

## **MP86981** 20A, 27V Intelli-Phase Solution (Single IC with Integrated HS/LS FETs and Driver)

The Future of Analog IC Technology

# DESCRIPTION

The MP86981 is a monolithic Half Bridge with built in internal power MOSFETs and gate drivers. It achieves 20A continuous output current over a wide input supply range.

Integration of the Driver and MOSFETs results in high efficiency due to optimal dead time control and parasitic inductance reduction.

The MP86981 is a Monolithic IC approach to drive up to 20A per phase. This very small 5x5 QFN can be used from 100KHz to 1MHz operation.

This device is designed to work with tri state output controller.

The MP86981 is ideal for notebook applications where efficiency and small size are a premium.

### FEATURES

- Wide 4.5V to 21V Operating Input Range
- 20A Output Current
- Simple Logic Interface(5.0V)
- Synchronous Gate Driver Delivers up to 95% Efficiency
- Operation from 100KHz to 1MHz
- Accepts 3-state PWM Input
- Thermal Shutdown
- Used for multi phase operation
- Available in a 5mm x 5mm QFN Package

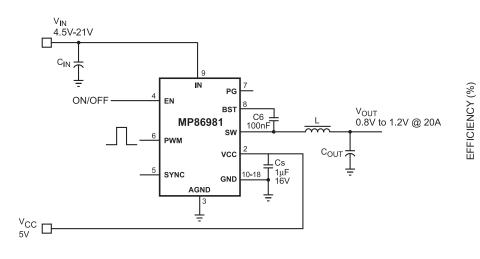

### **APPLICATIONS**

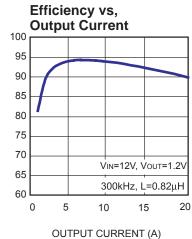

- Power modules
- Notebook, Core Voltage
- Graphic Card Core Regulators

### Recommended Operating Conditions <sup>(3)</sup>

Supply Voltage V <sub>IN</sub>	4.5V to 21V
Operating Temperature	–40°C to +85°C

# Thermal Resistance <sup>(4)</sup> $\theta_{JA}$ $\theta_{JC}$

### 5x5 QFN ...... 36 ...... 8.... °C/W

#### Notes:

1) Exceeding these ratings may damage the device.

- 2) The maximum allowable power dissipation is a function of the maximum junction temperature T<sub>J</sub>(MAX), the junction-to-ambient thermal resistance θ<sub>JA</sub>, and the ambient temperature T<sub>A</sub>. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P<sub>D</sub>(MAX)=(T<sub>J</sub>(MAX)-T<sub>A</sub>)/ θ<sub>JA</sub>. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on approximately 4" square of 4-layer PCB.

### **PIN FUNCTIONS**

Pin #	Name	Description
1	NC	Not Connected.
2	VCC	BG Driver Bias Supply. Decouple with a 1µF ceramic capacitor.
3	AGND	Signal Ground.
4	EN	On/Off Control. A LOW places SW into high impedance state.
5	SYNC	An open enables Lower Synchronous Switch. Pull down low puts Low Switch into Diode Emulation mode.
6	PWM	Pulse Width Modulation Control. Accepts three state input. Force PWM to midstate or open to place SW into high impedance state.
7	PG	Power Good. Open drain output is low impedance to ground until internal supplies are good.
8	BST	Bootstrap. This capacitor is needed to drive the power switch's gate above the supply voltage. It is connected between SW and BST pins to form a floating supply across the power switch driver.
9 Exposed Pad	IN	Supply Voltage. $C_{IN}$ is needed to prevent large voltage spikes from appearing at the input.
10–18 Exposed Pad	GND	Power Ground.
Exposed Pad	SW	Switch Output. These pins are fused together.

## **OPERATION**

The MP86981 is a 20A Half Bridge driver ideally suited for Multi-Phase Buck regulators.

When the EN transitions from Low to High, the internal voltage regulators are enabled. Once both the  $V_{CC}$  and  $V_{BST}$  signals are sufficiently

high and Thermal Shutdown is not tripped, the operation begins.

To allow M2, the lower DMOS, to enter Diode Emulation, the SYNC pin is driven Low.
