

# Addendum for New QFN Package Migration

This addendum provides the changes to the 98A case outline numbers for products covered in this book. Case outlines were changed because of the migration from gold wire to copper wire in some packages. See the table below for the old (gold wire) package versus the new (copper wire) package.

To view the new drawing, go to [Freescale.com](http://Freescale.com) and search on the new 98A package number for your device.

For more information about QFN package use, see EB806: *Electrical Connection Recommendations for the Exposed Pad on QFN and DFN Packages*.

## MC9RS08LA8

### Features:

- 8-Bit RS08 Central Processor Unit (CPU)
  - Up to 20 MHz CPU at 2.7 V to 5.5 V across temperature range of –40°C to 85°C
  - Subset of HC08 instruction set with added BGND instruction
- On-Chip Memory
  - 8 KB flash read/program/erase over full operating voltage and temperature
  - 256-byte random-access memory (RAM)
  - Security circuitry to prevent unauthorized access to flash contents
- Power-Saving Modes
  - Wait and stop
- Clock Source Options
  - Oscillator (XOSC) — Loop-control Pierce oscillator; crystal or ceramic resonator range of 31.25 kHz to 39.0625 kHz or 1 MHz to 16 MHz
  - Internal clock source (ICS) — Internal clock source module containing a frequency-locked-loop (FLL) controlled by internal or external reference; supports bus frequencies up to 10 MHz
- System Protection
  - Watchdog computer operating properly (COP) reset with option to run from dedicated 1 kHz internal clock source or bus clock
  - Low-voltage detection with reset or interrupt; selectable trip points
  - Illegal opcode detection with reset
  - Illegal address detection with reset
  - Flash block protection
- Development Support
  - Single-wire background debug interface
  - Breakpoint capability to allow single breakpoint setting during in-circuit debugging
- Peripherals
  - **LCD** — Up to 8 × 21 or 4 × 25 segments; compatible with 5 V or 3 V LCD glass displays using on-chip charge pump; functional in wait, stop modes for very low power LCD operation; frontplane and backplane pins multiplexed with GPIO functions; selectable frontplane and backplane configurations
  - **ADC** — 6-channel, 10-bit resolution; 2.5 μs conversion time; automatic compare function; 1.7 mV/°C temperature sensor; internal bandgap reference channel; operation in stop; fully functional from 2.7 V to 5.5 V.
  - **TPM** — One 2-channel 16-bit timer/pulse-width modulator (TPM) module
  - **SCI** — One 2-channel serial communications interface module with optional 13-bit break; LIN extensions
  - **SPI** — One serial peripheral interface module in 8-bit data length mode with a receive data buffer hardware match function
  - **ACMP** — Analog comparator with option to compare to internal reference
  - **MTIM** — One 8-bit modulo timer
  - **KBI** — 8-pin keyboard interrupt module
  - **RTI** — One real-time interrupt module with optional reference clock.
- Input/Output
  - 33 GPIOs including 1 output only pin and 1 input only pin.
  - Hysteresis and configurable pullup device on all input pins; configurable slew rate and drive strength on all output pins.
- Package Options
  - 48-pin QFN
  - 48-pin LQFP

## 3 Electrical Characteristics

This chapter contains electrical and timing specifications.

### 3.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

**Table 2. Parameter Classifications**

<b>P</b>	Those parameters are guaranteed during production testing on each individual device.
<b>C</b>	Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
<b>T</b>	Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
<b>D</b>	Those parameters are derived mainly from simulations.

#### NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

### 3.2 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in [Table 3](#) may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this chapter.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ) or the programmable pull-up resistor associated with the pin is enabled.

**Table 3. Absolute Maximum Ratings**

Rating	Symbol	Value	Unit
Supply voltage	$V_{DD}$	2.7 to 5.5	V
Maximum current into $V_{DD}$	$I_{DD}$	120	mA
Digital input voltage	$V_{In}$	−0.3 to $V_{DD} + 0.3$	V
Instantaneous maximum current Single pin limit (applies to all port pins) <sup>1, 2, 3</sup>	$I_D$	±25	mA
Storage temperature range	$T_{stg}$	−55 to 150	°C

## Electrical Characteristics

- <sup>1</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive ( $V_{DD}$ ) and negative ( $V_{SS}$ ) clamp voltages, then use the larger of the two resistance values.
- <sup>2</sup> All functional non-supply pins are internally clamped to  $V_{SS}$  and  $V_{DD}$  except the  $\overline{\text{RESET}}/V_{PP}$  pin which is internally clamped to  $V_{SS}$  only.
- <sup>3</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{IN} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low which would reduce overall power consumption.

