# ENHANCED DIFFERENTIAL RECEIVER

Precision Edge<sup>®</sup> SY89250V

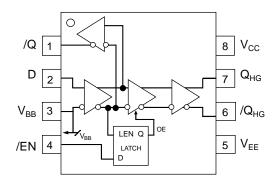

#### **FEATURES**

- 3.3V and 5V power supply options
- 250ps propagation delay
- Very high voltage gain
- Ideal for Pulse Amplifier and Limiting Amplifier applications
- Data synchronous Enable/Disable (/EN) on Q<sub>HG</sub> and /Q<sub>HG</sub> provides for complete glitchless gating of the outputs
- Ideal for gating timing signals
- Complete solution for high quality, high frequency crystal oscillator applications
- Available in an ultra-small 8-pin (2mm x 2mm) MLF™ package

#### **APPLICATIONS**

■ Oscillator modules

#### **BLOCK DIAGRAM**

Precision Edge®

## DESCRIPTION

The SY89250V is a differential PECL/ECL receiver/buffer in a space saving (2mm  $\times$  2mm) MLFTM package. The device is functionally equivalent to the SY100EL16VC, but features a 70% smaller footprint. It provides a  $V_{BB}$  output for either single-ended application or as a DC bias for AC-coupling to the device.

The SY89250V provides an /EN input which is synchronized with the data input (D) signal in a way that provides glitchless gating of the Q<sub>HG</sub> and /Q<sub>HG</sub> outputs. When the /EN signal is LOW, the input is passed to the outputs and the data output equals the data input. When the data input is HIGH and the /EN goes HIGH, it will force the QHG LOW and the /QHG HIGH on the next negative transition of the data input. If the data input is LOW when the /EN goes HIGH, the next data transition to a HIGH is ignored and QHG remains LOW and /Q<sub>HG</sub> remains HIGH. The next positive transition of the data input is not passed on to the data outputs under these conditions. The Q<sub>HG</sub> and /Q<sub>HG</sub> outputs remain in their disabled state as long as the /EN input is held HIGH. The /EN input has no influence on the /Q output and the data input is passed on (inverted) to this output whether /EN is HIGH or LOW. This configuration is ideal for crystal oscillator applications, where the oscillator can be free running and gated on and off synchronously without adding extra counts to the output.

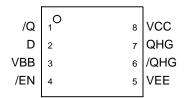

All support documentation can be found on Micrel's web site at www.micrel.com.

#### Notes:

- Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.
- 2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
- 3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the devices most negative potential on the PCB.
- 4. Output loaded with 50  $\!\Omega$  to V  $_{CC}$  –2  $\!V.$

## **AC ELECTRICAL CHARACTERISTICS**

 $V_{EE} = V_{EE}(min)$  to  $V_{EE}(max)$ ;  $V_{CC} = GND$ ;  $T_A = -40^{\circ}C$  to +85°C; unless otherwise stated.

| Symbol                          | Parameter                             |          | Condition            | Min  | Тур | Max  | Units |

| $V_{CMR}$                       | Common Mode Range                     | /EN      | Note 7               | -1.3 |     | -0.4 | V     |
| t <sub>r</sub> , t <sub>f</sub> | Output Q Rise/Fall Times (20% to 80%) |          | At full output swing | 100  | 225 | 350  | ps    |

#### Notes:

- 5. Duty cycle skew is the difference between a  $t_{\rm pd}$  propagation delay through a device.
- 6. Minimum input swing for which AC parameters are guaranteed. The device has a DC gain of  $\approx$  40 to Q, /Q outputs and a DC gain of  $\approx$  200 or higher to /Q<sub>HG</sub>, Q<sub>HG</sub> outputs.
- 7. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between  $V_{PP}(min)$  and 1V. The lower end of the CMR range varies 1:1 with  $V_{EE}$ . The numbers in the spec table assume a nominal  $V_{EE} = -3.3V$ . Note for PECL operation, the  $V_{CMR}(min)$  will be fixed at  $3.3V |V_{CMR}(min)|$ .
