

USB UART 2TM

Manual

All Mikroelektronika's development systems feature a large number of peripheral modules expanding microcontroller's range of application and making the process of program testing easier. In addition to these modules, it is also possible to use numerous additional modules linked to the development system through the I/O port connectors. Some of these additional modules can operate as stand-alone devices without being connected to the microcontroller.

Additional board

USB UART 2

The USB UART 2 additional board is used to connect a PC and the UART module built into the microcontroller.

Key features:

- Data transfer via UART;
- 5V DC power supply voltage;
- Low power consumption; etc.

Figure 1: USB UART 2 additional board

How to connect the board?

The USB UART 2 additional board can be easily connected to PC via a USB MINIB connector CN1. Connection with the microcontroller is established via 1x6 connector CN2 and 1x9 connector CN3. 1x6 connectors enable access to the microcontroller pins that are used for serial UART communication. A 1x9 connector CN3 is connected to the pins of the MCP2200 chip supplied on the additional board.
