peripheral clock.

### 67.6.5. Conversion Results

When a conversion is completed, the resulting digital value is stored in the Channel Data register (ADC\_CDRx) of the current channel and in the Last Converted Data register (ADC\_LCDR). By setting the TAG option in ADC\_EMR, ADC\_LCDR presents the channel number associated with the last converted data in the CHNB field.

When a conversion is completed, the channel EOC bit and the DRDY bit in the Interrupt Status register (ADC\_ISR) are set. In the case of a connected DMA channel, DRDY rising triggers a data request. In any case, either EOC and DRDY can trigger an interrupt.

Reading one of the ADC\_CDRx clears the corresponding EOC bit. Reading ADC\_LCDR clears the DRDY bit.

**Figure 67.4.** EOCx and DRDY Flag Behavior

If ADC\_CDR is not read before further incoming data is converted, the corresponding OVREx flag is set in the Overrun Status register (ADC\_OVER).

If new data is converted when DRDY is high, ADC\_ISR.GOVRE is set.

The OVREx flag is automatically cleared when ADC\_OVER is read, and the GOVRE flag is automatically cleared when ADC\_ISR is read.

**Figure 67.5.** EOCx, OVREx and GOVREx Flag Behavior

**WARNING** If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable.

#### 67.6.6. Conversion Results Format

The conversion results can be signed (2's complement) or unsigned depending on the value of the ADC\_EMR.SIGNMODE field.

If conversion results are signed and resolution is less than 16 bits, the sign is extended up to the bit 15 (for example, 0xF43 for 12-bit resolution is read as 0xFF43, and 0x467 is read as 0x0467).

#### 67.6.7. Conversion Triggers

Conversions of the active analog channels are started with a software or hardware trigger. The software trigger is provided by writing the Control register (ADC\_CR) with the START bit at 1 and ADC\_TRGR.TRGMOD=0.

The list of external/internal events is provided in [ADC\\_MR](#). The hardware trigger is selected using the ADC\_MR.TRGSEL field. The selected hardware trigger is enabled if TRGMOD = 1, 2 or 3 in the Trigger

register (ADC\_TRGR). In these modes, the software trigger is disabled (writing ADC\_CR.START=1 has no effect).

The ADC also provides a Dual Trigger mode (ADC\_LCTMR.DUALTRIG = 1) in which the higher index channel can be sampled at a rhythm different from the other channels. The trigger of the last channel is generated by the RTC. See [Last Channel Specific Measurement Trigger](#).

The ADC\_TRGR.TRGMOD field selects the hardware trigger from the following:

- Any edge, either rising or falling or both, detected on the external trigger pin ADTRG or internal triggers
- The Pen Detect, depending on how the PENDET bit is set in the Touchscreen Mode register (ADC\_TSMR)
- A continuous trigger, meaning the ADC Controller restarts the next sequence as soon as it finishes the current one
- A periodic trigger, which is defined by programming the ADC\_TRGR.TRGPER field

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence according to configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQR1/2, and ADC\_TSMR.

If a hardware trigger is selected, the start of a conversion is triggered after a delay starting at each rising edge of the selected signal. Due to asynchronous handling, the delay may vary in a range of two peripheral clock periods to one ADC clock period. This delay introduces sampling jitter in the A/D conversion process and may therefore degrade the conversion performance (e.g., SNR, THD).

**Figure 67.6.** Hardware Trigger Delay

If one of the TIOA outputs is selected, the corresponding Timer Counter channel must be programmed in Waveform mode.

Only one start command is necessary to initiate a conversion sequence on all the enabled channels. The ADC hardware logic automatically performs the conversions on the active channels, then waits for a new request. The Channel Enable (ADC\_CHER) and Channel Disable (ADC\_CHDR) registers enable the analog channels to be enabled or disabled independently.

If the ADC is used with a DMA, only the transfers of converted data from enabled channels are performed and the resulting data buffers should be interpreted accordingly.

#### 67.6.8. Sleep Mode and Conversion Sequencer

The ADC Sleep mode maximizes power saving by automatically deactivating the ADC when it is not being used for conversions. Sleep mode is selected by setting ADC\_MR.SLEEP.

Sleep mode is managed by a conversion sequencer, which automatically processes the conversions of all channels at lowest power consumption.

This mode can be used when the minimum period of time between two successive trigger events is greater than the start-up period of the ADC. Refer to the section “Electrical Characteristics”.

When a start conversion request occurs, the ADC is automatically activated. As the analog cell requires a start-up time, the logic waits during this time and starts the conversion on the enabled channels. When all conversions are complete, the ADC is deactivated until the next trigger. Events triggered during the sequence are ignored.

The conversion sequencer allows automatic processing with minimum processor intervention and optimized power consumption. Conversion sequences can be performed periodically using the internal timer (ADC\_TRGR) or the PWM event line. The periodic acquisition of several samples can be processed automatically without any intervention of the processor via the DMA.

The sequence can be customized by programming the Sequence Channel registers ADC\_SEQR1 and ADC\_SEQR2 and setting the USEQ bit of the Mode register (ADC\_MR). The user can choose a specific order of channels and can program up to 12 conversions by sequence. The user is free to create a personal sequence by writing channel numbers in ADC\_SEQR1 and ADC\_SEQR2. Not only can channel numbers be written in any sequence, channel numbers can be repeated several times. When ADC\_MR.USEQ is set, ADC\_SEQR1.USCHx and ADC\_SEQR2.USCHx are used to define the sequence. Only enabled USCHx fields will be part of the sequence. Each USCHx field has a corresponding enable, CHx-1, in ADC\_CHER.

If all ADC channels (i.e., 12) are used on an application board, there is no restriction of usage of the user sequence. However, if some ADC channels are not enabled for conversion but rather used as pure digital inputs, the respective indexes of these channels cannot be used in the user sequence fields (see ADC\_SEQR1/2). For example, if channel 4 is disabled (ADC\_CHSR[4] = 0), ADC\_SEQR1/2 fields USCH1 up to USCH12 must not contain the value 4. Thus the length of the user sequence may be limited by this behavior.

As an example, if only four channels over 12 (CH0 up to CH3) are selected for ADC conversions, the user sequence length cannot exceed four channels. Each trigger event may launch up to four successive conversions of any combination of channels 0 up to 3 but no more (i.e., in this case the sequence CH0, CH0, CH1, CH1, CH1 is impossible).

A sequence that repeats the same channel several times requires more enabled channels than channels actually used for conversion. For example, the sequence CH0, CH0, CH1, CH1 requires four enabled channels (four free channels on application boards) whereas only CH0, CH1 are really converted.

**Note:** The reference voltage pins always remain connected in Normal mode as in Sleep mode.

#### 67.6.9. Comparison Window

The ADC Controller features automatic comparison functions. It compares converted values to a low threshold, a high threshold or both, depending on the value of the ADC\_EMR.CMPMODE field. The comparison can be done on all channels or only on the channel specified in the ADC\_EMR.CMPSEL field. To compare all channels, ADC\_EMR.CMPALL must be set.

If set, ADC\_EMR.CMPTYPE can be used to discard all conversion results that do not match the comparison conditions. Once a conversion result matches the comparison conditions, all the subsequent conversion results are stored in ADC\_LCDR (even if these results do not meet the comparison conditions). Setting ADC\_CR.CMPRST immediately stops the conversion result storage until the next comparison match.

If ADC\_EMR.CMPTYPE is cleared, all conversions are stored in ADC\_LCDR. Only the conversions that match the comparison conditions trigger the ADC\_ISR.COMPE flag.

Moreover, a filtering option can be set by writing the number of consecutive comparison matches needed to raise the flag. This number can be written and read in the ADC\_EMR.CMPFILTER field. The filtering option is dedicated to reinforcing the detection of an analog signal overpassing a predefined threshold. The filter is cleared as soon as ADC\_ISR is read, so this filtering function must be used with peripheral DMA controller and works only when using Interrupt mode (no polling).

The flag can be read on ADC\_ISR.COMPE and can trigger an interrupt.

The high threshold and the low threshold can be read/write in the Compare Window register (ADC\_CWR).

Depending on the sign of the conversion, chosen with the ADC\_EMR.SIGNMODE field, the high threshold and low threshold values must be signed or unsigned to maintain consistency during the comparison. If the conversion is signed, both thresholds must also be signed; if the conversion is unsigned, both thresholds must be unsigned. If comparison occurs on all channels, the ADC\_EMR.SIGNMODE field must be set to ALL\_UNSIGNED or ALL\_SIGNED and the thresholds must be set accordingly.

## 67.6.10. Pseudo-Differential, Differential and Single-Ended Input Modes

### 67.6.10.1. Input-Output Transfer Functions

The ADC can be configured to operate in the following input voltage modes:

- Single-Ended—ADC\_CCR.DIFFx = 0 and ADC\_PDR.PDIFFx = 0. This is the default mode after a reset.
- Differential—ADC\_CCR.DIFFx = 1 and ADC\_PDR.PDIFFx = 0 (see the figure below). In Differential mode, the ADC requires differential input signals having a VDD/2 common mode voltage (refer to the section “Electrical Characteristics”).
- Pseudo-Differential—ADC\_PDR.PDIFFx = 1. In Pseudo-Differential mode, one of the analog pins is used as the negative input of the ADC (see table [Input Pins and Channel Numbers in Pseudo-Differential Mode](#)). The ADC samples the other analog inputs with respect to this one. The common mode input range is 0 to VDD (refer to the section “Electrical Characteristics”).

The following equations provide the unsigned ADC input-output transfer function in each mode<sup>(1)</sup>. With signed conversions (see field ADC\_EMR.SIGNMODE), subtract 2047 from the ADC\_LCDR.DATA value given below. Note that the Single-Ended mode introduces a x2 gain compared to the Pseudo-Differential mode.

In the formula, REFP = VREFP, REFN = VREFN.

Single-Ended mode:

$$\text{ADC\_LCDR.LDATA} = \frac{\text{ADx} - \text{REFN}}{\text{REFP} - \text{REFN}} \times 2^{12}$$

Differential mode:

$$\text{ADC\_LCDR.LDATA} = \left(1 + \frac{\text{ADx} - \text{ADx+1}}{\text{REFP} - \text{REFN}}\right) \times 2^{11}$$

Pseudo-Differential mode:

$$\text{ADC\_LCDR.LDATA} = \left(1 + \frac{\text{ADx} - \text{AD11}}{\text{REFP} - \text{REFN}}\right) \times 2^{11}$$

**Note:** Equations assume ADC\_EMR.OSR = 1

If ADC\_MR.ANACH is set, the ADC can manage both differential channels and single-ended channels. If ADC\_MR.ANACH is cleared, the parameters defined in ADC\_CCR are applied to all channels.

The following tables provide the internal positive and negative ADC inputs assignment with respect to the programmed mode (ADC\_CCR.DIFFx and ADC\_PDR.PDIFFx).

For example, if Differential mode is required on channel 0, input pins AD0 and AD1 are used. In this case, only channel 0 must be enabled by writing a 1 to ADC\_CHER.CH0.

**Table 67.2.** Input Pins and Channel Numbers in Single-Ended and Differential Modes

Internal ADC Inputs (VIN+, VIN-)		Channel Number	
Single-Ended Mode	Differential Mode	Single-Ended Mode	Differential Mode
AD0, ADVREFN	AD0, AD1	CH0	CH0
AD1, ADVREFN	–	CH1	

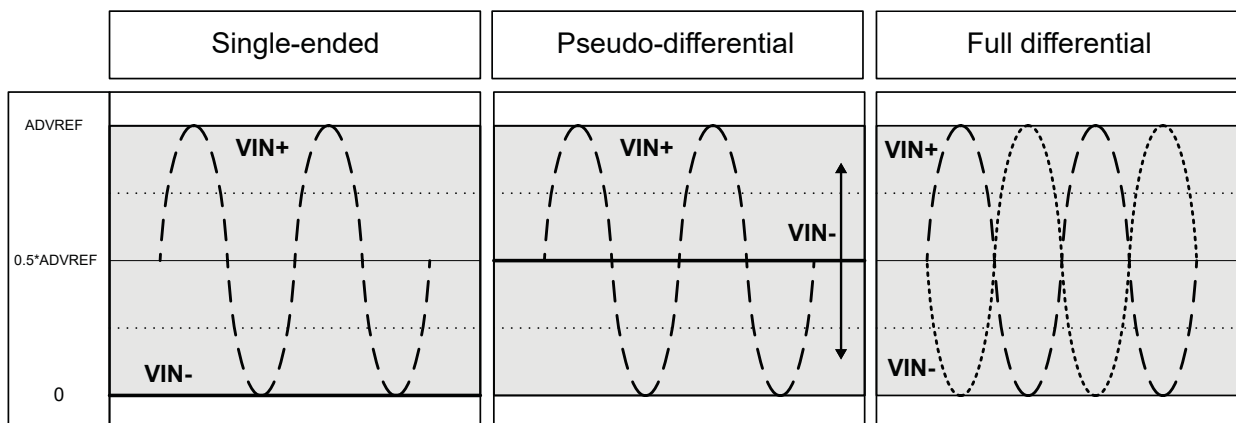

.....continued

Internal ADC Inputs (VIN+, VIN-)		Channel Number	
Single-Ended Mode	Differential Mode	Single-Ended Mode	Differential Mode
AD2, ADVREFN	AD2, AD3	CH2	CH2
AD3, ADVREFN	-	CH3	
AD4, ADVREFN	AD4, AD5	CH4	CH4
AD5, ADVREFN	-	CH5	
AD6, ADVREFN	AD6, AD7	CH6	CH6
AD7, ADVREFN	-	CH7	
AD8, ADVREFN	AD8, AD9	CH8	CH8
AD9, ADVREFN	-	CH9	
AD10, ADVREFN	AD10, AD11	CH10	CH10
AD11, ADVREFN	-	CH11	

In Pseudo-Differential mode, inputs are managed by a 12/2:1-channel analog multiplexer. See the table below.

**Table 67.3.** Input Pins and Channel Numbers in Pseudo-Differential Mode

Internal ADC Inputs (VIN+, VIN-)	Channel Number
AD0, AD11	CH0
AD1, AD11	CH1
AD2, AD11	CH2
AD3, AD11	CH3

**Figure 67.7.** Analog Full Scale Ranges in Single-Ended/Pseudo-Differential/Differential Applications**67.6.11. ADC Timings**

The ADC start-up time is programmed through the ADC\_MR.STARTUP field. Refer to the section "Electrical Characteristics".

The ADC Controller provides an inherent tracking time of six ADC clock cycles.

A minimal tracking time is necessary for the ADC to guarantee the best converted final value between two conversions. The tracking time can be adjusted to accommodate a range of source impedances. If more than six ADC clock cycles are required, the tracking time can be increased using the ADC\_MR.TRACKTIM field and ADC\_EMR.TRACKX4.

**WARNING**

No input buffer amplifier to isolate the source is included in the ADC. Refer to the section "Electrical Characteristics".

### 67.6.12. Last Channel Specific Measurement Trigger

The last channel (higher index available) embeds a specific mode allowing a measurement trigger period which differs from other active channels. This allows efficient management of the conversions especially if the channel is driven by a device with a variation of a different frequency from other converted channels (for example, but not limited to, temperature sensor).

The last channel can be sampled in different ways through the ADC Controller. The different methods of sampling depend on the ADC\_TRGR.TRGMOD configuration field and on ADC\_CHSR.CH11.

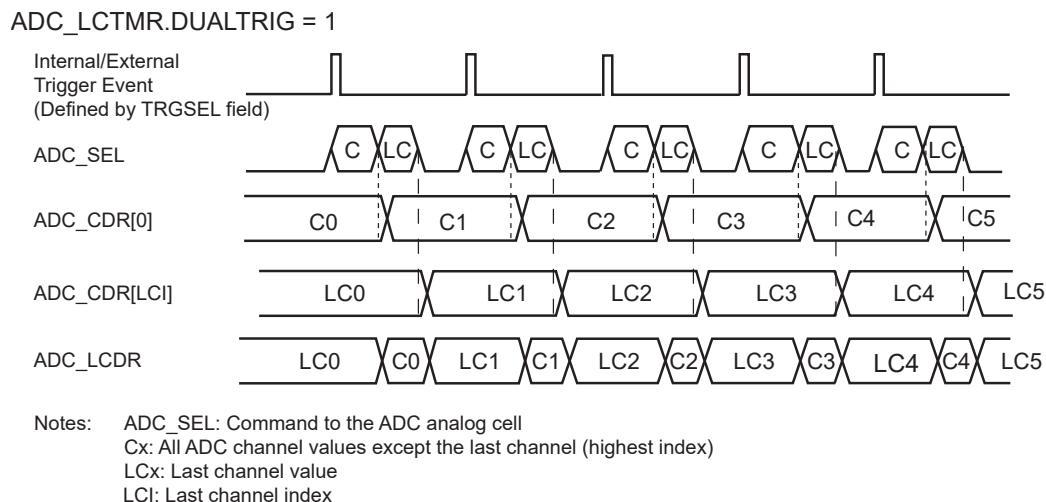

The last channel conversion can be triggered like the other channels by enabling ADC\_CHER.CH11.

The manual start can only be performed if field TRGMOD = 0. When ADC\_CR.START is set, the last channel conversion is scheduled together with the other enabled channels (if any). The result of the conversion is placed in the ADC\_CDR11 register, and the associated ADC\_ISR.EOC11 flag is set.

If the last channel is enabled in the Channel Status register (ADC\_CHSR), ADC\_LCTMR.DUALTRIG is cleared and field TRGMOD = 1, 2, 3, 5, the last channel is periodically converted together with the other enabled channels and the result is placed in the ADC\_LCDR and ADC\_CDR11 registers. Thus the last channel conversion result is part of the DMA Controller buffer (see the following figure).

When the conversion result matches the conditions defined in ADC\_LCTMR and ADC\_LCCWR, the ADC\_ISR.LCCHG flag is set.

**Figure 67.8.** Same Trigger for All Channels (ADC\_CHSR[LCI] = 1 and ADC\_TRGR.TRGMOD = 1, 2, 3, 5)

Assuming ADC\_CHSR[0] = 1 and ADC\_CHSR[LCI] = 1

If the last channel is driven by a device with a slower variation compared to other channels (temperature sensor for example), the channel can be enabled/disabled at any time. However, this may not be optimal for downstream processing.

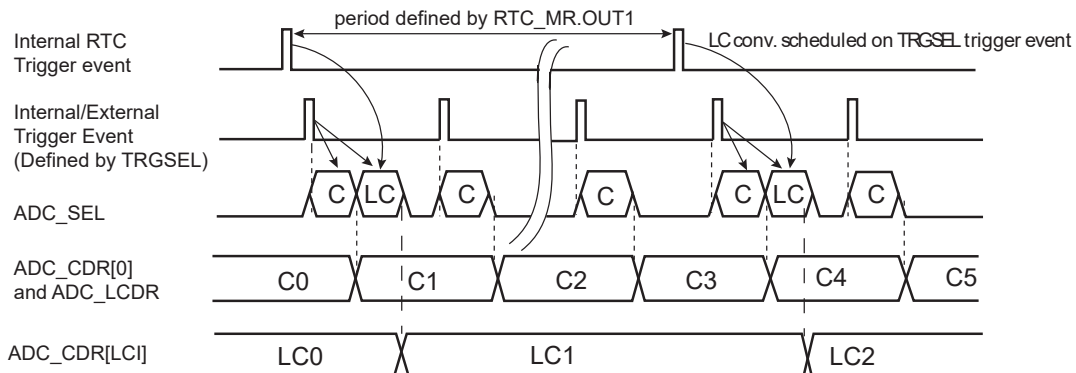

The ADC Controller allows a different way of triggering the measurement when DUALTRIG is set in the Last Channel Trigger Mode register (ADC\_LCTMR) but CH11 is not set in ADC\_CHSR.

Under these conditions, the last channel conversion is triggered with a period defined by the field RTC\_MR.OUTx (see [Block Diagram](#) for the value of 'x') while other channels are still active and triggered by internal/external triggers. The RTC event is processed on the next internal/external trigger event, as shown in the following figure. The internal/external trigger for other channels is selected through the ADC\_MR.TRGSEL field.

When DUALTRIG = 1, the result of each conversion of channel 11 is only uploaded in the ADC\_CDR11 register and not in ADC\_LCDR (see the following figure). Therefore, there is no change in the structure of the peripheral DMA controller buffer due to the conversion of the last channel: only the enabled channels are kept in the buffer. The end of conversion of the last channel is reported by the ADC\_ISR.EOC11 flag.

**Figure 67.9.** Independent Trigger Measurement for Last Channel (ADC\_CHSR[LCI] = 0 and ADC\_TRGR.TRGMOD = 1, 2, 3, 5)

ADC\_LCTMR.DUALTRIG = 1

Notes: ADC\_SEL: Command to the ADC analog cell  
Cx: All ADC channel values except the last channel (highest index)  
LCx: Last channel value  
LCI: Last channel index

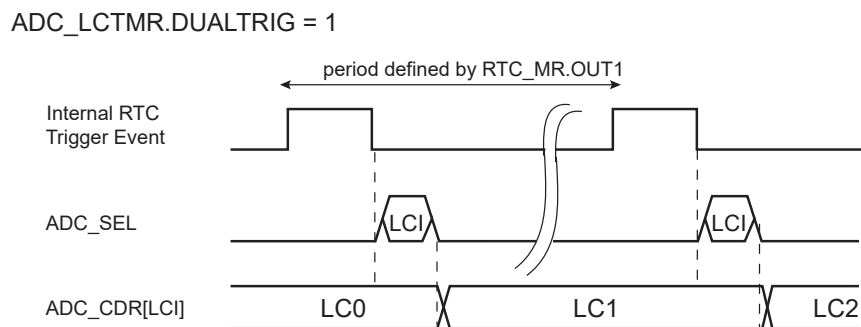

Assuming ADC\_CHSR[0] = 1

If DUALTRIG = 1 and field ADC\_TRGR.TRGMOD = 0 and none of the channels are enabled in ADC\_CHSR (ADC\_CHSR = 0), then only channel 11 is converted at a rate defined by the trigger event signal that can be configured in RTC\_MR.OUT1 (see the following figure).

This mode of operation, when combined with the Sleep mode operation of the ADC Controller, provides a low-power mode for last channel measure. This assumes there is no other ADC conversion to schedule at a high sampling rate or no other channel to convert.

**Figure 67.10.** Only Last Channel Measurement Triggered at Low Speed (ADC\_CHSR[LCI] = 0 and ADC\_TRGR.TRGMOD = 0)

Notes: ADC\_SEL: Command to the ADC analog cell  
LCx: Last channel value  
LCI: Last channel index

### 67.6.13. Enhanced Resolution Mode and Digital Averaging Function

#### 67.6.13.1. Enhanced Resolution Mode

The Enhanced Resolution mode is enabled if the OSR field is configured to 1, 2, 3 or 4 in ADC\_EMR. The enhancement is based on a digital averaging function.

There is no averaging on the last index channel if the measure is triggered by an RTC event.

In this mode, the ADC Controller will trade off conversion speed against accuracy by averaging multiple samples, thus providing a digital low-pass filter function.

The selected oversampling ratio applies to all enabled channels when triggered by an RTC event.

$$ADC\_LCDR.LDATA = \frac{1}{M} \times \sum_{k=0}^{N-1} ADC(k)$$

where N and M are as shown in the table below.

**Table 67.4.** Digital Averaging Function Configuration versus OSR Values

ADC_EMR.OSR Value	ADC_LCDR.LDATA Length	N Value	M Value	Full Scale Value	Maximum Value
0	12 bits	1	1	4095	4095
1	13 bits	4	2	8191	8190
2	14 bits	16	4	16383	16380
3	15 bits	64	8	32767	32760
4	16 bits	256	16	65535	65520

The average result is valid in ADC\_CDRx (x corresponds to the index of the channel) only if the ADC\_ISR.EOCn flag is set and if the ADC\_OVER.OVREN flag is cleared. The average result for all channels is valid in ADC\_LCDR only if ADC\_ISR.DRDY is set and ADC\_ISR.GOVRE is cleared.

Note that ADC\_CDRs are not buffered. Therefore, when an averaging sequence is ongoing, the value in these registers changes after each averaging sample. However, overrun flags in ADC\_OVER rise as soon as the first sample of an averaging sequence is received. Thus the previous averaged value is not read, even if the new averaged value is not ready.

Consequently, when an overrun flag rises in ADC\_OVER, it means that the previous unread data is lost but it does not mean that this data has been overwritten by the new averaged value as the averaging sequence concerning this channel can still be ongoing.

When an oversampling is performed, the maximum value that can be read on ADC\_CDRx or ADC\_LCDR is not the full-scale value, even if the maximum voltage is supplied on the analog input. See table above.

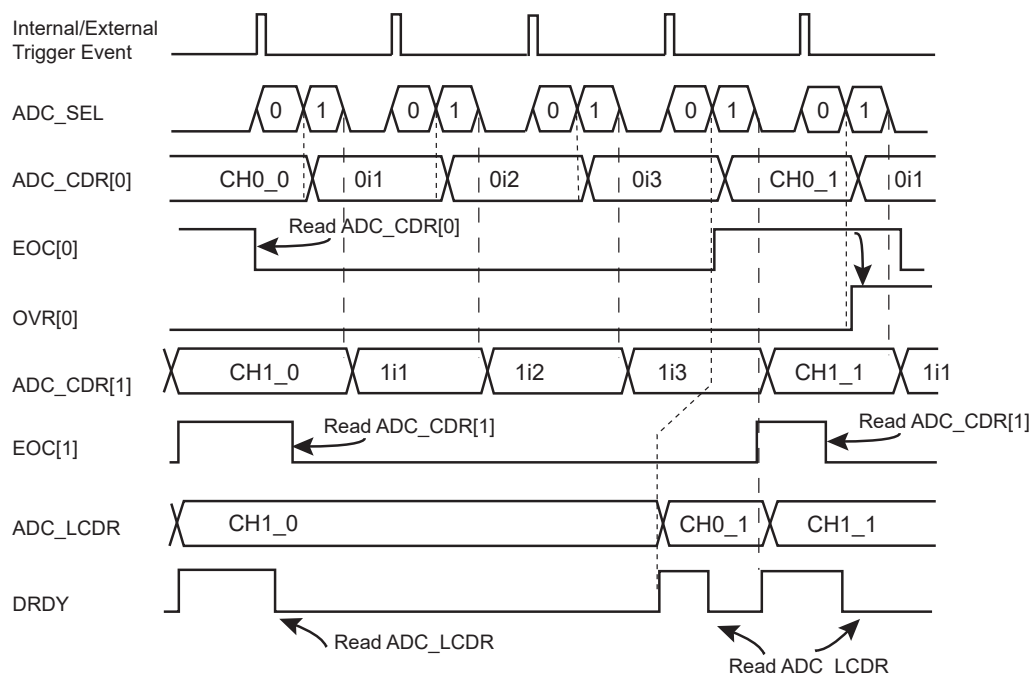

### 67.6.13.2. Averaging Function versus Trigger Events

The samples can be defined in different ways for the averaging function depending on the configuration of ADC\_EMR.ASTE and ADC\_MR.USEQ

When USEQ = 0, there are two possible ways to generate the averaging through the trigger event. If ADC\_EMR.ASTE = 0, every trigger event generates one sample for each enabled channel, as described in the following figure. Therefore, four trigger events are required to obtain the result of averaging if OSR = 1.

**Figure 67.11.** Digital Averaging Function Waveforms Over Multiple Trigger Events

ADC\_EMR.OSR = 1, ASTE = 0, ADC\_CHSR[1:0] = 0x3 and ADC\_MR.USEQ = 0

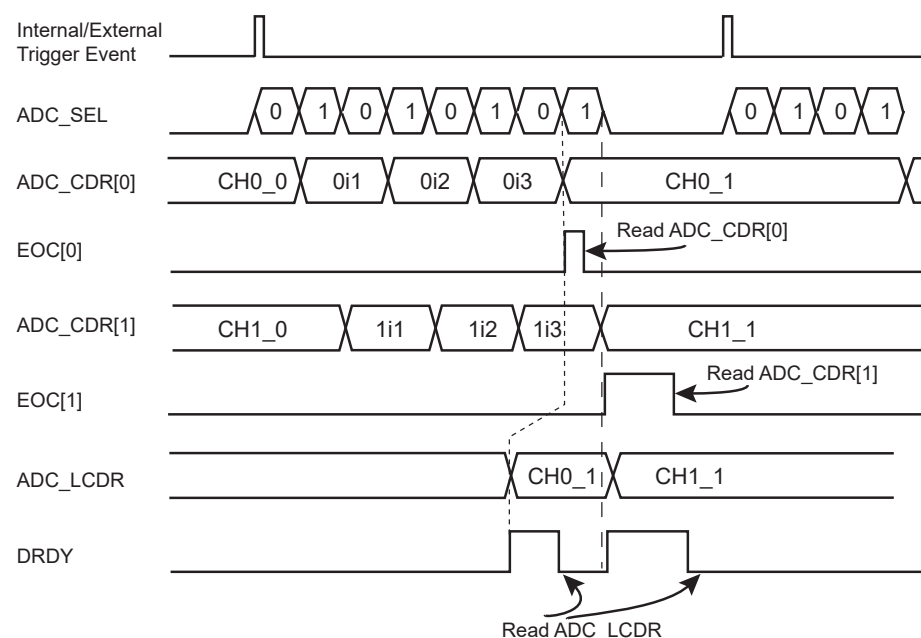

Note: ADC\_SEL: Command to the ADC analog cell  
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

If ADC\_EMR.ASTE = 1 and ADC\_MR.USEQ = 0, the sequence to be converted, defined in ADC\_CHSR, is automatically repeated n times (where n corresponds to the oversampling ratio defined in the ADC\_EMR.OSR field). As a result, only one trigger is required to obtain the result of the averaging function as described in the following figure.

**Figure 67.12.** Digital Averaging Function Waveforms on a Single Trigger Event

ADC\_EMR.OSR = 1, ASTE = 1, ADC\_CHSR[1:0] = 0x3 and ADC\_MR.USEQ = 0

Note: ADC\_SEL: Command to the ADC analog cell  
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

When USEQ = 1, the user can define the channel sequence to be converted by configuring ADC\_SEQR1/2 and ADC\_CHER so that channels are not interleaved during the averaging period. Under these conditions, a sample is defined for each end of conversion as described in the figure below.

When USEQ = 1 and ASTE = 1, OSR can be only configured to 1. Up to three channels can be converted in this mode. The averaging result will be placed in the corresponding ADC\_CDRx and in ADC\_LCDR for each trigger event. The ADC real sample rate remains the maximum ADC sample rate divided by 4.

It is important that the user sequence follows a specific pattern. The user sequence must be programmed in such a way that it generates a stream of conversion, where a same channel is successively converted.

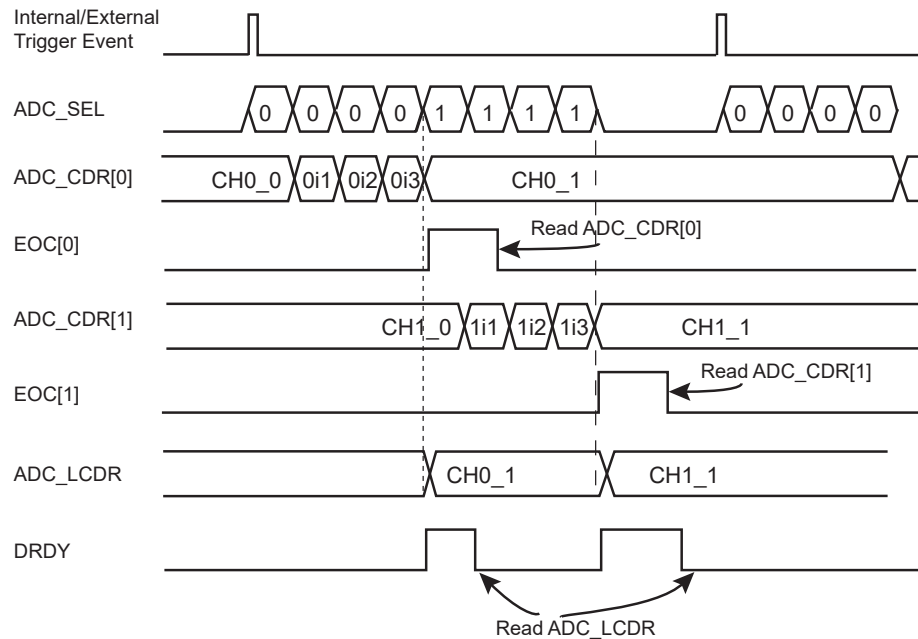

**Table 67.5.** Example Sequence Configurations (USEQ = 1, ASTE = 1, OSR = 1)

Register	Number of Channels Non-interleaved Averaging - Register Value		
	1 (e.g., CH0)	2 (e.g., CH0, CH1)	3 (e.g., CH0, CH1, CH2)
ADC_CHSR	0x0000_000F	0x0000_00FF	0x0000_0FFF
ADC_SEQR1	0x0000_0000	0x1111_0000	0x1111_0000
ADC_SEQR2	0x0000_0000	0x0000_0000	0x0000_2222

**Figure 67.13.** Digital Averaging Function Waveforms on a Single Trigger Event, Non-interleaved

ADC\_EMR.OSR = 1, ASTE = 1, ADC\_CHSR[7:0] = 0xFF and ADC\_MR.USEQ = 1  
ADC\_SEQR1 = 0x1111\_0000

Note: ADC\_SEL: Command to the ADC analog cell  
0i1, 0i2, 0i3, 1i1, 1i2, 1i3 are intermediate results and CH0\_0, CH0\_1, CH1\_0 and CH1\_1 are final results of average function.

#### 67.6.14. Automatic Error Correction

The ADC features automatic error correction of conversion results. Offset and gain error corrections are available. The correction can be enabled for each channel and correction values (offset and gain) are .

To enable error correction, the corresponding ECORRx bit must be set in the Channel Error Correction register (ADC\_CECR). The offset and gain values used to compensate the results are .

The error correction for channels used with the touchscreen is available in the ADC Touchscreen Correction Values register (ADC\_TSCVR).

The ADC\_EMR.ADCMODE field is used to configure a running mode of the ADC Normal mode, Offset Error mode, or Gain Error mode (see [ADC\\_EMR](#)). ADCMODE uses 3 internal references to be measured and to extract the offset and gain error from 3 point-measurement codes. If some references already exist on the final application connected to some input channel ADx, they can be used as a replacement of the ADCMODE to generate the 2 or 3 points of calibration and used to extract the GAINCORR and OFFSETCORR.

After a reset, the running mode of the ADC is Normal mode. Offset Error mode and Gain Error mode are used to determine values of offset compensation and gain compensation, respectively, to apply to conversion results. The table below provides formulas to obtain the compensation values, with:

- OFFSETCORR—the Offset Correction value. OFFSETCORR is a signed value.
- GAINCORR—the Gain Correction value
- GCi—the intermediate Gain Compensation value
- Gs—the value 15
- ConvValue—the value converted by the ADC (as returned in ADC\_LCDR or ADC\_CDR)

- Resolution—the resolution used to process the conversion (either RESOLUTION, RESOLUTION+1, RESOLUTION+2, RESOLUTION+3, RESOLUTION+4).

**Table 67.6. ADC Running Modes**

ADC_EMR.ADCMODE	Mode	Description
0	Normal	Normal mode of operation to perform conversions
1	Offset Error	For unsigned conversions: OFFSETCORR = ConvValue – $2^{(\text{Resolution} - 1)}$ For signed conversions: OFFSETCORR = ConvValue
2	Gain Error	GCI = ConvValue
3		$\text{GAINCORR} = \frac{3584}{\text{GCI} - \text{ConvValue}} \times 2^{(\text{Gs})}$

The final conversion result after error correction is obtained using the following formula:

$$\text{Corrected Data} = (\text{Converted Data} + \text{OFFSETCORR}) \times \frac{\text{GAINCORR}}{2^{(\text{Gs})}}$$

## 67.6.15. Touchscreen

### 67.6.15.1. Touchscreen Mode

The ADC\_TSMR.TSMODE parameter is used to enable/disable the touchscreen functionality, to select the type of screen (4-wire or 5-wire) and, in the case of a 4-wire screen, to activate (or not) the pressure measurement.

In 4-wire mode, channels 0, 1, 2 and 3 must not be used for classic ADC conversions. Likewise, in 5-wire mode, channels 0, 1, 2, 3, and 4 must not be used for classic ADC conversions.