## 3.3 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits and it is user-determined rather than being controlled by the MCU design. In order to take  $P_{I/O}$  into account in power calculations, determine the difference between actual pin voltage and  $V_{SS}$  or  $V_{DD}$  and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and  $V_{SS}$  or  $V_{DD}$  will be very small.

**Table 4. Thermal Characteristics**

Rating	Symbol	Value	Unit
Operating temperature range (packaged)	$T_A$	$T_L$ to $T_H$ -40 to 85	°C
Maximum junction temperature	$T_{JMAX}$	105	°C
Thermal resistance Single layer board	$\theta_{JA}$	71	°C/W
48-pin LQFP		84	
48-pin QFN		49	
Four layer board		28	

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C /W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$ , Watts chip internal power

$P_{I/O}$  = Power dissipation on input and output pins user determined

For most applications,  $P_{I/O} \ll P_{int}$  and can be neglected. An approximate relationship between PD and TJ

(if PI/O is neglected) is:

$$P_D = K \div (T_J + 273^{\circ}\text{C}) \quad \text{Eqn. 2}$$

Solving Equation 1 and Equation 2 for K gives:

$$K = P_D \times (T_A + 273^{\circ}\text{C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from Equation A-3 by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving equations 1 and 2 iteratively for any value of  $T_A$ .

### 3.4 ESD Protection and Latch-Up Immunity

Although damage from electrostatic discharge (ESD) is much less common on these devices than on early CMOS circuits, normal handling precautions must be used to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits. During the device qualification ESD stresses were performed for the human body model (HBM), the machine model (MM) and the charge device model (CDM).

A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification. Complete DC parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

**Table 5. ESD and Latch-up Test Conditions**

Model	Description	Symbol	Value	Unit
Human Body	Series resistance	R1	1500	$\Omega$
	Storage capacitance	C	100	pF
	Number of pulses per pin	—	3	—
Machine	Series resistance	R1	0	$\Omega$
	Storage capacitance	C	200	pF

	Latch-up current at $T_A = 85^\circ\text{C}$	$I_{LAT}$	$\pm 75^3$	—	mA

<sup>1</sup> Parameter is achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted.

<sup>2</sup> These pins meet JESD78A Class II (section 1.2) Level A (section 1.3) requirement of  $\pm 100$  mA.

<sup>3</sup> This pin meets JESD78A Class II (section 1.2) Level B (section 1.3) characterization to  $\pm 75$  mA.

## 3.5 DC Characteristics

This section includes information about power supply requirements, I/O pin characteristics, and power supply current in various operating modes.

Resolution of trimmed DCO output frequency at fixed voltage and temperature	$\Delta f_{dco\_res\_t}$	—	—	±0.2	% $f_{dco}$
Total deviation of trimmed DCO output frequency over voltage and temperature	$\Delta f_{dco\_t}$	—	—	±2	% $f_{dco}$
FLL acquisition time <sup>3,5</sup>	$t_{acquire}$	—	—	1	ms
Long term Jitter <sup>6</sup> of DCO output clock (averaged over 2ms interval)	$C_{Jitter}$	—	—	0.6	% $f_{dco}$

<sup>1</sup> Data in Typical column was characterized at 3.0 V, 25 °C or is typical recommended value.

<sup>2</sup> See crystal or resonator manufacturer's recommendation.

<sup>3</sup> This parameter is characterized and not tested on each device.

<sup>4</sup> Proper PC board layout procedures must be followed to achieve specifications.

<sup>5</sup> This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

- <sup>6</sup> Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{\text{BUS}}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via  $V_{\text{DD}}$  and  $V_{\text{SS}}$  and variation in crystal oscillator frequency increase the  $C_{\text{Jitter}}$  percentage for a given interval.

## 3.8 AC Characteristics

This section describes ac timing characteristics for each peripheral system.

