PN5190

NFC frontend

Rev. 3.2 — 17 November 2021 Product data sheet

1 General description

This document describes the functionality and electrical specification of the high-power NFC-IC PN5190B1, silicon version B1, using firmware or V2.0 or higher.

Additional documents supporting a design-in of the PN5190B1 are available from NXP, this additional design-in information is not part of this document.

The PN5190B1 supports highly innovative and unique features which do not require any host controller interaction. These features include dynamic power control (DPC), adaptive waveform control (AWC), and fully automatic EMD error handling.

The independence of real-time host controller interactions makes this product a good fit for systems which operate a pre-emptive multitasking OS like Linux or Android.

In this document, the term „MIFARE card“ refers to a contactless card using an IC out of the MIFARE Classic, MIFARE Plus, MIFARE Ultralight or MIFARE DESFire product family.

2 Features and benefits

2.1 RF functionality

- As a highly integrated high performance full NFC Forum-compliant frontend IC for contactless communication at 13.56 MHz, this NFC frontend IC utilizes an outstanding modulation and demodulation concept completely integrated for relevant 13.56 MHz based contactless communication methods and protocols.
  PN5190B1 supports communication with all products of the MIFARE product-based card family including MIFARE Ultralight, MIFARE Classic 1K/4K, MIFARE DESFire EV1/EV2 and MIFARE Plus cards CRYPTO implemented in hardware for R/W of all NXP MIFARE product-based cards (includes intellectual-property licensing rights for NXP ISO/IEC 14443-A, Innovatron ISO/IEC 14443-B, and NXP MIFARE products).
  The PN5190B1 frontend IC supports the following RF operating modes:

2.1.1 ISO/IEC14443-A

- Reader/writer mode supporting ISO/IEC 14443-A R/W up to 848 kBit/s

2.1.2 ISO/IEC14443-B

- Reader/writer mode supporting ISO/IEC 14443-B up to 848 kBit/s

2.1.3 FeliCa

- Reader/writer mode supporting FeliCa 212 kBit/s and 424 kBit/s (without crypto)

2.1.4 Tag type reading

- Supports reading of all NFC tag types (type 1, type 2, type 3, type 4A and type 4B, type 5)

2.1.5 MIFARE card reading

- Reader/writer communication mode for the MIFARE card family including MIFARE Classic

2.1.6 ISO/IEC 15693

- Reader/writer mode supporting ISO/IEC 15693 (ICODE)
- Proprietary data rates based on ISO/IEC15693 with 106 kbit and 212 kbit/s (for NXP NTAG 5 communication)

2.1.7 ISO/IEC 18000-3 Mode 3

- Reader/writer mode supporting ISO/IEC 18000-3 Mode 3

2.1.8 ISO/IEC 18092

- ISO/IEC 18092 (NFC-IP1)

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

2.1.9 ISO/IEC 21481

- ISO/IEC 21481 (NFC-IP-2)

2.1.10 Peer to peer

- P2P Passive 106 kbit/s TO 424 kbit/s, Initiator and Target
- P2P Active 106 kbit/s TO 424 kbit/s, Initiator and Target
- Proprietary passive communication for type A up to 848 kbit/s
- Functionality according to ISO/IEC 21481 (NFC-IP-2)

2.1.11 Card emulation

- ISO/IEC4443-A card mode from 106 Kbit/s up to 848 Kbit/s (PICC) with active load modulation for increased communication range.

2.2 Host interface

- One host interface based on SPI is implemented:
  - SPI interface with data rates up to 15 Mbit/s with MOSI, MISO, NSS and SCK signals
  - Interrupt request line to inform host controller on events
  - Independent TX and RX buffer for RF data with size of 1024 bytes each

2.3 Integrated DC-DC

- The PN5190B1 implements an integrated DC-DC which can be used to supply the transmitter. Since the supply voltage of the transmitter LDO can be up to 6.0 Volts, this simplifies the design of the power supply.
  A single supply concept for the RF system, e.g. with single 3.3 V supply, is possible and allows making use of the maximum RF output power by providing a maximum transmitter supply voltage.
  The integrated DC-DC is used by the dynamic power control (DPC) to reduce the maximum power dissipation of the chip.
  The usage of the DC-DC is optional.
  For applications making use of the low-power card detection, the DC-DC is available.
  For applications using the ultra low-power card detection (ULPCD), the DC-DC cannot be used.

4 Firmware versions

Firmware versions covered by this data sheet:

Version 2.00:

- This version cannot be replaced by FW versions using smaller version numbers (e.g. replacing FW2.0 by FW1.9 is not possible)
- This FW version is not available on volume production devices, but can be installed by the user
  Before using this firmware in Peer to Peer target mode, for better communication stability the EEPROM address 0x292 (default A6E813C**0**) shall be initialized with the value (A6E813C**1** - 0x292:0xC1 0x203: 0x13 0x294:0xE8 0x295:0xA6). This setting has no influence on reader or card emulation modes.