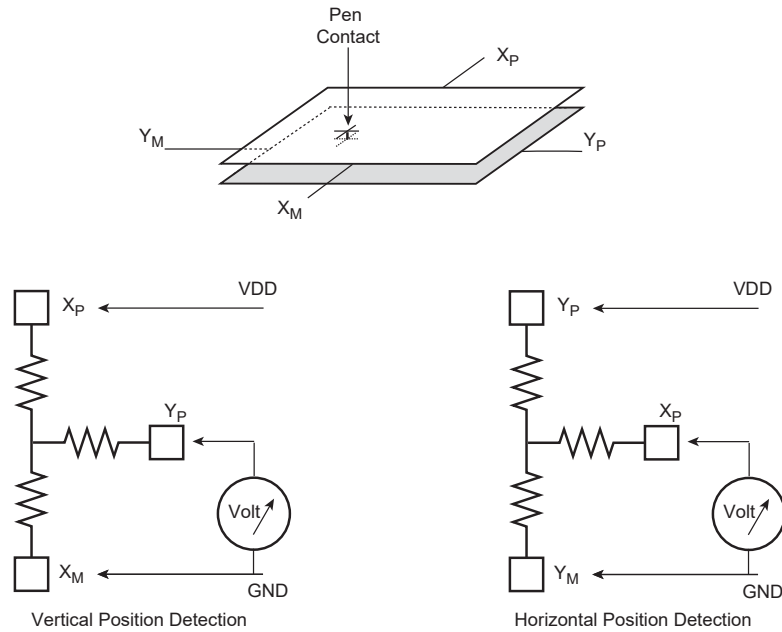

### 67.6.15.2. 4-wire Resistive Touchscreen Principles

A resistive touchscreen is based on two resistive films, each one being fitted with a pair of electrodes, placed at the top and bottom on one film, and on the right and left on the other. In between, there is a layer acting as an insulator, but also enables contact when you press the screen. This is illustrated in the following figure.

The ADC Controller can perform the following tasks without external components:

- position measurement
- pressure measurement
- pen detection

**Figure 67.14.** Touchscreen Position Measurement

#### 67.6.15.3.4-wire Position Measurement Method

As shown in the above figure, to detect the position of a contact, a supply is first applied from top to bottom. Due to the linear resistance of the film, there is a voltage gradient from top to bottom. When a contact is performed on the screen, the voltage propagates at the point the two surfaces come into contact. If the input impedance on the right and left electrodes is high enough, the film intrinsic resistor does not affect this voltage.

For the horizontal direction, the same method is used, but by applying supply from left to right. The range depends on the supply voltage and on the loss in the switches that connect to the top and bottom electrodes.

In an ideal world (linear, with no loss through switches), the horizontal position is equal to:

$$VY_M / VDD \text{ or } VY_P / VDD.$$

The implementation with on-chip power switches is shown in the figure below. The voltage measurement at the output of the switch compensates for the switches loss.

It is possible to correct for switch loss by performing the operation:

$$[VY_P - VX_M] / [VX_P - VX_M].$$

This requires additional measurements, as shown in the figure below.

**Figure 67.15. Touchscreen Switches Implementation**

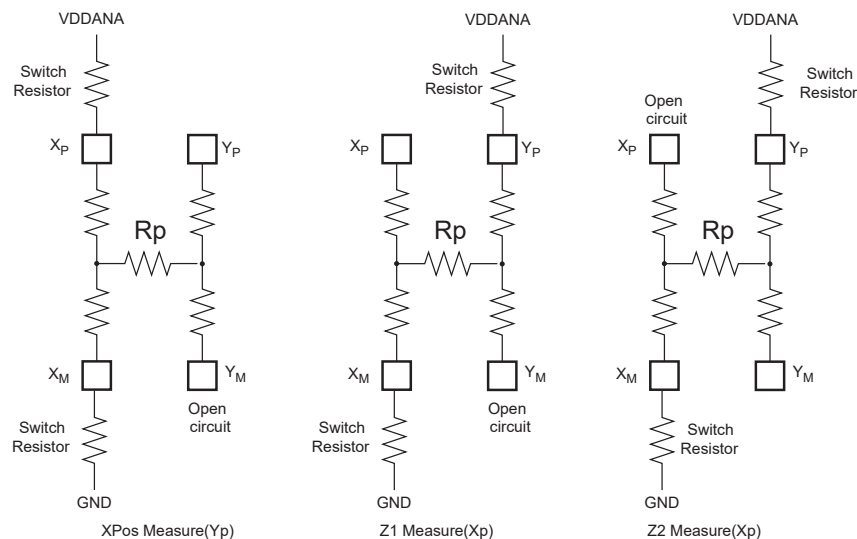

#### 67.6.15.4.4-wire Pressure Measurement Method

The method to measure the pressure ( $R_p$ ) applied to the touchscreen is based on the known resistance of the X-Panel resistance ( $R_{xp}$ ).

Three conversions ( $X_{pos}, Z1, Z2$ ) are necessary to determine the value of  $R_p$  (Zaxis resistance).

$$R_p = R_{xp} \times (X_{pos}/1024) \times [(Z2/Z1)-1]$$

**Figure 67.16. Pressure Measurement**

#### 67.6.15.5.5-wire Resistive Touchscreen Principles

To make a 5-wire touchscreen, a resistive layer with a contact point at each corner and a conductive layer are used.

The 5-wire touchscreen differs from the 4-wire type mainly in that the voltage gradient is applied only to one layer, the resistive layer, while the other layer is the sense layer for both measurements.

The measurement of the X position is obtained by biasing the upper left corner and lower left corner to  $V_{DDANA}$  and the upper right corner and lower right to ground.

To measure along the Y axis, bias the upper left corner and upper right corner to  $V_{DDANA}$  and bias the lower left corner and lower right corner to ground.

**Figure 67.17. 5-Wire Principle**

#### 67.6.15.6.5-wire Position Measurement Method

In an application only monitoring clicks, 100 points per second is typically needed. For handwriting or motion detection, the number of measurements to consider is approximately 200 points per second. This must take into account that multiple measurements are included (over sampling, filtering) to compute the correct point.

The 5-wire touchscreen panel works by applying a voltage at the corners of the resistive layer and measuring the vertical or horizontal resistive network with the sense input. The ADC converts the voltage measured at the point the panel is touched.

A measurement of the Y position of the pointing device is made by:

- Connecting Upper left (UL) and upper right (UR) corners to VDDANA
- Connecting Lower left (LL) and lower right (LR) corners to ground.

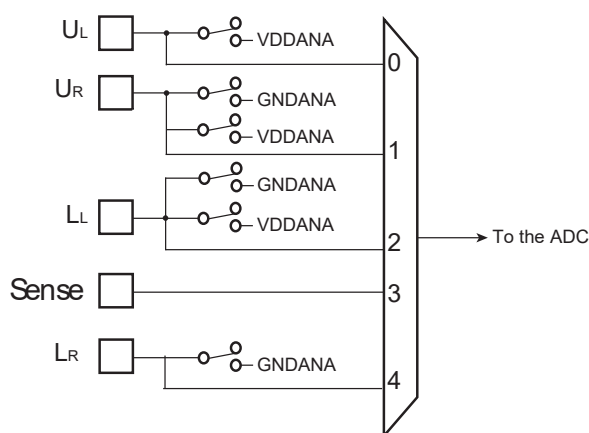

The voltage measured is determined by the voltage divider developed at the point of touch (Y position) and the SENSE input is converted by ADC.

A measurement of the X position of the pointing device is made by:

- Connecting the upper left (UL) and lower left (LL) corners to ground
- Connecting the upper right and lower right corners to VDDANA.

The voltage measured is determined by the voltage divider developed at the point of touch (X position) and the SENSE input is converted by ADC.

**Figure 67.18.** Touchscreen Switches Implementation

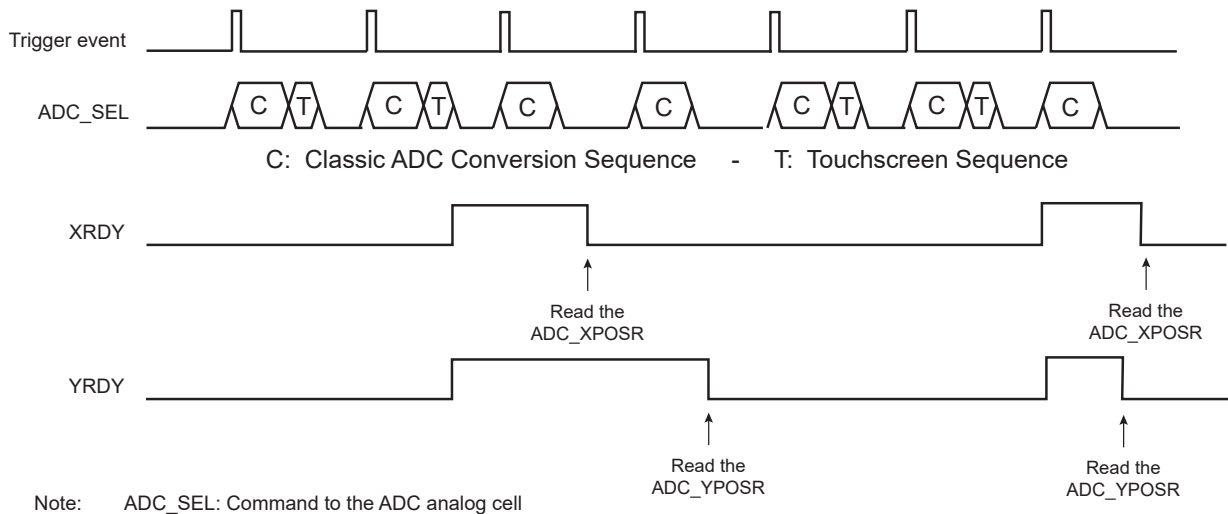

#### 67.6.15.7. Sequence and Noise Filtering

The ADC Controller can manage ADC conversions and touchscreen measurement. On each trigger event the sequence of ADC conversions is performed as described in [Sleep Mode and Conversion Sequencer](#). The touchscreen measure frequency can be specified in number of trigger events by writing the ADC\_TSMR.TSFREQ parameter. An internal counter counts triggers up to TSFREQ, and

every time it rolls out, a touchscreen sequence is appended to the classic ADC conversion sequence (see figure below).

Additionally the user can average multiple touchscreen measures by writing the ADC\_TSMR.TSAV parameter. This can be 1, 2, 4 or 8 measures performed on consecutive triggers as illustrated in the figure below. Consequently, the ADC\_TSMR.TSFREQ parameter must be greater than or equal to the ADC\_TSMR.TSAV parameter.

**Figure 67.19.** Insertion of Touchscreen Sequences (TSFREQ = 2; TSAV = 1)

#### 67.6.15.8. Measured Values, Registers and Flags

As soon as the controller finishes the Touchscreen sequence, XRDY, YRDY and PRDY are set and can generate an interrupt. These flags can be read in the Interrupt Status register (ADC\_ISR). They are reset independently by reading in the ADC Touchscreen X Position register (ADC\_XPOSR), the ADC Touchscreen Y Position register (ADC\_YPOSR) and the ADC Touchscreen Pressure register (ADC\_PRESSR).

ADC\_XPOSR presents XPOS (VX - VXmin) on its LSB and XSCALE (VXMAX - VXmin) aligned on the 16th bit.

ADC\_YPOSR presents YPOS (VY - VYmin) on its LSB and YSCALE (VYMAX - VYmin) aligned on the 16th bit.

To improve the quality of the measure, the user must calculate XPOS/XSCALE and YPOS/YSCALE.

VXMAX, VXmin, VYMAX, and VYmin are measured at the first start-up of the controller. These values can change during use, so it can be necessary to refresh them. Refresh can be done by writing '1' in the ADC\_CR.TSCALIB field.

ADC\_PRESSR presents Z1 on its LSB and Z2 aligned on the 16th bit. See [4-wire Pressure Measurement Method](#).

#### 67.6.15.9. Pen Detect Method

When there is no contact, it is not necessary to perform a conversion. However, it is important to detect a contact by keeping the power consumption as low as possible.

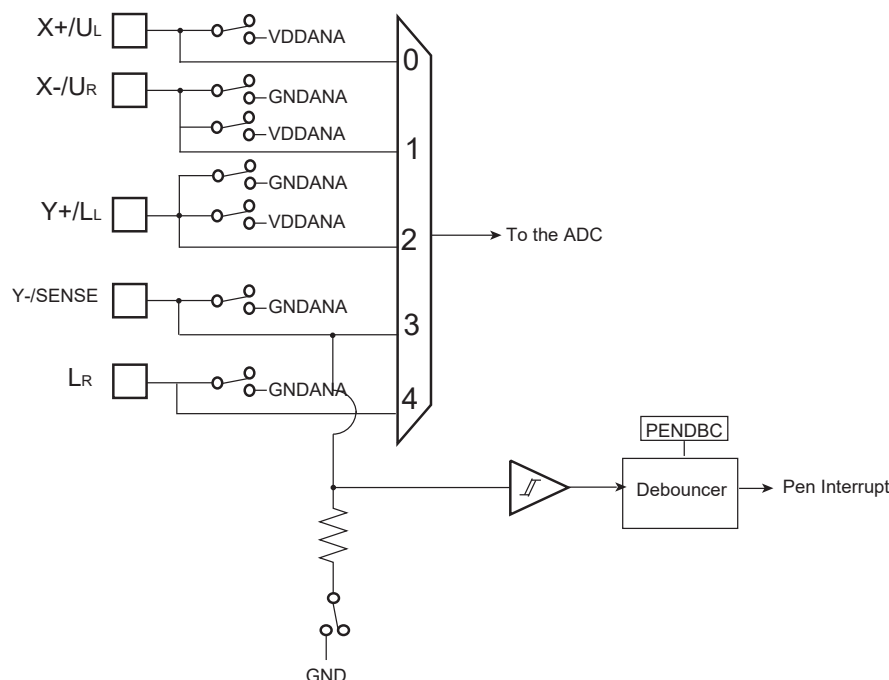

The implementation polarizes one panel by closing the switch on ( $X_P/U_L$ ) and ties the horizontal panel by an embedded resistor connected to  $Y_M$  / Sense. This resistor is enabled by a fifth switch. Since there is no contact, no current is flowing and there is no related power consumption. As soon as a contact occurs, a current is flowing in the Touchscreen and a Schmitt trigger detects the voltage in the resistor.

The Touchscreen Interrupt configuration is entered by programming ADC\_TSMR.PENDET. If this bit is written at 1, the controller samples the pen contact state when it is not converting and waiting for a trigger.

To complete the circuit, a programmable debouncer is placed at the output of the Schmitt trigger. This debouncer is programmable up to  $2^{15}$  ADC clock periods. The debouncer length can be selected by programming the ADC\_TSMR.PENDBC field.

Due to the analog switch's structure, the debouncer circuitry is only active when no conversion (touchscreen or classic ADC channels) is in progress. Thus, if the time between the end of a conversion sequence and the arrival of the next trigger event is lower than the debouncing time configured on ADC\_TSMR.PENDBC, the debouncer will not detect any contact.

**Figure 67.20.** Touchscreen Pen Detect

The touchscreen pen detect can be used to generate an ADC interrupt to wake up the system. The pen detect generates two types of status, reported in ADC\_ISR:

- ADC\_ISR.PEN is set as soon as a contact exceeds the debouncing time as defined by ADC\_TSMR.PENDBC and remains set until ADC\_ISR is read.
- ADC\_ISR.NOPEN is set as soon as no current flows for a time over the debouncing time as defined by PENDBC and remains set until ADC\_ISR is read.

Both bits are automatically cleared as soon as ADC\_ISR is read, and can generate an interrupt by writing ADC\_IER.

Moreover, the rising of either one of them clears the other, they cannot be set at the same time.

ADC\_ISR.PENS shows the current status of the pen contact.

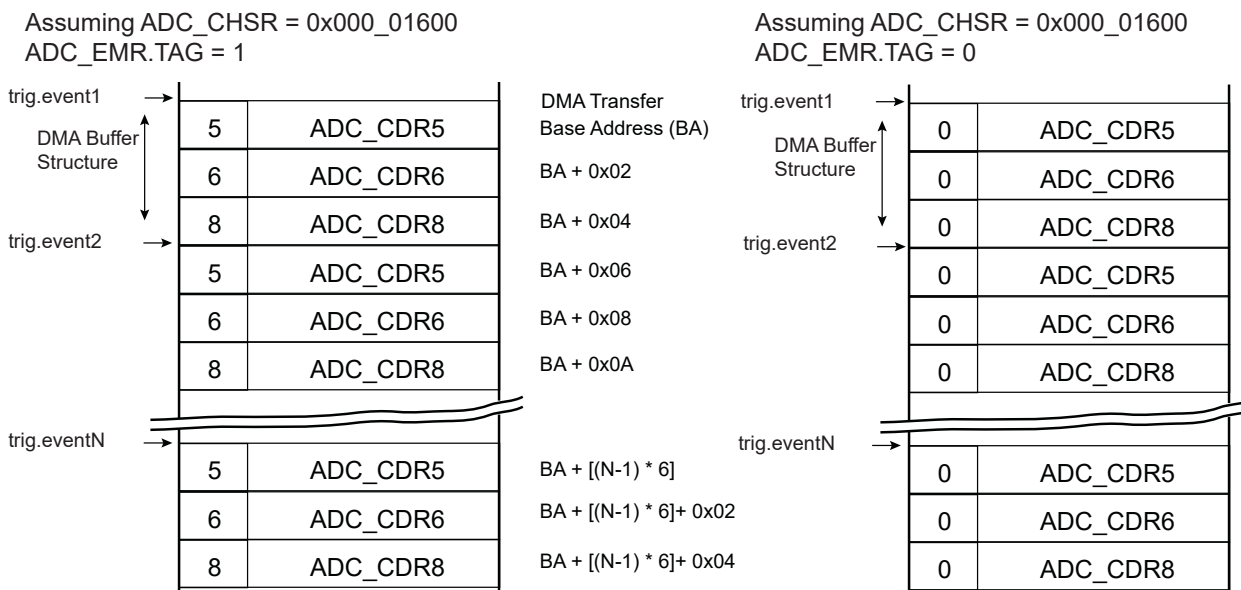

#### 67.6.16. Buffer Structure

The DMA read channel is triggered each time a new data is stored in ADC\_LCDR. The same data structure is repeatedly stored in ADC\_LCDR each time a trigger event occurs. Depending on user mode of operation (ADC\_MR, ADC\_CHSR, ADC\_SEQR1, ADC\_SEQR2, ADC\_TSMR) the structure differs. Each data read to DMA buffer, carried on a half-word (16-bit), consists of last converted data right-aligned and when the ADC\_EMR.TAG is set, the four most significant bits are carrying the channel

number thus allowing an easier postprocessing in the DMA buffer or better checking the DMA buffer integrity.

**Figure 67.21. Buffer Structure**

As soon as touchscreen conversions are required, the pen detection function can help the postprocessing of the buffer. See [Pen Detection Status](#).

#### 67.6.16.1. Classic ADC Channels Only (Touchscreen Disabled)

When no touchscreen conversion is required (i.e., ADC\_TSMR.TSMODE = 0), the data structure within the buffer is defined by ADC\_MR, ADC\_CHSR, ADC\_SEQ1/2. See figure [Buffer Structure](#).

If the user sequence is not used (i.e., ADC\_MR.USEQ is cleared) then only the value of ADC\_CHSR defines the data structure. For each trigger event, enabled channels will be consecutively stored in ADC\_LCDR and automatically read to the buffer.

When the user sequence is configured (i.e., ADC\_MR.USEQ is set) not only does ADC\_CHSR modify the data structure of the buffer, but ADC\_SEQ1/2 may modify the data structure of the buffer as well.

#### 67.6.16.2. Touchscreen Channels Only

When only touchscreen conversions are required (i.e., TSMODE ≠ 0 in ADC\_TSMR and ADC\_CHSR equals 0), the structure of data within the buffer is defined by ADC\_TSMR.

When TSMODE = 1 or 3, each trigger event adds two half-words in the buffer (assuming TSAV = 0), first half-word being ADC\_XPOSR.XPOS, then ADC\_YPOSR.YPOS. If TSAV/TSFREQ ≠ 0, the data structure remains unchanged. Not all trigger events add data to the buffer.

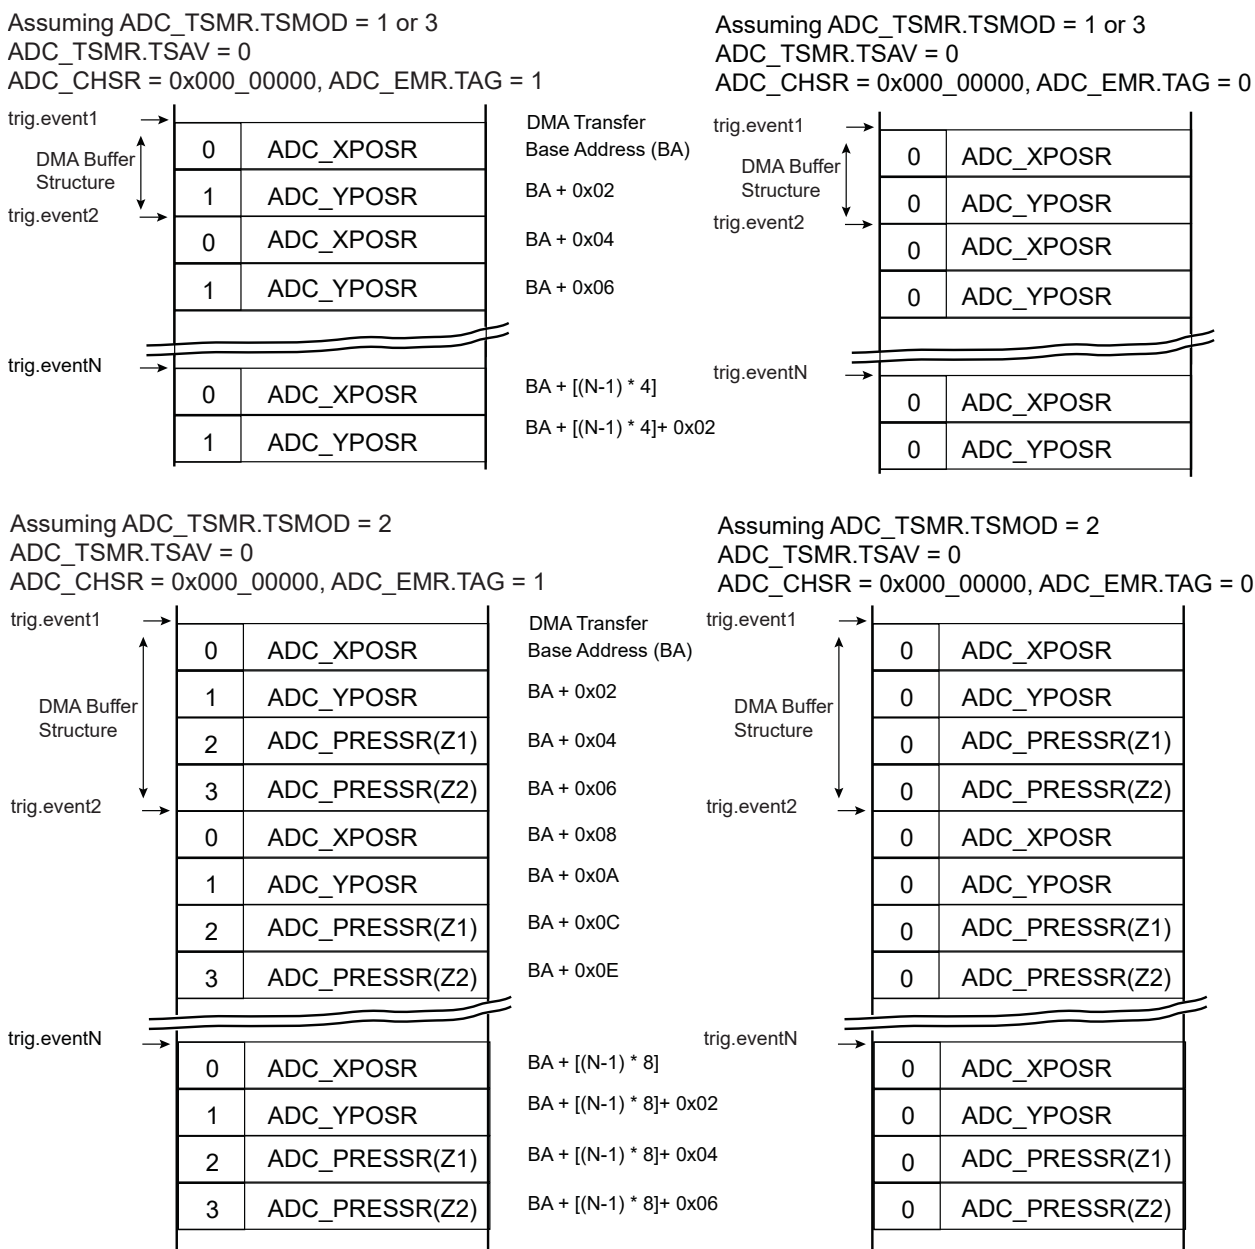

When TSMODE = 2, each trigger event adds four half-words to the buffer (assuming TSAV = 0), first half-word being ADC\_XPOSR.XPOS, followed by ADC\_YPOSR.YPOS and finally ADC\_PRESSR.Z1, followed by ADC\_PRESSR.Z2.

When ADC\_EMR.TAG is set, the CHNB field (four most significant bits of ADC\_LCDR) is cleared when ADC\_XPOSR.XPOS is transmitted and set when ADC\_YPOSR.YPOS is transmitted, allowing an easier post-processing of the buffer or a better checking of the buffer integrity. In case 4-wire with Pressure mode is selected, the Z1 value is transmitted to the buffer along with tag set to 2 and Z2 is tagged with value 3.

XSCALE and YSCALE (calibration values) are not transmitted to the buffer because they are supposed to be constant and moreover only measured at the very first start-up of the controller or upon user request.

There is no change in buffer structure whatever the value of PENDET.ADC\_TSMR, but it is recommended to use the pen detection function for buffer postprocessing (see [Pen Detection Status](#)).

**Figure 67.22.** Buffer Structure When Only Touchscreen Channels are Enabled

### 67.6.16.3. Interleaved Channels

When both classic ADC channels (CH4/CH5 up to CH12) are set in ADC\_CHSR and touchscreen conversions are required (TSMODE ≠ 0 in ADC\_TSMR), the structure of the buffer differs according to the ADC\_TSMR.TSAV and ADC\_TSMR.TSFREQ values.

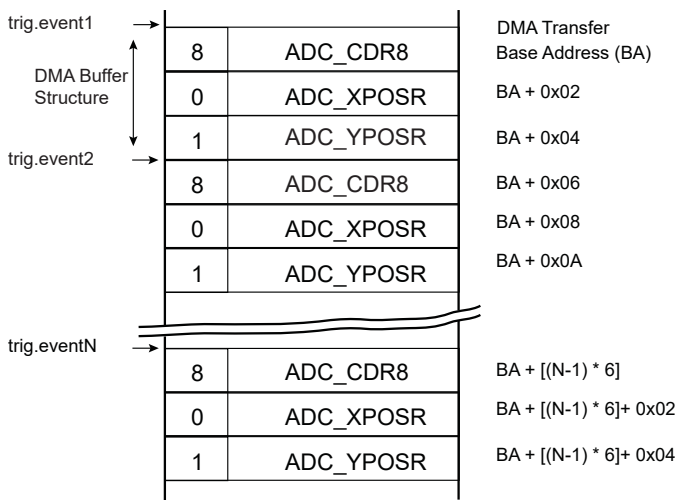

If  $TSFREQ \neq 0$ , not all events generate touchscreen conversions, therefore the buffer structure is based on  $2^{TSFREQ}$  trigger events. Given a  $TSFREQ$  value, the location of touchscreen conversion results depends on  $TSAV$  value.

When  $TSFREQ = 0$ ,  $TSAV$  must equal 0.

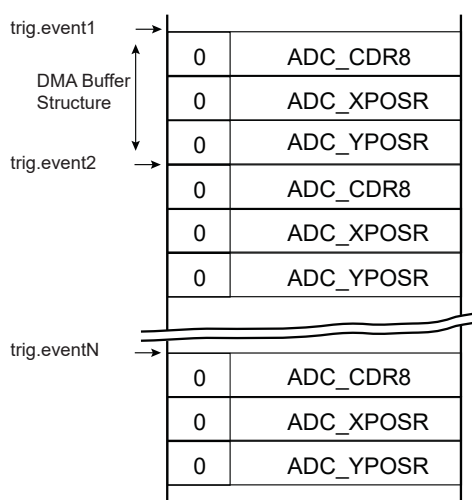

There is no change in buffer structure whatever the value of  $ADC\_TSMR.PENDET$ , but it is recommended to use the pen detection function for buffer post-processing (see [Pen Detection Status](#)).

**Figure 67.23.** Buffer Structure When Classic ADC and Touchscreen Channels are Interleaved

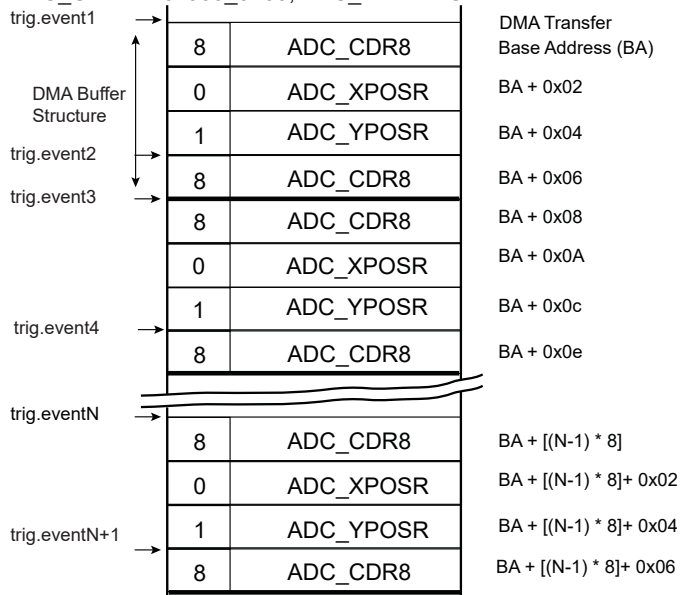

Assuming  $ADC\_TSMR.TSMOD = 1$   
 $ADC\_TSMR.TSAV = ADC\_TSMR.TSFREQ = 0$   
 $ADC\_CHSR = 0x000\_0100$ ,  $ADC\_EMR.TAG = 1$

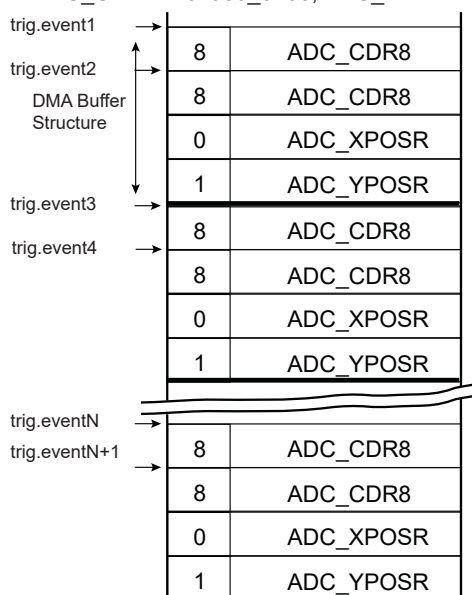

Assuming  $ADC\_TSMR.TSMOD = 1$   
 $ADC\_TSMR.TSAV = ADC\_TSMR.TSFREQ = 0$   
 $ADC\_CHSR = 0x000\_0100$ ,  $ADC\_EMR.TAG = 0$

Assuming  $ADC\_TSMR.TSMOD = 1$   
 $ADC\_TSMR.TSAV = 0$ ,  $ADC\_TSMR.TSFREQ = 1$   
 $ADC\_CHSR = 0x000\_0100$ ,  $ADC\_EMR.TAG = 1$

Assuming  $ADC\_TSMR.TSMOD = 1$   
 $ADC\_TSMR.TSAV = 1$ ,  $ADC\_TSMR.TSFREQ = 1$   
 $ADC\_CHSR = 0x000\_0100$ ,  $ADC\_EMR.TAG = 1$

#### 67.6.16.4. Pen Detection Status

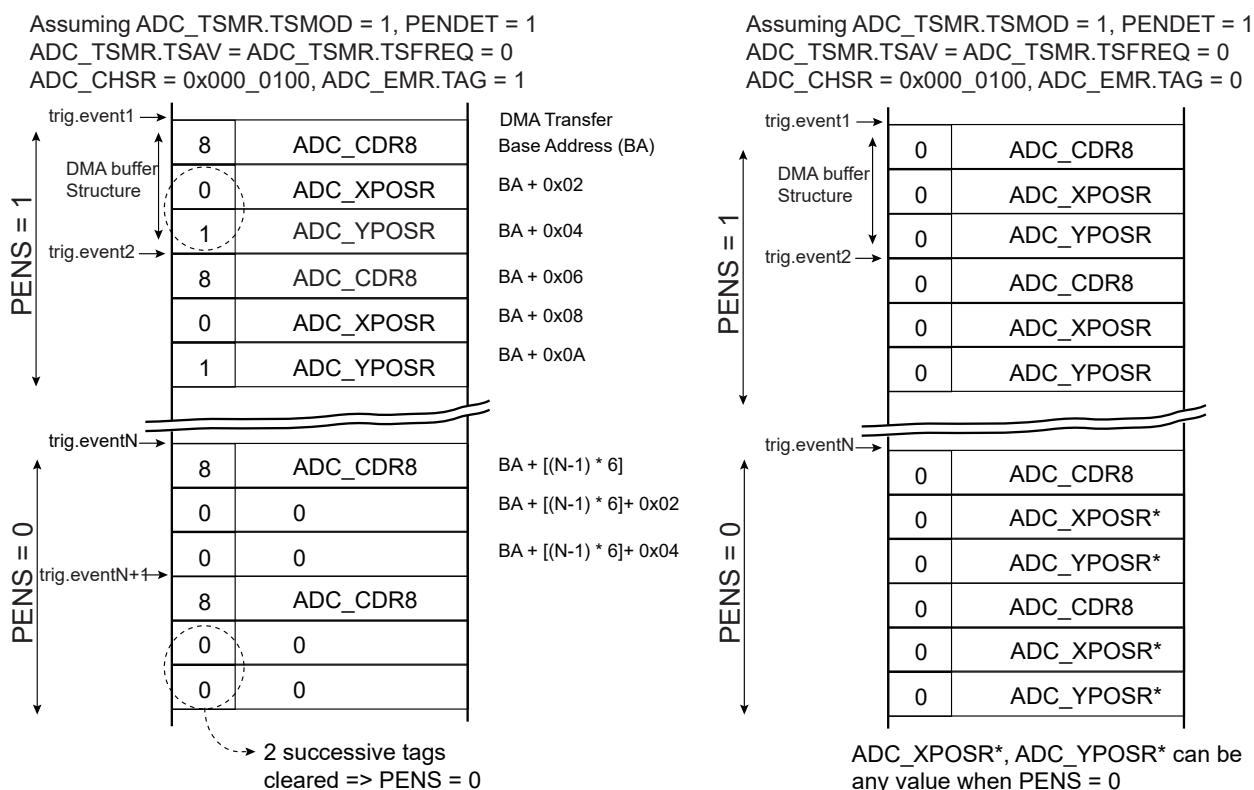

If the pen detection measure is enabled ( $ADC\_TSMR.PENDET$  is set), the XPOS, YPOS, Z1, Z2 values transmitted to the buffer through  $ADC\_LCDR$  are cleared (including the CHNB field), if the

ADC\_ISR.PENS flag is 0. When the ADC\_ISR.PENS flag is set, XPOS, YPOS, Z1, Z2 are normally transmitted.

Therefore, using pen detection together with tag function eases the post-processing of the buffer, especially to determine which touchscreen converted values correspond to a period of time when the pen was in contact with the screen.

When the pen detection is disabled or the tag function is disabled, XPOS, YPOS, Z1, Z2 are normally transmitted without tag and no relationship can be found with pen status, thus post-processing may not be easy.

**Figure 67.24.** Buffer Structure With and Without Pen Detection Enabled

## 67.6.17. Fault Event

The ADC Controller internal fault output is directly connected to the PWM fault input. The fault event may be asserted depending on the configuration of ADC\_EMR, ADC\_CWR, ADC\_LCMR and ADC\_LCCWR and converted values.

