

Precision 1:8 LVDS Clock Fanout Buffer with 2:1 Runt Pulse Eliminator Input MUX (Precision Edge®)

Features

- Selects between Two Clocks, and Provides 8 Precision, Low Skew LVDS Output Copies
- 2:1 MUX Input Provides a Glitch-free, Stable LVDS Output
- Guaranteed AC Performance Overtemperature and Supply Voltage:
 - Wide Operating Frequency: 1 kHz to >1.5 GHz
 - <150 ps t_r/t_f
 - <40 ps Output-to-Output Skew
- Unique Patent-pending Input Isolation Design Minimizes Crosstalk
- Fail-safe Input Prevents Oscillation
- Ultra-low Jitter Design:
 - 150 fs_{RMS} Phase Jitter
 - <0.7 ps_{RMS} MUX Crosstalk Induced Jitter
- Unique Patent-pending Input Termination and VT Pin Accepts DC- and AC-coupled Inputs (CML, PECL, LVDS)
- 350 mV LVDS Output Swing
- Power Supply 2.5V ±5%
- -40°C to +85°C Industrial Temperature Range
- Available in 32-lead (5 mm × 5 mm) VQFN Package

Applications

- Redundant Clock Switchover
- Failsafe Clock Protection

Markets

- LAN/WAN
- Enterprise Servers
- ATE
- Test and Measurements

General Description

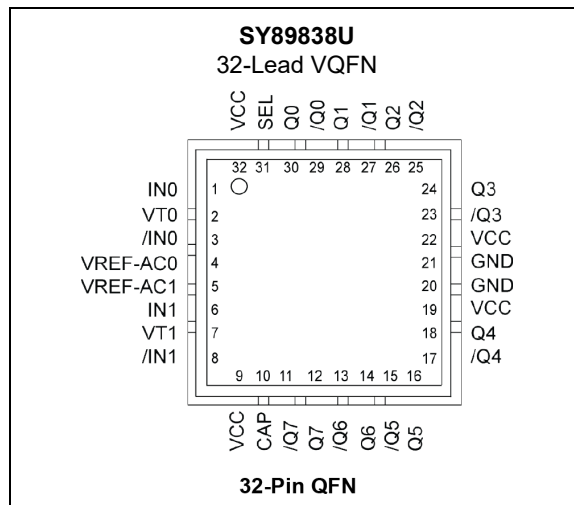

The SY89838U is a low jitter, low skew, high-speed 1:8 fanout buffer with a unique, 2:1 differential input multiplexer (MUX) optimized for redundant source switchover applications. Unlike standard multiplexers, the SY89838U's unique 2:1 Runt Pulse Eliminator (RPE) MUX prevents any short cycles or "runt" pulses during switchover.

In addition, a unique fail-safe input protection prevents metastable conditions when the selected input clock fails to a DC voltage (between the pins of the differential input drops below 200 mV). The SY89838U distributes clock frequencies from 1 kHz to 1.5 GHz, guaranteed, over temperature and voltage.