Version 2.01:

- This version is functionally equivalent to Version FW2.0 but offers updated EEPROM Settings compared to FW2.0
- This version cannot be replaced by FW versions using smaller version numbers (e.g. replacing FW2.1 by FW1.9 is not possible)
- This FW version is installed by default on volume production devices of PN5190 B1
- This FW and all upcoming FW versions will use the EEPROM Setting at address 0x292 = A6E813C**1** to configure the Peer to Peer target mode for better communication stability.

4.1 Version 2.02:

Skipped, not available

4.2 Version 2.03:

- This FW version is not available on volume production devices, but can be installed by the user
- The GPIO1 (general-purpose input/output) pin can be enabled to wake up an external DC-DC from power down for the VDDPA supply during LPCD.
- Updated Type-A 106 antenna-specific Protocol register settings for EMVCo to solve few EMVCo Card activation failures during fast card movement within the Field.
- PN5190 FW updated to handle SWITCH_MODE_NORMAL (Abort) scenarios even when Functional CMD and SWITCH_MODE_NORMAL CMD are sent to back to back within 10 micro sec
- Introduced a new DPC_CONFIG register to handle Dynamic Enable/Disable of DPC without depending on the DPC setting from EEPROM User Area.
- Card Mode (SWITCH_MODE_AUTOCOLL Command) support with Ultra Low-Power Standby feature (in Autonomous mode with standby mode) along with the existing Low-Power Standby configuration using EEPROM settings.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

- various updates to increase the configuration flexibility for FeliCa communication:
  - Updated PN5190 FW to indicate Length Error when received FeliCa response is greater than 28 Bytes when RX_MULTIPLE is Enabled
  - Updated PN5190 FW to indicate correct numbers of received bytes when RETRIEVE_RF_DATA is used to retrieve FeliCa response packets received when RX_MULTIPLE is Enabled.
  - Updated to fix issue of EXCHANGE_RF_DATA returning with success even before Receiving RF Response on few IC's upon POR.
  - Updated PN5190 FW to clear all pending Interrupt Status bits before performing RF Exchange to fix TX Failure observed when FeliCa response is received around FDT timeout.
  - Added a new feature to extend RX Guard Timer in Integer multiple of 'dwRXIRQ_GuardTime' EEPROM timeout configuration in order to extend RX Guard Timeout beyond 1.048 sec.

All information provided in this document is subject to legal disclaimers.

27	ATX_D	Input	SPI slave data input
28	IRQ	Output	Host communication/ event Interrupt signal
29	VDDIO	Supply	IO pads power supply
30	GPIO3	Output	General Purpose Out 3
31	GPIO2	Output	General Purpose Out 2
32	GPIO1	Output	General Purpose Out 1
33	GPIO0	Output	General Purpose Out 0
34	n.c.	-	-
35	VSS	Supply GND	Ground
36	VDDC	Output	Power supply for Digital Core, to be connected to ground via 220 nF blocking cap
37	VEN	Input	Hardware reset, low active (independent from V_{PVDD})
38	VDDNV	Output	Non-volatile memory power supply, to be connected to ground via 220 nF blocking cap
39	VBATPWR	Supply	To be connected to boost inductor pin 2 and transmitter power supply
40	VSS_PWR	Supply GND	DC-DC boost ground

For best performance, all blocking capacitors shall be placed on the same side of the PCB, traces from pin to capacitor shall be as short as possible.

Compared to the BGA package, all ground connections named VSS are connected on the leadframe of the package. Therefore general VSS pins do exist, pins are not distinguished by function like on the BGA package type e.g. VSS_PMU. The exceptions are the pins VSS_PWR, VSS_PA and VSS_REF.

All Supply GND connections shall be connected by low-ohmic connections on the PCB.

All information provided in this document is subject to legal disclaimers.

9 Functional description

9.1 Functional overview

The PN5190B1 is an NFC frontend with high transmitter output power. It implements the RF functionality like an antenna driving and receiver circuitry and all the low-level functionality to realize an NFC Forum and EMVCo compliant reader.

Connection to host controller

The PN5190B1 connects to a host microcontroller with a fast SPI interface (15 Mbit/s) for configuration, NFC data exchange and high-level NFC protocol implementation. An optimized TLV-based framing is supported to reduce the command handling overhead on the host controller and to reduce command-response latencies.

Clock supply

The PN5190B1 uses an external 27.12 MHz crystal as clock source for generating the RF field and its internal digital logic. Alternatively, an internal PLL allows using an accurate external clock source of either 24 MHz, 32 MHz and 48 MHz (configured in EEPROM register CLK_INPUT_FREQ, 0012h)). This allows saving the 27.12 MHz crystal in systems which implement one of the mentioned clock frequencies.