Two types of comparison can trigger a comparison event (fault output pulse):

- The first comparison type is based on ADC\_LCCWR settings, i.e., on all converted channels except the last one;
- The second comparison type is linked to the last channel.

As an example, overcurrent and temperature exceeding limits can trigger a fault to PWM.

When the comparison event occurs, the ADC fault output generates a pulse of one peripheral clock cycle to the PWM fault input. This fault line can be enabled or disabled within PWM. Should it be activated and asserted by the ADC Controller, the PWM outputs are immediately placed in a safe state (pure combinational path). Note that the ADC fault output connected to the PWM is not the COMPE bit. Thus the Fault mode (FMODE) within the PWM configuration must be FMODE = 1.

### 67.6.18. Register Write Protection

To prevent any single software error from corrupting ADC behavior, certain registers in the address space can be write-protected by setting the bits WPEN and WPITEN in the [ADC\\_WPMR](#).

If a write access to the protected registers is detected, the WPVS flag in the [ADC\\_WPSR](#) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS flag is automatically reset by reading [ADC\\_WPSR](#).

The following registers are write-protected when [ADC\\_WPMR.WPEN](#) is set:

- [ADC Mode Register](#)
- [ADC Channel Sequence 1 Register](#)
- [ADC Channel Sequence 2 Register](#)
- [ADC Channel Enable Register](#)
- [ADC Channel Disable Register](#)
- [ADC Last Channel Trigger Mode Register](#)
- [ADC Last Channel Compare Window Register](#)
- [ADC Extended Mode Register](#)
- [ADC Compare Window Register](#)
- [ADC Channel Configuration Register](#)
- [ADC Analog Control Register](#)
- [ADC Pseudo-Differential Register](#)
- [ADC\\_Touchscreen Mode Register](#)
- [ADC Trigger Register](#)

### 67.7.1. ADC Control Register

**Name:** ADC\_CR  
**Offset:** 0x00  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPCTEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
				CMPRST		TSCALIB	START	SWRST
Access				W		W	W	W
Reset				–		–	–	–

#### Bit 4 – CMPRST Comparison Restart

Value	Description
0	No effect.
1	Stops the conversion result storage until the next comparison match.

#### Bit 2 – TSCALIB Touchscreen Calibration

If conversion is in progress, the calibration sequence starts at the beginning of a new conversion sequence. If no conversion is in progress, the calibration sequence starts at the second conversion sequence located after the TSCALIB command (Sleep mode, waiting for a trigger event). TSCALIB measurement sequence does not affect the Last Converted Data register (ADC\_LCDR).

Value	Description
0	No effect.
1	Programs screen calibration (VDD/GND measurement)

#### Bit 1 – START Start Conversion

Value	Description
0	No effect.
1	Triggers a single sequence of analog-to-digital conversions if ADC_TRGR.TRGMOD=0.

#### Bit 0 – SWRST Software Reset

Value	Description
0	No effect.

Value	Description
1	Resets the ADC.

**67.7.2. ADC Mode Register**

**Name:** ADC\_MR  
**Offset:** 0x04  
**Reset:** 0x20000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	USEQ	MAXSPEED	TRANSFER[1:0]		TRACKTIM[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	ANACH				STARTUP[3:0]			
Access	R/W				R/W	R/W	R/W	R/W
Reset	0				0	0	0	0
Bit	15	14	13	12	11	10	9	8
	PRESCAL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
		FWUP	SLEEP		TRGSEL[2:0]			
Access		R/W	R/W		R/W	R/W	R/W	
Reset		0	0		0	0	0	

**Bit 31 – USEQ** User Sequence Enable

Value	Name	Description
0	NUM_ORDER	Normal mode: the controller converts channels in a simple numeric order depending only on the channel index.
1	REG_ORDER	User Sequence mode: the sequence respects what is defined in ADC_SEQR1 and ADC_SEQR2 and can be used to convert the same channel several times.

**Bit 30 – MAXSPEED** Maximum Sampling Rate Enable in Freerun Mode

This bit should always be set to 1.

**Bits 29:28 – TRANSFER[1:0]** Transfer Time

The TRANSFER field must be set to 2 to guarantee the optimal transfer time.

**Bits 27:24 – TRACKTIM[3:0]** Tracking Time

ADC_EMR.TRACK4X	TRACKTIM		
	0 to 3	4 to 14	15
0	$6 \times t_{ADCLK}$		$7 \times t_{ADCLK}$
1	$6 \times t_{ADCLK}$	$[(4 \times (\text{TRACKTIM} + 1)) - 10] \times t_{ADCLK}$	

**Bit 23 – ANACH** Analog Change

Value	Name	Description
0	NONE	No analog change on channel switching: DIFF0 is used for all channels.
1	ALLOWED	Allows different analog settings for each channel. .

### Bits 19:16 – STARTUP[3:0] Start-Up Time

Value	Name	Description
0	SUT0	0 periods of ADCCLK
1	SUT8	8 periods of ADCCLK
2	SUT16	16 periods of ADCCLK
3	SUT24	24 periods of ADCCLK
4	SUT64	64 periods of ADCCLK
5	SUT80	80 periods of ADCCLK
6	SUT96	96 periods of ADCCLK
7	SUT112	112 periods of ADCCLK
8	SUT512	512 periods of ADCCLK
9	SUT576	576 periods of ADCCLK
10	SUT640	640 periods of ADCCLK
11	SUT704	704 periods of ADCCLK
12	SUT768	768 periods of ADCCLK
13	SUT832	832 periods of ADCCLK
14	SUT896	896 periods of ADCCLK
15	SUT960	960 periods of ADCCLK

### Bits 15:8 – PRESCAL[7:0] Prescaler Rate Selection

$$\text{PRESCAL} = (f_{\text{peripheral clock}} / (2 \times f_{\text{ADCCLK}})) - 1.$$

### Bit 6 – FWUP Fast Wake-Up

Value	Name	Description
0	OFF	If SLEEP is 1, then both ADC core and reference voltage circuitry are off between conversions.
1	ON	If SLEEP is 1, then Fast Wake-Up Sleep mode: the voltage reference is on between conversions and ADC core is off.

### Bit 5 – SLEEP Sleep Mode

Value	Name	Description
0	NORMAL	Normal mode: the ADC core and reference voltage circuitry are kept on between conversions.
1	SLEEP	Sleep mode: the wake-up time can be modified by programming the FWUP bit.

### Bits 3:1 – TRGSEL[2:0] Trigger Selection

The trigger selection can be performed only if ADC\_TRGR.TRGMOD = 1, 2 or 3.

Value	Name	Description
0	ADC_TRIG0	ADTRG
1	ADC_TRIG1	TIOA0
2	ADC_TRIG2	TIOA1
3	ADC_TRIG3	TIOA2
4	ADC_TRIG4	RTCOU1
5	ADC_TRIG5	Reserved
6	ADC_TRIG6	Reserved
7	ADC_TRIG7	Reserved

### 67.7.3. ADC Channel Sequence 1 Register

**Name:** ADC\_SEQR1  
**Offset:** 0x08  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	USCH8[3:0]				USCH7[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	USCH6[3:0]				USCH5[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	USCH4[3:0]				USCH3[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	USCH2[3:0]				USCH1[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 0:3, 4:7, 8:11, 12:15, 16:19, 20:23, 24:27, 28:31 – USCHx User Sequence Number x

This register can be used only if the ADC\_MR.USEQ field is set to '1'.

Any USCHx field is processed only if the ADC\_CHSR.CHx-1 bit reads logical '1', else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

Example: for each trigger event, to obtain the "CH3 CH1 CH0 CH4 CH4" conversion sequence, use the following settings:

ADC\_SEQR1.USCH1=3, ADC\_CHSR.CH0=1

ADC\_SEQR1.USCH2=1, ADC\_CHSR.CH1=1

ADC\_SEQR1.USCH3=0, ADC\_CHSR.CH2=1

ADC\_SEQR1.USCH4=4, ADC\_CHSR.CH3=1

ADC\_SEQR1.USCH5=4, ADC\_CHSR.CH4=1

#### 67.7.4. ADC Channel Sequence 2 Register

**Name:** ADC\_SEQR2  
**Offset:** 0x0C  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	USCH12[3:0]				USCH11[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	USCH10[3:0]				USCH9[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

#### Bits 0:3, 4:7, 8:11, 12:15 – USCHx User Sequence Number x

This register can be used only if the ADC\_MR.USEQ field is set to '1'.

Any USCHx field is processed only if the ADC\_CHSR.CHx-1 bit reads logical '1', else any value written in USCHx does not add the corresponding channel in the conversion sequence.

Configuring the same value in different fields leads to multiple samples of the same channel during the conversion sequence. This can be done consecutively, or not, according to user needs.

## 67.7.5. ADC Channel Enable Register

**Name:** ADC\_CHER  
**Offset:** 0x10  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					CH11	CH10	CH9	CH8
Access					W	W	W	W
Reset					–	–	–	–
Bit	7	6	5	4	3	2	1	0
	CH7	CH6	CH5	CH4	CH3	CH2	CH1	CH0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx Channel x Enable

If ADC\_MR.USEQ = 1, CHx corresponds to the enable of sequence number x+1 described in ADC\_SEQR1 and ADC\_SEQR2 (for example, CH0 enables sequence number USCH1).

Value	Description
0	No effect.
1	Enables the corresponding channel.

## 67.7.6. ADC Channel Disable Register

**Name:** ADC\_CHDR  
**Offset:** 0x14  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					CH11	CH10	CH9	CH8
Access					W	W	W	W
Reset					–	–	–	–
Bit	7	6	5	4	3	2	1	0
	CH7	CH6	CH5	CH4	CH3	CH2	CH1	CH0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx** Channel x Disable

**WARNING**

If the corresponding channel is disabled during a conversion or if it is disabled and then reenabled during a conversion, its associated data and corresponding EOCx and GOVRE flags in ADC\_ISR and OVREx flags in ADC\_OVER are unpredictable

Value	Description
0	No effect.
1	Disables the corresponding channel.

## 67.7.7. ADC Channel Status Register

**Name:** ADC\_CHSR  
**Offset:** 0x18  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					CH11	CH10	CH9	CH8
Access					W	W	W	W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CH7	CH6	CH5	CH4	CH3	CH2	CH1	CH0
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – CHx Channel x Status

Value	Description
0	The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is disabled.
1	The corresponding channel (or part of sequence, see ADC_SEQyR.USCHx field) is enabled. As an example, when ADC_MR.USEQ=1 and ADC_CHSR.CH2=1, the channel configured in ADC_SEQ1R.USCH3 is part of the sequence of conversions.

## 67.7.8. ADC Last Converted Data Register

**Name:** ADC\_LCDR  
**Offset:** 0x20  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
				CHNBOSR[4:0]				
Access				R	R	R	R	R
Reset				0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	LDATA[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	LDATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 28:24 – CHNBOSR[4:0] Channel Number in Oversampling Mode

Indicates the last converted channel when the ADC\_EMR.TAG bit is set and the ADC\_EMR0.OSR field is not equal to 0. If the ADC\_EMR.TAG bit is not set, CHNBOSR = 0.

### Bits 15:0 – LDATA[15:0] Last Data Converted

The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed.

If OSR = 0 and TAG = 1 in ADC\_EMR, the 4 MSBs of LDATA carry the channel number to obtain a packed system memory buffer made of 1 converted data stored in a halfword (16-bit) instead of 1 converted data in a 32-bit word, thus dividing by 2 the size of the memory buffer.

**67.7.9. ADC Interrupt Enable Register**

**Name:** ADC\_IER  
**Offset:** 0x24  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [ADC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
		NOPEN	PEN			COMPE	GOVRE	DRDY
Access		W	W			W	W	W
Reset		–	–			–	–	–

Bit	23	22	21	20	19	18	17	16
		PRDY	YRDY	XRDY	LCCHG			
Access		W	W	W	W			
Reset		–	–	–	–			

Bit	15	14	13	12	11	10	9	8
					EOC11	EOC10	EOC9	EOC8
Access					W	W	W	W
Reset					–	–	–	–

Bit	7	6	5	4	3	2	1	0
	EOC7	EOC6	EOC5	EOC4	EOC3	EOC2	EOC1	EOC0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 30 – NOPEN** No Pen Contact Interrupt Enable

**Bit 29 – PEN** Pen Contact Interrupt Enable

**Bit 26 – COMPE** Comparison Event Interrupt Enable

**Bit 25 – GOVRE** General Overrun Error Interrupt Enable

**Bit 24 – DRDY** Data Ready Interrupt Enable

**Bit 22 – PRDY** Touchscreen Measure Pressure Ready Interrupt Enable

**Bit 21 – YRDY** Touchscreen Measure YPOS Ready Interrupt Enable

**Bit 20 – XRDY** Touchscreen Measure XPOS Ready Interrupt Enable

**Bit 19 – LCCHG** Last Channel Change Interrupt Enable

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion Interrupt Enable x

**67.7.10. ADC Interrupt Disable Register**

**Name:** ADC\_IDR  
**Offset:** 0x28  
**Reset:** –  
**Property:** Write-only

This register can only be written if the WPITEN bit is cleared in the [ADC Write Protection Mode Register](#).

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
		NOPEN	PEN			COMPE	GOVRE	DRDY
Access		W	W			W	W	W
Reset		–	–			–	–	–

Bit	23	22	21	20	19	18	17	16
		PRDY	YRDY	XRDY	LCCHG			
Access		W	W	W	W			
Reset		–	–	–	–			

Bit	15	14	13	12	11	10	9	8
					EOC11	EOC10	EOC9	EOC8
Access					W	W	W	W
Reset					–	–	–	–

Bit	7	6	5	4	3	2	1	0

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

**Bit 30 – NOPEN** No Pen Contact Interrupt Disable

**Bit 29 – PEN** Pen Contact Interrupt Disable

**Bit 26 – COMPE** Comparison Event Interrupt Disable

**Bit 25 – GOVRE** General Overrun Error Interrupt Disable

**Bit 24 – DRDY** Data Ready Interrupt Disable

**Bit 22 – PRDY** Touchscreen Measure Pressure Ready Interrupt Disable

**Bit 21 – YRDY** Touchscreen Measure YPOS Ready Interrupt Disable

**Bit 20 – XRDY** Touchscreen Measure XPOS Ready Interrupt Disable

**Bit 19 – LCCHG** Last Channel Change Interrupt Disable

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion Interrupt Disable x

## 67.7.11. ADC Interrupt Mask Register

**Name:** ADC\_IMR  
**Offset:** 0x2C  
**Reset:** 0x00000000  
**Property:** Read-only

The following configuration values are valid for all listed bit names of this register:

0: The corresponding interrupt is disabled.

1: The corresponding interrupt is enabled.

Bit	31	30	29	28	27	26	25	24
		NOPEN	PEN			COMPE	GOVRE	DRDY
Access		R	R			R	R	R
Reset		0	0			0	0	0

Bit	23	22	21	20	19	18	17	16
		PRDY	YRDY	XRDY	LCCHG			
Access		R	R	R	R			
Reset		0	0	0	0			

Bit	15	14	13	12	11	10	9	8
					EOC11	EOC10	EOC9	EOC8
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	EOC7	EOC6	EOC5	EOC4	EOC3	EOC2	EOC1	EOC0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 30 – NOPEN** No Pen Contact Interrupt Mask

**Bit 29 – PEN** Pen Contact Interrupt Mask

**Bit 26 – COMPE** Comparison Event Interrupt Mask

**Bit 25 – GOVRE** General Overrun Error Interrupt Mask

**Bit 24 – DRDY** Data Ready Interrupt Mask

**Bit 22 – PRDY** Touchscreen Measure Pressure Ready Interrupt Mask

**Bit 21 – YRDY** Touchscreen Measure YPOS Ready Interrupt Mask

**Bit 20 – XRDY** Touchscreen Measure XPOS Ready Interrupt Mask

**Bit 19 – LCCHG** Last Channel Change Interrupt Disable

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion Interrupt Mask x

**67.7.12. ADC Interrupt Status Register**

**Name:** ADC\_ISR  
**Offset:** 0x30  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	PENS	NOPEN	PEN			COMPE	GOVRE	DRDY
Access	R	R	R			R	R	R
Reset	0	0	0			0	0	0

Bit	23	22	21	20	19	18	17	16
		PRDY	YRDY	XRDY	LCCHG			
Access		R	R	R	R			
Reset		0	0	0	0			

Bit	15	14	13	12	11	10	9	8
					EOC11	EOC10	EOC9	EOC8
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	EOC7	EOC6	EOC5	EOC4	EOC3	EOC2	EOC1	EOC0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

**Bit 31 – PENS** Pen Detect Status  
PENS is not a source of interruption.

Value	Description
0	The pen does not press the screen.
1	The pen presses the screen.

**Bit 30 – NOPEN** No Pen Contact (cleared on read)

Value	Description
0	No loss of pen contact since the last read of ADC_ISR.
1	At least one loss of pen contact since the last read of ADC_ISR.

**Bit 29 – PEN** Pen contact (cleared on read)

Value	Description
0	No pen contact since the last read of ADC_ISR.
1	At least one pen contact since the last read of ADC_ISR.

**Bit 26 – COMPE** Comparison Event (cleared on read)

Value	Description
0	No comparison event since the last read of ADC_ISR.
1	At least one comparison event (defined in ADC_EMR and ADC_CWR) has occurred since the last read of ADC_ISR.

**Bit 25 – GOVRE** General Overrun Error (cleared on read)

Value	Description
0	No general overrun error occurred since the last read of ADC_ISR.
1	At least one general overrun error has occurred since the last read of ADC_ISR.

**Bit 24 – DRDY** Data Ready (automatically set / cleared)

Value	Description
0	No data has been converted since the last read of ADC_LCDR.
1	At least one data has been converted and is available in ADC_LCDR.

**Bit 22 – PRDY** Touchscreen Pressure Measure Ready (cleared on read)

Value	Description
0	No measure has been performed since the last read of ADC_PRESSR.
1	At least one measure has been performed since the last read of ADC_ISR.

**Bit 21 – YRDY** Touchscreen YPOS Measure Ready (cleared on read)

Value	Description
0	No measure has been performed since the last read of ADC_YPOSR.
1	At least one measure has been performed since the last read of ADC_ISR.

**Bit 20 – XRDY** Touchscreen XPOS Measure Ready (cleared on read)

Value	Description
0	No measure has been performed since the last read of ADC_XPOSR.
1	At least one measure has been performed since the last read of ADC_ISR.

**Bit 19 – LCCHG** Last Channel Change (cleared on read)

Value	Description
0	There is no comparison match (defined in the Last Channel Compare Window register (ADC_LCCWR) since the last read of ADC_ISR.
1	The converted value reported on ADC_CDR11 has changed since the last read of ADC_ISR, according to what is defined in ADC_LCTMR and ADC_LCCWR.

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – EOCx** End of Conversion x (automatically set / cleared)

Value	Description
0	The corresponding analog channel is disabled, or the conversion is not finished. This flag is cleared when reading the corresponding ADC_CDRx registers.
1	The corresponding analog channel is enabled and conversion is complete.

### 67.7.13. ADC Last Channel Trigger Mode Register

**Name:** ADC\_LCTMR  
**Offset:** 0x34  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
			CMPMOD[1:0]					DUALTRIG
Access			R/W	R/W				R/W
Reset			0	0				0

#### Bits 5:4 – CMPMOD[1:0] Last Channel Comparison Mode

Value	Name	Description
0	LOW	Generates the ADC_ISR.LCCHG flag when the converted data is lower than the low threshold of the window.
1	HIGH	Generates the ADC_ISR.LCCHG flag when the converted data is higher than the high threshold of the window.
2	IN	Generates the ADC_ISR.LCCHG flag when the converted data is in the comparison window.
3	OUT	Generates the ADC_ISR.LCCHG flag when the converted data is out of the comparison window.

#### Bit 0 – DUALTRIG Dual Trigger On

Value	Description
0	All channels are triggered by event defined by ADC_MR.TRGSEL.
1	Last channel (higher index) trigger period is defined by RTC_MR.OUT1.

## 67.7.14. ADC Last Channel Compare Window Register

**Name:** ADC\_LCCWR  
**Offset:** 0x38  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	HIGHTHRES[11:8]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	HIGHTHRES[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	LOWTHRES[11:8]							
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	LOWTHRES[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 27:16 – HIGHTHRES[11:0]** High Threshold  
High threshold associated to compare settings of ADC\_LCTMR.

**Bits 11:0 – LOWTHRES[11:0]** Low Threshold  
Low threshold associated to compare settings of ADC\_LCTMR.

## 67.7.15. ADC Overrun Status Register

**Name:** ADC\_OVER  
**Offset:** 0x3C  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					OVRE11	OVRE10	OVRE9	OVRE8
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	OVRE7	OVRE6	OVRE5	OVRE4	OVRE3	OVRE2	OVRE1	OVRE0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – OVREx Overrun Error x

**Note:** An overrun error does not always mean that the unread data has been replaced by a new valid data. See [Enhanced Resolution Mode and Digital Averaging Function](#) for details.

Value	Description
0	No overrun error on the corresponding channel since the last read of ADC_OVER.
1	An overrun error has occurred on the corresponding channel since the last read of ADC_OVER.

**67.7.16. ADC Extended Mode Register**

**Name:** ADC\_EMR  
**Offset:** 0x40  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
			ADCMODE[1:0]			SIGNMODE[1:0]		TAG
Access			R/W	R/W		R/W	R/W	R/W
Reset			0	0		0	0	0

Bit	23	22	21	20	19	18	17	16
		TRACKX4	SRCCLK	ASTE		OSR[2:0]		
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	0	0		0	0	0

Bit	15	14	13	12	11	10	9	8
			CMPFILTER[1:0]				CMPALL	
Access			R/W	R/W			R/W	
Reset			0	0			0	

Bit	7	6	5	4	3	2	1	0
	CMPSEL[3:0]					CMPTYPE	CMPMODE[1:0]	
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	0	0		0	0	0

**Bits 29:28 – ADCMODE[1:0] ADC Running Mode**

See [Automatic Error Correction](#) for details on ADC Running mode.

Value	Name	Description
0	NORMAL	Normal mode of operation.
1	OFFSET_ERROR	Offset Error mode to measure the offset error. See <a href="#">Table 67.6</a> .
2	GAIN_ERROR_HIGH	Gain Error mode to measure the gain error. See <a href="#">Table 67.6</a> .
3	GAIN_ERROR_LOW	Gain Error mode to measure the gain error. See <a href="#">Table 67.6</a> .

**Bits 26:25 – SIGNMODE[1:0] Sign Mode**

If conversion results are signed and resolution is below 16 bits, the sign is extended up to the bit 15 (for example, 0xF43 for 12-bit resolution will be read as 0xFF43 and 0x467 will be read as 0x0467). See [Conversion Results Format](#).

Value	Name	Description
0	SE_UNSG_DF_SIGN	Single-Ended channels: Unsigned conversions. Pseudo-differential channels and Differential channels: Signed conversions.
1	SE_SIGN_DF_UNSG	Single-Ended channels: Signed conversions. Pseudo-differential channels and Differential channels: Unsigned conversions.
2	ALL_UNSIGNED	All channels: Unsigned conversions.
3	ALL_SIGNED	All channels: Signed conversions.

**Bit 24 – TAG Tag of ADC\_LCDR**

Value	Description
0	Sets ADC_LCDR.CHNB field to zero.

Value	Description
1	Appends the channel number to the conversion result in ADC_LCDR.

**Bit 22 – TRACKX4** Tracking Time x4

Value	Description
0	The ADC_MR.TRACKTIM field effect is multiplied by 1.
1	The ADC_MR.TRACKTIM field effect is multiplied by 4.

**Bit 21 – SRCCLK** External Clock Selection

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source for the ADC prescaler.
1	GCLK	GCLK is the source clock for the ADC prescaler, thus the ADC clock can be independent of the core/peripheral clock.

**Bit 20 – ASTE** Averaging on Single Trigger Event

Value	Name	Description
0	MULTI_TRIG_AVERAGE	The average requests several trigger events.
1	SINGLE_TRIG_AVERAGE	The average requests only one trigger event.

**Bits 18:16 – OSR[2:0]** Over Sampling Rate

Value	Name	Description
0	NO_AVERAGE	No averaging. ADC sample rate is maximum.
1	OSR4	1-bit enhanced resolution by averaging. ADC sample rate divided by 4.
2	OSR16	2-bit enhanced resolution by averaging. ADC sample rate divided by 16.
3	OSR64	3-bit enhanced resolution by averaging. ADC sample rate divided by 64.
4	OSR256	4-bit enhanced resolution by averaging. ADC sample rate divided by 256.

**Bits 13:12 – CMPFILTER[1:0]** Compare Event Filtering

Number of consecutive compare events necessary to raise the flag = CMPFILTER+1

When programmed to 0, the flag rises as soon as an event occurs.

See [Comparison Windows](#) when using the filtering option (CMPFILTER > 0).

**Bit 9 – CMPALL** Compare All Channels

Value	Description
0	Only channel indicated in CMPSEL field is compared.
1	All channels are compared.

**Bits 7:4 – CMPSEL[3:0]** Comparison Selected Channel

If CMPALL = 0: CMPSEL indicates which channel has to be compared.

If CMPALL = 1: No effect.

**Bit 2 – CMPTYPE** Comparison Type

Value	Name	Description
0	FLAG_ONLY	Any conversion is performed and comparison function drives the ADC_ISR.COMPE flag.
1	START_CONDITION	Comparison conditions must be met to start the storage of all conversions until the ADC_CR.CMPRST bit is set.

**Bits 1:0 – CMPMODE[1:0]** Comparison Mode

Value	Name	Description
0	LOW	When the converted data is lower than the low threshold of the window, generates the ADC_ISR.COMPE flag.

Value	Name	Description
1	HIGH	When the converted data is higher than the high threshold of the window, generates the ADC_ISR.COMPE flag.
2	IN	When the converted data is in the comparison window, generates the ADC_ISR.COMPE flag.
3	OUT	When the converted data is out of the comparison window, generates the ADC_ISR.COMPE flag.

## 67.7.17. ADC Compare Window Register

**Name:** ADC\_CWR  
**Offset:** 0x44  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	HIGHTHRES[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	HIGHTHRES[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	LOWTHRES[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	LOWTHRES[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – HIGHTHRES[15:0]** High Threshold  
High threshold associated to compare settings of ADC\_EMR.

**Bits 15:0 – LOWTHRES[15:0]** Low Threshold  
Low threshold associated to compare settings of ADC\_EMR.

## 67.7.18. Channel Configuration Register

**Name:** ADC\_CCR  
**Offset:** 0x4C  
**Reset:** 0  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
					DIFF11	DIFF10	DIFF9	DIFF8
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	23	22	21	20	19	18	17	16
	DIFF7	DIFF6	DIFF5	DIFF4	DIFF3	DIFF2	DIFF1	DIFF0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

**Bits 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27 – DIFFx** Differential Inputs for Channel x

Value	Description
0	The corresponding channel is set in Single-Ended mode.
1	The corresponding channel is set in Differential mode.

## 67.7.19. ADC Channel Data Register

**Name:** ADC\_CDRx  
**Offset:** 0x50 + x\*0x04 [x=0..11]  
**Reset:** 0  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
	DATA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DATA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

### Bits 15:0 – DATA[15:0] Converted Data

The analog-to-digital conversion data is placed into this register at the end of a conversion and remains until a new conversion is completed. ADC\_CDRx is only loaded if the corresponding analog channel is enabled.

## 67.7.20. ADC Analog Control Register

**Name:** ADC\_ACR  
**Offset:** 0x94  
**Reset:** 0x00000101  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

By default, bits 12 and 13 are set to 1 and 0, respectively, and must not be modified.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
							IBCTL[1:0]	
Access							R/W	R/W
Reset							0	1
Bit	7	6	5	4	3	2	1	0
							PENDETSSENS[1:0]	
Access							R/W	R/W
Reset							0	1

### Bits 9:8 – IBCTL[1:0] ADC Bias Current Control

Adapts performance versus power consumption. Refer to the section “Electrical Characteristics” for further details.

### Bits 1:0 – PENDETSSENS[1:0] Pen Detection Sensitivity

Modifies the pen detection input pull-up resistor value. Refer to the section “Electrical Characteristics” for further details.

## 67.7.21. ADC Pseudo-Differential Register

**Name:** ADC\_PDR  
**Offset:** 0xA0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access

Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	PDIFF7	PDIFF6	PDIFF5	PDIFF4	PDIFF3	PDIFF2	PDIFF1	PDIFF0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – PDIFFx** Pseudo-Differential Inputs for Channel x

Value	Description
0	The channel is configured as defined by the ADC_CCR.DIFFx bit.
1	The channel is configured in Pseudo-Differential mode.

## 67.7.22. ADC Touchscreen Mode Register

**Name:** ADC\_TSMR  
**Offset:** 0xB0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	PENDBC[3:0]							PENDET
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0
Bit	23	22	21	20	19	18	17	16
		NOTSDMA			TSSCTIM[3:0]			
Access		R/W			R/W	R/W	R/W	R/W
Reset		0			0	0	0	0
Bit	15	14	13	12	11	10	9	8
					TSFREQ[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
			TSAV[1:0]				TSMODE[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

**Bits 31:28 – PENDBC[3:0]** Pen Detect Debouncing Period  
Debouncing period =  $2^{\text{PENDBC}}$  ADCCLK periods.

**Bit 24 – PENDET** Pen Contact Detection Enable  
When PENDET = 1, XPOS, YPOS, Z1, Z2 values of ADC\_XPOSR, ADC\_YPOSR, ADC\_PRESSR are automatically cleared when ADC\_ISR.PENS = 0.

Value	Description
0	Pen contact detection disabled.
1	Pen contact detection enabled.

**Bit 22 – NOTSDMA** No TouchScreen DMA

Value	Description
0	XPOS, YPOS, Z1, Z2 are transmitted in ADC_LCDR.
1	XPOS, YPOS, Z1, Z2 are never transmitted in ADC_LCDR, therefore the buffer does not contains touchscreen values.

**Bits 19:16 – TSSCTIM[3:0]** Touchscreen Switches Closure Time  
Defines closure time of analog switches necessary to establish the measurement conditions.  
The closure time is:  
Switch Closure Time = (TSSCTIM × 4) ADCCLK periods.

**Bits 11:8 – TSFREQ[3:0]** Touchscreen Frequency  
Defines the touchscreen frequency compared to the trigger frequency.  
TSFREQ must be greater or equal to TSAV.

The touchscreen frequency is:  
 $\text{Touchscreen Frequency} = \text{Trigger Frequency} / 2^{\text{TSFREQ}}$

**Bits 5:4 – TSAV[1:0] Touchscreen Average**

Value	Name	Description
0	NO_FILTER	No filtering. Only one ADC conversion per measure.
1	AVG2CONV	Averages 2 ADC conversions.
2	AVG4CONV	Averages 4 ADC conversions.
3	AVG8CONV	Averages 8 ADC conversions.

**Bits 1:0 – TSMODE[1:0] Touchscreen Mode**

When TSMOD equals 01 or 10 (i.e., 4-wire mode), channels 0, 1, 2 and 3 must not be used for classic ADC conversions. When TSMOD equals 11 (i.e., 5-wire mode), channels 0, 1, 2, 3, and 4 must not be used.

Value	Name	Description
0	NONE	No touchscreen.
1	4_WIRE_NO_PM	4-wire touchscreen without pressure measurement.
2	4_WIRE	4-wire touchscreen with pressure measurement.
3	5_WIRE	5-wire touchscreen.

### 67.7.23. ADC Touchscreen X Position Register

**Name:** ADC\_XPOSR  
**Offset:** 0xB4  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	XSCALE[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	XSCALE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	XPOS[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	XPOS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

#### Bits 27:16 – XSCALE[11:0] Scale of XPOS

Indicates the max value that XPOS can reach. This value should be close to  $2^{12}$ .

#### Bits 11:0 – XPOS[11:0] X Position

The position measured is stored here. If  $XPOS = 0$  or  $XPOS = XSIZE$ , the pen is on the border.  
When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), XPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

## 67.7.24. ADC Touchscreen Y Position Register

**Name:** ADC\_YPOSR  
**Offset:** 0xB8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
	YSCALE[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	YSCALE[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	YPOS[11:8]							
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	YPOS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 27:16 – YSCALE[11:0] Scale of YPOS

Indicates the max value that YPOS can reach. This value should be close to  $2^{12}$ .

### Bits 11:0 – YPOS[11:0] Y Position

The position measured is stored here. If YPOS = 0 or YPOS = YSIZE, the pen is on the border.  
When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), YPOS is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

## 67.7.25. ADC Touchscreen Pressure Register

**Name:** ADC\_PRESSR  
**Offset:** 0xBC  
**Reset:** 0x00000000  
**Property:** Read-only

**Note:** These values are unavailable if ADC\_TSMR.TSMODE is not set to 2.

Bit	31	30	29	28	27	26	25	24
					Z2[11:8]			
Access					R	R	R	R
Reset					0	0	0	0
Bit	23	22	21	20	19	18	17	16
	Z2[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
					Z1[11:8]			
Access					R	R	R	R
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	Z1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

### Bits 27:16 – Z2[11:0] Data of Z2 Measurement

Data Z2 necessary to calculate pen pressure.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), Z2 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

### Bits 11:0 – Z1[11:0] Data of Z1 Measurement

Data Z1 necessary to calculate pen pressure.

When pen detection is enabled (ADC\_TSMR.PENDET set to '1'), Z1 is tied to 0 while there is no detection of contact on the touchscreen (i.e., when the ADC\_ISR.PENS bit is cleared).

**67.7.26. ADC Trigger Register**

**Name:** ADC\_TRGR  
**Offset:** 0xC0  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TRGPER[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TRGPER[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
Access								
Reset								
Bit	7	6	5	4	3	2	1	0
						TRGMOD[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

**Bits 31:16 – TRGPER[15:0] Trigger Period**

Effective only if TRGMOD defines a periodic trigger.

Defines the periodic trigger period, with the following equation:

$$\text{Trigger Period} = (\text{TRGPER} + 1) / \text{ADCCLK}$$

The minimum time between two consecutive trigger events must be strictly greater than the duration time of the longest conversion sequence depending on the configuration of registers ADC\_MR, ADC\_CHSR, ADC\_SEQR1/2, ADC\_TSMR.

When TRGMOD is set to pen detect trigger (i.e., 100) and averaging is used (i.e., field TSAV ≠ 0 in ADC\_TSMR) only one measure is performed. Thus, XRDY, YRDY, PRDY, DRDY will not rise on pen contact trigger. To achieve measurement, several triggers must be provided either by software or by setting the TRGMOD on continuous trigger (i.e., 110) until flags rise.

**Bits 2:0 – TRGMOD[2:0] Trigger Mode**

Value	Name	Description
0	NO_TRIGGER	No hardware trigger enabled, only software trigger can start conversions
1	EXT_TRIG_RISE	Rising edge of the selected hardware trigger event, defined in ADC_MR.TRGSEL
2	EXT_TRIG_FALL	Falling edge of the selected hardware trigger event
3	EXT_TRIG_ANY	Any edge of the selected hardware trigger event
4	PEN_TRIG	Pen Detect Trigger (shall be selected only if PENDET is set and TSMODE > 0)
5	PERIOD_TRIG	ADC internal hardware periodic trigger (see field TRGPER)
6	CONTINUOUS	Continuous mode

**67.7.27. ADC Correction Values Register**

**Name:** ADC\_CVR  
**Offset:** 0xD4  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	GAINCORR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	GAINCORR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	OFFSETCORR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	OFFSETCORR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – GAINCORR[15:0]** Gain Correction

Gain correction to apply on converted data. Only bits 0 to 15 are relevant (other bits are ignored and read as 0).

**Bits 15:0 – OFFSETCORR[15:0]** Offset Correction

Offset correction to apply on converted data. The offset is signed (2's complement), only bits 0 to 11 are relevant (other bits are ignored and read as 0).

## 67.7.28. ADC Channel Error Correction Register

**Name:** ADC\_CECR  
**Offset:** 0xD8  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
Access								
Reset								
Bit	15	14	13	12	11	10	9	8
					ECORR11	ECORR10	ECORR9	ECORR8
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0
Bit	7	6	5	4	3	2	1	0
	ECORR7	ECORR6	ECORR5	ECORR4	ECORR3	ECORR2	ECORR1	ECORR0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 – ECORRx** Error Correction Enable for channel x

Value	Description
0	Automatic error correction is disabled for channel x.
1	Automatic error correction is enabled for channel x.