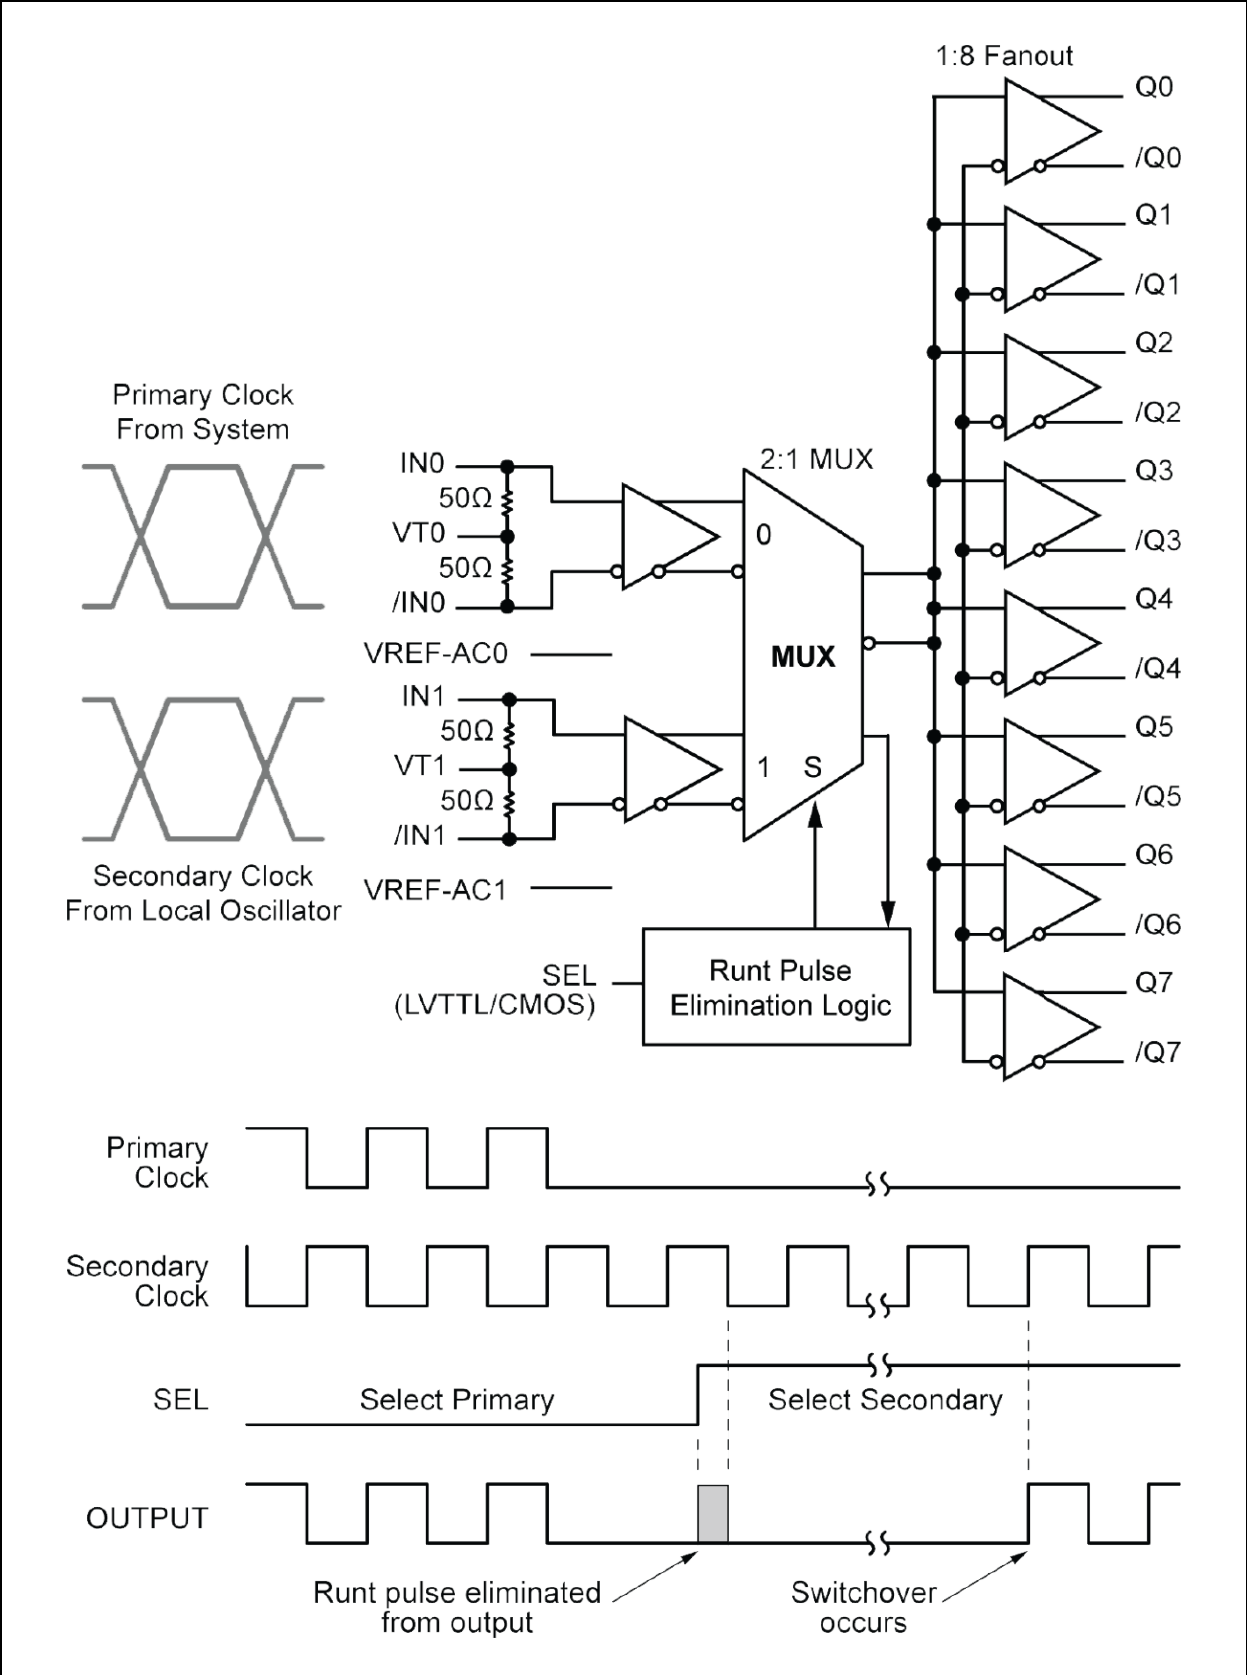

The differential input includes Microchip's unique, 3-lead input termination architecture that allows customers to interface to any differential signal (AC- or DC-coupled) as small as 200 mV (400 mV_{PP}) without any level shifting or termination resistor networks in the signal path. The outputs are 350 mV compatible LVDS with fast rise/fall times guaranteed to be less than 150 ps.

The SY89838U operates from a 2.5V ±5% supply and is guaranteed over the full industrial temperature range of -40°C to +85°C. For applications that require 800 mV LVPECL outputs, consider the SY89837U. The SY89838U is part of Microchip's high-speed, Precision Edge® product line.

Package Type

Typical Application

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings[†]

Supply Voltage (V_{CC})	–0.5V to +4.0V
Input Voltage (V_{IN})	–0.5V to V_{CC}
Input Current (V_T), Source or sink current on IN, /IN	±50 mA
Termination Current, Source or sink current on V_T	±100 mA
V_{REF-AC} source or sink current	±2 mA

Operating Ratings^{††}

Supply Voltage (V_{CC})	+2.375V to +2.625V
-----------------------------	--------------------

† Notice: Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

†† Notice: The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.

TABLE 1-1: DC ELECTRICAL CHARACTERISTICS

All values applicable for when $T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ unless otherwise stated. (Note 1)						
Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