Integrated DC-DC

The integrated DC-DC allows a single supply voltage while delivering maximum RF output power. Dependent on the application target either a direct transmitter supply or a transmitter supply by the integrated DC-DC can be chosen. The usage of the integrated DC-DC is the preferred choice for a stable RF performance, even in case of a de-charged battery. Optimized usage of a battery charge can be achieved by directly connecting the transmitters to the supply. The DC-DC is controlled by the Dynamic Power Control 2.0 to keep the power dissipation of the chip minimized in antenna loading cases which require a reduction of the RF output power.

The DC-DC is a step-up converter and is able to deliver an output voltage from approx. 2.8 V up to 6.0 V. The targeted output voltage can be configured by software.

The DC-DC clock is synchronized with the clock of the receiver - this avoids the typical performance reduction by DC-DC noise which can be seen in systems using external DC-DCs.

Transmitter LDO (TX_LDO)

The Transmitter output drivers are supplied by a transmitter LDO which reduces external noise and is used for the DPC functionality to lower the supply voltage of the transmitters. The high granularity of 100 mV for setting the TX_LDO output voltage together with a sophisticated control loop and true current measurement ensures that a DPC regulation is not accidentally treated as received data.

Low-power card detection

The low-power card detection (LPCD) allows saving battery charge during polling for NFC counterparts like cards and mobile phones. In general, the low-power card detection provides a functionality, which allows to power down the reader for a certain amount of time to safe energy. After some time, the reader becomes active again to poll for cards. If no card is detected, the reader can go back to the power down state. During the polling time, a host controller can be set to a power-saving mode. An interrupt request from the

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

PN5190B1 allows waking up the host controller in case an antenna detuning by a card or cell phone had been detected.

Two modes for the low-power card detection are available:

- LPCD (software based) which allows maximum detection range. For detecting a card presence, I/Q channel information is used.
- ULPCD (hardware based) which offers maximum current savings. For detecting a card presence, only the amplitude information is used.

Dynamic power control 2.0

The next generation Dynamic Power Control (DPC2.0) with true transmitter current measurement works autonomous without host interaction. Avoiding additional host controller processing load is important for time critical applications like payment. A fast control response time of less than 1 ms allows using optimized antenna matchings.

Adaptive wave shape control

The Adaptive Wave Shape Control (AWC) helps to keep the waveshapes within specification limits, even in case of antenna detuning. This simplifies the time-consuming antenna matching procedure and does not require any matching compromises to be taken.

Receiver signal level control

The receiver signal chain consists of an automatic controller RF input attenuator and a true Baseband Amplifier (BBA). This feature delivers an outstanding communication range with tags, labels, cards and mobile phones.

RF Debugging

Comprehensive and innovative debug features are implemented to support the NFC reader development even for difficult and non-standard compliant cards and mobile phones. An Integrated Chip scope allows performing a non-intrusive debugging of receiver signals without the need of connecting additional wires to the chip. Capturing of chip-internal signals is done by configuring flexible trigger conditions, sampled internal data is stored in RAM memory, transferred by SPI to a host microcontroller and visualized on a PC by the NFC Cockpit development tool. A virtual comfort interface (VCOM) is supported by the NFC cockpit tool, which allows to use the NFC cockpit together with any host microcontroller. Analog debug signals (AUX1, AUX2) are available as well and allow the connection of an Oscilloscope for analog and digital signal debugging.

The receiver signal processing is optimized to cope with noisy environments. This is beneficial, especially in case a TFT display or DC-DCs are part of the NFC system.

Automatic EMD error handling

An automatic EMD handling performed without host interaction relaxes the timing requirements on the Host Controller. Automatic EMD error handling according to ISO/IEC14443 and EMVCo 3.0 is supported. In addition, the EMD error handling is widely configurable, which allows adaptions in case of future possible specification changes.

Automatic antenna tuning

Two analog outputs are available to connect variable capacitors for automatic antenna tuning (AAT). The automatic antenna tuning allows compensating for production tolerances or changing environments like surrounding metal. This is especially beneficial for applications which make use of OEM NFC Modules which are finally used in an unknown environment. The automatic antenna tuning is performed command triggered.

Firmware update

The PN5190B1 supports a secure update of the implemented firmware. The secure firmware download mode is using a dedicated command set, but a framing which is not different from the standard host interface commands used for NFC operation of the device. In Secure Firmware update mode, the PN5190B1 requires no dedicated physical handling of the SPI interface lines. The firmware download does not require any additional hardware pin to be handled, instead the download mode is activated by a command, followed by a hardware reset. After booting from reset, the PN5190B1 will be in download mode.

Register configuration

Internal registers of the PN5190B1 store volatile configuration data and accessible by the host interface. The internal registers are reset to configurable initial values in case of powerON, hardware-reset and standby.

The configuration for dedicated RF protocols and antenna-dependent configuration is defined in non-volatile memory. This configuration is typically done only once during production, and is performed by a command issued from the host microcontroller.