**67.7.29. ADC Touchscreen Correction Values Register**

**Name:** ADC\_TSCVR  
**Offset:** 0xDC  
**Reset:** 0x00000000  
**Property:** Read/Write

This register can only be written if the WPEN bit is cleared in the [ADC Write Protection Mode Register](#).

Bit	31	30	29	28	27	26	25	24
	TSGAINCORR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	TSGAINCORR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	TSOFFSETCORR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	TSOFFSETCORR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

**Bits 31:16 – TSGAINCORR[15:0] Touchscreen Gain Correction**

Gain correction to apply on converted data for the touchscreen channels. Only bits 0 to 15 are relevant (other bits are ignored and read as 0).

**Bits 15:0 – TSOFFSETCORR[15:0] Touchscreen Offset Correction**

Offset correction to apply on converted data for the touchscreen channels. The offset is signed (2's complement), only bits 0 to 11 are relevant (other bits are ignored and read as 0).

### 67.7.30. ADC Write Protection Mode Register

**Name:** ADC\_WPMR  
**Offset:** 0xE4  
**Reset:** 0x00000000  
**Property:** Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCTEN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

#### Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x414443	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0

#### Bit 2 – WPCTEN Write Protection Control Enable

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection on control registers if WPKEY corresponds to 0x414443 (“ADC” in ASCII).
1	Enables the write protection on control registers if WPKEY corresponds to 0x414443 (“ADC” in ASCII).

#### Bit 1 – WPITEN Write Protection Interrupt Enable

See [Register Write Protection](#) for the list of registers that can be protected.

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x414443 (“ADC” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x414443 (“ADC” in ASCII).

#### Bit 0 – WPEN Write Protection Enable

See [Register Write Protection](#) for the list of write-protected registers.

Value	Description
0	Disables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII).
1	Enables the write protection if WPKEY value corresponds to 0x414443 (“ADC” in ASCII).

### 67.7.31. ADC Write Protection Status Register

**Name:** ADC\_WPSR  
**Offset:** 0xE8  
**Reset:** 0x00000000  
**Property:** Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								
Bit	23	22	21	20	19	18	17	16
	WPVSR[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSR[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

#### Bits 23:8 – WPVSR[15:0] Write Protection Violation Source

When WPVS = 1, WPVSR indicates the register address offset at which a write access has been attempted.

#### Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of ADC_WPSR.
1	A write protection violation has occurred since the last read of ADC_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSR.

# Electrical and Mechanical Characteristics

## 68. Electrical Characteristics

### 68.1. Electrical Parameters Usage

Tables in sections [I/O Characteristics](#), [Digital Peripheral Characteristics](#), [Analog Peripheral Characteristics](#), [Power Consumption in Active Mode](#) and [Operation and Power Consumption in Low-Power Modes](#) define the limiting values for several electrical parameters.

- Unless otherwise noted, these values are valid over the junction temperature range  $T_J = [-40^{\circ}\text{C} + 125^{\circ}\text{C}]$ .
- Parameters annotated as "Simulation data" are not production-tested. Their limiting values come from simulations run in corner case conditions and were verified by electrical characterization over a limited number of samples. Additionally, the specifications in [Digital Peripheral Characteristics](#) are simulation data, even though they are not annotated as such.
- These limits may be affected by the board on which the device is mounted. In particular, noisy supply and ground conditions must be avoided and care must be taken to provide:
  - a PCB with a low-impedance ground plane. A single unbroken ground plane is a minimum requirement.
  - low-impedance decoupling of the device power supply inputs. A 10 nF to 220 nF Ceramic X7R (or X5R) capacitor placed very close to each power supply input is a minimum requirement. See specific recommendations regarding analog pins or functions in the corresponding sections. To reduce any potential electromagnetic compatibility (EMC) related issues, it is good practice to double this decoupling capacitor whenever possible with a high frequency one, for example one 100 pF (C0G or NP0) per power supply input.
  - low-impedance power supply decoupling of external components. This recommendation aims at avoiding large current spikes flowing into the PCB ground and power planes.
- In addition, although the device is specified with wide operating supply ranges on most of its supply inputs (for example 1.7V to 3.6V), large and fast supply variations may lead to unpredictable device behavior including, but not limited to, out-of-specification operation. Therefore, in addition to maintaining the power supply inputs within their specified ranges, it is mandatory to keep the power supply variations within the limits shown in the following table during the device operation.

**Table 68.1.** Maximum Power Supply Variations

Symbol	Parameter	Conditions	Min	Max	Unit
$V_N$	Peak-to-peak ripple and noise voltage	Applies to: VDDCORE, VDDBU, VDDIOP0, VDDIOP1, VDDQSPI, VDDNF, VDDIOM	–	3	% $V_{DC}^{(1)}$
		Applies to: VDDIN33, VDDANA	–	1	% $V_{DC}^{(1)}$
SR	Slewrate of power supply variations	$\Delta V \leq 5\% V_{DC\_MIN}^{(2)(3)}$	–	$\pm 50$	V/ms
		$\Delta V \leq 10\% V_{DC\_MIN}$	–	$\pm 10$	V/ms
		$\Delta V > 10\% V_{DC\_MIN}$	–	$\pm 1$	V/ms

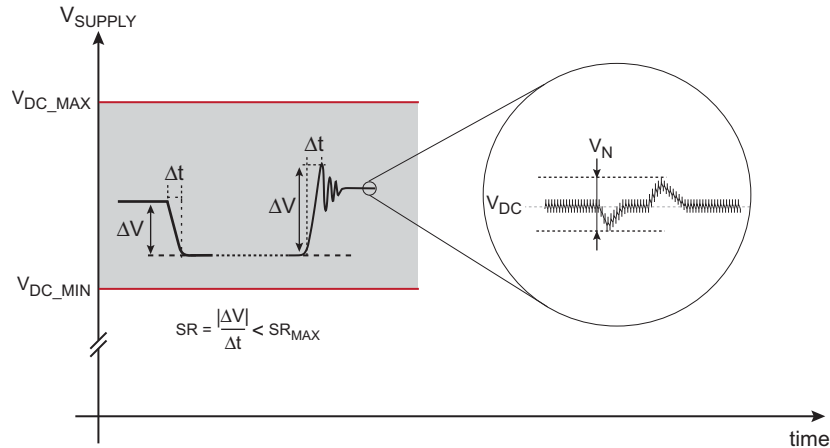

**Notes:**

1.  $V_{DC}$  is the power supply DC value.
2.  $V_{DC\_MIN}$  is the minimum operating voltage of the supply input as described in table [Recommended Operating Conditions on Power Supply Inputs](#).
3.  $\Delta V$  is the variation amplitude. The slewrate specification applies when  $\Delta V \geq V_N$ .

The following examples and figure illustrate the above table:

- When working with VDDIOP0 = 3.3V, a maximum power supply ripple and noise voltage of 99 mV peak-to-peak (3% of 3.3V) must be respected.
- When working with VDDIN33 = 3.3V, a maximum power supply ripple and noise voltage of 33 mV peak-to-peak (1% of 3.3V) must be respected.

**Figure 68.1.** Maximum Power Supply Variation

## 68.2. Absolute Maximum Ratings

**Table 68.2.** Absolute Maximum Ratings

<b>Storage Temperature</b>	-60°C to +150°C	<b>Note:</b> Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. <b>Exposure to absolute maximum rating conditions for extended periods may affect device reliability.</b>
<b>Voltage Difference between two ground pins (among GND, GNDANA and GNDIN33)</b>	±50 mV	
<b>Voltage on Power Supply Inputs with respect to ground pins:</b>		
VDDCORE	-0.3V to 1.4V	
VDDIOM, VDDIOP0, VDDIOP1	-0.3V to 4.0V	
VDDANA, VDDIN33	-0.3V to 4.0V	
VDDNF, VDDQSPI, VDDBU	-0.3V to 4.0V	
<b>Voltage on Digital or Analog Input Pins with respect to ground</b>	-0.3V to 4.0V	
<b>Injected Current into any input pin</b>	± 1 mA	
<b>Total Injected Current in all input pins of a common power supply pair</b>	± 10 mA	
<b>Maximum DC Output Current:</b>		
On all I/O lines into one power rail	100 mA	
Per output pin	25 mA	

**Note:** All I/O pins are internally clamped to their respective VDD and GND rails as defined in the [Pin Description](#) table. For example, for PA2 this corresponds to VDDIOP0 and GND.

## 68.3. Recommended Operating Conditions

**Table 68.3.** Recommended Operating Conditions on Power Supply Inputs

Power Input	Parameter	Conditions	Min	Max	Unit
VDDCORE	Core logic power supply (including CPU, memories and peripherals)	$f_{CPU} \leq 420 \text{ MHz}$ , $f_{MCK} \leq 140 \text{ MHz}$ $f_{CPU} \leq 600 \text{ MHz}$ , $f_{MCK} \leq 200 \text{ MHz}$	1.02 1.12	1.21 1.21	V
VDDIOM	SDRAM I/O lines power supply	SDR-SDRAM	3.00	3.60	V
		LPDDR-SDRAM, LPDDR-SDRAM, DDR2-SDRAM	1.70	1.90	V
VDDNF	NAND Flash I/O lines power supply	–	1.70	3.60	V
VDDQSPI	VDDQSPI I/O lines power supply	–	1.70	3.60	V
VDDANA <sup>(1)</sup>	VDDANA I/O lines, A/D converter, OTP memory power supply	–	3.00	3.60	V
VDDIN33 <sup>(1)</sup>	2.5V regulator power input, USB interface I/O lines power supply	–	3.00	3.60	V
VDDIOP0	VDDIOP0 I/O lines power supply	–	1.70	3.60	V
VDDIOP1	VDDIOP1 I/O lines power supply	–	1.70	3.60	V
VDDBU	Backup domain power supply	–	1.60	3.60	V
$t_{R\_VDD}$	Power supply slope at power-up	Applies to any of the power supply inputs listed above	0.2	20	mV/ $\mu$ s
$t_{F\_VDD}$	Power supply slope at power-down	Applies to any of the power supply inputs listed above	-20	-1	mV/ $\mu$ s

**Note:**

- VDDANA and VDDIN33 are powered from one single power source so that:  
 $V(VDDANA, VDDIN33) \leq \pm 50 \text{ mV}$ .

**Table 68.4.** Recommended Operating Conditions on Input Pins (see Note 1)

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{IN}$	Input line voltage range on inputs <sup>(2)(3)</sup>	–	-0.3V	$V_{DD} + 0.3V$	V
$I_{IN}$	DC current injection on inputs <sup>(4)</sup>	–	–	$\pm 0.2$	mA
$I_{TOT\_INJ}$	Total current injection per power rail or per ground rail <sup>(5)</sup>	–	–	$\pm 2$	mA

**Notes:**

- In this table, VDD refers to the voltage of the associated power rail of the I/O line, as defined in the [Pin Description](#) table. For example, for PA2, VDD refers to VDDIOP0.
- Input voltages  $V_{IN} \leq 0V$  or  $V_{IN} \geq V_{DD}$  lead to negative or positive current injection on inputs.
- For analog inputs [PB17:PB6], input voltages  $V_{IN} \geq \min(V_{DDANA}, V_{ADVREFP})$  lead to saturated A/D conversion to 0xFFF.
- Current injection on A/D converter analog inputs [PB17:PB6] may degrade the analog performance of the corresponding channel or the analog performance of other analog channels.
- Corresponds to the sum of the positive currents into one power rail and, respectively, to the sum of the negative currents into one ground rail, as defined in the [Pin Description](#) table.

**Table 68.5.** Recommended Thermal Operating Conditions

Symbol	Parameter	Conditions	Min	Max	Unit
$T_A$	Ambient temperature range	–	-40	105	°C
$T_J$	Junction temperature range	–	-40	125	°C

**Table 68.6.** BGA228 Package Thermal Characteristics

$R_{JA}$	Junction-to-ambient thermal resistance	–	37	°C/W
$R_{JC}$	Junction-to-case thermal resistance	–	18	°C/W
$R_{JB}$	Junction-to-board thermal resistance	–	25	°C/W
$\Psi_{J-top}$	Junction-to-package-top characterization parameter	–	0.5	°C/W

**Table 68.7.** BGA256 Package Thermal Characteristics

Symbol	Parameter	Conditions	Typ	Unit
$R_{JA}$	Junction-to-ambient thermal resistance	–	41	°C/W
$R_{JC}$	Junction-to-case thermal resistance	–	20	°C/W
$R_{JB}$	Junction-to-board thermal resistance	–	29	°C/W
$\Psi_{J-top}$	Junction-to-package-top characterization parameter	–	0.6	°C/W

**Table 68.8.** Recommended Operating Conditions on Internal Clocks

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{CPU\_CLK}$	Processor clock (CPU_CLK) frequency	$V_{DDCORE} \geq 1.12V$	–	600	MHz
		$V_{DDCORE} \geq 1.02V$	–	420	MHz
$f_{MCK}$	Main system bus clock (MCK) frequency	$V_{DDCORE} \geq 1.12V$	–	200	MHz
		$V_{DDCORE} \geq 1.02V$	–	140	MHz

**Table 68.9.** Recommended Operating Conditions on SDRAM Interface

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{SDRAM\_CLK}$	SDRAM clock frequency	$V_{DDCORE} \geq 1.12V$			
		16-bit SDR-SDRAM	–	200	MHz
		16-bit LPDDR-SDRAM	–	166	MHz
		16-bit DDR2-SDRAM	125	200	MHz
		16-bit LPDDR-SDRAM	–	200	MHz
		$V_{DDCORE} \geq 1.12V$			
		32-bit SDR-SDRAM	–	180	MHz
		32-bit LPDDR-SDRAM	–	158	MHz
		$V_{DDCORE} \geq 1.02V$			
		16-bit SDR-SDRAM	–	140	MHz
		16-bit LPDDR-SDRAM	–	140	MHz
		16-bit DDR2-SDRAM	125	140	MHz
		16-bit LPDDR-SDRAM	–	140	MHz

## 68.4. Recommended Power Supply Sequencing

In the following sections, various recommended power sequences are described. Operating the device outside this scope may lead to unpredictable behavior. In addition, in all modes other than the MPU Backup mode, every power supply input must be powered to operate the device.

### 68.4.1. Power-Up and Power-Down

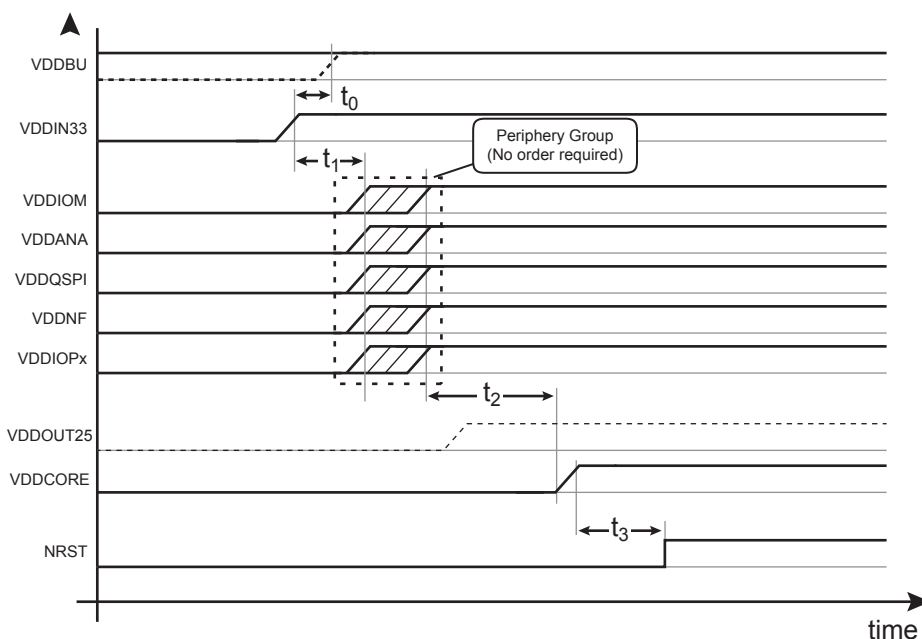

At power-up, from a power supply sequencing perspective, the SAM9X60 power supply inputs are categorized into three independent groups:

- VDDCORE
- VDDIN33
- Periphery group containing all other power supply inputs except VDDBU

The figure below shows the recommended power-up sequence. Note the following:

- VDDBU
  - When supplied from a precharged storage element (battery or supercapacitor), VDDBU is an always-on supply input and is therefore not part of the power supply sequencing.
  - When no storage element is used on VDDBU in the application, VDDBU must be tied to VDDIN33.
  - When a supercapacitor is used in the application to power VDDBU during Backup mode, this element must be isolated from VDDBU during its (slow) charge, so that VDDBU closely follows VDDIN33. In table [Power-up Timing Requirements](#), the parameter  $t_0$  limits the delay to establish VDDBU after VDDIN33.
- VDDOUT25 is the output of the internal 2.5V VDDOUT25 regulator, therefore, there is no power supply requirement on this pin. VDDOUT25 is automatically started at VDDIN33 rise when VDDIN33 is above its Power-On-Reset threshold.

**Figure 68.2.** Recommended Power Sequence at Power-up

**Table 68.10.** Power-up Timing Requirements

Symbol	Parameter	Conditions <sup>(1)</sup>	Min	Max	Unit
$t_0$	VDDBU Delay	Delay from established VDDIN33 to established VDDBU	–	0.2	ms
$t_1$	VDDIN33 to Periphery Group delay	Delay from established VDDIN33 to the first established Periphery Group supply	0	–	ms
$t_2$	Periphery Group to VDDCORE delay	Delay from the last established Periphery Group supply to VDDCORE supply turn-on	0	–	ms
$t_3$	Reset Delay at power-up	From established VDDCORE to NRST high	8	–	ms

**Note:**

1. The term "established" refers to a power supply established to 90% of its final value.

The following figure shows the SAM9X60 power-down sequence that starts by asserting the NRST line to 0. Once NRST is asserted, the supply inputs can be immediately shut down without any specific timing or order. VDDBU may not be shut down if the application uses a backup storage element on this supply input.

**Figure 68.3.** Recommended Power Sequence at Power-down

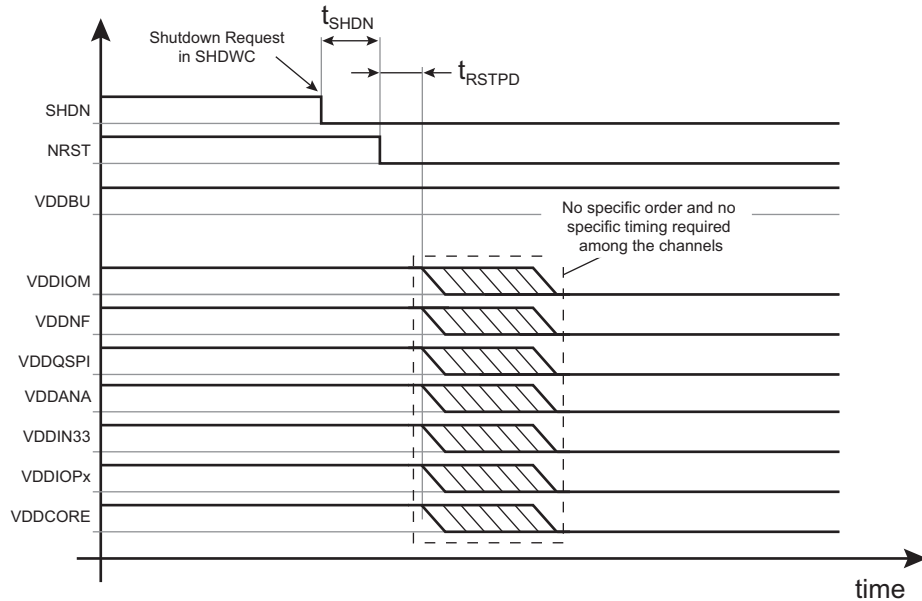

**Table 68.11.** Power-down Timing Requirements

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{RSTPD}$	NRST delay at power-down	Delay from NRST low to the first supply out of its operating range	0	-	ms

#### 68.4.2. Backup Mode Entry and Wake-up

The following figure shows the recommended power-down sequence to place the SAM9X60 in Backup mode. The SHDN signal, output of Shutdown Controller (SHDWC), signals the shutdown request to the external power supply. This output is supplied by VDDBU that is present in Backup mode. In a similar way to the power-down sequence, the NRST signal must be asserted prior to turning the SAM9X60 power supplies off.

**Figure 68.4.** Recommended Power Sequence at Backup Mode Entry

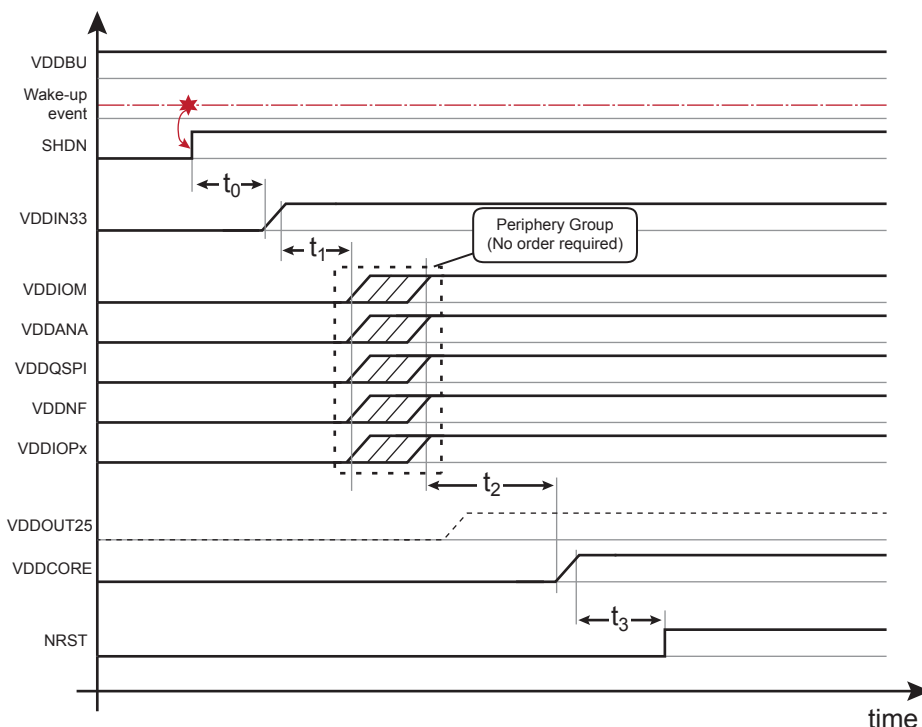

**Table 68.12.** Backup Mode Entry Timing Requirements

Symbol	Parameter	Conditions <sup>(1)</sup>	Min	Max	Unit
$t_{SHDN}$	SHDN Delay at Backup mode entry	Delay from SHDN low to NRST low	0	–	ms
$t_{RSTPD}$	NRST Delay at power-down	Delay from NRST low to the first supply out of its operating range	0	–	ms

The following figure shows the recommended power-up sequence to wake up SAM9X60 from Backup mode. Upon a wake-up event (WKUP pin, RTC alarm, etc.), the Shutdown Controller automatically toggles its SHDN output back to VDDDBU to request the external power supply to restart. This power-up sequence is the same as the one shown in figure [Recommended Power Sequence at Power-up](#). In particular, the supply group's definition is the same.

**Figure 68.5.** Recommended Power Sequence at Wake-up from Backup Mode

**Table 68.13.** Wake-up from Backup Mode Timing Requirements

Symbol	Parameter	Conditions	Min	Max	Unit
$t_0$	VDDIN33 delay	Delay from SHDN high to VDDIN33 turn-on	0	–	ms
$t_1$	VDDIN33 to peripheral group delay	Delay from VDDIN33 established to the first peripheral group supply established	0	–	ms
$t_2$	Peripheral group to VDDCORE delay	Delay from the last peripheral group established supply to VDDCORE supply turn-on	0	–	ms
$t_3$	Reset delay at power-up	From VDDCORE established to NRST high	8	–	ms

**Note:**

1. The term "established" refers to a power supply established to 90% of its final value.

## 68.5. I/O Characteristics

The device features two types of Input/Output (I/O) circuits:

- GPIO
- DDRIO

Unless otherwise specified:

- The following specifications apply to:
  - the GPIO type
  - the DDRIO type when these I/Os are not driven by the MPDDRC
- $V_{DD}$  refers to the voltage of the associated power rail of the I/O line, as defined in the [Pin Description](#) table. For example, for PA2,  $V_{DD}$  refers to the voltage applied on VDDIOP0.

The DRIVE and SLEWRATE controls for the GPIO type are set in the PIO\_DRIVE and PIO\_SLEWR registers, respectively. The DRIVE control for the DDRIO type is set in the SFR\_CCFG\_EBICSA register.

### 68.5.1. I/O DC Characteristics

**Table 68.14.** Input DC Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{IL}$	Low-level input voltage <sup>(1)</sup>	–	–	$0.3 \times V_{DD}$	V
$V_{IH}$	High-level input voltage <sup>(1)</sup>	–	$0.7 \times V_{DD}$	–	V
$I_{IH}$	Input-high input leakage current <sup>(1)</sup>	Pull-down resistor disabled; $V_{IN} = V_{DD} = 3.6V$	$T_J \leq 30^\circ C$ –50 $T_J \leq 125^\circ C$ –150	50 150	nA nA
$I_{IL}$	Input-low input leakage current <sup>(1)</sup>	Pull-up resistor disabled; $V_{IN} = 0V, V_{DD} = 3.6V$	$T_J \leq 30^\circ C$ –50 $T_J \leq 125^\circ C$ –150	50 150	nA nA
$R_{PULL}$	Programmable pull-up or pull-down resistor	Digital Input mode	60	140	k $\Omega$
$C_{IN}$	Input capacitance <sup>(1)</sup>	–	–	4	pF
$V_{hys}$	Input hysteresis <sup>(1)</sup>	–	0.15	–	V

**Note:**

- Simulation data

**Table 68.15.** Output DC Characteristics ( $1.7V < V_{DD} < 1.9V$ )

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
$V_{OL}$	Low-level output voltage	Any	$I_O$ max	–	$0.2 \times V_{DD}$	V
$V_{OH}$	High-level output voltage	Any	$I_O$ max	$0.8 \times V_{DD}$	–	V
$I_{OL}$ or $I_{OH}$	Low-level or high-level output current	GPIO	Drive = 0, Slewrate = 0	–	3	mA
			Drive = 1, Slewrate = 0	–	4	mA
			Drive = 0, Slewrate = 1	–	1	mA
			Drive = 1, Slewrate = 1	–	2	mA
		DDRIO	Drive = 0	–	3	mA
			Drive = 1	–	4	mA

**Table 68.16.** Output DC Characteristics ( $3.0V < V_{DD} < 3.6V$ )

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
$V_{OL}$	Low-level output voltage	Any	$I_O$ max	–	$0.2 \times V_{DD}$	V
$V_{OH}$	High-level output voltage	Any	$I_O$ max	$0.8 \times V_{DD}$	–	V
$I_{OL}$ or $I_{OH}$	Low-level/high-level output current	GPIO	Drive = 0, Slewrate = 0	–	9	mA
			Drive = 1, Slewrate = 0	–	10	mA
			Drive = 0, Slewrate = 1	–	3	mA
			Drive = 1, Slewrate = 1	–	6	mA
		DDRIO	Drive = 0	–	8	mA
			Drive = 1	–	10	mA

## 68.5.2. I/O AC Characteristics

### 68.5.2.1. Output Driver AC Characteristics

The timing definitions necessary to specify the maximum operating frequency of an output driver are given in the following figure.

**Figure 68.6.** Timing Definitions of a Digital Output Signal

$T$ : Period of the digital output signal

$f = 1 / T$ : Frequency of the digital output signal

$t_{HIGH}$ : Time during which the output waveform is greater than  $V_{DD} / 2$

$t_{LOW} = T - t_{HIGH}$ : Time during which the output waveform is less than  $V_{DD} / 2$

$d = t_{HIGH} / T$ : Output waveform duty cycle

$V_O$ : Output waveform amplitude

In tables [Output Driver AC Characteristics \(1.7V < VDD < 1.9V\)](#) and [Output Driver AC Characteristics \(3.0V < VDD < 3.6V\)](#), the maximum operating frequency  $f_{MAX}$  ensures that the driver's output waveform fulfills all the following characteristics:

- $t_R < 0.75 / f_{MAX}$  and  $t_F < 0.75 / f_{MAX}$
- $d$ : the duty cycle of the output waveform is between 45% and 55%
- $V_O$ : the output waveform amplitude is greater than 95% VDD

The  $f_{MAX}$  parameter indicates the speed limit of an output driver across various operating conditions: supply voltage range, load capacitance, drive strength and slewrate programming. The effective maximum output frequency of a specific output line may be limited by the peripheral that drives this line.

Tables [Output Driver AC Characteristics \(1.7V < VDD < 1.9V\)](#) and [Output Driver AC Characteristics \(3.0V < VDD < 3.6V\)](#) give the AC output characteristics of the output drivers in the following conditions:

- Output load: 10 pF capacitor to ground
- Two VDD ranges:
  - 1.7V < VDD < 1.9V
  - 3.0V < VDD < 3.6V
- Two Drive settings: 0 and 1
- Two Slewrate settings for the GPIO type: 0 and 1. The DDRIO drivers do not have slewrate settings and rather use an autocalibration setting. See [DDR/SDR I/O Calibration](#).

For the GPIO drivers, the table below gives the recommended Drive and Slewrate settings depending on the output switching frequency and the two commonly used VDD ranges (1.8V and

3.3V). Other settings are possible but they may lead to excessively fast rise and fall times ( $t_R$ ,  $t_F$ ), with a potentially negative impact on the electromagnetic emissions of the application.

For the DDRIO drivers, it is recommended to use Drive = 0 if the VDD range is 3.0V to 3.6V, and Drive = 1 if the VDD range is 1.7V to 1.9V.

**Table 68.17.** Recommended GPIO Drive and Slewrate Settings versus GPIO Use Case

VDD Range	Low-speed $f_{GPIO} \leq 50 \text{ MHz}^{(1)}$	High-speed $50 \text{ MHz} \leq f_{GPIO} \leq 150 \text{ MHz}^{(1)}$
1.7V – 1.9V	Drive = 1, Slewrate = 1	Drive = 1, Slewrate = 0
3.0V – 3.6V	Drive = 0, Slewrate = 1	Drive = 0, Slewrate = 0

**Note:**

1. This is an indicative value. See tables [Output Driver AC Characteristics \(1.7V < VDD < 1.9V\)](#) and [Output Driver AC Characteristics \(3.0V < VDD < 3.6V\)](#) for accurate maximum frequency specifications.

**Table 68.18.** Output Driver AC Characteristics (1.7V < V<sub>DD</sub> < 1.9V)

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
$t_R$ or $t_F$	Rise or fall time <sup>(1)(4)</sup>	Any	$C_L = 10 \text{ pF}$	–	–	–
		GPIO	Drive = 0, Slewrate = 0	0.9	4.0	ns
			Drive = 1, Slewrate = 0	0.8	2.8	ns
			Drive = 0, Slewrate = 1	3.0	12.0	ns
			Drive = 1, Slewrate = 1	1.6	5.6	ns
		DDRIO	Drive = 0	1.2	3.1	ns
			Drive = 1	1.0	2.6	ns
$f_{MAX}$	Maximum frequency <sup>(2)(3)(4)</sup>	Any	$C_L = 10 \text{ pF}$	–	–	–
		GPIO	Drive = 0, Slewrate = 0	90	–	MHz
			Drive = 1, Slewrate = 0	130	–	MHz
			Drive = 0, Slewrate = 1	25	–	MHz
			Drive = 1, Slewrate = 1	50	–	MHz
		DDRIO	Drive = 0	90	–	MHz
			Drive = 1	100	–	MHz

**Notes:**

1. Measured between  $V_O = 10\% V_{DD}$  and  $V_O = 90\% V_{DD}$
2.  $f_{MAX} = 0.75 / (t_R + t_F)$ . Frequency numbers are rounded for legibility.
3.  $f_{MAX}$  may be limited by the peripheral that drives the I/O line.
4. Simulation data

**Table 68.19.** Output Driver AC Characteristics (3.0V < V<sub>DD</sub> < 3.6V)

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
$t_R$ or $t_F$	Rise or fall time <sup>(1)(4)</sup>	Any	$C_L = 10 \text{ pF}$	–	–	–
		GPIO	Drive = 0, Slewrate = 0	0.9	2.0	ns
			Drive = 1, Slewrate = 0	0.8	1.8	ns
			Drive = 0, Slewrate = 1	3.0	6.6	ns
			Drive = 1, Slewrate = 1	1.6	3.3	ns
		DDRIO	Drive = 0	0.9	2.0	ns
			Drive = 1	0.8	1.7	ns

.....continued

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
$f_{MAX}$	Maximum frequency <sup>(2)(3)(4)</sup>	Any	$C_L = 10 \text{ pF}$	-	-	-
		GPIO	Drive = 0, Slewrate = 0	150	-	MHz
			Drive = 1, Slewrate = 0	170	-	MHz
			Drive = 0, Slewrate = 1	50	-	MHz
			Drive = 1, Slewrate = 1	75	-	MHz
		DDRIO	Drive = 0	140	-	MHz
			Drive = 1	160	-	MHz

**Notes:**

1. Measured between  $V_O = 10\% V_{DD}$  and  $V_O = 90\% V_{DD}$
2.  $f_{MAX} = 0.75 / (t_R + t_F)$ . Frequency numbers are rounded for legibility.
3.  $f_{MAX}$  may be limited by the peripheral that drives the I/O line.
4. Simulation data

### 68.5.2.2. Input AC Characteristics

The following table provides the input requirements of the signals to be connected to I/O lines when they are configured as digital inputs. In particular, these values apply when the **XIN** input is used as a clock input of the device (main crystal oscillator set in Bypass mode). They do not apply for the **XIN32** input which is designed for slow signals with frequencies up to **50 kHz**. Parameters  $V_{IL}$  and  $V_{IH}$  defined in table [Input DC Characteristics](#) apply.

**Table 68.20.** Input AC Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{IN}$	Input frequency <sup>(1)</sup>	XOUT connected to ground	-	-	50	MHz
$t_{IN}$	Input period	-	20	-	-	ns
$t_{HIGH}$	Time at high level	-	8	-	-	ns
$t_{LOW}$	Time at low level	-	8	-	-	ns
$t_R$	Rise time	-	-	-	2.2	ns
$t_F$	Fall time	-	-	-	2.2	ns

**Note:**

1. The maximum input frequency may be limited by the peripheral receiving this signal.

**Figure 68.7.** Digital Input AC Characteristics

### 68.5.3. DDR/SDR I/O Calibration and DDR Voltage Reference

#### 68.5.3.1. DDR/SDR I/O Calibration

The DDR/SDR I/Os embed an automatic impedance matching control to avoid overshoots and reach the best performance levels depending on the bus load and external memories. A serial termination

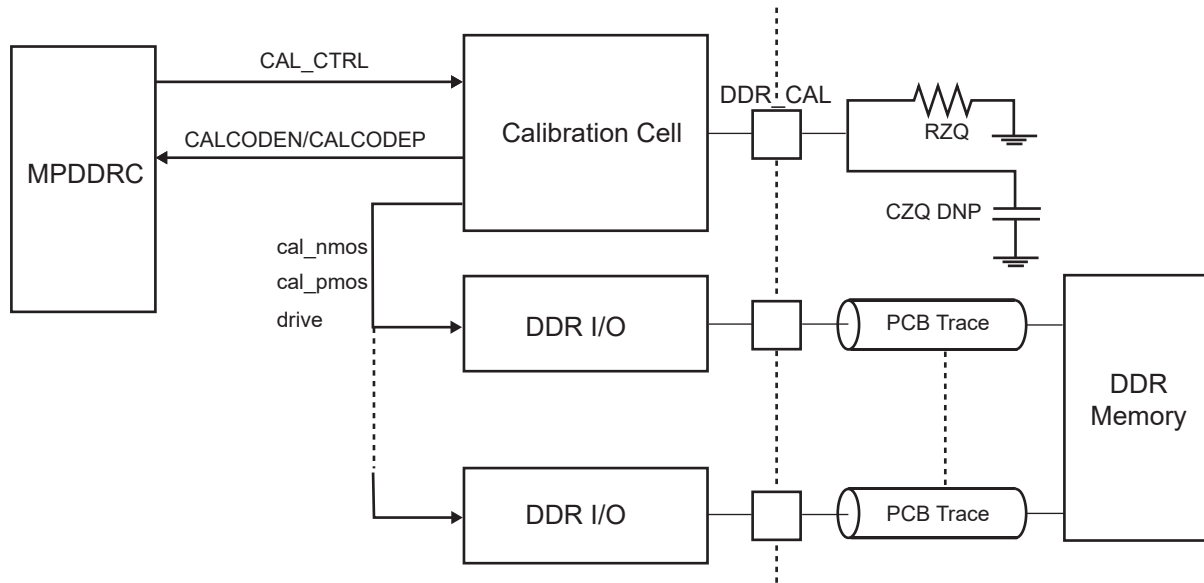

connection scheme, where the driver has an output impedance matched to the characteristic impedance of the line, is used to improve signal quality and reduce EMI.