Power Supply Voltage	V_{CC}	2.375	2.5	2.625	V	—
Power Supply Current	I_{CC}	—	250	350	mA	No load, max. V_{CC}
Input Resistance (IN-to- V_T)	R_{IN}	45	50	55	Ω	—
Differential Input Resistance (IN-to-/IN)	R_{DIFF_IN}	90	100	110	Ω	—
Input High Voltage (IN, /IN)	V_{IH}	1.2	—	V_{CC}	V	—
Input Low Voltage (IN, /IN)	V_{IL}	0	—	$V_{IH} - 0.2$	V	—
Input Voltage Swing (IN, /IN)	V_{IN}	0.2	—	V_{CC}	V	See Figure 6-1 and Note 2
Differential Input Voltage Swing IN-/IN	V_{DIFF_IN}	0.4	—	—	V	See Figure 6-2
Input Voltage Threshold that Triggers FSI	V_{IN_FSI}	—	30	100	mV	—
IN-to- V_T (IN, /IN)	V_{T_IN}	—	—	1.8	V	—
Output Reference Voltage	V_{REF-AC}	$V_{CC} - 1.3$	$V_{CC} - 1.2$	$V_{CC} - 1.1$	V	—

Note 1: The circuit is designed to meet the DC specifications shown in this table after thermal equilibrium has been established.

2: V_{IN} (max) is specified when V_T pin is floating.

TABLE 1-2: LVDS OUTPUTS DC ELECTRICAL CHARACTERISTICS

$V_{CC} = 2.5V \pm 5\%$; $T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$; $R_L = 100\Omega$ across output pair, or equivalent, unless otherwise stated. (Note 1)						
Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
Output Voltage Swing (Q, /Q)	V_{OUT}	250	325	—	mV	See Figure 6-1 and Figure 9-1
Output Output Voltage Swing Q - /Q	$V_{DIFF-OUT}$	500	650	—	mV	See Figure 6-2
Output Common Mode Voltage	V_{OCM}	1.125	—	1.275	V	See Figure 9-2
Change in Common Mode Voltage	ΔV_{OCM}	–50	—	+50	mV	See Figure 9-2

Note 1: High-frequency AC-parameters are guaranteed by design and characterization.

