

DESCRIPTION

The EV4433-L-00A is an evaluation board for the MP/MPQ4433GL.

MP/MPQ4433GL is a frequency programmable (350kHz to 2.5MHz), synchronous, step-down, switching regulator with integrated internal high-side and low-side power MOSFETs. It provides up to 3A highly efficient output current with current mode control for fast loop response.

The MP/MPQ4433GL employs AAM (Advanced Asynchronous Modulation) mode which helps to achieve high efficiency at light load condition by scaling down the switching frequency to reduce the switching and gate driving losses.

The EV4433-L-00A is a fully assembled and tested evaluation board, it generates +3.3V output voltage at load current up to 3A from a 3.3V to 36V input range.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V _{IN}	3.3 – 36	V
Output Voltage	V _{OUT}	3.3	V
Output Current	I _{OUT}	3	A

FEATURES

- Wide 3.3V-to-36V Operating Input Range
- 3A Continuous Output Current
- 1µA Low Shutdown Mode Current
- 10µA Sleep Mode Quiescent Current
- Internal 90mΩ High-Side and 40mΩ Low-Side MOSFETs
- 350kHz to 2.5MHz Programmable Switching Frequency
- Synchronize to External Clock Selectable In-Phase or 180° Out-of-Phase
- Power Good Indicator
- Programmable Soft-Start Time
- 80ns Minimum On Time
- Selectable Forced CCM and AAM
- Low Dropout Mode
- Over-Current Protection with Valley-Current Detection and Hiccup
- Thermal Shutdown
- Available in Wettable Flank
- Available in AEC-Q100 Grade-1
- Fully Assembled and Tested

APPLICATIONS

- Automotive Systems
- Industrial Power Systems

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

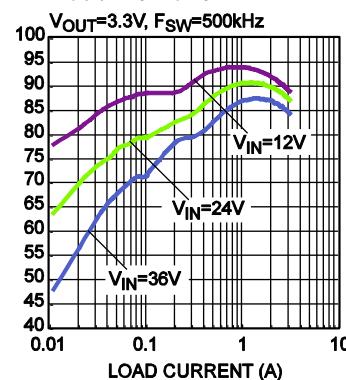

EVALUATION BOARD

EV4433-L-00A	MP/MPQ4433GL

Efficiency vs. Load Current

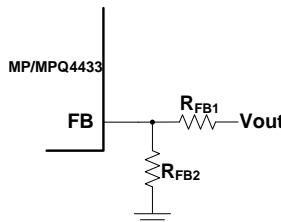

QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
Be aware that electronic loads represent a negative impedance to the regulator and if set to a too high current will trigger Hiccup mode.
2. Preset the power supply output to between 3.3V and 36V, and then turn it off.
If longer cables are used between the source and the EVB (>0.5m total), a damping capacitor should be installed at the input terminals. Especially when Vin is $\geq 24V$.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The MP/MPQ4433GL will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.05V to turn on the regulator, drive EN less than 0.93V to turn it off.
6. The oscillating frequency of MP/MPQ4433 can be programmed by an external frequency resistor R_{FREQ} . The value of R_{FREQ} can be estimated with below equation:

$$R_{FREQ} (\text{k}\Omega) = \frac{170000}{f_{SW}^{1.11} (\text{kHz})}$$

7. To use the Sync function, apply a 350kHz to 2.5MHz clock to the Sync pin to synchronize the internal oscillator frequency to the external clock. The external clock should be at least 250kHz larger than R_{FREQ} set frequency. The SYNC pin can also be used to select forced CCM mode or AAM mode. Drive it high before the chip starts up to choose forced CCM mode, and drive it low or leave it float to choose AAM mode.
8. The output voltage is set by the external resistor divider. Choose R_{FB1} to be around 40k Ω . Then R_{FB2} can be calculated with below equation:

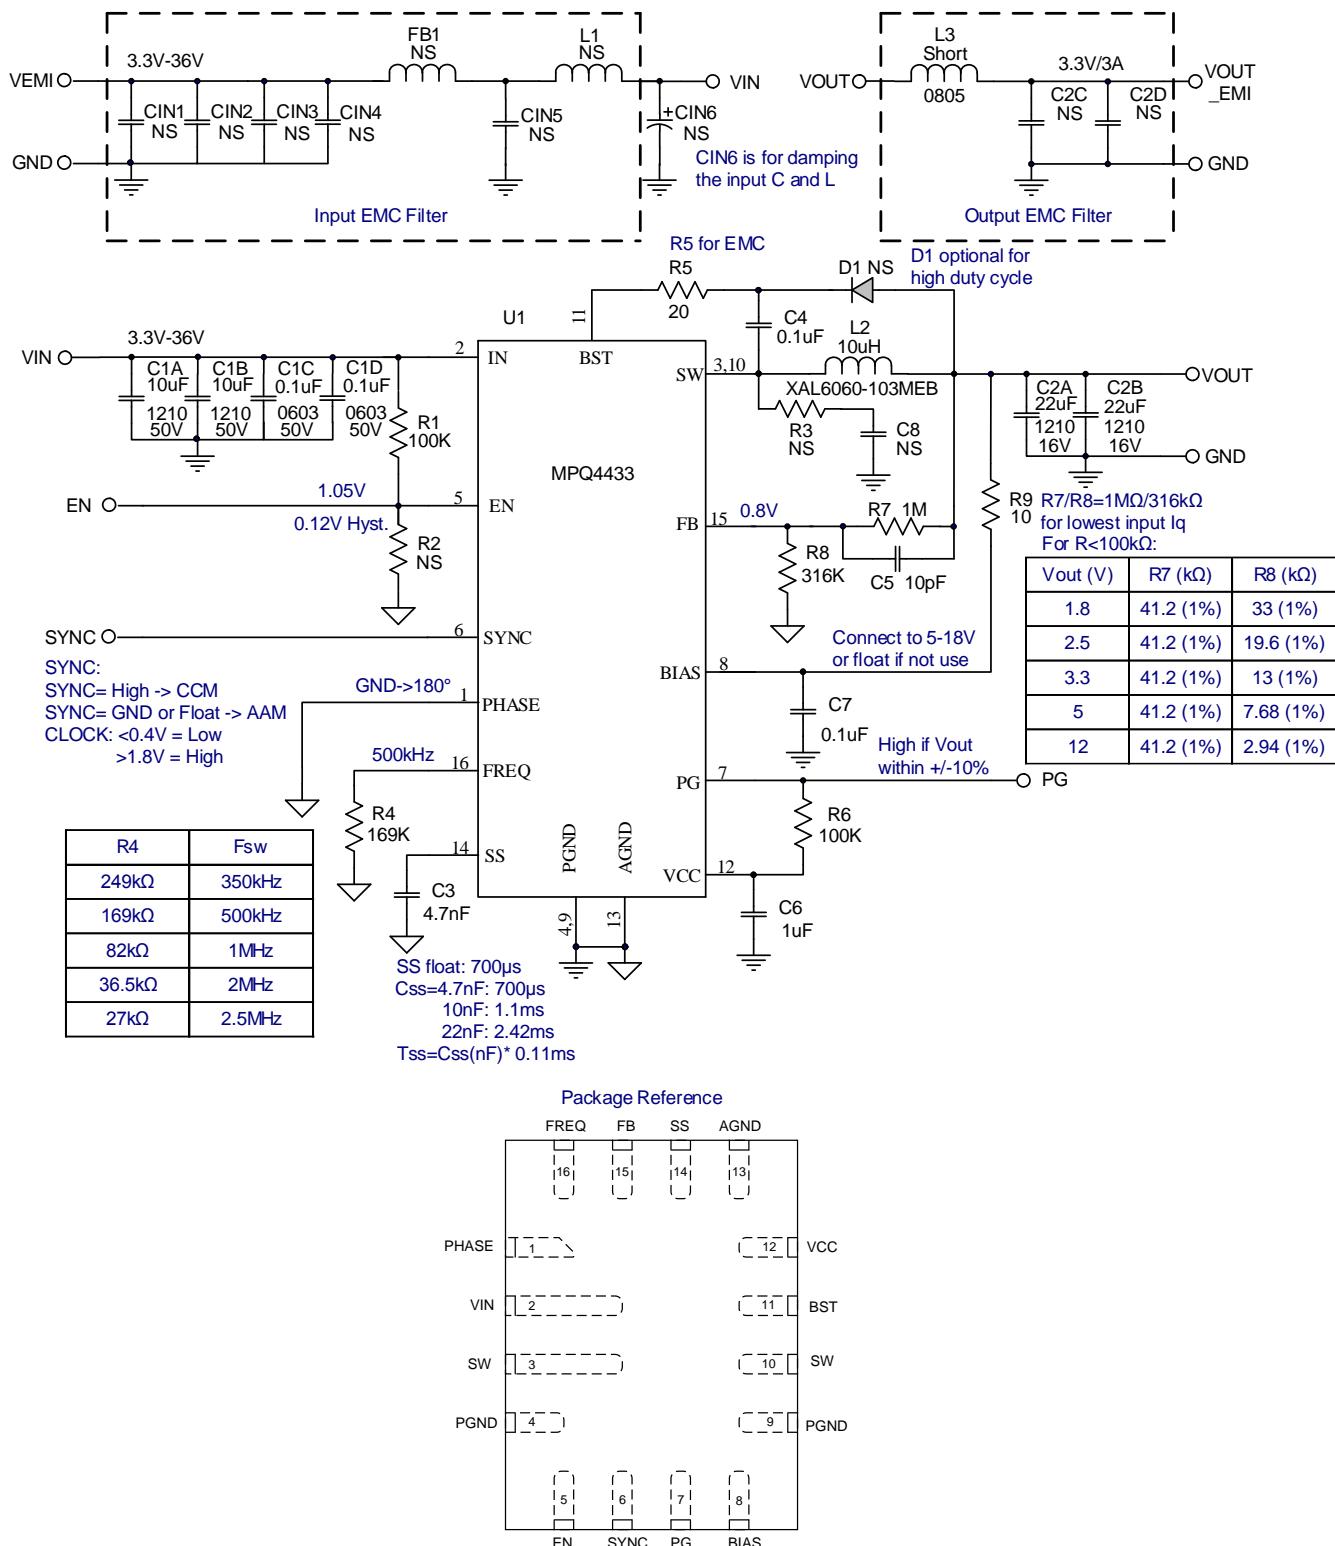

$$R_{FB2} = \frac{R_{FB1}}{\frac{V_{OUT}}{0.8V} - 1}$$

Below table lists the recommended feedback resistor values for common output voltages.

V _{OUT} (V)	R _{FB1} (k Ω)	R _{FB2} (k Ω)
1.8	41.2 (1%)	33 (1%)
2.5	41.2 (1%)	19.6 (1%)
3.3	41.2 (1%)	13 (1%)
5	41.2 (1%)	7.68 (1%)
12	41.2 (1%)	2.94 (1%)