One specific analog input, DDR\_CAL, is used to calibrate all DDR/SDR I/Os.

The MPDDRC and SDRAMC support the ZQ calibration procedure used to calibrate the SAM9X60 DDR/SDR I/O drive strength and the commands to set up the external memory device drive strength (refer to [DDR-SDRAM Controller \(MPDDRC\)](#)). The calibration cell supports all the supported memory types. Calibration is performed in the initialization phase only.

**Figure 68.8.** DDR Calibration Cell

The calibration cell provides an input pin, DDR\_CAL, loaded with one of the following resistor RZQ values:

- 20 K $\Omega$  for LPDDR
- 20 K $\Omega$  for DDR2
- 16.9 K $\Omega$  for SDR
- 20 K $\Omega$  for LPDDR

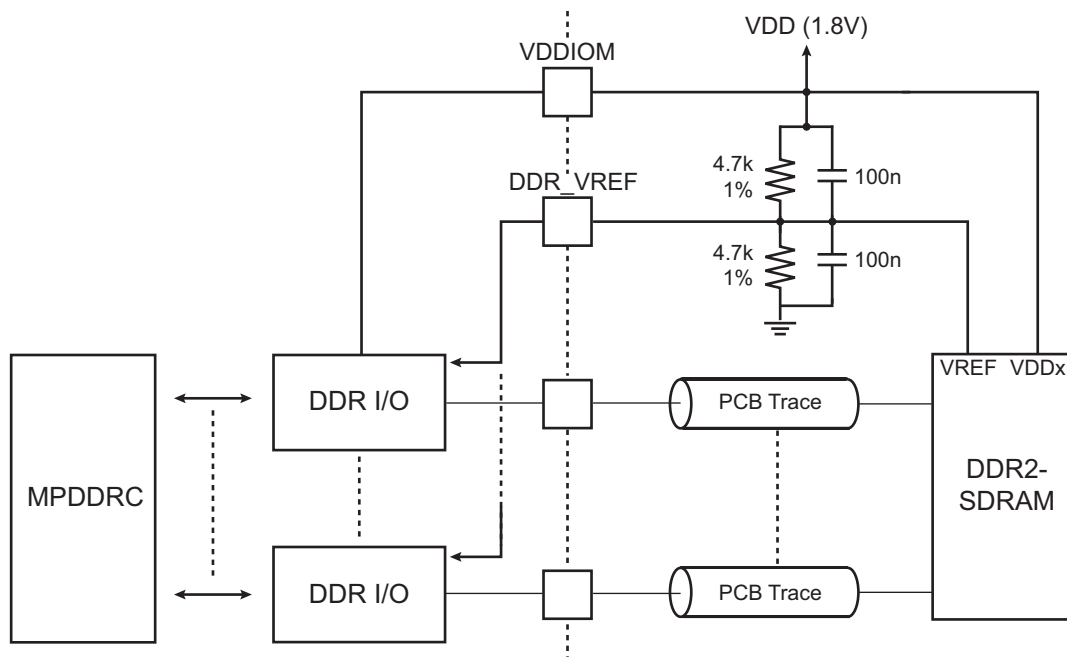

The typical value for CZQ is 22 pF.

### 68.5.3.2.DDR\_VREF Recommended Circuits

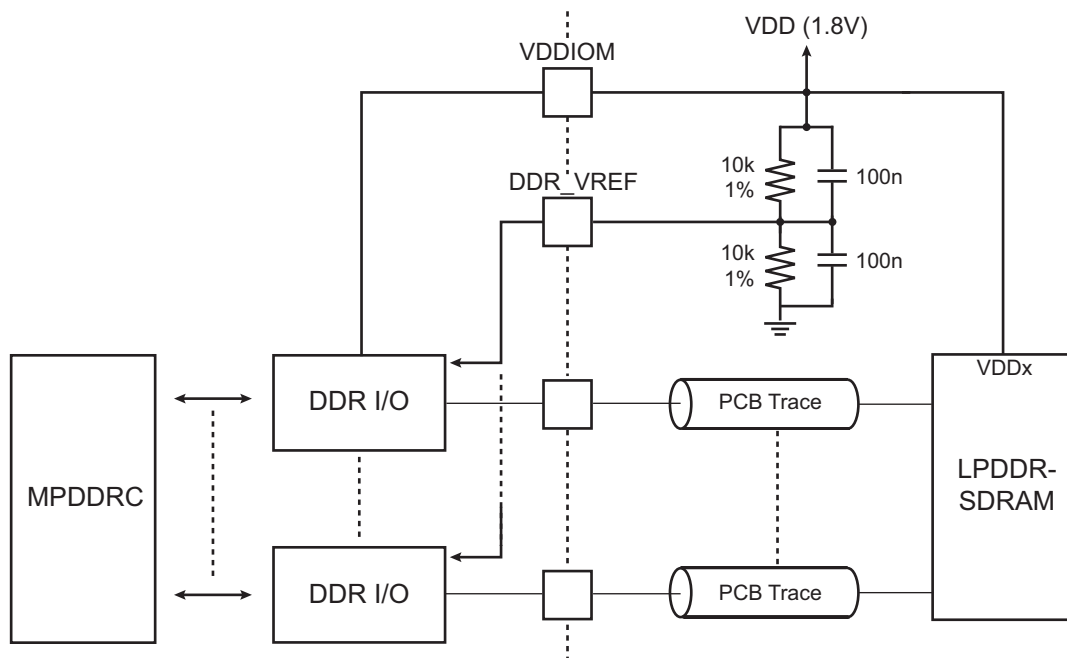

The DDR\_VREF pin serves as a voltage reference input for the DDR I/Os when DDR2 or LPDDR external SDRAM memories are used. This pin is not used with SDR or LPDDR SDRAM memories, and must therefore be connected to ground.

The following figures give the recommended schematics for each case: DDR2, LPDDR and SDR/LPDDR.

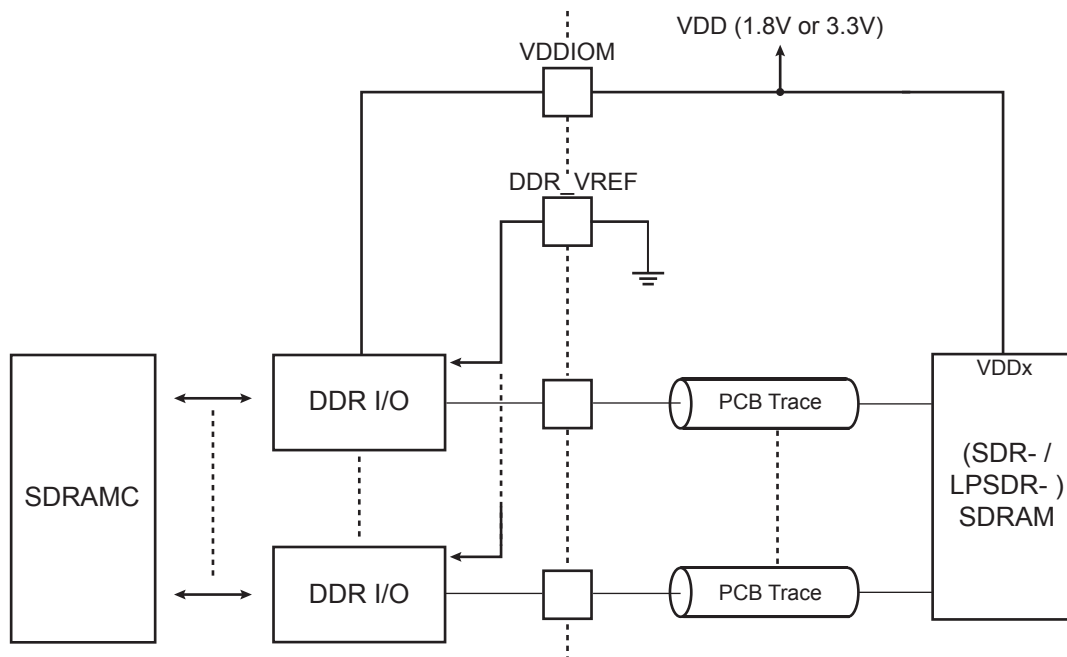

**Figure 68.9.** DDR\_VREF Recommended Schematic with DDR2-SDRAM

**Figure 68.10.** DDR\_VREF Recommended Schematic with LPDDR-SDRAM

**Figure 68.11.** DDR\_VREF Recommended Schematic with (LP)SDR-SDRAM

## 68.6. Digital Peripheral Characteristics

### 68.6.1. DDR-SDRAM Controller (MPDDRC) and SDRAM Controller (SDRAMC)

The MPDDRC and SDRAMC are respectively compliant with the following JEDEC standards:

- DDR2-SDRAM: JESD79-2F with operating frequencies up to 200 MHz
- LPDDR-SDRAM: JESD209B with operating frequencies up to 200 MHz
- SDR-SDRAM: PC100 and PC133 with frequencies up to 200 MHz
- LPSPDR-SDRAM : PC100 and PC133 with low-power extensions and frequencies up to 166 MHz

The physical interface (PCB layout) between the processor and its memory has a major impact on signal integrity. Microchip provides IBIS models of the SAM9X60 device and strongly recommends to verify this processor-memory interface on a PCB simulation tool. For design guidance, refer to the application note “SAM9X60 Hardware Design Considerations” (AN3311), available on [www.microchip.com](http://www.microchip.com).

The following table gives the recommended settings on the MPDDRC\_RD\_DATA\_PATH.SHIFT\_SAMPLING or SDRAMC\_MDR.SHIFT\_SAMPLING field depending on the memory type and on its operating frequency.

**Table 68.21.** SHIFT\_SAMPLING Settings

SDRAM Type	SDRAM Clock Frequency	SHIFT_SAMPLING
DDR2-SDRAM	$125 \text{ MHz} \leq f_{\text{SDRAM\_CLK}} \leq 200 \text{ MHz}$	2
LPDDR-SDRAM	$f_{\text{SDRAM\_CLK}} \leq 200 \text{ MHz}$	2
SDR-SDRAM	$f_{\text{SDRAM\_CLK}} \leq 200 \text{ MHz}$	3
LPSPDR-SDRAM	$f_{\text{SDRAM\_CLK}} \leq 166 \text{ MHz}$	3

### 68.6.2. Secure Digital MultiMedia Card Controller (SDMMC)

The Secure Digital MultiMedia Card Controller (SDMMC) complies with the following specifications:

- SD Host Controller Standard Specification Version 3.00

- Embedded MultiMedia Card Specification (e.MMC) Version 4.51
  - e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
  - e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
  - e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- SD Memory Card Specification Version 3.00
- SDIO Specification Version 3.00
  - SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
  - SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)

### 68.6.3. Quad Serial Peripheral Interface (QSPI)

**Figure 68.12.** QSPI Host Mode with (CPOL= NCPHA= 0) or (CPOL= NCPHA= 1) and Single Data Rate

**Figure 68.13.** QSPI Host Mode with (CPOL = 0 and NCPHA=1) or (CPOL=1 and NCPHA= 0) and Single Data Rate

**Figure 68.14.** QSPI Host Mode in Double Data Rate Mode

### 68.6.3.1.QSPI Supported Operation

The following table summarizes the supported operating modes (Single Data Rate, Double Data Rate, or none) of the QSPI peripheral as a function of the ratios between CPU\_CLK, MCK, QSPI 2x MCK and QSCK frequencies. Frequencies are expressed in MHz.

**Table 68.22.** QSPI Operation

CPU_CLK	MDIV	MCK	STH/WCS	QSPI 2x MCK	QSCK	Supported Operation
600	3	200	STH	400	50	SDR and DDR
	4	150	STH	300	75	SDR and DDR
540	3	180	STH	360	60	SDR and DDR
	4	135	STH	270	67.5	SDR and DDR
420	3	140	WCS	280	70	SDR and DDR
	4	105	WCS	210	52.5	SDR and DDR

**Note:** "-" means the operation is not supported.

### 68.6.3.2.Maximum QSPI Frequency

The following formulas provide the achievable QSCK frequency in Host Read and Host Write modes for Single Data Rate and Dual Data Rate modes, including external component timing parameters. When the result of these formulas exceeds the QSCK frequency listed in [Table 68.22](#), the frequency indicated in [Table 68.22](#) applies.

- **Host Write in Single Data Rate Mode**

$$f_{QSCK\_MAX} = \frac{1}{QSPI_2(\text{or } QSPI_5) + t_{SU\_CLIENT}}$$

Where  $t_{SU\_CLIENT}$  is the input setup time of the client device.

- **Host Read in Single Data Rate Mode**

$$f_{QSCK\_MAX} = \frac{1}{QSPI_0(\text{or } QSPI_3) + t_{VALID}}$$

Where  $t_{VALID}$  is the client time response to output data after detecting a QSCK edge.

- For a QSPI client device with  $t_{VALID}$  (or  $t_V$ ) = 12 ns, with  $QSPI_0 = 1.2$  ns,  $f_{QSCK\_MAX} = 75.7$  MHz.
- If CPU\_CLK = 600 MHz and MCK = 200 MHz, this value is greater than the 50 MHz value listed in [Table 68.22](#), therefore  $f_{QSCK\_MAX} = 50$  MHz.

- **Host Write in Dual Data Rate Mode**

$$f_{QSCK\_MAX} = \frac{0.5}{QSPI_{12} + t_{SU\_CLIENT}}$$

Where  $t_{SU\_CLIENT}$  is the input setup time of the client device.

- **Host Read in Single Data Rate Mode**

$$f_{QSCK\_MAX} = \frac{1}{2x(QSPI_{10} + t_{VALID})}$$

Where  $t_{VALID}$  is the client time response to output data after detecting a QSCK edge.

- For a QSPI Flash memory device with  $t_{VALID}$  (or  $t_V$ ) = 6 ns, and  $QSPI_{10} = 1.2$  ns,  $f_{QSCK\_MAX} = 69$  MHz.
- If CPU\_CLK = 600 MHz and MCK = 200 MHz, this value is greater than the 50 MHz value listed in [Table 68.22](#), therefore  $f_{QSCK\_MAX} = 50$  MHz.

### 68.6.3.3.QSPI Timings

Timings are given in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.95V, maximum external capacitor = 15 pF, DRV= 1, SR = 0

- 3.3V domain: VDDIO from 3.00V to 3.6V, maximum external capacitor = 15 pF, DRV= 0, SR = 0

**Table 68.23.** QSPI Timings in Single Data Rate Mode

Symbol	Parameter	Conditions	Min	Max	Unit
QSPI <sub>0</sub>	QIOx data in to QSCK rising edge (input setup time)	3.3V domain	1.2	–	ns
		1.8V domain	1.1	–	ns
QSPI <sub>1</sub>	QIOx data in to QSCK rising edge (input hold time)	3.3V domain	0.2	–	ns
		1.8V domain	0.2	–	ns
QSPI <sub>2</sub>	QSCK rising edge to QIOx data out valid	3.3V domain	0	1.4	ns
		1.8V domain	0	1.9	ns
QSPI <sub>3</sub>	QIOx data in to QSCK falling edge (input setup time)	3.3V domain	1.1	–	ns
		1.8V domain	1.1	–	ns
QSPI <sub>4</sub>	QIOx data in to QSCK falling edge (input hold time)	3.3V domain	0.5	–	ns
		1.8V domain	0.4	–	ns
QSPI <sub>5</sub>	QSCK falling edge to QIOx data out valid	3.3V domain	0	1.3	ns
		1.8V domain	0	1.6	ns

In the following table:

- $t_{HCLK}$  is the HCLK period.
- k is 0.25 if  $f_{MCK} = f_{QSCK}$  and k=0.5 when  $f_{MCK} \geq f_{QSCK}$

**Table 68.24.** QSPI Timings in Double Data Rate Mode

Symbol	Parameter	Conditions	Min	Max	Unit
QSPI <sub>10</sub>	QIOx data in to QSCK edge (rising or falling, input setup time)	3.3V domain	1.2	–	ns
		1.8V domain	1.4	–	ns
QSPI <sub>11</sub>	QIOx data in to QSCK edge (rising or falling, input hold time)	3.3V domain	0.5	–	ns
		1.8V domain	0.4	–	ns
QSPI <sub>12</sub>	QSCK edge (rising or falling) to QIOx data out valid	3.3V domain	$k \times T_{HCLK} - 0.6$	$k \times T_{HCLK} + 1.5$	ns
		1.8V domain	$k \times T_{HCLK} - 0.8$	$k \times T_{HCLK} + 2.0$	ns

#### 68.6.4. Flexible Serial Communication Controller (FLEXCOM) - SPI

In [Figure 68.16](#) and [Figure 68.17](#), the MOSI line shifting edge is represented with a hold time equal to 0. However, it is important to note that for this device, the MISO line is sampled prior to the MOSI line shifting edge. As shown in [Figure 68.15](#), the device sampling point extends the propagation delay ( $t_p$ ) for client and routing delays to more than half the SPI clock period, whereas the common sampling point allows only less than half the SPI clock period.

As an example, an SPI client working in Mode 0 can be safely driven if the SPI host is configured in Mode 0.

**Figure 68.15.** FLEXCOM in SPI Mode: MISO Capture in Host Mode

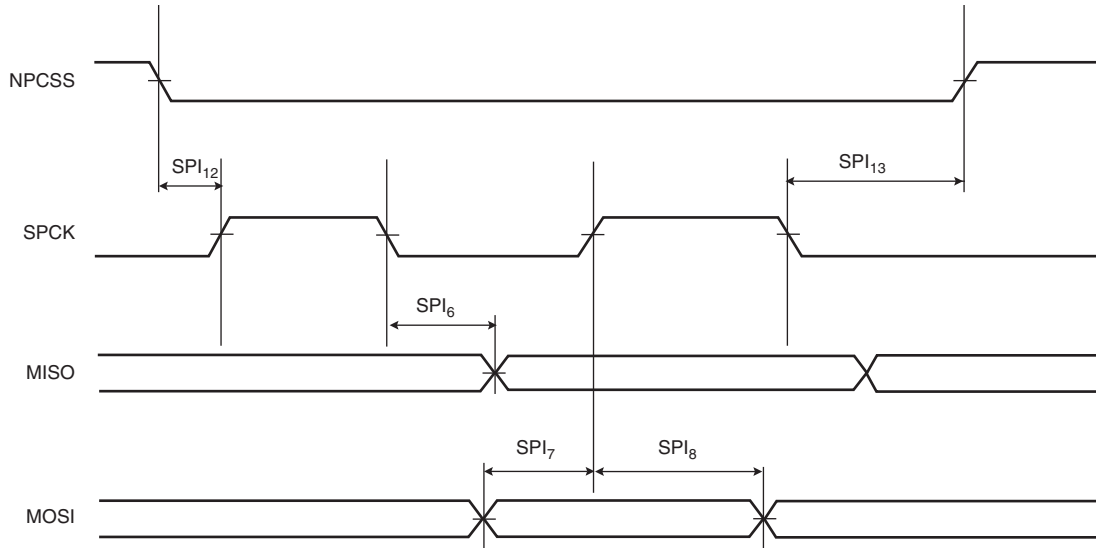

**Figure 68.16.** FLEXCOM in SPI Host Modes 1 and 2

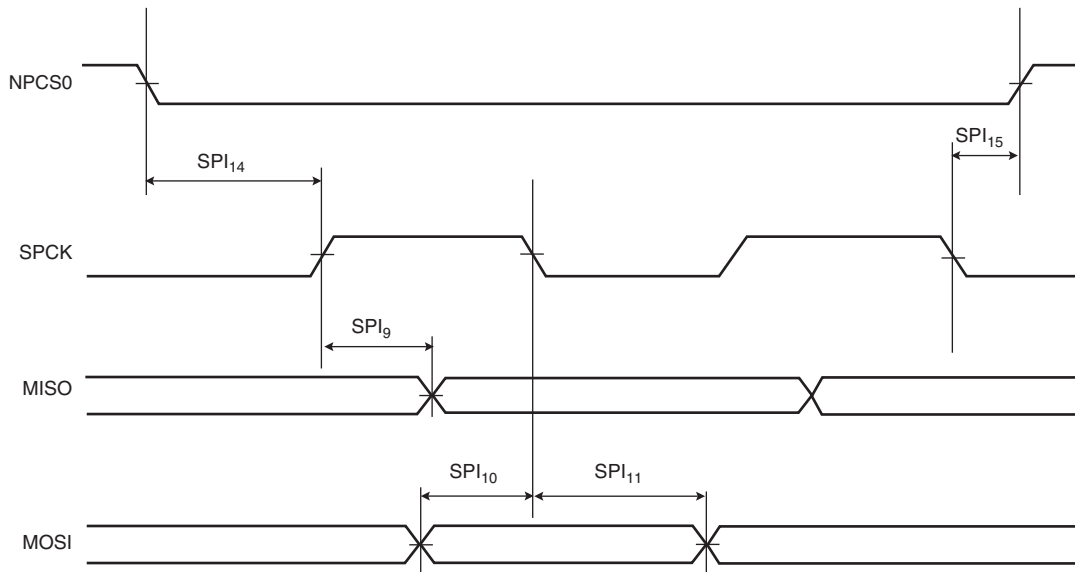

**Figure 68.17.** FLEXCOM in SPI Host Modes 0 and 3

**Figure 68.18.** FLEXCOM in SPI Client Modes 0 and 3

**Figure 68.19.** FLEXCOM in SPI Client Modes 1 and 2

**Figure 68.20.** FLEXCOM in SPI Client - NPCS Timings

#### 68.6.4.1.FLEXCOM SPI Timings

Timings are provided in the following conditions:

- 1.8V domain: VDDIO from 1.7V to 1.95V, maximum external capacitor = 15 pF, DRV = 1, SR = 1
- 3.3V domain: VDDIO from 3.00V to 3.6V, maximum external capacitor = 15 pF, DRV = 0, SR = 1

**Table 68.25.** FLEXCOM SPI Timings

Symbol	Parameter	Conditions	Min	Max	Unit
Host Mode					
SPI <sub>0</sub>	MISO setup time before SPCK rises	3.3V domain	16	–	ns
		1.8V domain	18	–	ns
SPI <sub>1</sub>	MISO hold time after SPCK rises	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
SPI <sub>2</sub>	SPCK rising to MOSI delay	3.3V domain	0	7.3	ns
		1.8V domain	0	7.3	ns
SPI <sub>3</sub>	MISO setup time before SPCK falls	3.3V domain	17.9	–	ns
		1.8V domain	18.2	–	ns
SPI <sub>4</sub>	MISO hold time after SPCK falls	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
SPI <sub>5</sub>	SPCK falling to MOSI delay	3.3V domain	0	9.2	ns
		1.8V domain	0	7.5	ns
Client Mode					
SPI <sub>6</sub>	SPCK falling to MISO delay	3.3V domain	2.9	13.6	ns
		1.8V domain	3.5	14.3	ns
SPI <sub>7</sub>	MOSI setup time before SPCK rises	3.3V domain	1.5	–	ns
		1.8V domain	1.6	–	ns
SPI <sub>8</sub>	MOSI hold time after SPCK rises	3.3V domain	0.6	–	ns
		1.8V domain	0.8	–	ns
SPI <sub>9</sub>	SPCK rising to MISO delay	3.3V domain	3.1	14.1	ns
		1.8V domain	3.6	14.7	ns
SPI <sub>10</sub>	MOSI setup time before SPCK falls (client)	3.3V domain	1.5	–	ns
		1.8V domain	1.6	–	ns
SPI <sub>11</sub>	MOSI hold time after SPCK falls (client)	3.3V domain	0.6	–	ns
		1.8V domain	0.8	–	ns
SPI <sub>12</sub>	NPCS setup to SPCK rising (client)	3.3V domain	5.7	–	ns
		1.8V domain	6.1	–	ns
SPI <sub>13</sub>	NPCS hold after SPCK falling (client)	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
SPI <sub>14</sub>	NPCS setup to SPCK falling (client)	3.3V domain	6.1	–	ns
		1.8V domain	6.4	–	ns
SPI <sub>15</sub>	NPCS hold after SPCK falling (client)	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
SPI <sub>16</sub>	NPCS falling to MISO valid (client)	3.3V domain	20.5	–	ns
		1.8V domain	21.4	–	ns

#### 68.6.4.2.Maximum FLEXCOM SPI Frequency

The following formulas give the maximum SPI frequency in Host Read and Write modes and in Client Read and Write modes.

#### 68.6.4.2.1.Host Write Mode

The SPI sends data to a client device only, for example an LCD. The limit is given by SPI<sub>2</sub> (or SPI<sub>5</sub>) timing. Since it gives a maximum frequency above the output driver maximum frequency (see [I/O AC Characteristics](#)), the max SPI frequency is the one from the output driver.

#### 68.6.4.2.2.Host Read Mode

$$f_{\text{SPCKmax}} = \frac{1}{\text{SPI}_0(\text{or SPI}_3) + t_{\text{valid}}}$$

$t_{\text{valid}}$  is the client time response to output data after detecting an SPCK edge.

For a nonvolatile memory with  $t_{\text{VALID}}$  (or  $t_v$ ) = 5 ns, using SPI<sub>3</sub> at 3.3V,  $f_{\text{SPCKmax}} = 56$  MHz.

#### 68.6.4.2.3.Client Read Mode

In Client mode, SPCK is the input clock for the SPI. The max SPCK frequency is given by setup and hold timings SPI<sub>7</sub>/SPI<sub>8</sub>(or SPI<sub>10</sub>/SPI<sub>11</sub>). Since this gives a frequency well above the output driver maximum frequency, the limit in Client Read mode is given by the SPCK output driver.

#### 68.6.4.2.4.Client Write Mode

$$f_{\text{SPCKmax}} = \frac{1}{2x(\text{SPI}_{6\text{max}}(\text{or SPI}_{9\text{max}}) + t_{\text{setup}})}$$

$t_{\text{setup}}$  is the setup time from the host before sampling data.

### 68.6.5. Flexible Serial Communication Controller (FLEXCOM) - USART

**Table 68.26.** FLEXCOM USART Timings

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{\text{SCK}}$	SCK frequency	Synchronous (SYNC=1) host or client	-	-	25	MHz
$f_s$	UART sampling clock frequency	Asynchronous (SYNC=0) <sup>(1)</sup>	-	-	25	MHz

**Note:**

1. The corresponding bit rate is  $R = f_s / 8 = 3.1$  Mbits/s with oversampling FLEX\_US\_MR.OVER=1 and  $R = f_s / 16 = 1.5$  Mbits/s with oversampling FLEX\_US\_MR.OVER=0. Refer to the Baud Rate Generator figure in the section [Flexible Serial Communication Controller \(FLEXCOM\)](#).

### 68.6.6. Flexible Serial Communication Controller (FLEXCOM) - TWI

The TWI communicates in Standard, Fast, Fast Mode Plus and High-Speed (HS) modes subject to the following:

- When the registers FLEX\_TWI\_CWGR, FLEX\_TWI\_HSCWGR and FLEX\_TWI\_MMR are programmed in the TWI Controller
- When pull-ups ( $R_p$ ) are computed to achieve the required rise time according to the total Cbus capacitance.

Possible limitations are given in the table and figures below.

**Table 68.27.** Two-Wire Interface I/O Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V <sub>IL</sub> , V <sub>IH</sub>	Low-level/High-level Input Voltage	All modes	See note <sup>(1)</sup>		V
V <sub>OL</sub> , V <sub>OH</sub>	Low-level/High-level Output Voltage	All modes	See note <sup>(2)</sup>		V
I <sub>OL</sub>	Low-level Output Current	Standard	See notes <sup>(2, 3)</sup>		mA
		Fast			
		Fast-Mode Plus	See note <sup>(2)</sup>		
		High-speed Mode			

.....continued

Symbol	Parameter	Conditions	Min	Max	Unit
$t_f$	Output fall time of both TWD and TWCK signals $V_{IHmin}$ to $V_{ILmax}$	Standard Fast Fast-Mode Plus	See note (4)		ns
$t_{FTWCK}, t_{FTWD}$	Fall time of both TWD and TWCK signals	High-speed Mode			
$t_{rTWCK}$	Rise time of TWCK, rise boost mode (push-pull mode)	$SCLRBL > 0$	See note (5)		ns

#### Notes:

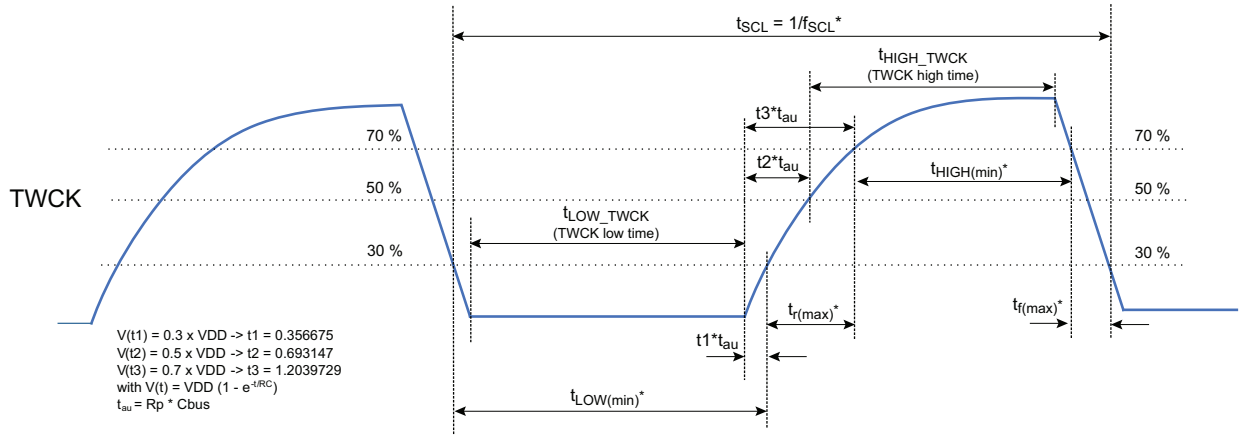

- See the table Input DC Characteristics.
- See the tables Output DC Characteristics ( $1.7V < VDD < 1.9V$ ) and Output DC Characteristics ( $3.0V < VDD < 3.6V$ ). If  $R_{p(min)}$  as specified in the I2C specification must be overridden (stronger) to meet the timing specification, the IBIS model of the product can be used to extract  $V_{OL(max)}$  vs  $I_{OL}$ .
- 20 mA is not supported for Fast Mode Plus.
- Fall time of FLEXCOM I/O buffers are not I2C-compliant. Fall time can be increased by adding series resistors (see series protection resistors in the I2C specification).  $R_s < 1\text{ K}\Omega$  depending on Cbus and  $R_p$  to respect  $V_{OL}, V_{IL}$  on the bus. Use Drive disabled (set to 0) and Slew rate enabled (set to 1) on the corresponding I/O. In the I/O AC Characteristics section, see falling times given for a 10 pF load. IBIS models of the product can be used to choose an adequate  $R_s$  value by simulating different drive/slew rate combinations with respect to the Cbus load.
- When in High-speed mode, the TWI Clock signal (TWCK) rise can be boosted to meet a very fast rise time of the parameter  $t_{rCL}$  of the I2C specification when the  $R_p$  value on TWCK is lower than  $R_{p(min)}$ . Bits in FLEX\_TWI\_MMR.SCLRBL must be programmed according to  $t_{MCKx}$  to respect these timings. This gives the number of peripheral clock periods during which the SCL rise is boosted, i.e. driven in Push-pull mode. Note that the Cbus value and the drive and slew rate settings still influence the rise time. Rise boost usage is more suited with high Cbus values.  
**Note:** MCKx refers to the MCK associated with the FLEXCOM. Refer to the Domain Clock column in the table "Peripheral Identifiers".

Figure 68.21. TWCK High-Speed Mode with Rise Boost Enabled

The figure below shows programmable register fields (CLDIV/HSCLDIV, CHDIV/HSCHDIV and optional CKDIV/HSCKDIV) in relation to  $t_{LOW}$ ,  $t_{HIGH}$ ,  $t_r$ ,  $t_f$ ,  $f_{SCL}$ ,  $t_{rCL}$ ,  $t_{rCL1}$ ,  $t_{fCL}$  from the I2C specification.

Figure 68.22. TWCK Timings Characteristics

**Note:** Symbols with an asterisk (\*) are I2C specification symbols:  $t_{LOW}$ ,  $t_{HIGH}$ ,  $t_r$ ,  $t_f$ .

**Note:** For High-speed mode,  $t_r = t_{rCL}$  or  $t_{rCL1}$  and  $t_f = t_{fCL}$  from the I2C specification.

➔ **Important:**  $t_{SCL} \cong t_{LOW(min)} + t_{r(max)} + t_{HIGH(min)} + t_{f(max)}$

#### 68.6.6.1.FLEXCOM TWI Timings

Table 68.28. TWI Interface Host Mode Timings

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{LOW\_TWCK}$	TWCK low time	–	See notes (1, 3, 4)	–	$\mu s$
$t_{HIGH\_TWCK}$	TWCK high time	–	See notes (2, 3, 4)	–	$\mu s$
$f_{TWCK}$	TWCK frequency <sup>(5)</sup>	Standard Fast Fast-Mode Plus High-speed Mode	0	0.1 0.4 1 3.4	MHz
$t_{HD(STA)}$	Hold time (repeated) START condition	Standard Fast Fast-Mode Plus	$t_{HIGH\_TWCK}$	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: $t_{LOW\_TWCK}$ <sup>(6)</sup> FLEX_TWI_CWGR.BRSRCCLK = 0: $2 \times t_{HIGH\_TWCK}$	–	ns
$t_{SU(STA)}$	Setup time for a repeated START condition	Standard Fast Fast-Mode Plus	$t_{LOW\_TWCK}$	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: $t_{LOW\_TWCK}$ FLEX_TWI_CWGR.BRSRCCLK = 0: $2 \times t_{LOW\_TWCK}$ (6)	–	ns

.....continued

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{HD(DAT)}$	Data hold time	Standard Fast Fast-Mode Plus	$2 \times t_{MCKx}$	$(HOLD + 3) \times t_{MCKx}$	ns
		High-speed Mode	0	150 @ $f_{TWCK \max} = 1.7 \text{ MHz}$ 70 @ $f_{TWCK \max} = 3.4 \text{ MHz}$	ns
$t_{SU(DAT)}$	Data setup time	Standard Fast Fast-Mode Plus	$t_{LOW} - (HOLD + 3) \times t_{MCKx}$	–	ns
		High-speed Mode	$t_{LOW\_TWCK}$	–	ns
$t_{SU(STO)}$	Setup time for STOP condition	Standard Fast Fast-Mode Plus	FLEX_TWI_CWGR.BRSRCCLK = 1: $t_{LOW\_TWCK}$ FLEX_TWI_CWGR.BRSRCCLK = 0: $t_{HIGH\_TWCK}$	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: $t_{HIGH+1}$ FLEX_TWI_CWGR.BRSRCCLK = 0: $t_{HIGH\_TWCK}$	–	ns
$t_{BUF}$	Bus free time between a STOP and a START condition	Standard Fast Fast-Mode Plus	$t_{LOW\_TWCK}$	–	ns

**Notes:**

1. TWCK low time ( $t_{LOW\_TWCK}$ )  $\geq t_{LOWmin} - t_1 * t_{au} \rightarrow HSCLDIV/CLDIV = ((t_{LOW\_TWCK} / t_{PERIPH}) - 3) / 2^{CKDIV \text{ or } HSCKDIV}$
2. TWCK high time ( $t_{HIGH\_TWCK}$ )  $\geq t_{HIGHmin} + (t_3 - t_2) * t_{au} \rightarrow HSCHDIV/CHDIV = ((t_{HIGH\_TWCK} / t_{PERIPH}) - 3) / 2^{CKDIV \text{ or } HSCKDIV}$
3.  $t_{TWCK} = (t_{LOW\_TWCK} + t_1 * t_{au}) + t_{r(max)} + (t_{HIGH\_TWCK} + (t_3 - t_2) * t_{au}) + t_{f(max)}$
4. The TWCK low/high time formulae in notes 1 and 2 are for Bit Rate Source Clock (BRSRCCLK) = 0 for all modes and RX Digital Filter (FILT) = 0 for Standard, Fast and FM+ Modes only. See FLEX\_TWI\_CWGR, FLEX\_TWI\_HSCWGR and FLEX\_TWI\_FILTR registers for more details.
5. 1.7 MHz (Cbus 400 pF max), 3.4 MHz (Cbus 100 pF max). Timings in the above table involving  $t_{LOW\_TWCK}$  and/or  $t_{HIGH\_TWCK}$  may limit the TWCK maximum frequency when interfacing with an I2C client requiring strict I2C timings.
6. If computing HSCLDIV and/or HSCHDIV results in 0,  $t_{SU(STA)}$  and/or  $t_{HD(STA)}$  is equal to  $6 \times t_{LOW\_TWCK}$  and/or  $6 \times t_{HIGH\_TWCK}$ , respectively.
7. MCKx refers to the MCK associated with the FLEXCOM. Refer to column Domain Clock in the table "Peripheral Identifiers".