EEPROM configuration

Non-Volatile EEPROM memory of the PN5190B1 is used to store configuration data that needs to be preserved in case the PN5190B1 is not connected to any supply voltage. The configuration for dedicated RF protocols and antenna-dependent configuration is defined in this non-volatile memory and copied to volatile registers by a host interface command. In addition, other configuration data which needs to be preserved during power supply disconnect is stored in this EEPROM memory as well. Examples for this are configurations for DPC, LPCD and ULPCD configurations.

RF configuration

The PN5190B1 allows a fast RF protocol selection based on the command Load_RF_configuraton and pre-defined user configuration data in non-volatile memory (EEPROM).

On the one hand, the configuration of modulation-related parameters can be done (e.f. selection of ISO/IEC14443-A), on the other hand antenna-specific parameters can be configured.

For more information, see [1].

9.2 Endianness

The endianness describes the order of bytes or bits within a binary representation of a value in the memory, which can be a register or EEPROM.

"Array size" defines the number of elements of "type size". Type size can be uint8 (8 bit), uint16 (16 bit) or uint32 (32 bit).

The location of byte sized data (8 bit) with an array size of 2 is as follows:

Value hex: 0x1234

address x: 12

address x+1: 34

The location of word sized data (16 bit) is as follows:

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Value hex: 0x1234

address x: 34

address x+1: 12

The location of word sized data (16 bit) in an array size of 2 is as follows:

The placement of the array is large endian, the placement of nibbles of the variable is small endian.

Value hex: 0xAABBCCDD

address x: BB

address x+1: AA

address x+2: DD

address x+3: CC

The location of double word sized data (32 bit) is as follows:

Value hex: 0xAABBCCDD

address x: DD

address x+1: CC

address x+2: BB

address x+3: AA

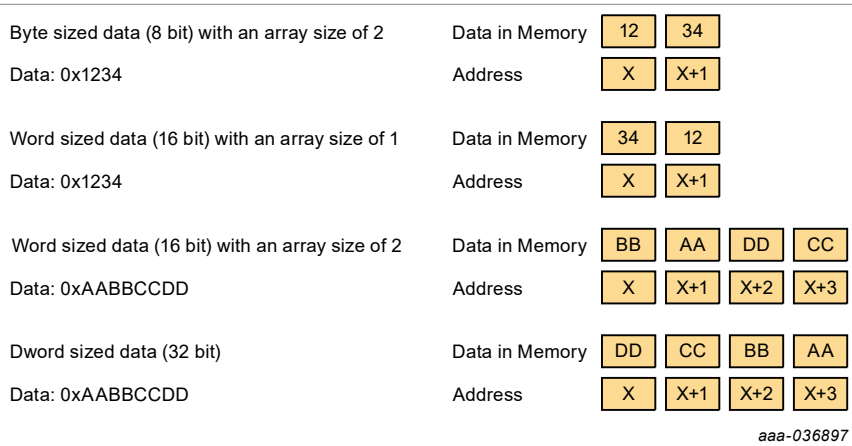

Figure 4. Endianness examples

Data from the EEPROM is read in little endian format - LSB first. This means that the byte at the lower address is read first.

9.3 Initial calibration

The PN5190B1 requires a calibration before the RF field is switched on for the first time with unloaded condition.

"Unloaded" means: Without any additional metal in proximity of the antenna except for the NFC reader components itself.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

During development of new readers, this calibration shall be done each time the antenna design, antenna matching or EMC filter is modified.

The calibration sequence is the following:

Write EEPROM CfgNovCal (0xC83) – 0x00

Write REGISTER TX_NOV_CALIBRATE_AND_STORE_VAL (addr: 0x5d) - 0x01

Write EEPROM CfgNovCal (0xC83) – 0x02

9.4 System power states

The PN5190B1 can operate in different power states. The functionality and current consumption is dependent on the actual system power state.

Power states can be changed by the level on the pin VEN and by connecting/ disconnecting the power supply of VBAT. Power state change will also be triggered by certain events - VDDIO Loss, Over-Current detection, Over-Temperature.

In addition, state changes are triggered possible by host commands.

Disconnecting and connecting the power supply on VBAT restarts the PN5190B1 always in Active State after releasing the pin VEN (transition low to high).

A transition of low to high on pin VEN restarts the PN5190B1 always in Active State.

The following power states are supported:

Power state	Description	typical current consumption
Power OFF	The NFC system (supply pin VBAT, RF transmitter) is not supplied by a battery/system PMU. Other domains might be supplied (for example, IO pad interface on pin VDDIO). Device is not functional	-
PMU OFF	The NFC system is disabled by the host via a low signal on pin VEN. No internal clocks of the PN5190B1 are active. Entry to PMU OFF can also be triggered by power loss on VDDIO. Wake-up events to change PMU OFF state: Power reset on pin VBAT, VEN rising edge, RX ULPCD detect, ULP abort signal on PIN3, VDDIO restore.	5 µA
ULP standby	The host can set the PN5190B1 into Ultra-low power card detection state (ULP Standby state) via programming of the ULPCD bit (Switch mode command). In the ULP Standby state, the PN5190B1 is able to activate the transmitter and receiver after defined time (expiry of wake-up timer) to detect the card. If a card is not detected, the transmitter and receiver is deactivated and the wake-up timer restarted. Power consumption of ULP Standby mode is much lower than Hard Power Down State and Standby State. Only the wake-up timer is active during ULP Standby state Wake-up events: Power reset on pin VBAT, VEN rising edge, GPIO3 level, Card detected. Variant 1: Configurable wake-up timer allows system to boot into active Variant 2: Configurable wake-up timer allows checking regularly for a card in the field.	Variant 1: 5 µA Variant2: 22 µA

