EV4026-J-00C

Universal Input, 18W
Primary-side-control with Active PFC
Isolated T8 LED Lamp Driver Evaluation Board

The Future of Analog IC Technology

DESCRIPTION

The EV4026-J-00C Evaluation Board is designed to demonstrate the capabilities of MP4026. The MP4026 is a primary-side-control offline LED lighting controller which can achieve high power factor and accurate LED current for an isolated lighting application in a single stage converter. It works in boundary conduction mode for reducing the MOSFET and Diode switching losses.

The EV4026-J-00C is typically designed for driving an isolated 18W T8 LED lamp with $36V_{TYP}$, 500mA LED load at universal input (90V-265VAC, 50/60Hz).

The EV4026-J-00C has high performances in efficiency, line/load regulation and meets IEC61547 surges, IEC61000-3-2 Class C harmonics and EN55015 conducted EMI. It has multi-protection function as over-voltage protection, short-circuit protection, primary-side OCP, etc.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	90-264	VAC
Output Voltage	V_{OUT}	36	V
LED Current	I_{LED}	500	mA
Output Power	P_{OUT}	18	W
Efficiency (full load)	η	84~86	%
PF		>0.9	
THD		<20	%

FEATURES

- Small IC package: Thin SOT23-6
- Real current control without secondary-feedback circuit
- Good line/load regulation
- High power factor>0.9 over universal input voltage
- Boundary conduction mode improves efficiency
- Input UVLO
- Primary-side over current protection
- Over-voltage protection(OVP)
- Short-circuit protection(SCP)
- Primary-side over-current protection(OCP)
- Over-temperature protection(OTP)
- Fit inside T8 tube enclosure

APPLICATIONS

- T8 Tube Replacement
- Solid State Lighting
- Industrial & Commercial Lighting
- Residential Lighting

Warning: Although this board is designed to satisfy safety requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

CIRCUIT DESCRIPTION

The EV4026-J-00C is configured in a single-stage FLYBACK topology, it uses primary-side-control which can mostly simplify the schematic and get a cost effective BOM. It can also achieve high power factor and accurate LED current.

F1, RV1, L1, L2, L3, R1, CX1, C1 and BD1 compose the input stage. F1 fuses the AC input to protect for the component failure or some excessive short events. RV1 is used to absorb the high ring voltage of surge test. L1, L2, CX1, L3, R1 and C1 associated with L4, CY1 form the EMI filter which can meet the requirement for universal input. The bridge rectifier BD1 rectifies the input line voltage. Small bulk CBB capacitor C1 is used for a low impedance path for the primary switching current, to maintain high power factor, the capacitance of C1 should be selected with low value.

R3, R4, R17, C3 provide sine wave reference for the primary peak current to get an active PFC function. The divided voltage should be lower than the max voltage rating of MULT pin.

R2, R5, C2, C10, D2 are used to supply the power for MP4026. A 6.8μF electrolytic capacitor C10 is selected to maintain the supply voltage. At start-up, C10 is first charged up by the starter resistor R2 from the line voltage, when the VCC voltage passes the turn on threshold the IC starts to work and the gate begins to switch, then the VCC power supply is taken over by the auxiliary winding through R5, D2.

R7, R9, D2, C5 are used to detect the auxiliary winding to get the transformer magnetizing current zero crossing signal for realizing the valley switching operation, and also monitor the output OVP condition. The OVP voltage is set by the divider ratio of R7, R9. D2 is used to block the negative plateau voltage of auxiliary winding when MOSFET is turn on. C5 is used to decouple the high frequency noise influence on CS/ZCD pin.

R10, R11, R12 are primary sensing resistors for primary side current control. The value of R10, R11 and R12 set the output LED current. R6 is used to form a feedforward from input line voltage to optimize the line regulation. C6, R15, R16, D3 are used to damp the leakage inductance energy so the drain voltage can be suppressed at a safe level.

Diode D4 rectifies the secondary winding voltage and the capacitor C8, C9 are the output filter. The resistor R14 is placed as pre-load to limit the output voltage rise too high in open load condition.

Electric Strength Test

Primary circuit to secondary circuit electric strength testing was completed according to IEC61347-1 and IEC61347-2-13.

Input and output was shorted respectively. 3750VAC/50Hz sine wave applied between input and output for 1min, and operation was verified.

Surge Test

Line to Line 500V and Line to Power Earth 1kV surge testing was completed according to IEC61547. Input voltage was set at 230VAC/50Hz. Output was loaded at full load and operation was verified following each surge event.

Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (Pass/Fail)
500	230	L to N	90	Pass
-500	230	L to N	270	Pass
1000	230	L to PE	90	Pass

QUICK START GUIDE

1. Preset AC Power Supply to 90VAC ≤ V_{IN} ≤265VAC.
2. Turn Power Supply off.
3. Connect the LED string between “LED+” (anode of LED string) and “LED-” (cathode of LED string).
4. Connect Power Supply terminals to AC V_{IN} terminals as shown on the board.
5. Turn AC Power Supply on after making connections.