**Table 68.29. Two-Wire Interface Client High-Speed Mode Timings**

Symbol	Parameter	Conditions	Min	Max	Unit
$f_{TWCK}$	TWCK clock frequency	–	–	3.4	MHz
$t_{HD(DAT)}$	Data hold time	$f_{TWCK} = 1.7 \text{ MHz}$	0	70	ns
		$f_{TWCK} = 3.4 \text{ MHz}$	0	150	
$t_{SU(DAT)}$	Data setup time	$f_{TWCK} = 1.7 \text{ MHz}$ $f_{TWCK} = 3.4 \text{ MHz}$	10	–	ns

### 68.6.7. Static Memory Controller (SMC)

Timings are given in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.95V, maximum external capacitor = 15 pF, DRV= 1, SR = 0
- 3.3V domain: VDDIO from 3.00V to 3.6V, maximum external capacitor = 15 pF, DRV= 0, SR = 0

Timings are given assuming a capacitance load on data, control and address output lines.

In the following tables,  $t_{CPMCK}$  is MCK period.

#### 68.6.7.1. Read Timings

**Table 68.30.** SMC Read Signals - NRD-controlled (READ\_MODE = 1)

Symbol	Parameter	Conditions	Min	Max	Unit
NO HOLD SETTINGS (NRD_HOLD = 0)					
SMC <sub>1</sub>	Data setup before NRD high	3.3V domain	16	–	ns
		1.8V domain	18	–	ns
SMC <sub>2</sub>	Data hold after NRD high	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
HOLD SETTINGS (NRD_HOLD ≠ 0)					
SMC <sub>3</sub>	Data setup before NRD high	3.3V domain	12.8	–	ns
		1.8V domain	15.1	–	ns
SMC <sub>4</sub>	Data hold after NRD high	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
HOLD or NO HOLD SETTINGS (NRD_HOLD ≠ 0, NRD_HOLD = 0)					
SMC <sub>5</sub>	A0–A22 valid before NRD high	3.3V domain	(NRD_SETUP + NRD_PULSE) × t <sub>CPMCK</sub> - 10	–	ns
		1.8V domain	(NRD_SETUP + NRD_PULSE) × t <sub>CPMCK</sub> - 8.7	–	ns
SMC <sub>6</sub>	NCS low before NRD high	3.3V domain	(NRD_SETUP + NRD_PULSE - NCS_RD_SETUP) × t <sub>CPMCK</sub> - 9.9	–	ns
		1.8V domain	(NRD_SETUP + NRD_PULSE - NCS_RD_SETUP) × t <sub>CPMCK</sub> - 8.5	–	ns
SMC <sub>7</sub>	NRD pulse width	3.3V domain	NRD_PULSE × t <sub>CPMCK</sub> - 0.1	–	ns
		1.8V domain	NRD_PULSE × t <sub>CPMCK</sub> - 0.2	–	ns

**Table 68.31.** SMC Read Signals - NCS-controlled (READ\_MODE= 0)

Symbol	Parameter	Conditions	Min	Max	Unit
NO HOLD SETTINGS (NCS_RD_HOLD = 0)					
SMC <sub>8</sub>	Data setup before NCS high	3.3V domain	24.3	–	ns
		1.8V domain	24.9	–	ns
SMC <sub>9</sub>	Data hold after NCS high	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
HOLD SETTINGS (NCS_RD_HOLD ≠ 0)					
SMC <sub>10</sub>	Data setup before NCS high	3.3V domain	21.9	–	ns
		1.8V domain	22.6	–	ns
SMC <sub>11</sub>	Data hold after NCS high	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
HOLD or NO HOLD SETTINGS (NCS_RD_HOLD ≠ 0, NCS_RD_HOLD = 0)					

.....continued

Symbol	Parameter	Conditions	Min	Max	Unit
SMC <sub>12</sub>	A0-A22 Valid before NCS High	3.3V domain	$(NCS\_RD\_SETUP + NCS\_RD\_PULSE) \times t_{CPMCK} - 8.6$	-	ns
		1.8V domain	$(NCS\_RD\_SETUP + NCS\_RD\_PULSE) \times t_{CPMCK} - 7.2$	-	ns
SMC <sub>13</sub>	NRD low before NCS High	3.3V domain	$(NCS\_RD\_SETUP + NCS\_RD\_PULSE - NRD\_SETUP) \times t_{CPMCK} - 0.4$	-	ns
		1.8V domain	$(NCS\_RD\_SETUP + NCS\_RD\_PULSE - NRD\_SETUP) \times t_{CPMCK} - 0.5$	-	ns
SMC <sub>14</sub>	NCS pulse width	3.3V domain	$NCS\_RD\_PULSE \times t_{CPMCK} - 2.8$	-	ns
		1.8V domain	$NCS\_RD\_PULSE \times t_{CPMCK} - 1.5$	-	ns

## 68.6.7.2. Write Timings

**Table 68.32.** SMC Write Signals - NWE-controlled (WRITE\_MODE = 1)

Symbol	Parameter	Conditions	Min	Max	Unit
HOLD or NO HOLD SETTINGS (NWE_HOLD ≠ 0, NWE_HOLD = 0)					
SMC <sub>15</sub>	Data out valid before NWE high	3.3V domain	NWE_PULSE × t <sub>CPMCK</sub> - 10.4	–	ns
		1.8V domain	NWE_PULSE × t <sub>CPMCK</sub> - 9.4	–	ns
SMC <sub>16</sub>	NWE pulse width	3.3V domain	NWE_PULSE × t <sub>CPMCK</sub> - 2	–	ns
		1.8V domain	NWE_PULSE × t <sub>CPMCK</sub> - 0.3	–	ns
SMC <sub>17</sub>	A0–A22 valid before NWE low	3.3V domain	NWE_SETUP × t <sub>CPMCK</sub> - 10.5	–	ns
		1.8V domain	NWE_SETUP × t <sub>CPMCK</sub> - 9.2	–	ns
SMC <sub>18</sub>	NCS low before NWE high	3.3V domain	(NWE_SETUP - NCS_RD_SETUP + NWE_PULSE) × t <sub>CPMCK</sub> - 10.3	–	ns
		1.8V domain	(NWE_SETUP - NCS_RD_SETUP + NWE_PULSE) × t <sub>CPMCK</sub> - 8.8	–	ns
HOLD SETTINGS (NWE_HOLD ≠ 0)					
SMC <sub>19</sub>	NWE high to data OUT, NBS0/A0 NBS1, A1 - A23 change	3.3V domain	NWE_HOLD × t <sub>CPMCK</sub> - 4.5	–	ns
		1.8V domain	NWE_HOLD × t <sub>CPMCK</sub> - 5.0	–	ns
SMC <sub>20</sub>	NWE high to NCS inactive <sup>(1)</sup>	3.3V domain	(NWE_HOLD - NCS_WR_HOLD) × t <sub>CPMCK</sub> - 3.3	–	ns
		1.8V domain	(NWE_HOLD - NCS_WR_HOLD) × t <sub>CPMCK</sub> - 3.6	–	ns
NO HOLD SETTINGS (NWE_HOLD = 0)					
SMC <sub>21</sub>	NWE high to data OUT, NBS0/A0 NBS1, A1 - A23, NCS change <sup>(1)</sup>	3.3V domain	- 4.7	–	ns
		1.8V domain	- 5.0	–	ns

**Note:**

1. Hold length = Total cycle duration - setup duration - pulse duration. "hold length" is for "NCS\_WR\_HOLD length" or "NWE\_HOLD length".

**Table 68.33.** SMC Write Signals - NCS-Controlled (WRITE\_MODE = 0)

Symbol	Parameter	Conditions	Min	Max	Unit
SMC <sub>22</sub>	Data out valid before NCS high	3.3V domain	$NCS\_WR\_PULSE \times t_{CPMCK} - 9.3$	-	ns
		1.8V domain	$NCS\_WR\_PULSE \times t_{CPMCK} - 7.8$	-	ns
SMC <sub>23</sub>	NCS pulse width	3.3V domain	$NCS\_WR\_PULSE \times t_{CPMCK} - 2.8$	-	ns
		1.8V domain	$NCS\_WR\_PULSE \times t_{CPMCK} - 1.5$	-	ns

.....continued

Symbol	Parameter	Conditions	Min	Max	Unit
SMC <sub>24</sub>	A0-A22 valid before NCS low	3.3V domain	$NCS\_WR\_SETUP \times t_{CPMCK} - 9.3$	-	ns
		1.8V domain	$NCS\_WR\_SETUP \times t_{CPMCK} - 7.9$	-	ns
SMC <sub>25</sub>	NWE low before NCS high	3.3V domain	$(NCS\_WR\_SETUP - NWE\_SETUP + NCS\_PULSE) \times t_{CPMCK} - 6.4$	-	ns

		1.8V domain	$(NCS\_WR\_HOLD - NWE\_HOLD) \times t_{CPMCK} - 8.5$	-	ns

Figure 68.23. SMC Timings - NCS-controlled Read and Write

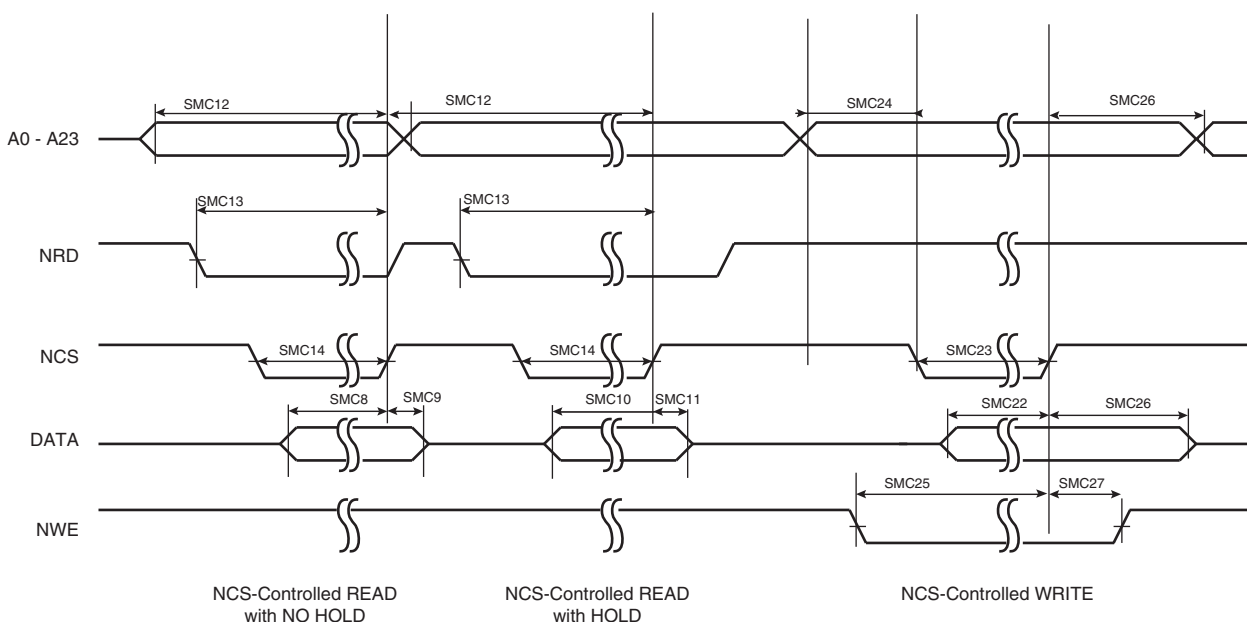

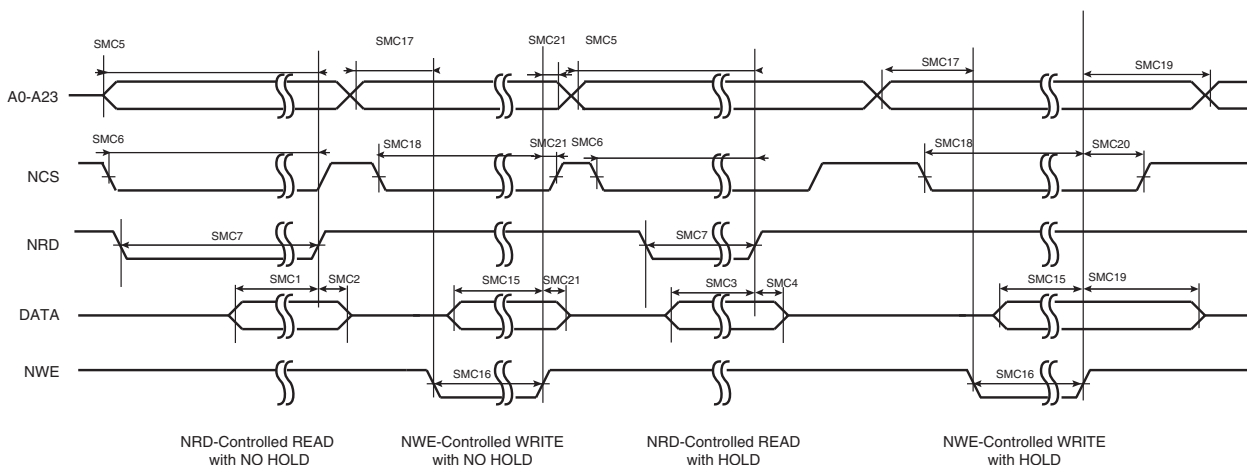

Figure 68.24. SMC Timings - NRD-controlled Read and NEW-controlled Write

### 68.6.8. Synchronous Serial Controller (SSC)

Timings are given in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.95V, maximum external capacitor = 15 pF, DRV = 1, SR = 1
- 3.3V domain: VDDIO from 3.00V to 3.6V, maximum external capacitor = 15 pF, DRV = 0, SR = 1

**Figure 68.31.** SSC Receiver, RK and RF in Output

**Figure 68.32.** SSC Receiver, RK in Output and RF in Input

**Table 68.34.** SSC Timings

Symbol	Power supply		Conditions	1.8V		3.3V		Unit
	Parameter			Min	Max	Min	Max	
Transmitter								
SSC <sub>0</sub>	TK edge to TF/TD (TK output, TF output)	–	0	3.8	0	5.5	ns	
SSC <sub>1</sub>	TK edge to TF/TD (TK input, TF output)	–	3.1	14.4	2.5	13.8	ns	
SSC <sub>2</sub>	TF setup time before TK edge (TK output)	–	12.8	–	12.3	–	ns	
SSC <sub>3</sub>	TF hold time after TK edge (TK output)	–	0	–	0	–	ns	
		–	0	3.8	0	5.5	ns	
SSC <sub>4</sub>	TK edge to TF/TD (TK output, TF input)	STTDLY = 0 START = 4, 5 or 7	2 × t <sub>CPMCK</sub>	3.8 + (2 × t <sub>CPMCK</sub> )	2 × t <sub>CPMCK</sub>	5.5 + (2 × t <sub>CPMCK</sub> )	ns	
SSC <sub>5</sub>	TF setup time before TK edge (TK input)	–	0	–	0	–	ns	
SSC <sub>6</sub>	TF hold time after TK edge (TK input)	–	t <sub>CPMCK</sub>	–	t <sub>CPMCK</sub>	–	ns	
		–	3.1	14.3	2.5	13.8	ns	
SSC <sub>7</sub>	TK edge to TF/TD (TK input, TF input)	STTDLY = 0 START = 4, 5 or 7	3.1 + (3 × t <sub>CPMCK</sub> )	14.3 + (3 × t <sub>CPMCK</sub> )	2.5 + (3 × t <sub>CPMCK</sub> )	13.8 + (3 × t <sub>CPMCK</sub> )	ns	
SSC <sub>14</sub>	TK low or high time <sup>(1)</sup>	V <sub>TK</sub> > V <sub>IH</sub> or V <sub>TK</sub> < V <sub>IL</sub>	3 × t <sub>CPMCK</sub> + 1.5	–	3 × t <sub>CPMCK</sub> + 1.7	–	ns	
SSC <sub>15</sub>	TK rise time or fall time <sup>(1)</sup>	10% to 90%	–	10	–	10	ns	
Receiver								
SSC <sub>8</sub>	RF/RD setup time before RK edge (RK input)	–	0	–	0	–	ns	
SSC <sub>9</sub>	RF/RD hold time after RK edge (RK input)	–	t <sub>CPMCK</sub>	–	t <sub>CPMCK</sub>	–	ns	
SSC <sub>10</sub>	RK edge to RF (RK input)	–	3.5	15.8	3.0	15.2	ns	
SSC <sub>11</sub>	RF/RD setup time before RK edge (RK output)	–	13.3 - t <sub>CPMCK</sub>	–	12.8 - t <sub>CPMCK</sub>	–	ns	
SSC <sub>12</sub>	RF/RD hold time after RK edge (RK output)	–	t <sub>CPMCK</sub>	–	t <sub>CPMCK</sub>	–	ns	
SSC <sub>13</sub>	RK edge to RF (RK output)	–	0	4.9	0	6.5	ns	

**Note:**

1. SSC<sub>14</sub> and SSC<sub>15</sub> apply to RK when RK is selected instead of TK (SSC\_TCMR.CKS = RK).

### 68.6.9. Inter-IC Sound Multi-Channel Controller (I2SMCC)

Timings are given in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.95V, maximum external capacitor = 15 pF, DRV = 1, SR = 1
- 3.3V domain: VDDIO from 3.00V to 3.6V, maximum external capacitor = 15 pF, DRV = 0, SR = 1

**Figure 68.33.** I2SMCC Timing Diagram in Host Mode

**Figure 68.34.** I2SMCC Timing Diagram in Client Mode

**Table 68.35.** I2SMCC Timings

Symbol	Parameter	Conditions	Min	Max	Unit
<b>Host Mode</b>					
I2S <sub>0</sub>	I2SMCC_DINx setup time before I2SMCC_SCK rises	3.3V domain	10.5	–	ns
		1.8V domain	12.7	–	ns
I2S <sub>1</sub>	I2SMCC_DINx hold time after I2SMCC_SCK rises	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
I2S <sub>2</sub>	I2SMCC_SCK falling to I2SMCC_DOUTx delay	3.3V domain	0	3.4	ns
		1.8V domain	0	1.7	ns
I2S <sub>3</sub>	I2SMCC_SCK falling to I2SMCC_WS delay	3.3V domain	0	3.5	ns
		1.8V domain	0	1.9	ns
<b>Client Mode</b>					

.....continued

Symbol	Parameter	Conditions	Min	Max	Unit
I2S <sub>4</sub>	I2SMCC_DINx setup time before I2SMCC_SCK rises	3.3V domain	0.1	–	ns
		1.8V domain	0.2	–	ns
I2S <sub>5</sub>	I2SMCC_DINx hold time after I2SMCC_SCK rises	3.3V domain	2.1	–	ns
		1.8V domain	2.3	–	ns
I2S <sub>6</sub>	I2SMCC_WS setup time before I2SMCC_SCK rises	3.3V domain	2.2	–	ns
		1.8V domain	2.5	–	ns
I2S <sub>7</sub>	I2SMCC_WS hold time after I2SMCC_SCK rises	3.3V domain	1.3	–	ns
		1.8V domain	1.4	–	ns
I2S <sub>8</sub>	I2SMCC_SCK falling to I2SMCC_DOUTx delay	3.3V domain	1.9	12.0	ns
		1.8V domain	2.5	12.7	ns

### 68.6.10. Image Sensor Interface (ISI)

Timings are given in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.95V, maximum external capacitor = 15 pF, DRV = 1, SR = 1
- 3.3V domain: VDDIO from 3.00V to 3.6V, maximum external capacitor = 15 pF, DRV = 0, SR = 1

Figure 68.35. ISI Timing Diagram

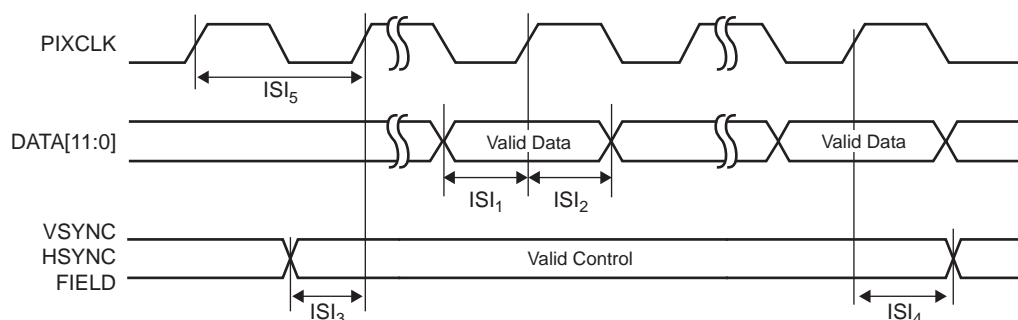

Table 68.36. ISI Timings

Symbol	Parameter	Conditions	Min	Max	Unit
ISI <sub>1</sub>	DATA setup time before PIXCLK rises	3.3V domain	2.5	–	ns
		1.8V domain	2.8	–	ns
ISI <sub>2</sub>	DATA hold time after PIXCLK rises	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
ISI <sub>3</sub>	VSYNC / HSYNC / FIELD setup time before PIXCLK rises	3.3V domain	2.5	–	ns
		1.8V domain	2.8	–	ns
ISI <sub>4</sub>	VSYNC / HSYNC / FIELD hold time after PIXCLK rises	3.3V domain	0	–	ns
		1.8V domain	0	–	ns
ISI <sub>5</sub>	PIXCLK frequency	3.3V domain	–	75	MHz
		1.8V domain	–	75	MHz

### 68.6.11. Ethernet MAC 10/100 (EMAC)

Timings are given in the following conditions:

- VDDIO from 3.00V to 3.6V, maximum external capacitor = 15 pF, DRV = 0, SR = 0

### 68.6.11.1.Ethernet MAC MDIO Interface Timings

**Table 68.37.** Ethernet MAC MDIO Interface Timings

Symbol	Parameter	Min	Max	Unit
$f_{MDC}$	MDC clock frequency <sup>(1)</sup>	–	10	MHz
EMAC <sub>1</sub>	MDIO input data setup time before MDC rising edge	10	–	ns
EMAC <sub>2</sub>	MDIO input data hold time after MDC rising edge	0	–	ns
EMAC <sub>3</sub>	MDC falling edge to MDIO output data valid	0	25	ns

**Note:**

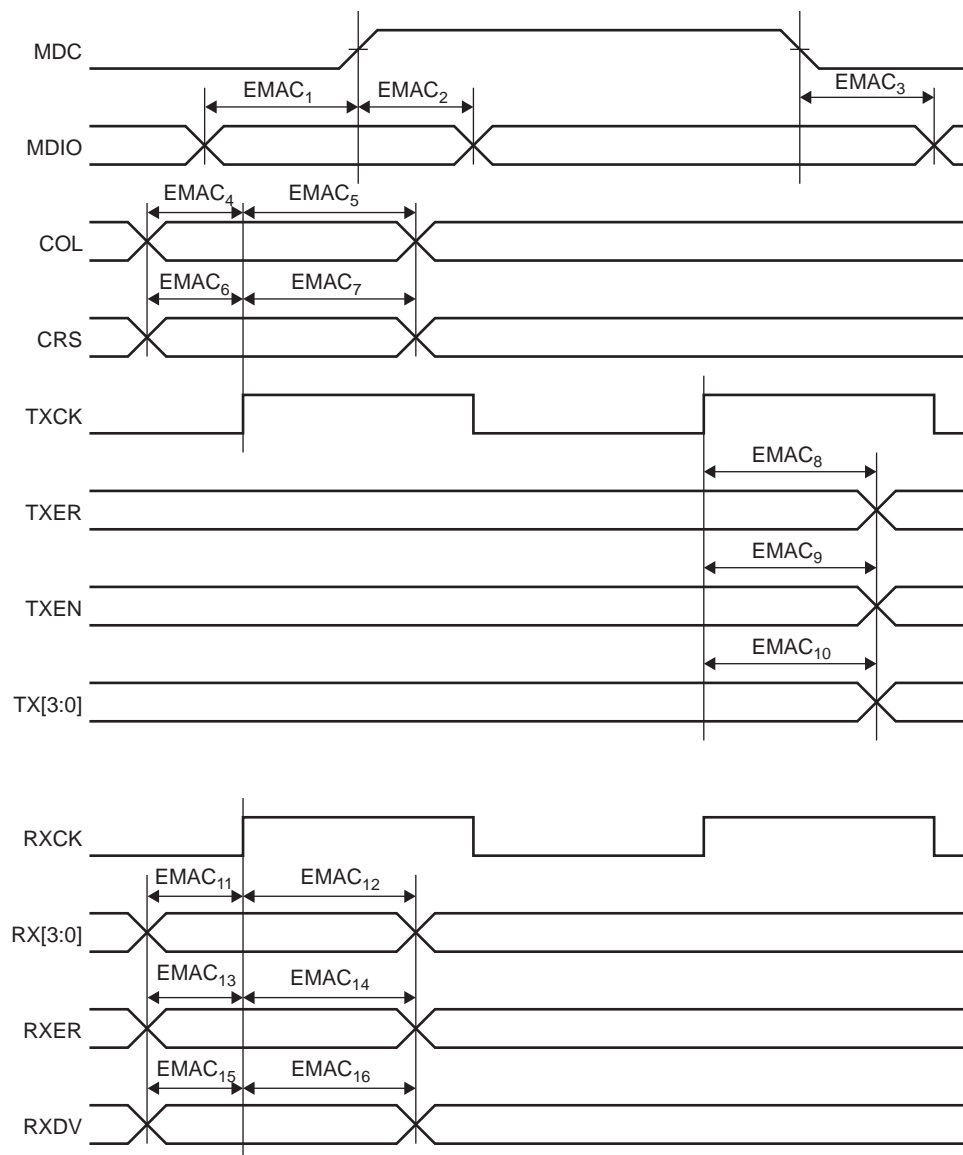

- The Ethernet PHY should be selected to comply with  $f_{MDC} = f_{MCK}/64$ .  
If  $f_{MCK} = 200$  MHz,  $f_{MDC(min)} = 200/64 = 3.125$  MHz.

### 68.6.11.2.Ethernet MAC MII Mode

**Table 68.38.** Ethernet MAC MII Specific Signals

Symbol	Parameter	Min	Max	Unit
EMAC <sub>4</sub>	Setup for COL from TXCK rising	10	–	ns
EMAC <sub>5</sub>	Hold for COL from TXCK rising	10	–	ns
EMAC <sub>6</sub>	Setup for CRS from TXCK rising	10	–	ns
EMAC <sub>7</sub>	Hold for CRS from TXCK rising	10	–	ns
EMAC <sub>8</sub>	TXER toggling from TXCK rising	10	25	ns
EMAC <sub>9</sub>	TXEN toggling from TXCK rising	10	25	ns
EMAC <sub>10</sub>	TX[3:0] toggling from TXCK rising	10	25	ns
EMAC <sub>11</sub>	Setup for RX[3:0] from RXCK	10	–	ns
EMAC <sub>12</sub>	Hold for RX[3:0] from RXCK	10	–	ns
EMAC <sub>13</sub>	Setup for RXER from RXCK	10	–	ns
EMAC <sub>14</sub>	Hold for RXER from RXCK	10	–	ns
EMAC <sub>15</sub>	Setup for RXDV from RXCK	10	–	ns
EMAC <sub>16</sub>	Hold for RXDV from RXCK	10	–	ns

**Figure 68.36.** Ethernet MAC MDIO Interface and MII Mode

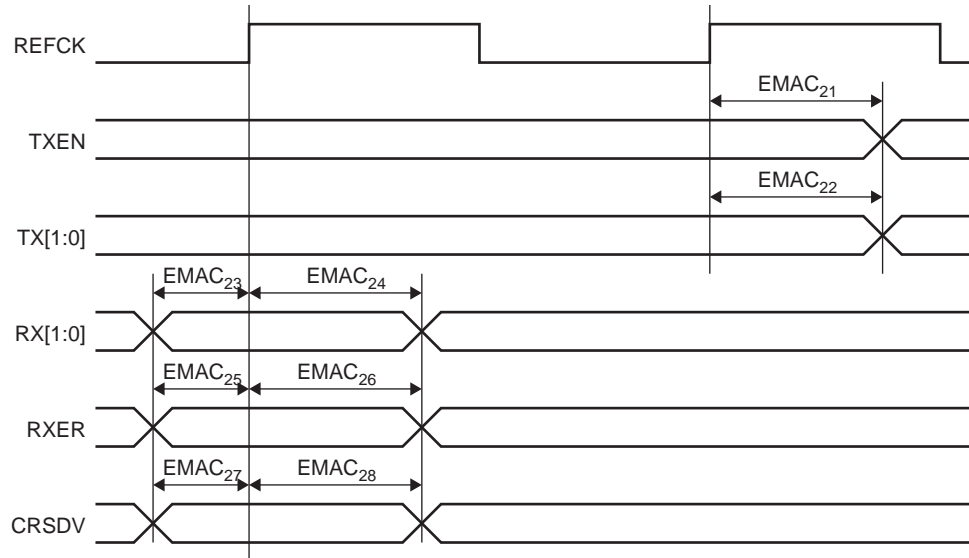

### 68.6.11.3. Ethernet MAC RMII Mode

**Table 68.39.** Ethernet MAC RMII Mode

Symbol	Parameter	Min	Max	Unit
$EMAC_{21}$	TXEN toggling from REFCK rising	2	16	ns
$EMAC_{22}$	TX[1:0] toggling from REFCK rising	2	16	ns
$EMAC_{23}$	Setup for RX[1:0] from REFCK rising	4	-	ns
$EMAC_{24}$	Hold for RX[1:0] from REFCK rising	2	-	ns
$EMAC_{25}$	Setup for RXER from REFCK rising	4	-	ns
$EMAC_{26}$	Hold for RXER from REFCK rising	2	-	ns
$EMAC_{27}$	Setup for CRSDV from REFCK rising	4	-	ns
$EMAC_{28}$	Hold for CRSDV from REFCK rising	2	-	ns

**Figure 68.37.** Ethernet MAC RMII Timings

## 68.7. Analog Peripheral Characteristics

### 68.7.1. VDDOUT25 Voltage Regulator

**Table 68.40.** VDDOUT25 Voltage Regulator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDIN33</sub>	Supply voltage range (VDDIN33)	–	3.0	–	3.6	V
V <sub>START</sub>	Input startup voltage	–	V <sub>IT+</sub> POR VDDIN33	–	–	V
V <sub>STOP</sub>	Input shutdown voltage	–	V <sub>IT</sub> POR VDDIN33	–	–	V
t <sub>START</sub>	Startup time <sup>(1)</sup>	From VDDIN33 > V <sub>START</sub> to VDDOUT25 set to 95% of its final value	–	–	6	ms
I <sub>LOAD_EXT</sub>	External DC output current <sup>(2)</sup>	–	–	–	1	mA
V <sub>DDOUT25</sub>	VDDOUT25 accuracy	–	2.45	–	2.55	V
I <sub>INRUSH</sub>	Inrush current <sup>(1)(3)</sup>	I <sub>LOAD</sub> = 0	–	–	100	mA
C <sub>IN</sub>	Input decoupling capacitor <sup>(4)</sup>	–	2.2	–	–	μF
C <sub>OUT</sub>	Stable output capacitor range <sup>(5)</sup>	Capacitance	1	2.2	2.7	μF
		ESR	0.01	–	0.3	Ω
R <sub>DIS</sub>	Output discharge resistor value <sup>(1)</sup>	Regulator off	100	–	300	Ω

#### Notes:

- Simulation data
- This regulator is designed to supply SAM9X60 internal circuits (PLLs, oscillators, etc.). To supply external components, only DC current is permissible (resistive divider, for example).
- Input current when charging the external output capacitor C<sub>OUT</sub>.
- An X5R or X7R ceramic capacitor connected between VDDIN33 and the device's closest GND pin is a minimum requirement to reduce the inrush current and maximize the regulator's performances.
- To ensure stability, an external X5R or X7R ceramic output capacitor, C<sub>OUT</sub>, must be connected between the VDDOUT25 and the device's closest GND pin.

### 68.7.2. VDDCORE Power-On-Reset

**Table 68.41.** Core Power Supply Power-On-Reset Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDCORE</sub>	Supply voltage range (VDDCORE)	–	0.5	–	1.21	V
V <sub>IT-</sub>	Negative-going input threshold voltage (VDDCORE)	Measured with a -10V/s ramp rate	0.68	–	0.92	V
V <sub>IT+</sub>	Positive-going input threshold voltage (VDDCORE)	Measured with a +10V/s ramp rate	0.70	–	0.99	V
V <sub>hys</sub>	Hysteresis voltage <sup>(1)</sup>	–	20	–	60	mV
t <sub>RES</sub>	Reset Time	–	1	–	5	ms
t <sub>DET-</sub>	V <sub>IT-</sub> detection propagation time <sup>(2)</sup>	100 mV threshold overdrive	–	–	10	µs

**Notes:**

1.  $V_{hys} = V_{IT+} - V_{IT-}$
2. Simulation data

### 68.7.3. VDDIN33 Power-On-Reset

**Table 68.42.** VDDIN33 POR Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDIN33</sub>	Supply voltage range (VDDIN33)	–	–	–	3.6	V
V <sub>IT-</sub>	Negative-going input threshold voltage (VDDIN33)	Measured with a -10V/s ramp rate	2.40	–	2.60	V
V <sub>IT+</sub>	Positive-going input threshold voltage (VDDIN33)	Measured with a +10V/s ramp rate	2.44	–	2.65	V
V <sub>hys</sub>	Hysteresis voltage <sup>(1)</sup>	–	40	–	60	mV
t <sub>RES</sub>	Reset time	–	1	–	6	ms
t <sub>DET-</sub>	V <sub>IT-</sub> detection propagation time <sup>(2)</sup>	100 mV threshold overdrive	–	–	30	µs

**Notes:**

1.  $V_{hys} = V_{IT+} - V_{IT-}$
2. Simulation data

### 68.7.4. VDDBU Power-On-Reset

**Table 68.43.** VDDBU POR Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDBU</sub>	Supply voltage range (VDDBU)	–	–	–	3.6	V
V <sub>IT-</sub>	Negative-going input threshold voltage (VDDBU)	Measured with a -10V/s ramp rate	1.38	–	1.51	V
V <sub>IT+</sub>	Positive-going input threshold voltage (VDDBU)	Measured with a +10V/s ramp rate	1.42	–	1.55	V
V <sub>hys</sub>	Hysteresis voltage <sup>(1)</sup>	–	25	–	45	mV
t <sub>RES</sub>	Reset time	–	1.2	–	3.3	ms
t <sub>DET-</sub>	V <sub>IT-</sub> detection propagation time <sup>(2)</sup>	100 mV threshold overdrive	–	–	6	µs

**Notes:**

1.  $V_{hys} = V_{IT+} - V_{IT-}$
2. Simulation data

**Figure 68.38.** VDDIN33/VDDCORE/VDDBU Power-On Reset Characteristics

### 68.7.5. Slow RC Oscillator

**Table 68.44.** Slow RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDBU</sub>	Supply voltage range (V <sub>DDBU</sub> ) <sup>(1)</sup>	–	V <sub>IT-</sub>	–	3.6	V
f <sub>SLOWRC</sub>	Frequency accuracy	V <sub>DDBU</sub> = 3.3V, T <sub>J</sub> = 0 to +50°C	31	32	33	kHz
		V <sub>DDBU</sub> = V <sub>IT-</sub> to 3.6V T <sub>J</sub> = -40 to +125°C	29	–	35	kHz

**Note:**

1. In this table, V<sub>IT-</sub> corresponds to the negative-going input threshold voltage of the V<sub>DDBU</sub> POR (see the table [V<sub>DDBU</sub> POR Characteristics](#)). Operation of the device backup section, and in particular of the Slow RC oscillator, is granted down to the V<sub>DDBU</sub> POR V<sub>IT-</sub> threshold.

