

DESCRIPTION

The EVM3515-QV-02A is an evaluation board for MPM3515, a synchronous rectified, step-down Mini-Module regulator with built-in power MOSFETS, inductor and two capacitors.

The Evaluation Board can deliver a 1.5A continuous output current with excellent load and line regulation over a wide input supply range.

Full protection features include over-current protection and thermal shut down.

The MPM3515 is available in a space-saving QFN-17 (3mmx5mmx1.6mm) package.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	4 -36	V
Output Voltage	V_{OUT}	3.3	V
Output Current	I_{OUT}	1.5	A

FEATURES

- Complete Switch Mode Power Supply
- 4V-to-36V Wide Operating Input Range
- 1.5A Continuous Load Current
- Low $R_{DS(ON)}$ Internal Power MOSFETs
- Fixed 2.2MHz Switching Frequency
- 450kHz-2.2MHz Frequency Sync
- Forced CCM mode
- Power Good Indicator
- OCP Protection with Valley Current Detection and Hiccup
- Thermal Shutdown
- Output Adjustable from 0.8V
- Available in QFN-17 (3mmx5mmx1.6mm) Package
- Available in AEC-Q100 Grade 1

APPLICATIONS

- Industrial Controls
- Automotive
- Medical and Imaging Equipment
- Telecom Applications
- Distributed Power Systems

QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively. Set load current between 0-1.5A. Be aware that electronic loads represent a negative impedance to the regulator and if set to a too high current will trigger over-current-protection or short-current-protection.
2. Preset the power supply output between 4V and 36V, and then turn off the power supply. If longer cables are used between the source and the EVB (>0.5m total), a damping capacitor should be installed at the input terminals, especially when $V_{IN} \geq 24V$.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The board will automatically start up. The default V_{OUT} is 3.3V.
5. To get better EMI performance, connect the input power supply between VEMI and GND.
6. To use EN turning on/off MPM3515, remove R3 first. Then give a voltage between EN and GND higher than 1.45V to turn on, lower than 1V to turn off. To use the SYNC function, connect an external clock with a range of 450 kHz to 2.2MHz to synchronize the internal clock rising edge to the external clock rising edge.
7. The external resistor divider sets the output voltage. The feedback resistor R1 sets the feedback loop bandwidth with the internal compensation capacitor C3. Choose R1 to be around 75k Ω when $V_{out} \geq 1V$. R2 can then be calculated with below equation:

$$R2 = \frac{R1}{\frac{V_{OUT}}{0.807V} - 1}$$
