

## LOW POWER VIDEO AMPLIFIER WITH Y-C MIXER

### ■ GENERAL DESCRIPTION

The NJM2274 is a low power, 3V operation video amplifier with Y/C mixer and 75ohm driver, which connect TV monitor directly.

The NJM2274 has mute function, and suitable for energy save products and low power systems such as a digital camera, DVC and other video amplifier systems.

### ■ PACKAGE OUTLINE

**NJM2274R**

**(MSOP8 (VSP8))**

### ■ FEATURES

- Low Operating Voltage      2.8 to 5.5V
- Internal Y/C MIX Circuit
- 12dB amplifier,
- 75Ω Driver Circuit (2-line drive)
- Y-input: Clamp  
C-input: Bias
- Operating Current            9.3mA typ. at V<sup>+</sup>=3.0V
- Operating Current at Power Save   0.9mA typ. at V<sup>+</sup>=3.0V
- Bipolar Technology
- Package Outline              MSOP8 (VSP8)\*

## APPLICATION CIRCUIT

### (1) Standard circuit

### (2) SAG correction unused circuit

### (3) Two-line driving circuit

#### (1) Standard circuit

The SAG correction reduces output coupling capacitor values.

The capacitor of C1 (33μF) is recommended for the portable application.

However, the 33μF capacitor may deteriorate SAG, and lose synchronization by luminance fluctuation.

Adjust the C1 value, checking the waveform containing a lot of low frequency components like a bounce waveform (In case of worst condition). Change the capacitor of C1 into a large value to improve SAG.

#### (2) SAG correction unused circuit

Cancel the SAG correction to improve lost synchronization.

Connect the coupling capacitor after connecting the Vout pin and Vsag pin. The recommended value is 470μF or more.

#### (3) Two-line driving circuit

This circuit drives two-line of 150Ω. However, it may cause to lose synchronization by an input signal of large APL change (100% white signals more than 1Vp-p). Confirm the large APL change waveform (100% white signals more than 1Vp-p) and evaluate sufficiently.
