

## LOW DROPOUT VOLTAGE REGULATOR

### ■ GENERAL DESCRIPTION

The NJM2871/A, NJM2872/A are low dropout voltage regulators designed for cellular phone application.

Advanced Bipolar technology achieves low noise, high ripple rejection and low quiescent current.

### ■ PACKAGE OUTLINE

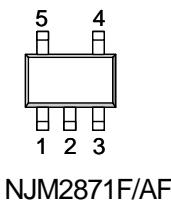

NJM2871F/AF  
NJM2872F/AF

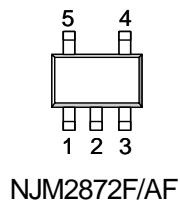

### ■ FEATURES

- High Ripple Rejection      70dB typ. ( $f=1\text{kHz}$ ,  $V_o=3\text{V}$  Version)
- Output Noise Voltage       $V_{no}=30\mu\text{VRms}$  typ. ( $C_p=0.01\mu\text{F}$ )
- Output capacitor with  $1.0\mu\text{F}$  ceramic capacitor ( $V_o \geq 2.7\text{V}$ )
- Output Current       $I_o(\text{max.})=150\text{mA}$
- High Precision Output       $V_o \pm 2\%$   
 $V_o \pm 1\%$ :A Version
- Low Dropout Voltage      0.10V typ. ( $I_o=60\text{mA}$ )
- ON/OFF Control      (Active High)
- Operating Voltage Range      +2.5V~+14V ( $V_o \leq 2.0\text{V}$  version)
- Internal Short Circuit Current Limit
- Internal Thermal Overload Protection
- Bipolar Technology
- Package Outline      SOT-23-5

### ■ PIN CONFIGURATION

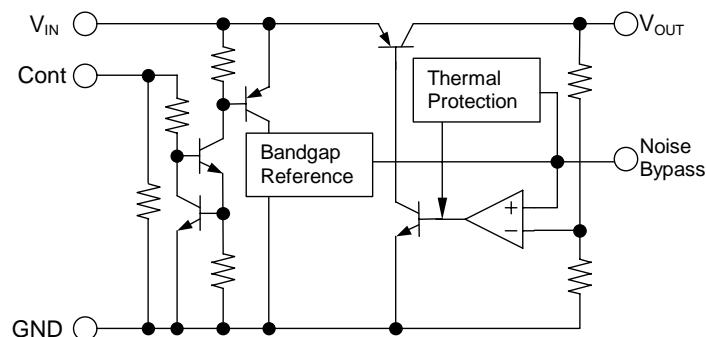

PIN FUNCTION  
 1. CONTROL (Active High)  
 2. GND  
 3. NOISE BYPASS  
 4.  $V_{OUT}$   
 5.  $V_{IN}$

## □ TEST CIRCUIT

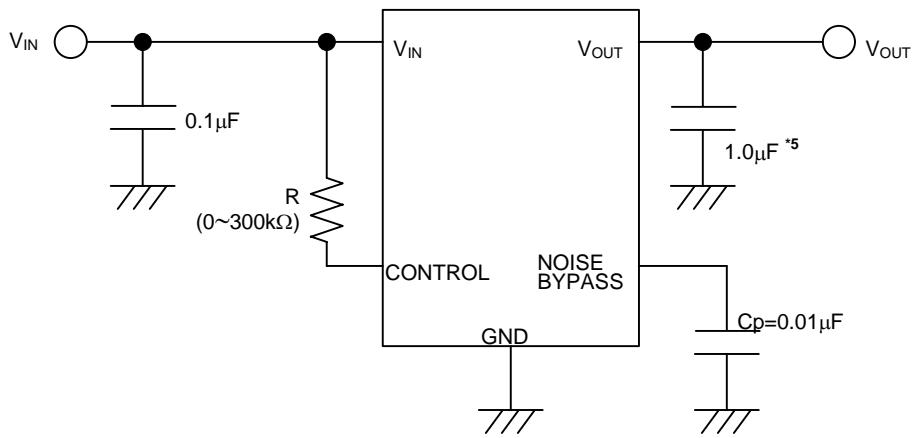

\*4  $2.0V < V_o \leq 2.6V$  version :  $C_O = 2.2\mu F$  (ceramic)  
 $V_o \leq 2.0V$  version :  $C_O = 4.7\mu F$  (ceramic)