TABLE 1-3: LVTTTL/CMOS DC ELECTRICAL CHARACTERISTICS

$V_{CC} = 2.5V \pm 5\%$; $T_A = -40^{\circ}C$ to $+85^{\circ}C$, unless otherwise stated. (Note 1)						
Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
Input HIGH Voltage	V_{IH}	2.0	—	—	V	—
Input LOW Voltage	V_{IL}	—	—	0.8	V	—
Input HIGH Current	I_{IH}	–125	—	30	μA	—
Input LOW Current	I_{IL}	–300	—	—	μA	—

Note 1: High-frequency AC-parameters are guaranteed by design and characterization.

TABLE 1-4: AC ELECTRICAL CHARACTERISTICS

$V_{CC} = 2.5V \pm 5\%$; $T_A = -40^{\circ}C$ to $+85^{\circ}C$, RPE enabled, Input $t_r/t_f \leq 600$ ps (20% to 80%), $R_L = 100\Omega$, unless otherwise noted. (Note 1)						
Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
Maximum Operating Frequency	f_{MAX}	1.5	2.0		GHz	RPE enabled
Differential Propagation Delay, IN-to-Q	t_{pd}	500	700	950	ps	$V_{IN} \geq 250$ mV, see Note 2
Differential Propagation Delay, SEL-to-Q				17	cycles	RPE enabled—see Timing Diagram
Differential Propagation Delay, SEL-to-Q				1000	ps	RPE disabled ($V_{IN} = V_{CC}/2$)
Differential Propagation Delay Temperature Coefficient	t_{pd_tempco}		115		fs/ $^{\circ}C$	—
Output-to-output Skew	t_{SKEW}		20	40	ps	See Note 3
Part-to-part Skew				200	ps	See Note 4
RMS Phase Jitter	t_{JITTER}		150		fs	Output = 622 MHz, Integration Range 12 kHz–20 MHz.
Crosstalk-induced Jitter				0.7	ps _{RMS}	See Note 5
Output Rise/Fall Time (20% to 80%)	t_r, t_f	40	80	150	ps	At full output swing

Note 1: High-frequency AC-parameters are guaranteed by design and characterization.

- 2:** Propagation delay is a function of rise and fall time at IN. See “Typical Operating Characteristics” for more details.
- 3:** Output-to-output skew is measured between two different outputs under identical transitions.
- 4:** Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and with no skew of the edges at the respective inputs.
- 5:** Crosstalk is measured at the output while applying two similar differential clock frequencies that are asynchronous with respect to each other at the inputs.

TABLE 1-5: TEMPERATURE SPECIFICATIONS

Parameter	Symbol	Min.	Typ.	Max.	Units	Conditions
Temperature Range						
Operating Temperature	T_A	–40	—	+85	$^{\circ}C$	—
Lead Temperature	T_{LEAD}	—	+260	—	$^{\circ}C$	Soldering, 20 sec.
Storage Temperature	T_S	–65	—	+150	$^{\circ}C$	—
Package Thermal Resistance (Note 1)						
32-Lead VQFN, Still Air	θ_{JA}	—	+35	—	$^{\circ}C/W$	—
32-Lead VQFN, Junction-to-Board	Ψ_{JB}	—	+16	—	$^{\circ}C/W$	—

Note 1: Package thermal resistance assumes the exposed pad is soldered (or equivalent) to the device’s most negative potential on the PCB. The θ_{JA} and Ψ_{JB} values are determined for a 4-layer board in still-air, unless otherwise stated.

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 2-1](#).