### 68.7.6. Main RC Oscillator

**Table 68.45.** Main RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDIN33</sub>	Supply voltage range (V <sub>DDIN33</sub> ) <sup>(1)</sup>	–	3.0	–	3.6	V
I <sub>DDIN33</sub>	Current consumption (V <sub>DDIN33</sub> ) <sup>(2)</sup>	–	–	–	200	μA
t <sub>START</sub>	Startup time <sup>(2)</sup>	–	–	–	15	μs
f <sub>0</sub>	Nominal output frequency	–	–	12	–	MHz
f <sub>ACC</sub>	Output frequency accuracy	0°C < T <sub>J</sub> < +50°C	–	–	±2	%
		-20°C < T <sub>J</sub> < +70°C <sup>(2)</sup>	–	–	±3	
		-40°C < T <sub>J</sub> < +125°C	–	–	±5	
df/dV	Output frequency drift with V <sub>DDIN33</sub> <sup>(2)</sup>	V <sub>DDIN33</sub> : 3.0V to 3.6V	–	–	0.01	%/V
f <sub>STEP</sub>	Frequency trimming step size <sup>(2)</sup>	–	–	50	–	kHz
Duty	Output duty cycle	–	45	50	55	%

**Notes:**

1. This oscillator is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data

### 68.7.7. 32.768 kHz Crystal Oscillator

**Table 68.46.** 32.768 kHz Crystal Oscillator Characteristics

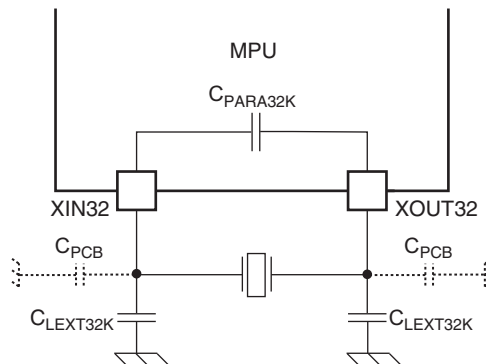

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
V <sub>DDBU</sub>	Supply voltage range (V <sub>DDBU</sub> )	–		V <sub>IT</sub> <sup>(1)</sup>	–	3.6	V
I <sub>V<sub>DDBU</sub></sub>	Current consumption (V <sub>DDBU</sub> ) <sup>(2)</sup>	–		–	–	3.1	μA
t <sub>START</sub>	Startup time <sup>(2)</sup>	ESR < 50 kΩ	C <sub>M</sub> = 0.6 fF	–	–	3.7	s
			C <sub>M</sub> = 3 fF	–	–	0.8	s
		ESR < 90 kΩ	C <sub>M</sub> = 0.6 fF	–	–	5.0	s
			C <sub>M</sub> = 3 fF	–	–	1.0	s
f <sub>OSC</sub>	Operating frequency	–		32.7	–	32.8	kHz
Duty	Duty cycle	–		40	50	60	%
C <sub>PARA32K</sub>	Internal parasitic capacitance <sup>(2)</sup>	Between XIN32 and XOUT32		–	1.7	–	pF

**Notes:**

1. In this table, V<sub>IT</sub> corresponds to the negative-going input threshold voltage of V<sub>DDBU</sub> POR (see the table [V<sub>DDBU</sub> POR Characteristics](#)). Operation of the device backup section is granted down to the V<sub>DDBU</sub> POR V<sub>IT</sub> threshold.
2. Simulation data

The 32.768 crystal oscillator supports a Bypass mode. See [Input AC Characteristics](#).

**Figure 68.39.** 32.768 kHz Crystal Oscillator

$$C_{LEXT32K} = 2 \times (C_{CRYSTAL} - C_{PARA32K} - C_{PCB} / 2)$$

where C<sub>PCB</sub> is the single-ended (ground-referenced) parasitic capacitance of the printed circuit board (PCB) on XIN32 and XOUT32 tracks. As an example, if the crystal is specified for a 12.5 pF load, with C<sub>PCB</sub> = 1 pF (on XIN32 and on XOUT32), C<sub>LEXT32K</sub> = 2 × (12.5 - 1.7 - 0.5) = 20.6 pF.

The table below summarizes recommendations for 32.768 kHz crystal selection.

**Table 68.47.** Recommended 32.768 kHz Crystal Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
C <sub>CRYSTAL</sub>	Crystal load capacitance	As specified by the crystal manufacturer	6	–	12.5	pF
R <sub>S</sub>	Equivalent series resistor	–	–	50	90	kΩ
C <sub>M</sub>	Motional capacitance	–	0.6	–	3	fF
C <sub>SHUNT</sub>	Shunt capacitance	–	0.6	–	2	pF
P <sub>ON</sub>	Drive level	–	0.2	–	–	μW

## 68.7.8. Main Crystal Oscillator

**Table 68.48.** Main Crystal Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDIN33</sub>	Supply voltage range (VDDIN33) <sup>(1)</sup>	–	3.0	–	3.6	V
I <sub>VDDIN33</sub>	Current consumption (VDDIN33) <sup>(2)</sup>	–	–	–	2.6	mA
t <sub>START</sub>	Startup time <sup>(2)</sup>	–	–	–	10	ms
f <sub>OSC</sub>	Operating frequency range	–	12	–	48	MHz
Duty	Duty cycle	–	40	50	60	%
C <sub>PARA</sub>	Parasitic load capacitance <sup>(2)</sup>	On XIN and XOUT	–	1	–	pF

**Notes:**

1. This oscillator is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data

The Main crystal oscillator supports a Bypass mode. See [Input AC Characteristics](#).

Three sets of crystal characteristics are supported with this oscillator corresponding to three operating frequency ranges:

- Set 1: Crystal frequency is between 12 and 20 MHz. See [Table 68.49](#).
- Set 2: Crystal frequency is between 20 and 30 MHz. See [Table 68.50](#).
- Set 3: Crystal frequency is between 30 and 48 MHz. See [Table 68.51](#).

When choosing a crystal, one and only one of these sets of characteristics must be completely satisfied.

**Table 68.49.** Recommended Crystal Characteristics (Set 1)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>0</sub>	Fundamental frequency	–	12	–	20	MHz
C <sub>CRYSTAL</sub>	Load capacitance	–	6	–	17.5	pF
C <sub>SHUNT</sub>	Shunt capacitance	–	–	–	3	pF
ESR	Equivalent series resistance	–	–	–	100	Ω
C <sub>M</sub>	Motional capacitance	–	1.3	–	3.2	fF
P <sub>ON</sub>	Drive level	–	150	–	–	μW

**Table 68.50.** Recommended Crystal Characteristics (Set 2)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>0</sub>	Fundamental frequency	–	20	–	30	MHz
C <sub>CRYSTAL</sub>	Load capacitance	–	6	–	12.5	pF
C <sub>SHUNT</sub>	Shunt capacitance	–	–	–	3	pF
ESR	Equivalent series resistance	–	–	–	100	Ω
C <sub>M</sub>	Motional capacitance	–	1.3	–	3.2	fF
P <sub>ON</sub>	Drive level	–	300	–	–	μW

**Table 68.51.** Recommended Crystal Characteristics (Set 3)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>0</sub>	Fundamental frequency	–	30	–	48	MHz
C <sub>CRYSTAL</sub>	Load capacitance	–	6	–	10	pF

.....continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$C_{SHUNT}$	Shunt capacitance	With $ESR_{MAX} = 60\Omega$	-	-	3	pF
		With $ESR_{MAX} = 80\Omega$	-	-	1	pF
ESR	Equivalent series resistance	With $C_{SHUNT\_MAX} = 1\text{pF}$	-	-	80	$\Omega$
		With $C_{SHUNT\_MAX} = 3\text{pF}$	-	-	60	$\Omega$
$C_M$	Motional capacitance	-	1.3	-	3.2	fF
$P_{ON}$	Drive level	-	400	-	-	$\mu\text{W}$

Figure 68.40. Main Crystal Oscillator Schematic

$$C_{LEXT} = 2 \times (C_{CRYSTAL} - C_{PARA} - C_{PCB} / 2).$$

where  $C_{PCB}$  is the single-ended (ground-referenced) parasitic capacitance of the printed circuit board (PCB) on XIN and XOUT tracks. As an example, if the crystal is specified for a 12.5 pF load, with  $C_{PCB}=1$  pF (on XIN and on XOUT),  $C_{LEXT} = 2 \times (12.5 - 1 - 0.5) = 22$  pF.

### 68.7.9. Crystal Oscillator Design Considerations

When choosing a crystal for the 32.768 kHz Crystal Oscillator or for the Main Crystal Oscillator, several parameters must be taken into account. Important parameters are as follows:

- **Crystal Load Capacitance:** the total capacitance loading the crystal, including the oscillator's internal parasitics and the PCB parasitics, must match the load capacitance for which the crystal's frequency is specified. Any mismatch in the load capacitance with respect to the crystal's specification leads to inaccurate oscillation frequency.
- **Crystal Drive Level:** use only crystals with specified drive levels greater than the minimum recommended value. Applications that do not respect this criterion may damage the crystal.
- **Crystal Equivalent Series Resistance (ESR):** use only crystals with a specified ESR lower than the maximum specified value. In applications where this criterion is not respected, the crystal oscillator may not start.
- **Crystal Shunt Capacitance:** use only crystals with a specified shunt capacitance lower than the maximum specified value. In applications where this criterion is not respected, the crystal oscillator may not start.
- **PCB Layout Considerations:** to minimize inductive and capacitive parasitics associated with XIN, XOUT, XIN32, XOUT32 traces, it is recommended to minimize as much as possible their routing length. These traces must be kept away from noisy switching signals (clock, data, PWM, etc.). A good practice is to shield them with a quiet ground to avoid coupling to neighboring signals.

## 68.7.10. PLL Characteristics

**Table 68.52.** PLLA Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDIN33</sub>	Supply voltage range (VDDIN33) <sup>(1)</sup>	–	3.0	–	3.6	V
V <sub>DDCORE</sub>	Supply voltage range (VDDCORE)	–	1.02	–	1.21	V
I <sub>VDDIN33</sub>	Current consumption (VDDIN33) <sup>(2)</sup>	f <sub>COREPLLCK</sub> = 1.2 GHz	–	–	3.0	mA
I <sub>VDDCORE</sub>	Current consumption (VDDCORE) <sup>(2)</sup>		–	–	3.5	mA
t <sub>START</sub>	Startup time <sup>(2)</sup>	–	–	–	50	μs
f <sub>IN</sub>	Input frequency range	<sup>(3)</sup>	12	–	48	MHz
f <sub>PLLACK</sub>	Output frequency range (PLLACK)	–	–	–	600	MHz
f <sub>COREPLLCK</sub>	COREPLLCK frequency range	–	600	–	1200	MHz

**Notes:**

1. This PLL is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data
3. For optimal setting of the PLLA, set the register PMC\_PLL\_ACR to the value 0x00020010.

**Table 68.53.** UPLL Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDIN33</sub>	Supply voltage range (VDDIN33) <sup>(1)</sup>	–	3.0	–	3.6	V
V <sub>DDCORE</sub>	Supply voltage range (VDDCORE)	–	1.02	–	1.21	V
I <sub>VDDIN33</sub>	Current consumption (VDDIN33) <sup>(5)</sup>	f <sub>COREPLLCK</sub> = 960 MHz	–	–	2.4	mA
I <sub>VDDCORE</sub>	Current consumption (VDDCORE) <sup>(5)</sup>		–	–	2.8	mA
t <sub>START</sub>	Startup time <sup>(3)(5)</sup>	–	–	–	150	μs
f <sub>IN</sub>	Input frequency range <sup>(2)</sup>	<sup>(6)</sup>	12	–	48	MHz
f <sub>COREPLLCK</sub>	COREPLLCK frequency range	–	600	–	1200	MHz
f <sub>OUT</sub>	Output frequency range <sup>(4)</sup>	–	f <sub>COREPLLCK</sub> / 2			MHz

**Notes:**

1. This PLL is powered by an internal dedicated voltage regulator, supplied from VDDIN33, that must be started by software before enabling this PLL. Refer to [Clock Generator](#).
2. Only 12, 16, 24 or 48 MHz input frequencies are authorized to support USB-related features of the bootloader program in ROM.
3. Covers the startup time of the PLL and of its dedicated voltage regulator.
4. The post divider is hardwired in a divide-by-2 configuration.
5. Simulation data
6. For optimal setting of the PLLUTMI, set PMC\_PLL\_ACR as follows:  
 PMC\_PLL\_ACR = 0x09023010 for f<sub>IN</sub> = [12 MHz, 18 MHz]  
 PMC\_PLL\_ACR = 0x12023010 for f<sub>IN</sub> = [18 MHz, 32 MHz]  
 PMC\_PLL\_ACR = 0x1B023010 for f<sub>IN</sub> = [32 MHz, 48 MHz]

## 68.7.11. 12-bit ADC Characteristics

**Table 68.54.** ADC Power Supply and Voltage Reference Input Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>DDANA</sub>	Supply voltage range (VDDANA)	–	3.0	–	3.6	V

.....continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I <sub>VDDANA</sub>	Current consumption on VDDANA <sup>(2)</sup>	Low Speed – $f_s \leq 500$ kS/s ADC_ACR.IBCTL = (00) <sub>2</sub>	–	0.7	1.0	mA
		Full Speed – $f_s \leq 1$ MS/s ADC_ACR.IBCTL = (01) <sub>2</sub>	–	1.2	1.7	mA
V <sub>ADVREFP</sub>	ADVREFP input voltage range <sup>(1)</sup>	–	2.4	–	V <sub>DDANA</sub>	V
R <sub>ADVREFP</sub>	ADVREFP input resistance to ground <sup>(2)</sup>	ADC on	7.2	–	12	kΩ
		ADC off	1	–	–	MΩ
C <sub>ADVREFP</sub>	Recommended decoupling capacitor on ADVREFP	–	1	–	–	μF

**Notes:**

1. ADVREFN pin must be connected to the PCB ground plane.
2. Simulation data

**Table 68.55.** ADC Timing Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f <sub>CKADC</sub>	ADC clock frequency	ADC_ACR.IBCTL = (00) <sub>2</sub>	0.1	–	10	MHz
		ADC_ACR.IBCTL = (01) <sub>2</sub>	0.2	–	20	MHz
t <sub>CONV</sub>	ADC conversion time <sup>(1)</sup>	–	20	–	–	t <sub>CKADC</sub>
f <sub>s</sub>	Sampling rate <sup>(2)</sup>	ADC_ACR.IBCTL = (00) <sub>2</sub>	–	–	0.5	MS/s
		ADC_ACR.IBCTL = (01) <sub>2</sub>	–	–	1	MS/s
t <sub>START</sub>	Startup time <sup>(4)</sup>	Off to on	–	–	5	μs
t <sub>TRACK</sub>	Track and hold time <sup>(3)</sup>	–	300	–	–	ns

**Notes:**

1.  $t_{CONV} = t_{CH} + t_{TRACK} + 14 \times t_{CKADC}$  with  $t_{CKADC} = 1 / f_{CKADC}$ .  $t_{CH} = 0$  when the ADC operates in the same input mode (single-ended, pseudo-differential or differential) for the current conversion than for the previous one.  $t_{CH} = 2$  when the ADC input mode is changed to perform the current conversion.
2.  $f_s = 1 / t_{CONV}$ .
3. See [Track and Hold Time versus Source Impedance – Sampling Rate](#).
4. Simulation data

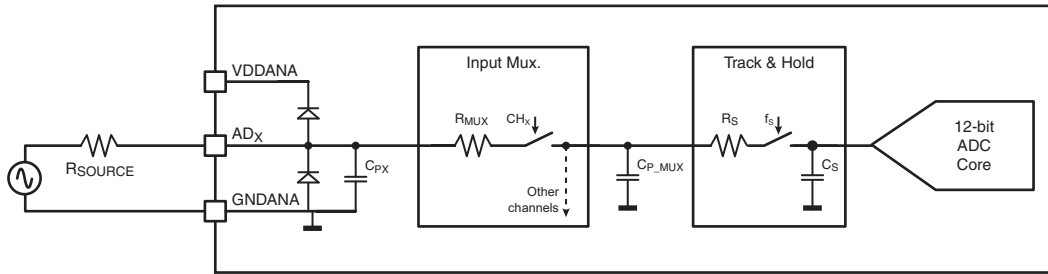

**Table 68.56.** ADC Analog Input Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V <sub>FS</sub>	Analog input full scale range <sup>(1)</sup>	ADC_CCR.DIFFx = 0	0	–	V <sub>ADVREF</sub>	V
		ADC_CCR.DIFFx = 1	–V <sub>ADVREF</sub>	–	V <sub>ADVREF</sub>	V
V <sub>INCM</sub>	Common mode input range in Differential Input mode <sup>(2)</sup>	ADC_CCR.DIFFx = 1	0.4 × V <sub>DDANA</sub>	–	0.6 × V <sub>DDANA</sub>	V
C <sub>s</sub>	ADC sampling capacitance <sup>(5)</sup>	–	–	–	3	pF
C <sub>P_ADx</sub>	ADx input parasitic capacitance <sup>(3)(5)</sup>	ADx pin configured as analog input	–	–	7	pF
R <sub>ON</sub>	Internal series resistor <sup>(3)(5)</sup>	–	–	–	2	kΩ
Z <sub>IN</sub>	Common mode input impedance <sup>(4)(5)</sup>	On ADx pin	1 / (f <sub>s</sub> · C <sub>s</sub> )	–	–	Ω

**Notes:**

1.  $V_{FS} = (V_{ADx} - V_{GNDANA})$  in Single-ended mode,  $V_{FS} = (V_{ADx} - V_{AD11})$  in Pseudo-differential mode, and  $V_{FS} = (V_{ADx} - V_{ADx+1})$  in Differential mode.
2.  $V_{INCM} = (V_{ADx} + V_{ADx+1}) / 2$ .
3. With respect to the equivalent model of figure [Equivalent Model of the Acquisition Path](#).
4. Assuming conversion on one single channel
5. Simulation data

**Figure 68.41.** Acquisition Path Block Diagram

For tracking time calculation, during the sampling phase of the converter, this acquisition path can be reduced to the equivalent model provided in the following figure, where:

- $R_{ON} = R_{MUX} + R_S$
- $C_{P\_ADX} = C_{PX} + C_{P\_MUX}$

**Figure 68.42.** Equivalent Model of the Acquisition Path

See [Track and Hold Time versus Source Impedance – Sampling Rate](#) for further details on how to use this model.

In the following table, unless otherwise specified, the specifications are given for two speed operating ranges.

- Source resistance = 50  $\Omega$
- $ADC\_EMR.OSR<2:0> = (000)_2$
- Low-speed
  - $f_{CKADC} = 10$  MHz,  $f_S = 500$  kS/s
  - $ADC\_ACR.IBCTL = (00)_2$
- High-speed
  - $f_{CKADC} = 20$  MHz,  $f_S = 1$  MS/s
  - $ADC\_ACR.IBCTL = (01)_2$

**Table 68.57.** Static Performance Characteristics<sup>(1)</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
RES <sub>ADC</sub>	Native ADC resolution	–	–	12	–	Bit

.....continued

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
INL	Integral non-linearity	Single mode	-3	-	+3	LSB
		Differential mode <sup>(3)</sup>	-2	-	+2	LSB
DNL	Differential non-linearity	Single mode	-2	-	+2	LSB
		Differential mode <sup>(3)</sup>	-1	-	+1	LSB
OE	Offset error <sup>(2)</sup>	-	-4	-	4	LSB
GE	Gain error <sup>(2)</sup>	-	-4	-	4	LSB

**WARNING**

ADC channels should be selected knowing that toggling the QSPI I/Os may decrease ADC channel 4 and 0 performances.

#### Notes:

- In this table, errors are expressed in LSB where:
  - LSB =  $V_{ADVREF} / 2^{12}$  in Single-ended mode (ADC\_CCR.DIFFx = 0 and ADC\_PDR.PDIFFx = 0)
  - LSB =  $V_{ADVREF} / 2^{11}$  in Differential or Pseudo-differential mode (ADC\_CCR.DIFFx = 1)
- Error with respect to the best fit line method.
- Simulation data

#### 68.7.11.1.Track and Hold Time versus Source Impedance – Sampling Rate

Referring to figure [Equivalent Model of the Acquisition Path](#), during its tracking phase, the 12-bit ADC charges its sampling capacitor  $C_S$  through various serial resistors modeled as  $R_{SOURCE}$  (source output resistor) and  $R_{ON}$  (multiplexer series resistor and sampling switch series resistor). In case of high output source resistance (low power resistive divider, for example), the tracking time must be increased to ensure full settling of the sampling capacitor voltage. Of course, programming a long tracking time may impact the sampling frequency ( $f_S$ ). The following formula gives the minimum tracking time that ensures a 12-bit accurate settling:

$$t_{TRACK} \geq 8 \times (R_{SOURCE} + R_{ON}) \times C_S$$

The ADC Controller (ADCC) counts the tracking time in ADC clock cycles ( $t_{CKADC}$ ). This time can be adjusted between 6 and 54 cycles by means of the fields ADC\_MR.TRACKTIM and ADC\_EMR.TRACKX4. At maximum ADC clock frequency (20 MHz), the maximum tracking time that can be programmed is 2.7  $\mu$ s. This limits 12-bit accurate sampling to sources having  $R_{SOURCE}$  in the 100 k $\Omega$  range. To overcome this limitation, the ADC clock frequency can be decreased.

The following two examples show typical use cases of tracking time and sampling frequency calculation.

**Example 1:** Calculated tracking time is lower than the default (minimum) tracking time.

- Assuming:  $f_{CKADC} = 8$  MHz ( $t_{CKADC} = 125$  ns),  $R_{SOURCE} = 10$  k $\Omega$
- The minimum required track time is:  $t_{TRACK} = 8 \times (10 \text{ k}\Omega + 2 \text{ k}\Omega) \times 3\text{pF} = 288$  ns
- $t_{TRACK}$  is less than the minimum tracking time ( $6 \times t_{CKADC} = 750$  ns): set TRACKTIM = 0 and TRACKX4 = 0
- The real tracking time is:  $6 \times t_{CKADC}$  (750 ns) and the conversion time is  $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 20 \times t_{CKADC}$
- The sampling rate is:  $f_S = 8 \text{ MHz} / 20 = 400$  kS/s
- The maximum allowable source resistance is:  $R_{SOURCE\_MAX} = (6 \times t_{CKADC}) / (3\text{pF} \times 8) - 2 \text{ k}\Omega = 29.25$  k $\Omega$

**Example 2:** Calculated tracking time is greater than the default (minimum) tracking time.

- Assuming:  $f_{CKADC} = 20 \text{ MHz}$  ( $t_{CKADC} = 50 \text{ ns}$ ),  $R_{SOURCE} = 10 \text{ k}\Omega$
- The minimum required track time is:  $t_{TRACK} = 8 \times (10 \text{ k}\Omega + 8 \text{ k}\Omega) \times 3 \text{ pF} = 432 \text{ ns}$
- $t_{TRACK}$  is greater than the minimum tracking time ( $6 \times t_{CKADC} = 300 \text{ ns}$ ): set TRACKTIM=4 and TRACKX4=1
- The real track time is:  $(4 \times (4 + 1) - 10) \times t_{CKADC} = 500 \text{ ns}$
- The conversion time is:  $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 24 \times t_{CKADC}$
- The sampling rate is:  $f_s = 20 \text{ MHz} / 24 = 833.3 \text{ kS/s}$
- The maximum allowable source resistance is:  $R_{SOURCE\_MAX} = (10 \times t_{CKADC}) / (3 \text{ pF} \times 8) - 8 \text{ k}\Omega = 12.8 \text{ k}\Omega$

### 68.7.12. HS USB Transceiver Characteristics

The device complies with all voltage, power, and timing characteristics and specifications as set forth in the USB 2.0 Specification. Refer to the USB 2.0 Specification for more information.

**Table 68.58.** USB 2.0 Transceiver Characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DDIN33}$	Supply voltage range (VDDIN33)	–	3.0	–	3.6	V
$I_{VDDIN33}$	HS transceiver current consumption (VDDIN33) <sup>(1)(3)</sup>	Bias circuits enabled only	–	–	15	mA
		HS	–	–	20	mA
		LS / FS - 0m cable <sup>(2)</sup>	–	–	5	mA
		LS / FS - 5m cable <sup>(2)</sup>	–	–	30	mA

**Notes:**

1. Current consumption is per USB port.
2. Including 1 mA due to pull-up/pull-down current.
3. Simulation data

## 68.8. Power Consumption in Active Mode

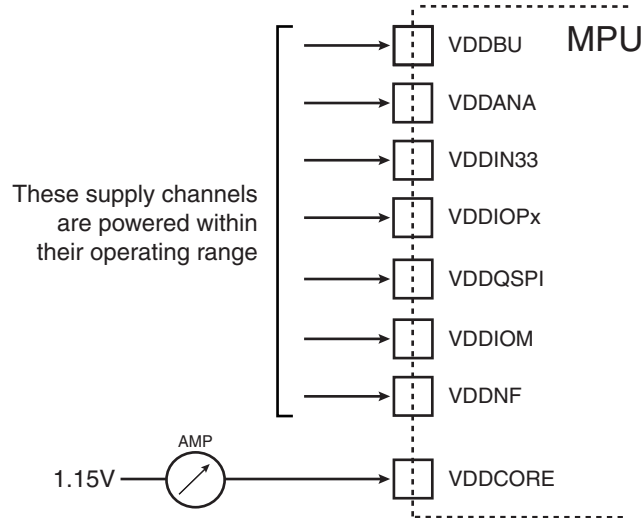

Tables [Processor Power Consumption Running a Dhrystone Benchmark from SRAM0](#) and [Power Consumption in Applicative Use Cases](#) report active power consumption data measured on a few typical samples of SAM9X60. These data do not provide maximum power consumption specifications.

### 68.8.1. Processor Power Consumption in Active Mode

The table below gives the processor power consumption in the following conditions:

- $f_{CPU\_CLK} = \text{from } 200 \text{ MHz to } 600 \text{ MHz}$
- $f_{MCK} = 200 \text{ MHz}$
- L1 caches enabled
- The ARM926EJ-S core executes a Dhrystone benchmark from the (internal) SRAM0
- Code compiled with speed optimization
- Peripheral clocks disabled
- Current measured as per the figure below

**Figure 68.43.** Current Measurement on VDDCORE

**Table 68.59.** Processor Power Consumption Running a Dhrystone Benchmark from SRAM0

$f_{\text{CPU\_CLK}}$	IDDCORE vs Ambient Temperature ( $T_A$ )						Unit
	-40°C	-10°C	25°C	50°C	85°C	105°C	
200 MHz	52.8	53.1	54.2	56.1	62.2	69.7	mA
400 MHz	73.7	74.0	75.2	76.9	83.5	90.9	mA
600 MHz	93.2	93.4	94.5	96.5	103.0	110.3	mA

**Figure 68.44.** Processor Current Consumption Running a Dhrystone Benchmark from SRAM0

## 68.8.2. System Power Consumption in Applicative Use Cases

Table 68.61 gives the processor power consumption in the following conditions:

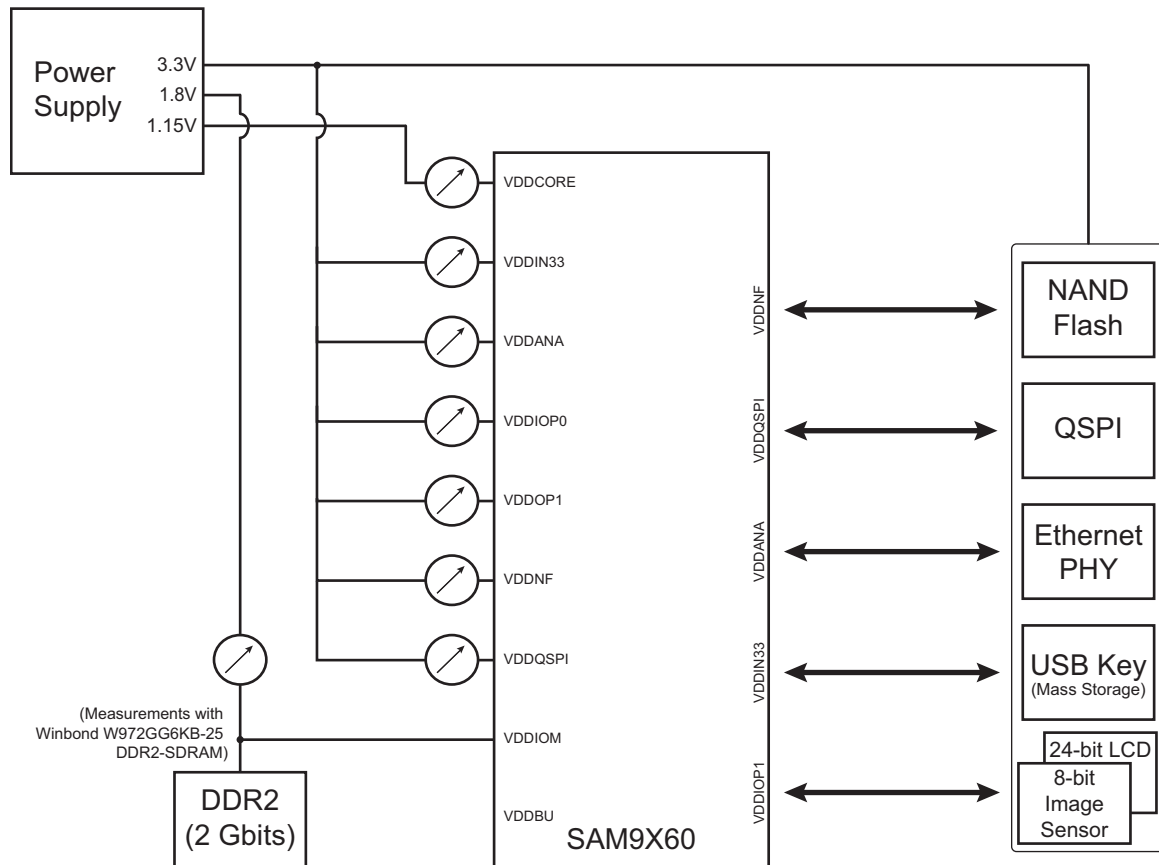

- $f_{\text{CPU\_CLK}} = 600 \text{ MHz}$
- $f_{\text{MCK}} = 200 \text{ MHz}$
- I & D caches enabled

- External SDRAM memory: 16-bit DDR2 operating at 200 MHz
- Uses cases are run on Linux<sup>®</sup>
- Current consumptions are measured according to figure [Current Measurement Schematic for Applicative Use Cases](#). Note that external component current consumptions are not counted. Either the 24-bit display or the 8-bit image sensor is connected to the SAM9X60, but not both.

**Table 68.60.** Use Case Definition

Use Case	Description of Test
1	After Linux boot root prompt
2	Video playback from USB mass storage (mp4 format, 480x272 @ 24fps, bitrate = 369 kbps)
3	Waveform (WAV) audio file decoding and playback on I2S. WAV file on USB mass storage
4	SAM9X60 running as iPerf server
5	Run Bonnie++ on USB mass storage
6	SAM9X60 running 2D graphic benchmark
7	Image sensor video recording with QVGA resolution - 10 fps

**Figure 68.45.** Current Measurement for Applicative Use Cases

**Table 68.61.** Power Consumption in Applicative Use Cases

Use Case	VDDCORE (1.15V)	VDDIOM (1.8V)	VDDIN33 (3.3V)	VDDNF (1.8V)	VDDPIOPO (3.3V)	VDDPIOPI (3.3V)	Unit	Total Power	Unit
1	60.25	35.7	10	3.9	0.17	0.011	mA	174	mW
2	101	72.7	15.8	3.5	0.71	8.7		337	
3	64	41.4	15.8	3.75	0.75	0.003		209	
4	77.5	92.7	10	3.55	0.168	0.006		296	
5	102	60	19.8	3.2	0.183	0.006		297	
6	98	97	10	3.4	0.71	8.5		357	
7	101	61.1	15.8	3.1	0.84	26		372	

## 68.9. Operation and Power Consumption in Low-Power Modes

The SAM9X60 features four low-power modes summarized in the following table. A detailed description of each mode is given in the following sections.

**Table 68.62.** Low-Power Modes Summary

		Low-power Mode			
		Backup Mode	ULP1	ULP0	Idle
VDDBU power		✓	✓	✓	✓
VDDCORE power		✗	✓	✓	✓
SDRAM or DDR power		✗	✓	✓	✓
I/O power		✗	✓	✓	✓
DDR Self-refresh		–	✓	✓	✗
Main crystal oscillator		–	✗	✗	✓
Main RC oscillator		–	✗	✗	✓
Main clock (MAINCK)	Source (MOSCSEL)	–	Main RC osc.	Main RC osc.	User-defined
	Status	–	✗	✗	✓
Main system bus clock (MCK)	Source (CSS)	–	MAINCK	User-defined (MD_SLCK, MAINCK, etc.)	User-defined (PLLA, etc.)
	Status	–	✗	✓	✓
CPU clock (HCLK)		–	✗	✓	✓
ARM926EJ-S state		–	Clocks stopped	WFI	WFI
Mode entry		Use SHDWC to shutdown all power supplies except VDDBU	Context saved in DDR DDR in Self-refresh ULP1 bit	Context saved in DDR DDR in Self-refresh WFI	WFI
Wake-up	Sources	RTC alarm WKUP0 pin	RTC / RTT alarm USB resume Wake-On-LAN WKUP[13:1]	Any non-masked interrupt	Any non-masked interrupt
	Event or interrupt sampling clock	MD_SLCK	Asynchronous	User-defined (MCK, periph_clk, etc.)	User-defined (MCK, periph_clk, etc.)
Main system bus clock (MCK) at wake-up		MAINCK (defaults to Main RC osc.)	MAINCK (configured to Main RC osc.)	User-defined	User-defined

**Note:**

1. ✓/✗ means either powered/unpowered for a power source, on/off for an oscillator, active/inactive for a clock signal, or in/out of Self-refresh mode for the external SDRAM.

## 68.9.1. Backup Mode

### 68.9.1.1. Operation

The Backup mode is designed to serve prolonged power-down periods of the processor. In this mode, only the backup area of the device powered by VDDBU is maintained (RTC, GPBR, SHDWC, BSCR). This mode is entered by shutting down all the power rails of the device except VDDBU. It is good practice to use the SHDN output of the Shutdown Controller (SHDWC) for this purpose.

The SAM9X60 exits Backup mode when an active wake-up event is triggered by the SHDWC. Upon this wake-up event, the SHDWC automatically toggles its SHDN output back to VDDBU and this signal typically helps to restart all the power supply channels at board level.

The wake-up events to exit Backup mode are:

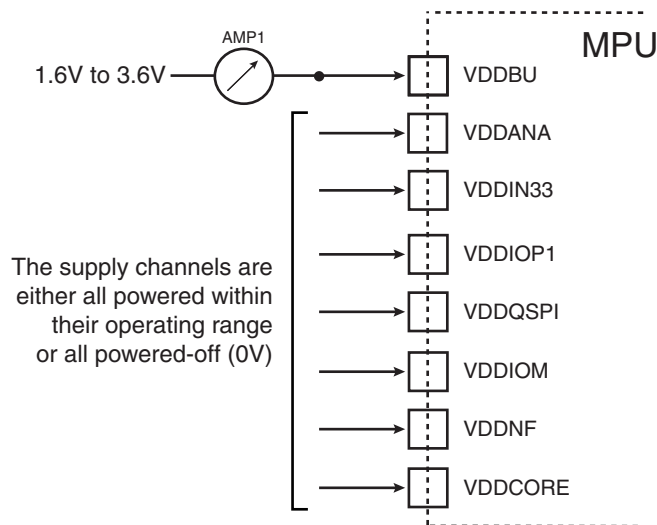

- WKUP0 pin (level transition, configurable debouncing)
- RTC alarm

### 68.9.1.2. Power Consumption

Backup mode configuration and measurements are defined as follows:

- POR backup on VDDBU is enabled
- RTC running
- Force wake-up (FWUP) enabled
- Current measurement as per the following figure

**Figure 68.46.** Measurement on VDDBU

**Table 68.63.** Current Consumption In Backup Mode

Symbol	Parameter	Conditions	Min	Max	Unit
I <sub>VDDBU</sub>	Current consumption in Backup mode (VDDBU)	VDDBU = 3.3 V	–	5	μA

The following figure shows the average Backup mode current consumption measured on a few typical devices.