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Power state	Description	typical current consumption
Hard power down	The NFC system is disabled by the Host system via the reset/enable signal on VEN or by detecting an external condition (for example, battery voltage monitor). The power dissipation is reduced to a minimum. No power dissipation or leakage is expected on the different interfaces. Low-power resources are enabled (VDDC_LP, VHV_LP, LQ_REF, LQ-BIAS). LFO clock is available. PCRM is supplied and is running in low-power state. I/Os are supplied by VDDC_HP. Wake-up events: Power reset on pin VBAT, VEN rising edge, RX ULP detect	40 µA
Standby	The NFC system can switch after a specific time of inactivity automatically into a low-power mode to minimize power dissipation. The state of external interfaces is maintained properly. PMU operates in low-power state. Wake-up counter clock is available. PCRM is supplied and running in low-power mode. I/Os are supplied by VDDC_LP. PMU FSM in PCRM manages the transition in power state. Wake-up sources: Activity on host IF, SWPM communication, ULPDET, LPDET, wake-up counter, power loss on VDDIO, GPIO, RxPROT, No High Temp on TX and so on.	45 µA
Suspend	All power sources are available. LFO and HFO clocks are available. CPU subsystem clock sources are gated, except for the LFO. I/O's are available.	2.5 mA
Active	The PN5190B1 is able to process internal or external events or data. All external power supply sources and the external clock need to be available, and all internal clocks are active.	20 mA (system without RF current)

9.5 Power supply

The device allows to configure different power supply options for the transmitter power amplifier. To make use of them, a combination of external connections and chip internal configurations needs to be done. The following supply options are available:

- Internal VDDPA configuration: The TX power amplifier is supplied by the internal voltage regulator (TX_LDO). In this configuration the DPC, current measurement and overcurrent protection is available. In addition, the TX_LDO is adding an improved rejection of noise on the supply lines.
- Direct VDDPA configuration: This configuration is recommended for applications which require highest efficiency, like battery supplied devices. In this configuration, a battery can be connected directly to the transmitter supply avoiding the voltage drop of approximately 0.3 V caused by the TX_LDO. A clean supply voltage without noise is required to achieve a good RF performance.
  In this configuration the DPC, current measurement and overcurrent protection is not available.

9.5.1 System power supply overview

The PN5190B1 is using three different supplies each for the following functional blocks:

1. Supply for the host interface and GPIO's (VDDIO)
2. Supply for the analog and digital blocks (VBAT/VBAT_PWR)
3. Supply of the RF drivers (VDDPA), DC-DC (VBAT_PWR) and TX_LDO (VUP)

The functionality of the GPIO's, Host Interface and internal analog and digital blocks is independent from the supply of the RF Driver. This allows to configure a dedicated

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

transmitter supply configuration at any time. Care shall be taken to switch on the RF field only after the transmitter-related power supply had been configured according to the external physical supply connections (VDDPA, VBAT_PWR, VUP).

The power supply configuration is configured in EEPROM and therefore will not get lost in case of power supply loss or reset of the chip. Typically, this configuration is only performed once during the production of a reader.

RF field shall not be turned on without setting the correct power supply configuration in the EEPROM.

Note: The Voltage on pin VDDIO must always be smaller or equal to the Voltage on pin VBAT.

9.5.2 Connecting blocking capacitors

Some pins are connected to blocking supply capacitors. PCB traces to these capacitors need to be as short as possible, and a low-ohmic grounding of the GND-side of the capacitors is required for optimized RF performance.

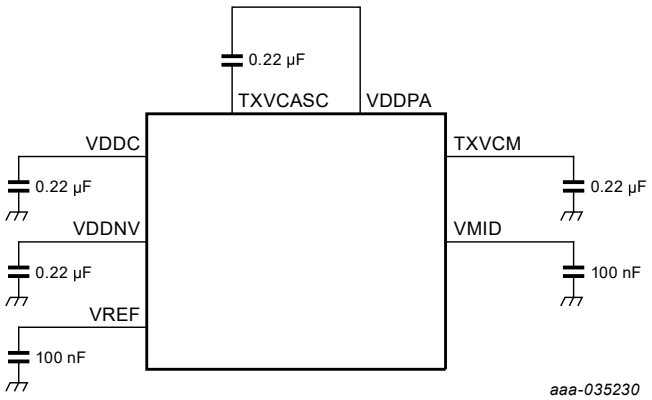

Figure 5. Blocking capacitors

9.5.3 Transmitter power supply

The PN5190B1 is configured by EEPROM for the different power supply options.

