

EasyPROTO™

Manual

All Mikroelektronika's development systems feature a large number of peripheral modules expanding microcontroller's range of application and making the process of program testing easier. In addition to these modules, it is also possible to use numerous additional modules linked to the development system through the I/O port connectors. Some of these additional modules can operate as stand-alone devices without being connected to the microcontroller.

Additional Board

SOFTWARE AND HARDWARE SOLUTIONS FOR EMBEDDED WORLD ...making it simple

EasyPROTO Additional Board

The *EasyPROTO* additional board is used to connect the microcontroller pins with a proto board. It is connected to some of the development system's ports via a 2x5 female connector provided on a flat cable, whereas for connection with a proto board the *EasyPROTO* additional board uses a 1x10 male connector.