# NJM2871/A, NJM2872/A

## □ TYPICAL APPLICATION

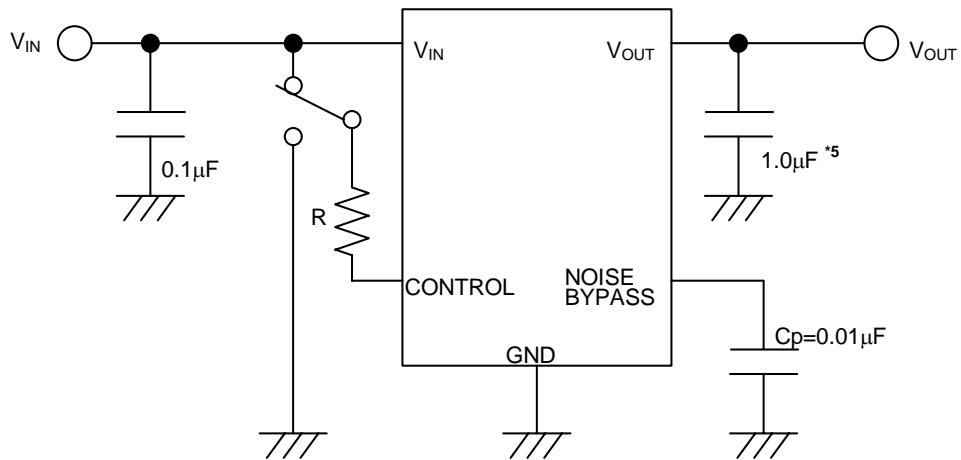

- ① In case that ON/OFF Control is not required:

\*5  $2.0V < V_o \leq 2.6V$  version :  $C_o=2.2\mu F$   
 $V_o \leq 2.0V$  version :  $C_o=4.7\mu F$

Connect control terminal to  $V_{IN}$  terminal

- ② In use of ON/OFF CONTROL:

\*5  $2.0V < V_o \leq 2.6V$  version :  $C_o=2.2\mu F$   
 $V_o \leq 2.0V$  version :  $C_o=4.7\mu F$

State of control terminal:

- "H" → output is enabled.
- "L" or "open" → output is disabled.

\*Noise bypass Capacitor  $C_p$

Noise bypass capacitor  $C_p$  reduces noise generated by band-gap reference circuit. Noise level and ripple rejection will be improved when larger  $C_p$  is used. Use of smaller  $C_p$  value may cause oscillation.

Use the  $C_p$  recommended value larger (refer to conditions of ELECTRIC CHARACTERISTIC) to avoid the problem.

\*In the case of using a resistance "R" between  $V_{IN}$  and control.

If this resistor is inserted, it can reduce the control current when the control voltage is high.

The applied voltage to control terminal should set to consider voltage drop through the resistor "R" and the minimum control voltage for ON-state.

The  $V_{CONT(ON)}$  and  $I_{CONT}$  have temperature dependence as shown in the "Control Current vs. Temperature" and "Control Voltage vs. Temperature" characteristics. Therefore, the resistance "R" should be selected to consider the temperature characteristics.

## \*Input Capacitor $C_{IN}$

Input Capacitor  $C_{IN}$  is required to prevent oscillation and reduce power supply ripple for applications when high power supply impedance or a long power supply line.

Therefore, use the recommended  $C_{IN}$  value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and  $V_{IN}$  as shortest path as possible to avoid the problem.

## \*Output Capacitor $C_O$

Output capacitor ( $C_O$ ) will be required for a phase compensation of the internal error amplifier.

The capacitance and the equivalent series resistance (ESR) influence to stable operation of the regulator.

Use of a smaller  $C_O$  may cause excess output noise or oscillation of the regulator due to lack of the phase compensation.

On the other hand, Use of a larger  $C_O$  reduces output noise and ripple output, and also improves output transient response when rapid load change.

Therefore, use the recommended  $C_O$  value (refer to conditions of ELECTRIC CHARACTERISTIC) or larger and should connect between GND and  $V_{OUT}$  as shortest path as possible for stable operation