### 3.8.1 Control Timing

**Table 10. Control Timing**

Parameter	Symbol	Min	Typical	Max	Unit
Bus frequency ( $t_{\text{cyc}} = 1/f_{\text{Bus}}$ )	$f_{\text{Bus}}$	0	—	10	MHz
Real time interrupt internal oscillator period	$t_{\text{RTI}}$	700	1000	1300	$\mu\text{s}$
External RESET pulse width <sup>1</sup>	$t_{\text{extrst}}$	150	—	—	ns
KBI pulse width <sup>2</sup>	$t_{\text{KBIPW}}$	$1.5 t_{\text{cyc}}$	—	—	ns
KBI pulse width in stop <sup>1</sup>	$t_{\text{KBIPWS}}$	100	—	—	ns
Port rise and fall time (load = 50 pF) <sup>3</sup> Slew rate control disabled (PTxSE = 0) Slew rate control enabled (PTxSE = 1)	$t_{\text{Rise}}, t_{\text{Fall}}$	— —	11 35	— —	ns

<sup>1</sup> This is the shortest pulse that is guaranteed to pass through the pin input filter circuitry. Shorter pulses may or may not be recognized.

<sup>2</sup> This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized in that case.

<sup>3</sup> Timing is shown with respect to 20%  $V_{\text{DD}}$  and 80%  $V_{\text{DD}}$  levels. Temperature range  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ .

### 3.8.2 TPM/MTIM Module Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

Table 11. TPM/MTIM Input Timing

Function	Symbol	Min	Max	Unit
External clock frequency	$f_{TCLK}$	0	$f_{Bus} 1/4$	MHz
External clock period	$t_{TCLK}$	4	—	$t_{CYC}$
External clock high time	$t_{clkh}$	1.5	—	$t_{CYC}$
External clock low time	$t_{clkl}$	1.5	—	$t_{CYC}$
Input capture pulse width	$f_{ICPW}$	1.5	—	$t_{CYC}$

### 3.9 Analog Comparator (ACMP) Electrical

Table 12. Analog Comparator Electrical Specifications

Characteristic	Symbol	Min	Typical	Max	Unit
Supply voltage	$V_{DD}$	2.7	—	5.5	V
Supply current (active)	$I_{DDAC}$	—	20	35	$\mu A$
Analog input voltage	$V_{AIN}$	$V_{SS} - 0.3$	—	$V_{DD}$	V
Analog input offset voltage <sup>1</sup>	$V_{AIO}$	—	20	40	mV
Analog Comparator hysteresis <sup>1</sup>	$V_H$	3.0	9.0	15.0	mV
Analog source impedance	$R_{AS}$	—	—	10	$k\Omega$
Analog input leakage current	$I_{ALKG}$	—	—	1.0	$\mu A$
Analog Comparator initialization delay	$t_{AINIT}$	—	—	1.0	$\mu s$
Analog Comparator bandgap reference voltage	$V_{BG}$	1.208	1.208	1.208	V

<sup>1</sup> These data are characterized but not production tested. Measurements are made with the device entered STOP mode.

### 3.10 Internal Clock Source Characteristics

Table 13. Internal Clock Source Specifications

Characteristic	Symbol	Min	Typical <sup>1</sup>	Max	Unit
Average internal reference frequency — untrimmed	$f_{int\_ut}$	25	31.25	41.66	kHz
Average internal reference frequency — trimmed	$f_{int\_t}$	31.25	39.0625 <sup>2</sup>	39.0625	kHz
DCO output frequency range — untrimmed	$f_{dco\_ut}$	12.8	16	21.33	MHz
DCO output frequency range — trimmed	$f_{dco\_t}$	16	20 <sup>3</sup>	20	MHz
Resolution of trimmed DCO output frequency at fixed voltage and temperature	$\Delta f_{dco\_res\_t}$	—	—	0.2	% $f_{dco}$
Total deviation of trimmed DCO output frequency over voltage and temperature	$\Delta f_{dco\_t}$	—	—	2	% $f_{dco}$
FLL acquisition time <sup>4,5</sup>	$t_{acquire}$	—	—	1	ms
Stop recovery time (FLL wakeup to previous acquired frequency) IREFSTEN = 0 IREFSTEN = 1	$t_{wakeup}$	—	100 86	—	$\mu s$

<sup>1</sup> Data in typical column was characterized at 3.0 V and 5.0 V, 25 °C or is typical recommended value.