TABLE 2-1: PIN FUNCTION TABLE

Pin Number	Pin Name	Description
1, 3, 6, 8	IN0, /IN0, IN1, /IN1	Differential Inputs: These input pairs are the differential signal inputs to the device. These inputs accept AC or DC-coupled signals as small as 100 mV (200 mV _{PP}). Each pin of a pair internally terminates to a VT pin through 50Ω. Please refer to Section 8.0, Input Interface Applications for more details.
2, 7	VT0, VT1	Input Termination Center-Tap: Each side of the differential input pair terminates to a VT pin. The VT0 and VT1 pins provide a center-tap to a termination network for maximum interface flexibility. See Section 8.0, Input Interface Applications for more details.
31	SEL	This single-ended TTL/CMOS-compatible input selects the inputs to the multiplexer. Note that this input is internally connected to a 25 kΩ pull-up resistor and will default to a logic HIGH state if left open. Input threshold is VCC/2.
9, 19, 22, 32	VCC	Positive Power Supply: Bypass with 0.1 μF//0.01 μF low ESR capacitors as close to VCC pins as possible.
30, 28, 26, 24, 18, 16, 14, 12, 29, 27, 25, 23, 17, 15, 13, 11	Q0–Q7, /Q0–/Q7	Differential Outputs: These LVDS output pairs are a logic function of the IN0, IN1, and SEL inputs. Please refer to the truth table below for details. Unused output pairs must be terminated with 100Ω across the pair.
20, 21	GND, Exposed Pad	Ground: Ground pin and exposed pad must be connected to the same ground plane.
10	CAP	Power-On Reset (POR) Initialization capacitor. When using the multiplexer with RPE capability, this pin is tied to a capacitor to VCC. The purpose is to ensure the internal RPE logic starts up in a known state. See “Power-On Rest (POR) Description” section for more details regarding capacitor selection. If this pin is tied directly to VCC, the RPE function will be disabled and the multiplexer will function as a normal multiplexer. The CAP pin should never be left open.
4, 5	VREF-AC0, VREF-AC1	Reference Voltage: These outputs bias to VCC–1.2V. They are used for AC-coupling inputs (IN, /IN). Connect VREF_AC directly to the VT pin. Bypass with 0.01 μF low ESR capacitor to VCC. See “Input Interface Applications” section. Maximum sink/source current is ±1.5mA.

TABLE 2-2: TRUTH TABLE

Inputs					Outputs	
IN0	/IN0	IN1	/IN1	SEL	Q	/Q
0	1	X	X	0	0	1
1	0	X	X	0	1	0
X	X	0	1	1	0	1
X	X	1	0	1	1	0

3.0 FUNCTIONAL DESCRIPTION

3.1 RPE MUX and Fail-Safe Input

The SY89838U is optimized for clock switchover applications where switching from one clock to another clock without runt pulses (short cycles) is required. It features two unique circuits:

3.1.1 RUNT-PULSE ELIMINATOR (RPE) CIRCUIT:

The RPE MUX provides a “glitchless” switchover between two clocks and prevents any runt pulses from occurring during the switchover transition. The design of both clock inputs is identical (i.e., the switchover sequence and protection is symmetrical for both input pair, IN0 or IN1. Thus, either input pair may be defined as the primary input). If not required, the RPE function can be permanently disabled to allow the switchover between inputs to occur immediately. If the CAP pin is tied directly to VCC, the RPE function will be disabled and the multiplexer will function as a normal multiplexer.

3.1.2 FAIL-SAFE INPUT (FSI) CIRCUIT:

The FSI function provides protection against a selected input pair that drops below the minimum amplitude requirement. If the selected input pair drops sufficiently below the 100 mV minimum single-ended input amplitude limit (V_{IN}), or 200 mV differentially (V_{DIFF_IN}), the output will latch to the last valid clock state.

3.2 RPE and FSI Functionality

The basic operation of the RPE MUX and FSI functionality is described with the following four example descriptions. All descriptions are related to the true inputs and outputs. The primary (or selected) clock is called CLK1; the secondary (or alternate) clock is called CLK2.

Due to the totally asynchronous relation of the IN and SEL signals and an additional internal protection against metastability, the number of pulses required for the operations described in [Example 3-1](#), [Example 3-2](#), [Example 3-3](#), and [Example 3-4](#) can vary within certain limits. Refer to “Timing Diagrams” for more detailed information.

EXAMPLE 3-1: TWO NORMAL CLOCKS AND RPE ENABLED

In this case the frequency difference between the two running clocks IN0 and IN1 must not be greater than 1.5:1. For example, if the IN0 clock is 500 MHz, the IN1 clock must be within the range of 334 MHz to 750 MHz.

If the SEL input changes state to select the alternate clock, the switchover from CLK1 to CLK2 will occur in three stages.

- 1. The output will continue to follow CLK1 for a limited number of pulses.
- 2. The output will remain LOW for a limited number of pulses of CLK2.
- 3. The output follows CLK2.

See [Figure 3-1](#).