**Figure 68.47.** Typical Current Consumption in Backup Mode

### 68.9.2. ULP0, ULP1 and Idle Modes

- In these three low-power modes, the SAM9X60 power supplies are all applied within their operating range. The power reduction is achieved by reducing the frequency or even stopping the clock signals of the processor and/or its peripherals.
- In Idle mode, only the processor clock is affected. In ULP0 and ULP1 modes, the clocks feeding both the processor and its peripherals are slowed down.
- In ULP0 or ULP1 mode, the SAM9X60 is placed in Retention mode and is able to resume on wake-up events (any interrupt or hardware event). This mode is a combination of the Wait for Interrupt mode of the ARM core and the system clocks frequency reduction or shut-off.

A detailed description of each mode is given in the following sections and is followed by a power consumption section dedicated to those modes.

#### 68.9.2.1. ULP0 Operation

The ULP0 mode maintains very low frequency clocks (MCK, CPU\_CLK) in the system to wake up on any interrupt. The selection of the clock frequency depends on the current consumption target versus the desired wake-up time. The higher the frequency, the higher the power consumption and the faster the wake-up time.

The sequence to enter ULP0 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM0.

1. Set the DDR to Self-refresh mode.
2. Disable PMC\_SCDR.DDRCLK.
3. Set the interrupts to wake up the system.
4. Disable all peripheral clocks.
5. Set the I/Os to an appropriate state and disable the USB transceivers (refer to [Special Function Registers \(SFR\)](#)).
6. Switch the system clock to MD\_SLCK or to any other preferred clock.
7. Set the SRAM memories to Light Sleep mode in SFR\_LS.
8. Disable the PLLs, the main oscillator and the 12 MHz RC oscillator.
9. Enter the Wait for Interrupt mode.

Wake-up from ULP0 mode is triggered by any enabled interrupt. When resuming, the software reconfigures the system (oscillator, PLL, etc.) in the same state as before WFI. Disable Light Sleep mode for SRAM memories in the SFR\_LS register prior to returning to full speed operation.

### 68.9.2.2. ULP1 Operation

Unlike the ULP0 mode, all the clocks are off in the ULP1 mode, and the number of wake-up sources is limited to the list below:

- WKUP[13:1] pins (level transition, configurable debouncing)
- RTC/RTT alarm
- USB Resume from Suspend mode
- Wake-On-LAN events from EMAC peripherals

The sequence to enter ULP1 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM0.

1. Set the DDR to Self-refresh mode.
2. Disable PMC\_SCDR.DDRCLK.
3. Set the events to enable a system wake-up.
4. Disable all peripheral clocks.
5. Set the I/Os to an appropriate state and disable the USB transceivers (refer to [Special Function Registers \(SFR\)](#)).
6. Switch the system clock to the 12 MHz RC oscillator.
7. Set the SRAM memories to Light Sleep mode in SFR\_LS.
8. Disable the PLLs and the main oscillator.
9. Enter ULP1 mode by setting the ULP1 bit in CKGR\_MOR.

When resuming, the software reconfigures the system (oscillator, PLL, etc.) in the same state as before entering ULP1. In particular, the SRAM memories Light Sleep mode must be disabled as soon as possible in the wake-up process.

### 68.9.2.3. Idle Mode Operation

The purpose of Idle mode is to optimize power consumption of the device versus response time. In this mode, only the processor clock is stopped. The peripheral clocks, including the DDR controller clock, can be enabled. The current consumption in this mode is application-dependent.

This mode is entered via the Wait for Interrupt (WFI) instruction and CPU\_CLK disabling.

The processor can be awakened from an interrupt. After a few CPU\_CLK cycles, the system resumes where it was before entering WFI mode.

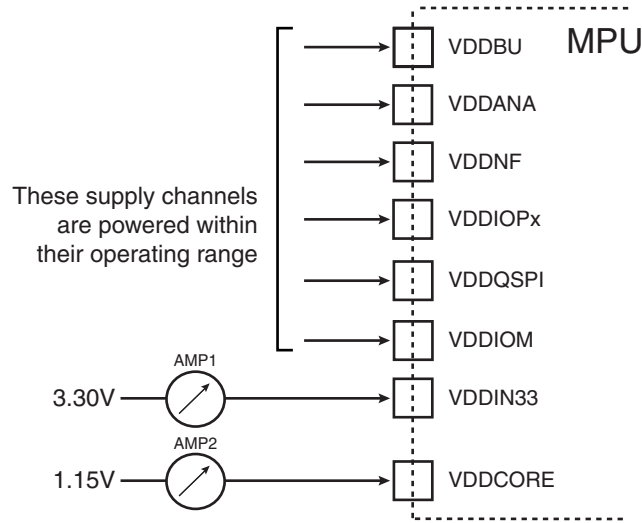

### 68.9.2.4. Power Consumption in ULP0, ULP1 and Idle Modes

- Figures [Typical Power Consumption in Idle Mode](#) and [Typical Power Consumption in ULP Mode 0 and ULP Mode 1](#) and [Table 68.64](#), [Table 68.65](#) and [Table 68.66](#) report SAM9X60's average power consumption in Idle, ULP0 and ULP1 modes versus temperature measured on a few typical devices. They do not provide maximum power consumption specifications.
- All power supply inputs are powered within their operating range and in particular VDDCORE = 1.15V.
- There is no consumption on the device's I/Os. To reach the best possible power consumption figures, it is of prime importance to set each I/O of the device to an appropriate state (pull-up/pull-down, etc.) with respect to the external components connected to these I/Os.
- USB transceivers are disabled.
- All peripheral clocks are disabled.

- Current measurement is as per the following figure.

**Figure 68.48.** Current Measurement in ULP0, ULP1 and Idle Modes

**Table 68.64.** Typical Current Consumption on VDDCORE in ULP0, ULP1 and Idle Modes

Low Power Mode\T <sub>A</sub> (°C)	-40°C	0°C	25°C	50°C	70°C	85°C	105°C	Unit	Wakeup Time	Unit
Idle (MCK=200 MHz)	46.9	47.2	47.4	48.6	50	52	56.3	mA	0.5	μs
ULP1	0.1	0.2	0.43	1.1	2.3	3.8	7.2		12	
ULP0 12 MHz	1.2	1.35	1.75	2.7	4.4	6.5	11		12	
ULP0 750 KHz	0.24	0.38	0.76	1.75	3.4	5.5	10.1		170	
ULP0 187 KHz	0.17	0.32	0.68	1.7	3.3	5.4	9.9		720	
ULP0 32 KHz	0.1	0.24	0.6	1.6	3.3	5.4	9.9		4200	

**Table 68.65.** Typical Current Consumption on VDDIN33 in ULP0, ULP1 and Idle Modes

Low Power Mode\T <sub>A</sub> (°C)	-40°C	0°C	25°C	50°C	70°C	85°C	105°C	Unit
Idle (MCK=200 MHz)	2.2	2.2	2.1	2.1	2.1	2.1	2.1	mA
ULP1	70	70	72	73	74	75	77	μA
ULP0 12 MHz	188	192	195	198	201	203	207	μA
ULP0 750 KHz	188	192	195	198	201	203	207	μA
ULP0 187 KHz	188	192	195	198	201	203	207	μA
ULP0 32 KHz	69	70	71	73	74	75	77	μA

**Table 68.66.** Typical Power Consumption in ULP0, ULP1 and Idle Modes

Low Power Mode\T <sub>A</sub> (°C)	-40°C	0°C	25°C	50°C	70°C	85°C	105°C	Unit
Idle (MCK=200 MHz)	61.195	61.54	61.44	62.82	64.43	66.73	71.675	mW
ULP1	0.35	0.46	0.73	1.51	2.89	4.62	8.53	
ULP0 12 MHz	2.00	2.19	2.66	3.76	5.72	8.14	13.33	
ULP0 750 KHz	0.90	1.07	1.52	2.67	4.57	6.99	12.30	
ULP0 187 KHz	0.82	1.00	1.43	2.61	4.46	6.88	12.07	
ULP0 32 KHz	0.34	0.51	0.92	2.08	4.04	6.46	11.64	

The following figures show the power consumption of the SAM9X60 in ULP0, ULP1 and Idle modes. These figures account for the current consumption in VDDCORE and VDDIN33:  $\text{Power (mW)} = I_{\text{DDIN33}} \times 3.3\text{V} + I_{\text{DDCORE}} \times 1.15\text{V}$  with  $I_{\text{DDIN33}}$  and  $I_{\text{DDCORE}}$  as measured in the above table.

**Figure 68.49.** Typical Power Consumption in Idle Mode

**Figure 68.50.** Typical Power Consumption in ULP0 Mode and ULP1 Mode

The following table gives the specification for ULP1 mode current consumption on VDDCORE and VDDIN33.

**Table 68.67.** Current Consumption in ULP1 Mode

Symbol	Parameter	Conditions	Min	Max	Unit
$I_{\text{VDDCORE}}$	Current consumption in ULP1 mode (VDDCORE)	VDDCORE = 1.15V	-	14	mA

.....continued

Symbol	Parameter	Conditions	Min	Max	Unit
$I_{VDDIN33}$	Current consumption in ULP1 mode (VDDIN33)	VDDIN33 = 3.3V	-	150	$\mu$ A

## 69. Mechanical Characteristics

### 69.1. 228-ball TFBGA Mechanical Characteristics

#### 228-Ball Thin, Fine Pitch Ball Grid Array (DWB) - 11x11 mm Body [TFBGA]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Microchip Technology Drawing C04-21484 Rev B Sheet 1 of 2

## 228-Ball Thin, Fine Pitch Ball Grid Array (DWB) - 11x11 mm Body [TFBGA]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Number of Terminals	N	228		
Pitch	e	0.65 BSC		
Overall Height	A	-	-	1.20
Ball Height	A1	0.22	0.27	0.32
Substrate Thickness	S	0.26 REF		
Mold Cap Thickness	M	0.53 REF		
Overall Length	D	11.00 BSC		
Overall Width	E	11.00 BSC		
Terminal Diameter	b	0.32	0.37	0.42

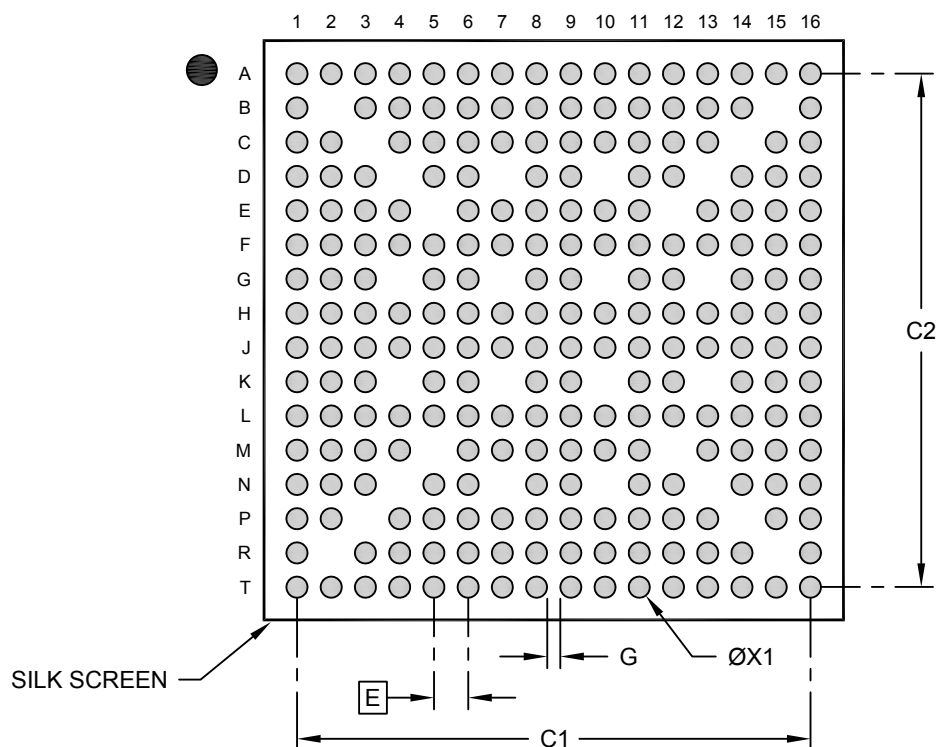

**Notes:**

- Pin 1 visual index feature may vary, but must be located within the hatched area.
- Dimensioning and tolerancing per ASME Y14.5M  
BSC: Basic Dimension. Theoretically exact value shown without tolerances.  
REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-21484 Rev B Sheet 1 of 2

## 228-Ball Thin, Fine Pitch Ball Grid Array (DWB) - 11x11 mm Body [TFBGA]

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

### RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E	0.65 BSC		
Contact Pad Spacing	C1		9.75	
Contact Pad Spacing	C2		9.75	
Contact Pad Diameter (X228)	X1			0.42
Contact Pad to Contact Pad	G1	0.20		

**Notes:**

1. Dimensioning and tolerancing per ASME Y14.5M

BSC: Basic Dimension. Theoretically exact value shown without tolerances.

Solder	LF35

# Revision History

## 70. Revision History

### 70.1. DS60001579H - 02/2025

Section	Changes
Global	<ul style="list-style-type: none"> <li>Added content related to the SAM9X60 Series high density package devices (SAM9X60(T)-V/6GW)</li> <li>Added content related to Software License Level (SLx)</li> <li>Data sheet format reworked</li> </ul>
Package and Pinout	Updated <a href="#">Figure 8.1</a> , <a href="#">Table 8.2</a>
Peripheral Identifiers	Updated <a href="#">Table 12.1</a>
External Bus Interface (EBI)	Added <a href="#">Device (FPGA, Static Memory, etc.) on NCS0</a> , <a href="#">DDR on NCS1</a> and <a href="#">NAND Flash on NCS2</a>
Debug Unit (DBGU)	<a href="#">Chip Identifier</a> : updated reset value information
OTP Memory Controller (OTPC)	<a href="#">OTPC_MR</a> : corrected KBDST field width
DDR-SDRAM Controller (MPDDRC)	Updated <a href="#">Security and Safety Analysis and Reports</a> <a href="#">MPDDRC_WPSR</a> : updated SEQE description
Shutdown Controller (SHDWC)	<a href="#">SHDW_MR</a> : removed AUTOLPM
Debug Unit (DBGU)	<a href="#">DBGU_CIDR Simplified</a> : updated reset value
Power Management Controller (PMC)	<a href="#">PMC_PLL_UPDT</a> : updated PLL ID definition
Inter-IC Sound Multi-Channel Controller (I2SMCC)	Updated <a href="#">Figure 49.7</a> <a href="#">TDM Reception and Transmission Sequence</a> : added note <a href="#">I2SMCC_MRA</a> : updated TDMFS description
Synchronous Serial Controller (SSC)	Updated <a href="#">Embedded Characteristics</a> (added "Up to 16 Channels in TDM Mode") Added <a href="#">Audio Sampling Rate Limitations</a>
Flexible Serial Communication Controller (FLEXCOM)	Updated <a href="#">Baud Rate Generator</a> , <a href="#">Baud Rate in Synchronous Mode</a> , <a href="#">FIFO Overflow/Underflow Error</a> , <a href="#">FIFO Overflow/Underflow Error</a> , <a href="#">FIFO Overflow/Underflow Error</a> Updated TXFPTEF and RXFPTEF definitions in <a href="#">FLEX_US_FESR</a> , <a href="#">FLEX_SPI_SR</a> , <a href="#">FLEX_TWI_FSR</a> Added note in <a href="#">FLEX_US_FIDI (LON_MODE)</a> , <a href="#">FLEX_US_LONB1TX</a> , <a href="#">FLEX_US_LONB1RX</a> , <a href="#">FLEX_US_IDTTX</a> , <a href="#">FLEX_US_IDTRX</a> <a href="#">FLEX_SPI_MR</a> : added LSBHALF Added detail on WPEN in <a href="#">FLEX_TWI_SMBTR</a>
USB Device High Speed Port (UDPHS)	Updated <a href="#">Transfer Without DMA</a> Throughout, corrected number of DMA channels from 7 to 6
Analog-to-Digital Controller (ADC)	Updated <a href="#">Table 67.4</a> <a href="#">ADC_SEQR2</a> : updated USCHx field width
Electrical Characteristics	Added <a href="#">Table 68.6</a> , <a href="#">Table 68.7</a> Updated <a href="#">Figure 68.15</a>

### 70.2. DS60001579G - 01/2024

Section	Changes
Global	Editorial changes throughout
<a href="#">Reference Document</a>	Added.
<a href="#">Memory Mapping</a>	DDR/SDR I/O Calibration: updated memory types for resistor values.

## .....continued

Section	Changes
General Purpose Backup Registers (GPBR)	GPBR_FCLR: updated register description.
Watchdog Timer (WDT)	WDT_MR: corrected positions of bits WDDBGHLT and WDIDLEHLT.
Reset Controller (RSTC)	RSTC_SR: updated reset value.
Real-Time Timer (RTT)	RTT Counting: updated. RTT_TSR: added TS_OVF bit; increased TSTAMP field width.
Real-Time Clock (RTC)	RTC Accurate Clock Calibration: updated. Waveform Generation: updated. Waveform Generation for ADC Trigger Event: updated. RTC_MR: index 1 now 'reserved'. Bit UTC, index 2, updated. RTC_SR: updated reset value. Added (DEFAULT_MODE) to register names: <ul style="list-style-type: none"> <li>• RTC_TIMR (DEFAULT_MODE)</li> <li>• RTC_TIMALR (DEFAULT_MODE)</li> <li>• RTC_CALALR (DEFAULT_MODE)</li> <li>• RTC_TSTR0 (DEFAULT_MODE)</li> <li>• RTC_TSTR1 (DEFAULT_MODE)</li> <li>• RTC_TSDRx (DEFAULT_MODE)</li> </ul>
OTP Memory Controller (OTPC)	Power Management: updated.
Bus Matrix (MATRIX)	No Default Host: updated. Slot Cycle Limit Arbitration: updated.
Slow Clock Controller (SCKC)	Switching from Embedded 32 RC Oscillator to 32.768 kHz Crystal Oscillator: modified from 4 to 39000 the number of slow clock cycles to wait for internal resynchronization
Power Management Controller (PMC)	32.768 kHz Crystal Oscillator: removed "Reverting to the slow RC oscillator is only possible by shutting down the VDD_NAME power supply." Main Crystal Oscillator Failure Detection: updated. CKGR_MOR: corrected reset value.
DMA Controller (XDMAC)	Memory to Peripheral Transfer Hierarchy: updated.
USB Device High Speed Port (UDPHS)	Transfer Without DMA: modified code content. Added (DEFAULT_MODE) to register names: <ul style="list-style-type: none"> <li>• UDPHS_EPTCTLENBx</li> <li>• UDPHS_EPTCTLDISx</li> <li>• UDPHS_EPTCTLx</li> <li>• UDPHS_EPTSETSTAx</li> <li>• UDPHS_EPTCLRSTAx</li> <li>• UDPHS_EPTSTAx</li> </ul>
Inter-IC Sound Multi-Channel Controller (I2SMCC)	I2S Reception and Transmission Sequence: updated text, figures and tables. Left-Justified Reception and Transmission Sequence: updated. I2SMCC_MRB: DMACHUNK description updated. I2SLINESIZE description updated for values 1 and 2. I2SMCC_ISRA: RXLRDYx and TXRRDYx bit descriptions updated.
Flexible Serial Communication Controller (FLEXCOM)	I/O Lines Description: updated. Baud Rate in Synchronous Mode: updated. Bus Clear Command, FIFO Pointer Error, FLEX_TWI_CR: modified. FLEX_TWI_SR (DEFAULT_MODE): updated reset value.

## .....continued

Section	Changes
Quad Serial Peripheral Interface (QSPI)	QSPI Bus Clock Modes: updated.
Secure Digital MultiMedia Card Controller (SDMMC)	SDMMC_CA0R: deleted note (2). Updated bit descriptions with standard “read-only” mention. SDMMC_CA1R: updated reset value.
Image Sensor Interface (ISI)	VSYNC/HSYNC Data Timing: updated.
Timer Counter (TC)	Block Diagram: updated. TC_BMR: updated TCxXCxS descriptions.
Triple Data Encryption Standard (TDES)	TDES_MR: updated reset value
Random Number Generator (TRNG)	TRNG_WPSR: modified SWETYP description (value 5).
Analog-to-Digital Controller (ADC)	ADC_MR: updated reset value. ADC_PDR: corrected number of channels.
Electrical Characteristics	I/O Characteristics: Table 68.15 and Table 68.16: updated with $V_{OL}$ and $V_{OH}$ values. FLEXCOM TWI Characteristics: updated text and figures. EMAC Timings: updated EMAC <sub>2</sub> min value. Low-Power Modes Summary: updated.

**70.3. DS60001579F - 09/2022**

Section	Changes
Global	Editorial changes throughout
Debug and Test	Updated IEEE 1149.1 JTAG Boundary Scan, JTAG ID Code value in JTAG ID Code Register
Boot Strategies	Added Secure Boot Strategy section Updated Default Boot Sequence (Without Boot Configuration Packet)
System Controller Write Protection (SYSCWP)	Corrected System Controller Peripheral Mapping
General Purpose Backup Registers (GPBR)	Corrected GPBRRPx and GPBRWPx field widths in GPBR_MR
Reset Controller (RSTC)	Updated Block Diagram, Figure 31.6, EXTRST description in RSTC_CR
Real-Time Clock (RTC)	Updated RTC_CR, RTC_MR, RTC_TIMALR, RTC_CALALR, RTC_CALALR (UTC_MODE)
OTP Memory Controller (OTPC)	Added Product Dependencies section
Clock Generator	Corrected formula in Divider and Phase Lock Loop Programming
Power Management Controller (PMC)	Updated ID description in PMC_PLL_UPDT, WIP description in PMC_WCR, PID description in PMC_PCR Removed references to MAINXTALCK in General Clock Distribution Block Diagram, USB Clock Controller, PMC_USB
DDR-SDRAM Controller (MPDDRC)	Removed the term “multiport” throughout Added Interrupt Sources section Updated Bus Monitor, Performance Monitor, CK_F_RANGE definition in MPDDRC_IO_CALIBR
SDRAM Controller (SDRAMC)	Updated SDRAM Device Initialization Step 5 Removed references to memory barrier in SDRAM Device Initialization
Programmable Multibit Error Correction Code Controller (PMECC)	Updated PMECC_ECCx reset value
DMA Controller (XDMAC)	Updated Description, and memory-to-memory transfer information in XDMAC Transfer Software Operation, XDMAC Software Requirements, XDMAC_CC

## .....continued

Section	Changes
2D Graphics Engine (GFX2D)	Updated <a href="#">Description</a> , <a href="#">Embedded Characteristics</a> , <a href="#">Block Diagram</a> , <a href="#">Functional Description</a> , <a href="#">Traffic Balancing Using Outstanding Regulation</a> Added field WFEMODE in <a href="#">WFE_WD0</a>
Ethernet MAC 10/100 (EMAC)	Updated <a href="#">Block Diagram</a>
USB Device High Speed Port (UDPHS)	Changed “AHB” to “system bus” throughout Corrected number of end points in <a href="#">UDPHS_IEN</a> , <a href="#">UDPHS_INTSTA</a> , <a href="#">UDPHS_EPTRST</a> Removed DMA_7 in <a href="#">UDPHS_IEN</a> , <a href="#">UDPHS_INTSTA</a> Updated <a href="#">Block Diagram</a> , EN_UDPHS description in <a href="#">UDPHS_CTRL</a>
Audio Class D Amplifier (CLASSD)	Updated <a href="#">Description</a>
Inter-IC Sound Multi-Channel Controller (I2SMCC)	Added <a href="#">Pad Hysteresis Control</a> , note in <a href="#">Host, Controller and Client Modes</a> , note in <a href="#">Product Dependencies</a> Updated <a href="#">TDM Reception and Transmission Sequence</a> , <a href="#">Figure 49.7</a> , <a href="#">I2SMCC_SR</a> , <a href="#">I2SMCC_ISRA</a> and <a href="#">I2SMCC_MRB</a> reset values Removed CLKSEL in <a href="#">I2SMCC_MRB</a>
Synchronous Serial Controller (SSC)	Updated <a href="#">Serial Clock Ratio Considerations</a>
Flexible Serial Communication Controller (FLEXCOM)	Updates throughout, including addition of sections <a href="#">Digital Filter</a> and <a href="#">Local Loopback Test Mode</a>
Quad Serial Peripheral Interface (QSPI)	Updated <a href="#">Block Diagram</a> , <a href="#">Serial Clock Phase and Polarity</a> , <a href="#">QSPI Bus Clock Modes</a> , <a href="#">SMRM</a> description in <a href="#">QSPI_MR</a> , <a href="#">CPHA</a> and <a href="#">CPOL</a> descriptions in <a href="#">QSPI_SCR</a>
Secure Digital MultiMedia Card Controller (SDMMC)	Added <a href="#">Note 2</a> in <a href="#">SDMMC_CA0R</a> Modified <a href="#">SDMMC_PSR</a> reset value
Timer Counter (TC)	Updated <a href="#">Table 62.2</a> , <a href="#">Clock Selection</a> , <a href="#">Figure 62.5</a> , <a href="#">Trigger Events</a> , <a href="#">Figure 62.7</a> , <a href="#">Pin List</a> , <a href="#">TRIGSRCB</a> description in <a href="#">TC_EMR</a>
Pulse Width Modulation Controller (PWM)	Corrected internal counter size from 32 to 16 bits Updated <a href="#">Figure 63.1</a> , <a href="#">Figure 63.2</a> , <a href="#">Figure 63.3</a> , <a href="#">DIVA</a> and <a href="#">DIVB</a> descriptions in <a href="#">PWM_MR</a>
Advanced Encryption Standard (AES)	Updated NIST specifications in <a href="#">Description</a> and <a href="#">Embedded Characteristics</a> ; updated <a href="#">Secure Protocol Layers Improved Performances</a> , <a href="#">BPE</a> description in <a href="#">AES_EMR</a> , <a href="#">AES_MR</a> reset value Added PKRPVS content in <a href="#">AES_WPSR</a> and <a href="#">AES_WPMR</a> Reinstated missing START bit at index 0 in <a href="#">AES_CR</a>
Secure Hash Algorithm (SHA)	Throughout: updated FIPS specification reference Updated <a href="#">Description</a> , <a href="#">Embedded Characteristics</a> , <a href="#">Internal Registers for Initial Hash Value or Expected Hash Result</a> , <a href="#">Manual Mode</a> (steps 4 and 8), <a href="#">ALGO</a> description in <a href="#">SHA_MR</a> , <a href="#">FIRST</a> description in <a href="#">SHA_CR</a> , <a href="#">IDATA</a> description in <a href="#">SHA_IDATARx</a> Added notes in <a href="#">Automatic Padding</a> , <a href="#">SHA_MSR</a> and <a href="#">DMA Mode</a>
Triple Data Encryption Standard (TDES)	Updated <a href="#">PKWO</a> description in <a href="#">TDES_MR</a>
Random Number Generator (TRNG)	Added sections <a href="#">First Value Read after Power-up</a> and <a href="#">Entropy</a> Updated <a href="#">Block Diagram</a> , <a href="#">Functional Description</a> , <a href="#">HALFR</a> description in <a href="#">TRNG_MR</a> , <a href="#">KSLAVE</a> description in <a href="#">TRNG_PKCBR</a>
Analog-to-Digital Controller (ADC)	Updated <a href="#">Figure 67.1</a> , <a href="#">ADC_ACR</a> reset value, <a href="#">TRGSEL</a> description in <a href="#">ADC_MR</a>
Electrical Characteristics	Reworked <a href="#">Maximum QSPI Frequency</a> Updated formulas in <a href="#">32.768 kHz Crystal Oscillator</a> and <a href="#">Main Crystal Oscillator</a> Corrected $C_{\text{PARA32K}}$ typical value in <a href="#">Table 68.46</a> Corrected EMAC <sub>3</sub> values in <a href="#">Table 68.37</a>

**70.4. DS60001579E - 09/2021**

Section	Changes
Debug Unit (DBGU)	DBGU_CIDR: added new reset value (0x819B35A2)
Power Management Controller (PMC)	Divder and Phase Lock Loop Programming and PMC_PLL_ACR: replaced PMC_PLL_ACR recommended values by references to the Electrical Characteristics section PMC_PLL_CTRL0: updated ENPLLCK bit description
Electrical Characteristics	EMAC Timings: added section Ethernet MAC MDIO Interface Timings; removed "Ethernet MAC Signals Relative to MDC" table and "Minimum and Maximum Access Times of Ethernet MAC Output Signals" figure

**70.5. DS60001579D - 09/2020**

Section	Changes
Added automotive content in Features, Electrical Characteristics, Ordering Information and Product Identification System	
Reset Controller (RSTC)	Added NRST_OUT content
Debug Unit (DBGU)	Updated ICE Access Prevention
Slow Clock Controller (SCKC)	Updated Embedded Characteristics
Power Management Controller (PMC)	Updated General Clock Distribution Block Diagram PMC_PLL_UPDT: corrected STUPTIM field size
DMA Controller (XDMAC)	Transfer Hierarchy Diagrams: removed "XDMAC Peripheral Transfer Hierarchy" figure Added Peripheral to Memory Transfer and Memory to Peripheral Transfer
LCD Controller (LDC)	Embedded Characteristics: updated Output mode content Updated YUV Frame Buffer Memory Mapping Renamed and updated Window Size table
2D Graphics Engine (GFX2D)	BLEND_WD0: added DREG field BLEND_WD5: replaced DFACT and SFACT by DCFACK and SCFACT, respectively; added DPREF, DAFACK, SPREF and SAFACK fields GFX2D_GC: removed bits CGDISCORE, CGDISAXI, CGDISFIFO
USB Host High Speed Port (UHPHS)	Corrected reset values for: <ul style="list-style-type: none"> <li>UHPHS_HCSPARAMS</li> <li>UHPHS_HCCPARAMS</li> <li>UHPHS_PORTSCx</li> </ul>
Image Sensor Interface (ISI)	Added write-protection content ISI_CFG2: updated RGB_SWAP and RGB_CFG bit descriptions ISI_Y2R_SET1: updated Yoff, Croff and Cboff bit descriptions ISI_R2Y_SET0: updated Roff bit description ISI_R2Y_SET1: updated Goff bit description ISI_R2Y_SET2: updated Boff bit description
Timer Counter (TC)	Updated <ul style="list-style-type: none"> <li>Embedded Characteristics</li> <li>Interrupt Sources</li> </ul> Removed unrequired fault output content
Triple Data Encryption Standard (TDES)	Updated TDES_MR
Electrical Characteristics	Updated Table 68.62 (CPU clock (HCLK) row)

## 70.6. DS60001579C - 07/2020

### Changes

Added [Microchip Recommended Power Management Solutions](#).

## 70.7. DS60001579B - 02/2020

Section	Changes
<b>All sections</b>	Changed order of bits (now from MSB to LSB) in Register Summary tables
<a href="#">Safety and Security Features</a>	Removed "Classical Advanced Software Crypto Library (CASCL)" from <a href="#">Security Features</a> table
<a href="#">Peripheral Identifiers</a>	Updated FLEXCOM Features table
<a href="#">Boot Strategies</a>	Updated <a href="#">NAND Flash Boot: NAND Flash Detection</a> introduction
<a href="#">OTP Memory Controller (OTPC)</a>	<a href="#">OTPC_CR</a> : updated READ bit description
<a href="#">Clock Generator</a>	Updated <a href="#">Main Clock (MAINCK) Block Diagram</a>
<a href="#">Power Management Controller (PMC)</a>	Updated: <ul style="list-style-type: none"> <li><a href="#">General Clock Distribution Block Diagram</a></li> <li>List of write-protected registers in <a href="#">Register Write Protection</a></li> </ul> <a href="#">PMC_CPU_CKR</a> : corrected MDIV field width
<a href="#">External Bus Interface (EBI)</a>	Updated <a href="#">Multi-Port DDR and SDRAM Controllers</a>
<a href="#">AHB Multiport DDR-SDRAM Controller (MPDDRC)</a>	<a href="#">DDR2-SDRAM Initialization</a> : added TRFC constraint content <a href="#">Monitor</a> : added monitor use example Updated: <ul style="list-style-type: none"> <li><a href="#">Quality Of Service Arbitration</a></li> <li><a href="#">Description</a></li> <li><a href="#">Change Frequency During Self-Refresh Mode with Low-power DDR-SDRAM Devices</a></li> </ul>
<a href="#">Flexible Serial Communication Controller (FLEXCOM)</a>	Added introduction in <a href="#">USART FIFO Mode Register</a> , <a href="#">USART FIFO Level Register</a> , <a href="#">USART FIFO Interrupt Mask Register</a> , <a href="#">SPI Status Register</a> , <a href="#">SPI FIFO Mode Register</a> , <a href="#">SPI FIFO Level Register</a> , <a href="#">TWI FIFO Mode Register</a> , <a href="#">TWI FIFO Level Register</a> , <a href="#">TWI FIFO Status Register</a> and <a href="#">TWI FIFO Interrupt Mask Register</a> . Updated: <ul style="list-style-type: none"> <li>Figure <a href="#">TWI Read Operation with Multiple Data Bytes + Write Operation with Multiple Data Bytes (Sr)</a></li> <li><a href="#">TWI Clock Waveform Generator Register</a> (CLDIV and CHDIV bit descriptions)</li> <li><a href="#">Modes of Operation, TWI Compatibility with I2C Standard</a> and <a href="#">TWI/SMBus Characteristics</a> (Fast Mode Plus and High Speed Modes)</li> </ul>
<a href="#">Image Sensor Interface (ISI)</a>	<a href="#">Power Management</a> : added note
<a href="#">Timer Counter (TC)</a>	<a href="#">Embedded Characteristics</a> : corrected number of channels <a href="#">Block Diagram</a> : added Note 2 <a href="#">TC_SRx</a> : corrected SECE bit position
<a href="#">Advanced Encryption Standard (AES)</a>	Updated: <ul style="list-style-type: none"> <li><a href="#">Operating Modes</a></li> <li><a href="#">AES_MR</a> (OPMOD field description)</li> <li><a href="#">AES_IVRx</a> (IV field description)</li> </ul>
<a href="#">Secure Hash Algorithm (SHA)</a>	<a href="#">SHA_MR</a> : updated ALGO bit field description
<a href="#">True Random Number Generator (TRNG)</a>	<a href="#">TRNG_PKBCR</a> : updated KSLAVE field description

.....continued

Section	Changes
Electrical Characteristics	Updated: <ul style="list-style-type: none"> <li>• <a href="#">Electrical Parameters Usage</a></li> <li>• <a href="#">Recommended Power Supply Sequencing</a> introduction</li> <li>• <a href="#">ULP0 Operation</a> and <a href="#">ULP1 Operation</a> sequences of operation</li> <li>• Table <a href="#">Main RC Oscillator Characteristics</a></li> <li>• Figure <a href="#">Current Measurement for Applicative Use Cases</a></li> </ul>
Mechanical Characteristics	Updated <a href="#">228-ball TFBGA Mechanical Characteristics</a>
Marking	Updated Line 4 description

## 70.8. DS60001579A - 10/2019

Changes
First issue.

## Microchip Information

### Trademarks

The “Microchip” name and logo, the “M” logo, and other names, logos, and brands are registered and unregistered trademarks of Microchip Technology Incorporated or its affiliates and/or subsidiaries in the United States and/or other countries (“Microchip Trademarks”). Information regarding Microchip Trademarks can be found at <https://www.microchip.com/en-us/about/legal-information/microchip-trademarks>.

ISBN: 979-8-3371-0587-1

### Legal Notice

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at [www.microchip.com/en-us/support/design-help/client-support-services](http://www.microchip.com/en-us/support/design-help/client-support-services).

THIS INFORMATION IS PROVIDED BY MICROCHIP “AS IS”. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP’S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer’s risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

### Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip products are strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