<sup>2</sup> This value has been trimmed to 39.0625 kHz when out of factory

<sup>3</sup> This value has been trimmed to 20 MHz when out of factory

## Electrical Characteristics

- <sup>4</sup> This parameter is characterized and not tested on each device.
- <sup>5</sup> This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (FBILP) to FLL enabled (FEI, FBI).

### 3.13 Flash Specifications

This section provides details about program/erase times and program-erase endurance for the flash memory. For detailed information about program/erase operations, see the reference manual.

Table 17. Flash Characteristics

Characteristic	Symbol	Min	Typical <sup>1</sup>	Max	Unit
Supply voltage for program/erase	$V_{\text{DD}}$	2.7	—	5.5	V
Program/Erase voltage	$V_{\text{PP}}$	11.8	12	12.2	V
$V_{\text{PP}}$ current	Program	—	—	200	$\mu\text{A}$
	Mass erase			100	
Supply voltage for read operation $0 < f_{\text{Bus}} < 10 \text{ MHz}$	$V_{\text{Read}}$	2.7	—	5.5	V

Table 17. Flash Characteristics (continued)

Characteristic	Symbol	Min	Typical <sup>1</sup>	Max	Unit
Byte program time	$t_{\text{prog}}$	20	—	40	$\mu\text{s}$
Mass erase time	$t_{\text{me}}$	500	—	—	ms
Cumulative program HV time <sup>2</sup>	$t_{\text{hv}}$	—	—	8	ms
Total cumulative HV time (total of $t_{\text{me}}$ & $t_{\text{hv}}$ applied to device)	$t_{\text{hv\_total}}$	—	—	2	hours
HVEN to program setup time	$t_{\text{pgs}}$	10	—	—	$\mu\text{s}$
PGM/MASS to HVEN setup time	$t_{\text{nvs}}$	5	—	—	$\mu\text{s}$
HVEN hold time for PGM	$t_{\text{nvh}}$	5	—	—	$\mu\text{s}$

$V_{\text{PP}}$ to PGM/MASS setup time	$t_{\text{vps}}$	20	—	—	ns
HVEN to $V_{\text{PP}}$ hold time	$t_{\text{vph}}$	20	—	—	ns
$V_{\text{PP}}$ rise time <sup>3</sup>	$t_{\text{vrs}}$	200	—	—	ns
Recovery time	$t_{\text{rcv}}$	1	—	—	$\mu\text{s}$
Program/erase endurance $T_{\text{L}}$ to $T_{\text{H}}$ = $-40\text{ }^{\circ}\text{C}$ to $85\text{ }^{\circ}\text{C}$	—	1000	—	—	cycles
Data retention	$t_{\text{D\_ret}}$	15	—	—	years

<sup>1</sup> Typicals are measured at  $25\text{ }^{\circ}\text{C}$ .

<sup>2</sup>  $t_{\text{hv}}$  is the cumulative high voltage programming time to the same row before next erase. Same address can not be programmed more than twice before next erase.

<sup>3</sup> Fast  $V_{\text{PP}}$  rise time may potentially trigger the ESD protection structure, which may result in over current flowing into the pad and cause permanent damage to the pad. External filtering for the  $V_{\text{PP}}$  power source is recommended. An example  $V_{\text{PP}}$  filter is shown in Figure 17.

Figure 17. Example  $V_{\text{PP}}$  Filtering

<sup>1</sup> Next Data applies if programming multiple bytes in a single row, refer to *MC9RS08LA8 Series Reference Manual*.

<sup>2</sup>  $V_{DD}$  must be at a valid operating voltage before voltage is applied or removed from the  $V_{PP}$  pin.

## 4 Ordering Information

This section contains ordering information for MC9RS08LA8 devices. See below for an example of the device numbering system.

## 5 Package Information and Mechanical Drawings

Table 18 provides the available package types and their document numbers. The latest package outline/mechanical drawings are available on the MC9RS08LA8 Series Product Summary pages at <http://www.freescale.com>.

To view the latest drawing, either:

- Click on the appropriate link in Table 18, or
- Open a browser to the Freescale® website (<http://www.freescale.com>), and enter the appropriate document number (from Table 18) in the “Enter Keyword” search box at the top of the page.