FIGURE 3-1: CLK1 TO CLK2 SWITCHOVER WHEN SEL INPUT CHANGES TO ALTERNATE CLOCK BETWEEN TWO NORMAL CLOCKS WHERE RPE IS ENABLED AND FREQUENCY DIFFERENCE IS <1.5:1.

EXAMPLE 3-2: INPUT CLOCK FAILURE: SWITCHING FROM A SELECTED CLOCK STUCK HIGH TO A VALID CLOCK (RPE ENABLED)

If CLK1 fails HIGH before the RPE MUX selects CLK2 (using the SEL pin), the switchover will occur in three stages.

- 1. The output will remain HIGH for a limited number of pulses of CLK2.
- 2. The output will switch to LOW and then remain LOW for a limited number of falling edges of CLK2.
- 3. The output will follow CLK2.

See [Figure 3-2](#).

EXAMPLE 3-3: INPUT CLOCK FAILURE: SWITCHING FROM A SELECTED CLOCK STUCK LOW TO A VALID CLOCK (RPE ENABLED)

If CLK1 fails LOW before the RPE MUX selects CLK2 (using the SEL pin), the switchover will occur in two stages.

- 1. The output will remain LOW for a limited number of falling edges of CLK2.
- 2. The output will follow CLK2.

See [Figure 3-3](#).

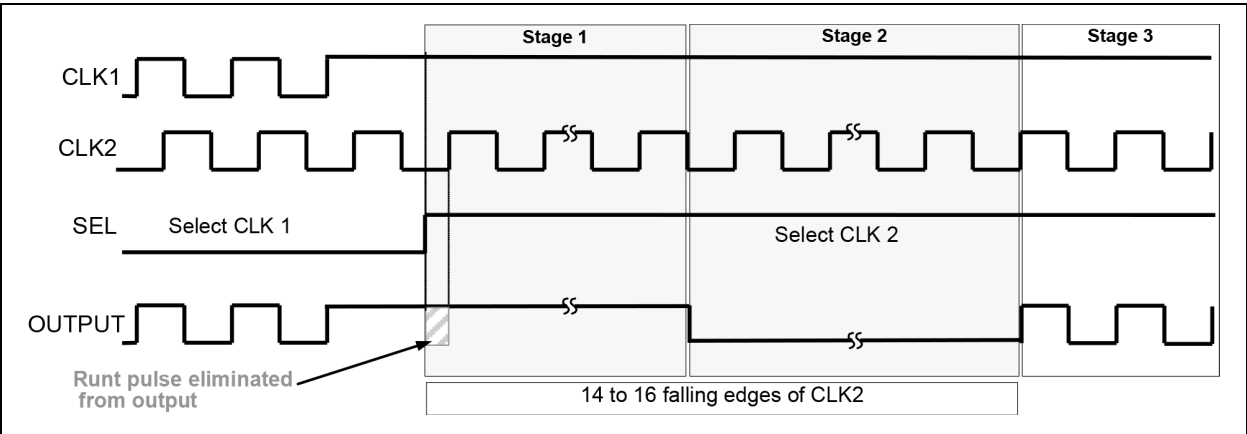

FIGURE 3-2: SWITCHING FROM A SELECTED CLOCK STUCK HIGH TO A VALID CLOCK (RPE ENABLED).

Note: In [Figure 3-2](#), output shows extended clock cycle during switchover and pulse width for both high and low of this cycle will always be greater than 50% of the CLK2 period.

FIGURE 3-3: SWITCHING FROM A SELECTED CLOCK STUCK LOW TO A VALID CLOCK (RPE ENABLED).

EXAMPLE 3-4: INPUT CLOCK FAILURE: SWITCHING FROM THE SELECTED CLOCK INPUT STUCK IN AN UNDETERMINED STATE TO A VALID CLOCK INPUT (RPE ENABLED)

If CLK1 fails to an undetermined state (e.g., amplitude falls below the 100 mV [V_{IN}] minimum single-ended input limit, or 200 mV differentially) before the RPE MUX selects CLK2 (using the SEL pin), the switchover to the valid clock CLK2 will occur either following [Example 3-2](#) or [Example 3-3](#), depending on the last valid state at the CLK1.

If the selected input clock fails to a floating, static, or extremely low signal swing, including 0 mV, the FSI function will eliminate any metastable condition and guarantee a stable output signal. No ringing and no undetermined state will occur at the output under these conditions.

