EVQ8633B-LE-00A

High Efficiency, 16V, 20A Synchronous Step-Down Converter Evaluation Board

DESCRIPTION

The EVQ8633B-LE-00A is an evaluation board for the MPQ8633B, a high-efficiency, monolithic, synchronous, step-down converter.

This EVB can deliver 20A of continuous load current over a wide operating input range. High efficiency can be achieved over a wide output current load range.

The MPQ8633B adopts internally compensated constant-on-time (COT) control mode that provides fast transient response and eases loop stabilization.

This EVB can be turned on or off via a remote on/off input (EN) referenced to ground. This input is compatible with popular logic devices.

QUICK-START GUIDE

The input voltage of the evaluation board can range from 8V to 16V. The minimum 8V input voltage is limited by the EN signal, which is derived from VIN through a resistor divider (R4 and R6). A lower input voltage (as low as 2.7V) can be set by fine-tuning the resistor divider values or by over-driving EN with an external control signal. The following is the procedure to turn on the evaluation board.

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output voltage between 8V and 16V and then turn the power supply off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively. Ensure that the power supply has a high enough current limit to supply the power.
4. Turn the power supply on. The EVQ8633B-LE-00A will start up automatically.
5. To use the enable function, apply a digital input to the EN pin. Drive EN above 1.5V to turn on the regulator. Drive EN below 1V to turn off the regulator.
6. Use R1 and R2 to set the output voltage with V_{FB} = 0.6V. Follow the Application Information section in the device datasheet to select the proper values for R1, R2, the inductor, and the output capacitor when the output voltage is changed.
7. The JP1 jumper can be used to select the operating frequency (600kHz, 800kHz, or 1000kHz) and light-load operation mode (pulse-skip mode, discontinuous conduction mode, or continuous conduction mode).