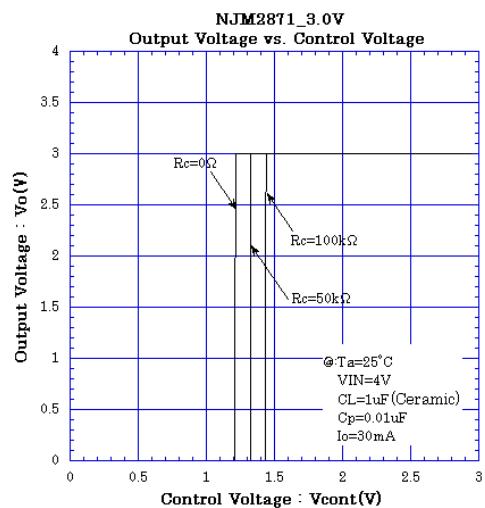

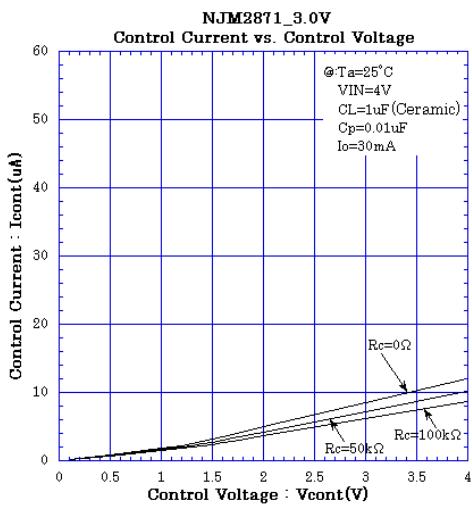

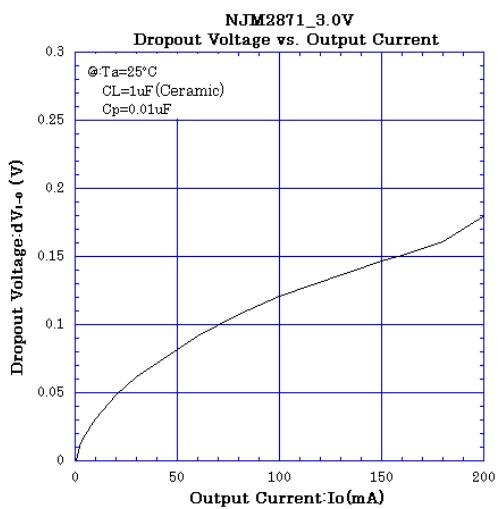

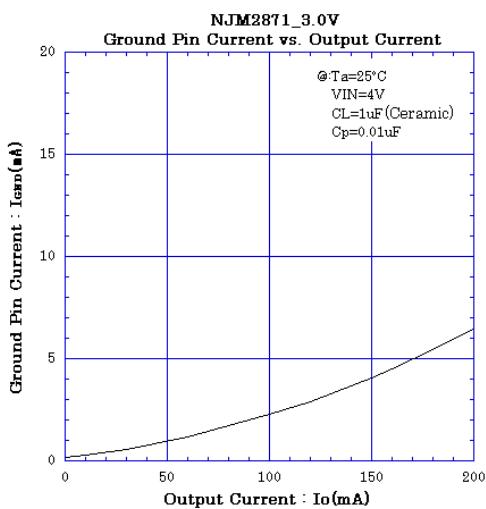

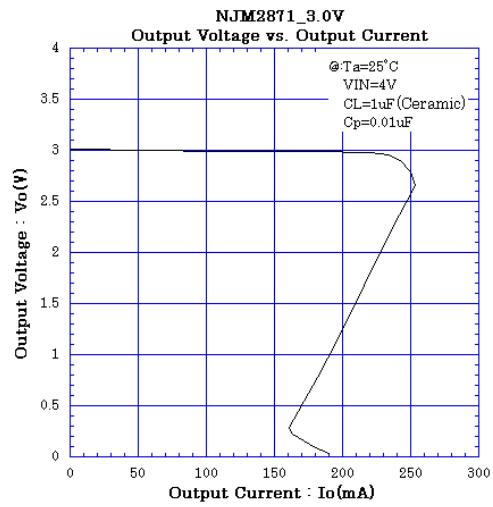

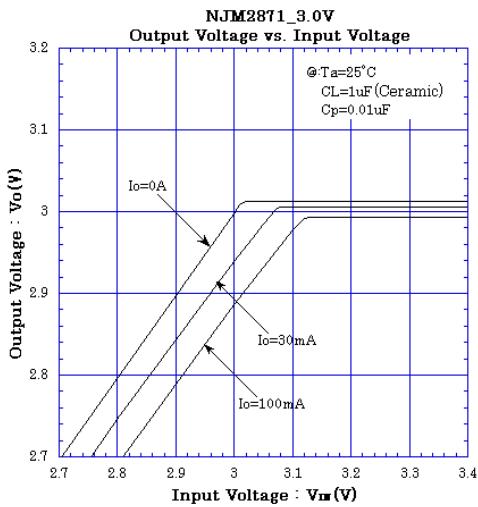

The recommended capacitance depends on the output voltage rank. Especially, low voltage regulator requires larger  $C_O$  value.

In addition, you should consider varied characteristics of capacitor (a frequency characteristic, a temperature characteristic, a DC bias characteristic and so on) and unevenness peculiar to a capacitor supplier enough.

When selecting  $C_O$ , recommend that have withstand voltage margin against output voltage and superior temperature characteristic though this product is designed stability works with wide range ESR of capacitor including low ESR products.