Please note that the FSI function will not prevent duty cycle distortions or runt pulses in case of a slowly deteriorating (but still toggling) input signal. Due to the FSI function, the propagation delay will depend on rise and fall time of the input signal and on its amplitude. Refer to [Section 5.0, Typical Characteristics](#) for more detailed information.

See also [Figure 3-4](#).

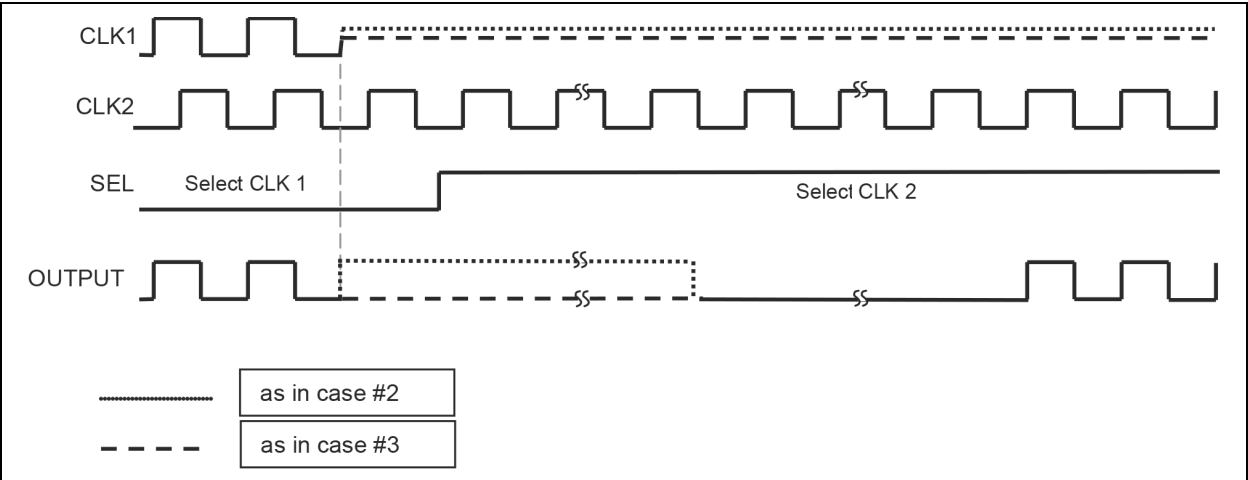

FIGURE 3-4: SWITCHING FROM THE SELECTED CLOCK INPUT STUCK IN AN UNDETERMINED STATE TO A VALID CLOCK INPUT (RPE ENABLED).

4.0 POWER-ON RESET (POR) DESCRIPTION

The SY89838U includes an internal power-on reset (POR) function to ensure the RPE logic starts-up in a known logic state once the power-supply voltage is stable.

An external capacitor connected between VCC and the CAP pin (pin 10) controls the delay for the power-on reset function.

Calculation of the required capacitor value is based on the time the system power supply needs to power up to a minimum of 2.3V.

The time constant for the internal power-on-reset must be greater than the time required for the power supply to ramp up to a minimum of 2.3V.

[Equation 4-1](#) describes this relationship:

EQUATION 4-1:

$$C(\mu F) \geq \frac{t_{dPS}(ms)}{12(ms/\mu F)}$$

As an example, if the time required for the system power supply to power up past 2.3V is 12 ms, the required capacitor value on pin 10 would be as shown in [Equation 4-2](#):

EQUATION 4-2:

$$C(\mu F) \geq \frac{12ms}{12(ms/\mu F)}$$
$$C(\mu F) \geq 1\mu F$$

5.0 TYPICAL CHARACTERISTICS

$V_{CC} = 2.5V$; $GND = 0V$; $V_{IN} \geq 250 \text{ mV}_{pk}$, $t_r/t_f \leq 300 \text{ ps}$, $R_L = 100\Omega$ across output pair; $T_A = 25^\circ C$, unless otherwise stated.

10.0 PACKAGING INFORMATION

10.1 Package Marking Information

Legend:	XX...X	Product code or customer-specific information
	W	Week code
	NNN	Alphanumeric traceability code (week)
	*	This package is Pb-free. The Pb-free JEDEC designator can be found on the outer packaging for this package.
	•	Pin one index is identified by a dot
Note:	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.	
	Underbar (_) and/or Overbar (¯) symbol may not be to scale.

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
 - Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
 - Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
 - Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable" Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
