

Features

Inputs/Outputs

- Accepts differential or single-ended input
 - LVPECL, LVDS, CML, HCSL, LVCMOS
- Eight precision LVPECL outputs
- Operating frequency up to 750 MHz

Power

- Options for 2.5 V or 3.3 V power supply
- Core current consumption of 122 mA
- On-chip Low Drop Out (LDO) Regulator for superior power supply rejection

Performance

- Ultra low additive jitter of 38 fs RMS

3.0 Functional Description

The ZL40206 is an LVPECL clock fanout buffer with eight output clock drivers capable of operating at frequencies up to 750MHz.

Inputs to the ZL40206 are externally terminated to allow use of precision termination components and to allow full flexibility of input termination. The ZL40206 can accept DC or AC coupled LVPECL, LVDS, CML or HCSL input signals; single ended input signals can also be accepted. A pin compatible device with internal termination is also available.

The ZL40206 is designed to fan out low-jitter reference clocks for wired or optical communications applications while adding minimal jitter to the clock signal. An internal linear power supply regulator and bulk capacitors minimize additive jitter due to power supply noise. The device operates from 2.5V $\pm$ 5% or 3.3V $\pm$ 5% supply. Its operation is guaranteed over the industrial temperature range -40°C to +85°C.

The device block diagram is shown in Figure 1; its operation is described in the following sections.

3.1 Clock Inputs

The ZL40206 is adaptable to support different types of differential and singled-ended input signals depending on the passive components used in the input termination. The application diagrams in the following figures allow the ZL40206 to accept LVPECL, LVDS, CML, HCSL and single-ended inputs.

* For frequencies below 100 MHz, increase C to avoid signal integrity issues.

3.2 Clock Outputs

LVPECL has a very low output impedance and a differential signal swing between 1V and 1.6 V. A simplified diagram for the output stage is shown in Figure 12. The LVPECL to LVDS output termination is not shown since there is a separate device that has the same input and LVDS outputs.

The methods to terminate the ZL40206 LVPECL drivers are shown in the following figures.

3.3 Device Additive Jitter

The ZL40206 clock fan out buffer is not intended to filter clock jitter. The jitter performance of this type of device is characterized by its additive jitter. Additive jitter is the jitter the device would add to a hypothetical jitter-free clock as it passes through the device. The additive jitter of the ZL40206 is random and as such it is not correlated to the jitter of the input clock signal.

The square of the resultant random RMS jitter at the output of the ZL40206 is equal to the sum of the squares of the various random RMS jitter sources including: input clock jitter; additive jitter of the buffer; and additive jitter due to power supply noise. There may be additional deterministic jitter sources that are not shown in Figure 19.

Figure 19 - Additive Jitter

3.4 Power Supply

This device operates employing either a 2.5V supply or 3.3V supply.

3.4.1 Sensitivity to power supply noise

Power supply noise from sources such as switching power supplies and high-power digital components such as FPGAs can induce additive jitter on clock buffer outputs. The ZL40206 is equipped with a low drop out (LDO) regulator and on-chip bulk capacitors to minimize additive jitter due to power supply noise. The on-chip regulation, recommended power supply filtering, and good PCB layout all work together to minimize the additive jitter from power supply noise.

3.4.2 Power supply filtering

Jitter levels may increase when noise is present on the power pins. For optimal jitter performance, the device should be isolated from the power planes connected to its power supply pins as shown in Figure 20.

- 10 μ F capacitors should be size 0603 or size 0805 X5R or X7R ceramic, 6.3 V minimum rating
- 0.1 μ F capacitors should be size 0402 X5R ceramic, 6.3 V minimum rating
- Capacitors should be placed next to the connected device power pins
- A 0.15 ohm resistor is recommended

Figure 20 - Decoupling Connections for Power Pins

3.4.3 PCB layout considerations

The power nets in Figure 20 can be implemented either as a plane island or routed power topology without changing the overall jitter performance of the device.
