

Low-Jitter I²C/SPI Programmable LVDS Oscillator

General Description

The DSC2130 and DSC2230 series of programmable, high-performance LVDS oscillators utilizes a proven silicon MEMS technology to provide excellent jitter and stability while incorporating high output frequency flexibility. DSC2130 and DSC2230 allow the user to modify the output frequency using I²C or SPI interface, respectively. User can also select from two pre-programmed default output frequencies using the control pin.

DSC2130 and DSC2230 are packaged in 14-pin 3.2x2.5 mm QFN packages and available in temperature grades from Ext. Commercial to industrial.

Operational Description

The DSC2130/2230 is a LVDS oscillator consisting of a MEMS resonator and a support PLL IC. The LVDS output is generated through independent 8-bit programmable dividers from the output of the internal PLL.

DSC2130/2230 allows for easy programming of the output frequencies using I²C/SPI interface. Upon power-up, the initial output frequency is controlled by an internal pre-programmed memory (OTP). This memory stores all coefficients required by the PLL for two different default frequencies. The control

pin (FS) selects the initial frequency. Once the device is powered up, a new output frequency can be programmed. Programming details are provided in the **Programming Guide**. Standard default frequencies are described in the following sections. Discera supports customer defined versions of the DSC2130/2230.

When Enable (pin 1) is floated or connected to VDD, the DSC2130/2230 is in operational mode. Driving Enable to ground will disable both output drivers (hi-impedance mode).

Output Clock Frequencies

Table 2 lists the standard frequency configurations and the associated ordering information to be used in conjunction with the ordering code. Customer defined combinations are available.

Table 2. Pre-programmed pin-selectable output frequency combinations

Ordering Info	Freq (MHz)	Select Bit [FS] – Default is [1]	
		0	1
C0001	f _{OUT}	148.352	74.1758
C0002	f _{OUT}	100	0*
C0003	f _{OUT}	100	150
C0004	f _{OUT}	148.5	148.35
C0005	f _{OUT}	315	0*
CXXXX	f _{OUT}	Contact factory for additional configurations.	

Frequency select bit are weakly tied high so if left unconnected the default setting will be [1] and the device will output the associated frequency highlighted in **Bold**.

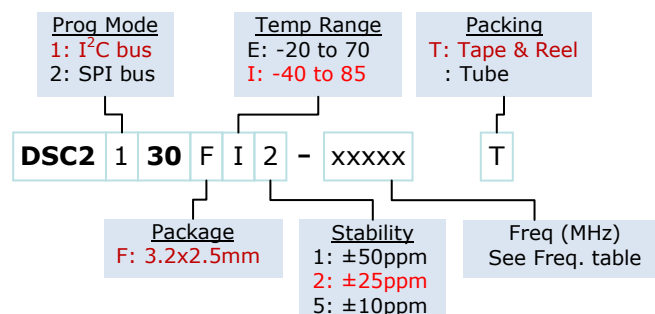

0* – denotes invalid selection, output frequency is not specified.