The following EEPROM Addresses are used to configure the power supply of the transmitter:

DCDC_PWR_CONFIG (0000h) - Enables/disables and configures the DC-DC according to the external supply connections.

TX_LDO_CONFIG (address 0002h) - Enables/disables and configures the TX_LDO.

TX_LDO_VDDPA_HIGH (address 0006h) - initial out voltage when DPC is used.

TX_LDO_VDDPA_LOW (address 0007h) - lowest VDDPA when DPC is used.

TX_LDO_VDDPA_MAX_RDR (address 0008h) - maximum voltage to be set in reader mode used by DPC.

TX_LDO_VDDPA_MAX_CARD (address 0009h) - VDDPA maximum voltage to be set in card mode used by DPC.

All information provided in this document is subject to legal disclaimers.

No specific registers are required to configure the pad supply (VDDIO) or the supply for the analog and digital blocks (VUP).

9.5.3.1 TX_LDO transmitter supply

TX_LDO supplied VDDPA configuration: The TX power amplifier is supplied by the internal voltage regulator (TX_LDO).

In this configuration the DPC, current measurement and overcurrent protection is available. In addition, the TX_LDO is adding an improved rejection of noise on the supply lines.

A decoupling cap is required on VDDPA pin.

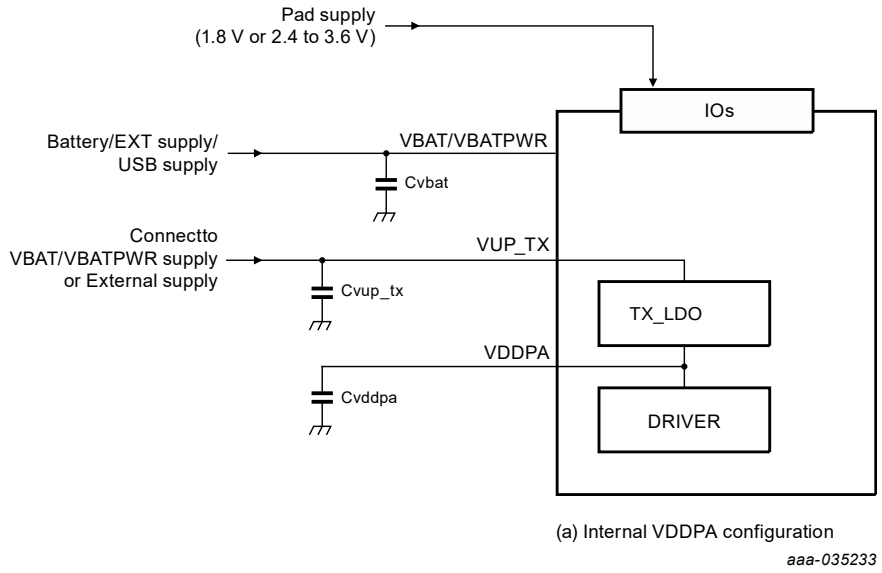

Figure 6. Transmitter supply

9.6 Clock generation

The device supports the operation with two clock options, which is configured in EEPROM address CLK_INPUT_FREQ (0012h).

One option is clocking by a crystal (default), the other a clocking by an external clock input frequency.

It is important to consider additional phase noise introduced e.g. by clock drivers in the design. Phase noise of the external clock has an impact on the RF performance which can be achieved.

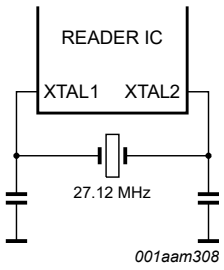

Figure 14. Clocking by crystal

9.7 External interfaces

The PN5190B1 requires the connection of a power supply, and a clock source like crystal or external clock and a host microcontroller connected by the SPI interface for operation.

Additional connections of the package require the connection of stabilizing capacitors and ground.

The RF interface connects transmitter and receiver to the EMC filter of a connected antenna matching network. Additional connections are available for the GPIO's (on PN5190B1 only outputs are implemented) and 2x DAC functionality (analog outputs).

The GPIO's implement internal Pull-up/Pull-down resistors. The output of the GPIO's can be configured in the pad configuration PAD_CONFIG (0052h).

For more information see [2].

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

9.8 Transmitter overcurrent and temperature protection [2]

The PN5190B1 implements different mechanisms to protect the chip against damage.

On the one hand, an overcurrent protection exists which shuts down the Transmitter Driver in case of a out of spec current. This can be enabled in EEPROM TXLDO_CONFIG (0002h), bit 11: overcurrent enable (0: disable, 1: enable)

On the other hand, an internal temperature sensor allows to monitor the temperature of the chip. This is configured in the EEPROM TEMP_WARNING (0014h). Three temperatures can be configured: 114 °C, 2:125 °C, 3:130 °C. GPIO0 is used to indicate this temperature warning to a connected host.

