EV8904DD-00A

500mA Low-Current LDO Linear Regulator EV Board

The Future of Analog IC Technology

DESCRIPTION

The EV8904DD-00A evaluation board demonstrates the performance of MP8904, a monolithic low-current, low-dropout LDO linear regulator. It operates from a 2.5V to 6.5V input bias voltage and regulates the output voltage from as low as 0.5V.

It requires a bias supply (2.5V to 6.5V) separate from V_{IN} to run the internal reference and LDO drive circuitry. The output current comes directly from the input voltage supply for high efficiency regulation. The 0.5V internal reference voltage allows the output to be programmed to a range of 0.5V to 5V.

The EV8904DD-00A provides thermal overload and current limit protection. The MP8904 is available in an 8-pin QFN (2mm x 3mm) package.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	2.5 – 6.5	V
Dropout Voltage	$V_{DROPOUT}$	300	mV
Output Current	I_{OUT}	0.5	A

FEATURES

- Wide 2.5V to 6.5V Input Voltage Range
- Stable with Very Small Ceramic Capacitors
- 300mV Dropout at 500mA Output
- 2% Feedback Accuracy
- Adjustable Output Range from 0.5V to 5V
- Stable With Low-ESR Output Capacitors
- Low 100μA Ground Current
- Internal Thermal Protection
- Current Limit Protection
- Fully Assembled and Tested

APPLICATIONS

- Low Current Regulators
- Battery-Powered Systems
- Mobile Devices, such as Cell Phones and GPS Navigators

QUICK START GUIDE

The output voltage of this board is set to 1.8V.

1. Connect the positive and negative terminals of the load to the VOUT and GND pins respectively.
2. Preset the power supply output between 2.5V and 6.5V, and then turn off the power supply.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The board will automatically start up.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.2V to turn on the regulator or less than 0.4V to turn it off.
6. The default resistor values on the board are R1=26.1kΩ and R2=10kΩ. Changing these resistor values will change the output voltage. Use the following equation to determine resistor values for different output voltages:

$$V_{OUT} = 0.5Vx(1+\frac{R1}{R2})$$