The actual measured temperature is available in the register TEMP_SENSOR (005Bh).

This is a safety feature only. A design shall not functionally rely on this feature since the operating conditions will be violated if the overcurrent detection becomes active.

9.9 Loading a dedicated RF configuration

The PN5190B1 allows an efficient selection of a dedicated RF protocol.

The selection of one RF protocol is done by sending a command to the PN5190B1. This instruction is used to load the RF configuration from EEPROM into registers.

It is possible to configure RF technology, mode (target/initiator) and baud rate.

Configurations can be loaded separately for the receiver (RX configuration) and transmitter (TX configuration).

The Command used for loading a dedicated RF protocol is LOAD_RF_CONFIGURATION (0Dh).

9.10 FeliCa RF functionality

The FeliCa mode is the general reader/writer to card communication scheme according to the FeliCa specification.

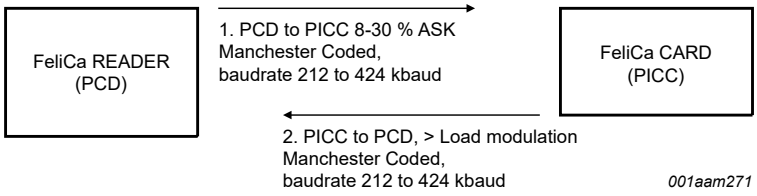

Figure 15. FeliCa read/write communication diagram

The physical parameters are described in the table below:

2 Please refer to the Errata sheet if the device is used with FW2.0 or FW2.1.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Table 7. Communication for FeliCa reader/writer

Communication direction	Signal type	Transfer speed FeliCa	FeliCa higher transfer speeds
		212 kbit/s	424 kbit/s
Reader to card (send data from the PN5190B1 to a card) f_c = 13.56 MHz	reader side modulation	8 % to 30 % ASK	8 % to 30 % ASK
	bit encoding	Manchester encoding	Manchester encoding
	bit rate	$f_c/64$	$f_c/32$
Card to reader (PN5190 B1 receives data from a card)	card side modulation	Load modulation,	Load modulation,
	bit encoding	Manchester encoding	Manchester encoding

The PN5190B1 needs to be connected to a host which implements the FeliCa protocol.

Multiple reception cycles (RxMultiple)

For FeliCa timeslot handling in PCD mode, PN5190B1 implements multiple reception cycles. The feature is enabled by setting the control bit RX_MULTIPLE_ENABLE in the register TRANSCEIVE_CONTROL in combination with the transceive state machine.

Unlike for normal operation, the receiver is enabled again after a reception is finished. As there is only one receive buffer available, but several responses are expected, the buffer is split into sub buffers of 32 byte length. Hence, the maximum number of responses which can be handled is limited to 8. As the maximum length defined for a FeliCa response is 20 bytes, the buffer size defined does fulfill the requirements for that use case. The first data frame received is copied onto buffer address 0. The subsequent frames are copied to the buffer address 32 * NumberOfReceivedFrames. The maximum number of data bytes allowed per frame is limited to 28.

All bytes in the buffer between the payload and the status byte are uninitialized and therefore invalid. The firmware on the host shall not use these bytes. The last word of the sub buffer (position 28 to 31) contains a status word. The status word contains the number of received bytes (may vary from the FeliCa length in case of an error), the CLError flag indicating any error in the reception (which is a combination of 3 individual error flags DATA_INTEGRITY_ERROR || PROTOCOL_ERROR || COLLISION_DETECTED) the individual error flags and the LenError flag indicating an incorrect length byte (either length byte is greater than 28 or the number of received bytes is shorter than indicated by the length byte). All unused bits (RFU) are masked to 0.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

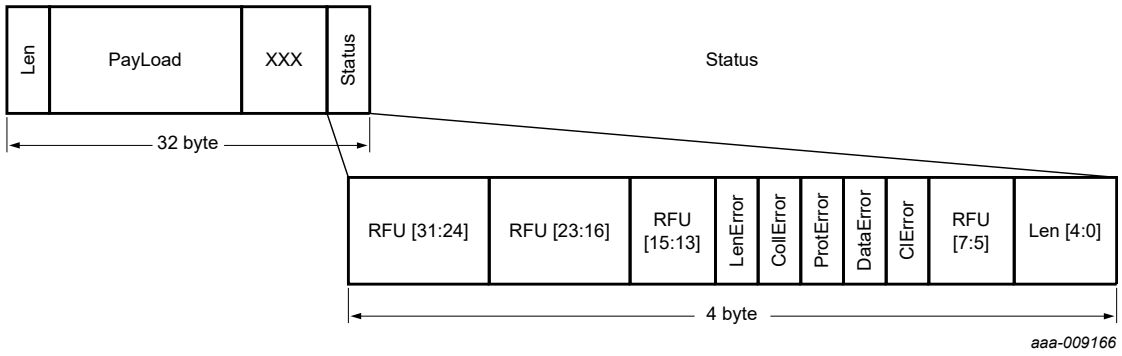

Figure 16. RxMultiple data format

There are 4 different cases possible for a reception:

1. *Correct reception* - Data integrity is correct (no CRC error), and additionally the number of bytes received is equal to the length byte. Data is written to the buffer. No error set in status byte.
2. *Erroneous reception* - Data is incorrect (data integrity error - CRC wrong) but frame length is correct. Data is written to buffer and the bits CLError and DataError in the status byte are set.
3. *Erroneous reception* - the length byte received indicates a frame length greater than 28. Data is written to buffer and the bit LenError in status byte is set.
4. *Erroneous reception* - the length byte is larger than the number of data bytes, which have been received. Data received is written to buffer and the ProtocolError bit in the status byte is set.

At the end of the reception, additionally the bit field RX_NUM_FRAMES_RECEIVED in the register RX_STATUS_REG is updated to indicate the number of received frames. Upon start of a new EXCHANGE_RF_DATA command, the flag RX_NUM_FRAMES_RECEIVED is cleared.

9.11 Dynamic power control (DPC)

The DPC is used for a special antenna tuning, called "symmetric antenna tuning". For an "asymmetric antenna tuning", the DPC is not required.

However, even for "asymmetric antenna tuning" with high output power needs, it might turn out that the RF field is too strong in close proximity of the antenna to be compliant with ISO/IEC14443 requirements. In this case, the DPC can be used as well to reduce the RF output power dependent on the distance of the card from the reader antenna.

The DPC works very well with a tuning called "symmetric tuning". With symmetric tuning, a detuning of the antenna is causing a reduction of the antenna impedance. This low antenna impedance might lead to a current which is too high for the targeted application. The DPC allows to limit the transmitter current even under antenna detuning conditions.

DPC is useful:

- To achieve NFC Forum and ISO/IEC 14443 compliancy (e.g. NFC Forum Power Transfer Maximum, ISO/IEC 14443 Field Emission Maximum)
- To improve interoperability

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

The Dynamic Power Control (DPC 2.0) allows controlling the transmitter driver voltage in 100 mV steps dependent on the actual transmitter current.

A lookup table is used to configure the transmitter output voltage and by this control the RF output power.

Features of the Dynamic power control (DPC 2.0):

- True current measurement provides maximum information for the regulation loop
- The transmitter current can be limited and additionally reduced according to detected transmitter current condition / antenna detuning condition
- DPC works autonomously without host interaction causing no additional processing load on the host
- Fastest response time of 1 ms for regulation
- Used for adaptive waveshape control (AWC)
- Used for adaptive RX sensitivity control (ARC)

The DPC is able to operate in two modes:

1. Current limiting mode
2. Current limiting + Current reduction mode

The DPC is configured in the EEPROM, this configuration is used after startup. This avoids that the host needs to configure the chip after each reset or power-off.

The following EEPROM registers are most relevant for the DPC configuration:

0xF8: DPC_Config: Enables/Disables the DPC (enable: 0x39, disable: 0x00)

0xF9: DPC_TargetCurrent: Unloaded VDDPA target current in mA, the target current +/- Hysteresis is limiting the current for the DPC.

- The DPC_TargetCurrent is the current which can be measured for the selected antenna impedance and transmitter supply voltage in unloaded condition. This is the current the system is designed to operate at.

0xFB: DPC_Hysteresis: Absolute difference to current target current in mA that triggers a DPC update event.

- The configuration of the hysteresis ensures, that the DPC is not regulating if small changes of the transmitter current occur due to external disturbances. A typical value for the DPC_Hysteresis is e.g. 20 mA.

0x8B: DPC_Lookup_Table: configures the current reduction

The DPC_LOOKUP_TABLE allows in addition to the limitation of the current, to configure

- an additional current reduction on top of the current limitation, achieved by further lowering the transmitter supply voltage
- a relative change of modulated amplitude level
- and a relative change of falling and raising edge time constant for ASK10% and ASK100% modulations

This lookup table is initialized with 0x00 for devices delivered from the factory. (The customer development board is already initialized with useful data in EEPROM which work well with the antenna of the board).

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

The 0x00 entry in the DPC_LOOKUP_TABLE means that no additional function then the current limitation takes place for the DPC.

In order to achieve a limitation of the current even in the case of an antenna impedance that is lowered, the Transmitter supply voltage is reduced accordingly.

This transmitter supply voltage reduction is now used as index for the DPC_LOOKUP_TABLE.

For a specific transmitter supply voltage, it is possible to further reduce the current below the value of DPC_TargetCurrent or to configure parameters for waveshaping and modulation. All these entries are relative values, granularity of the entries dependent on the transmitter supply voltage is 0.1 V, resulting in 42 table entries.

The DPC updates the content of the following register dependent on the antenna load / lookup table configuration:

0x30 - DGRM_RSSI

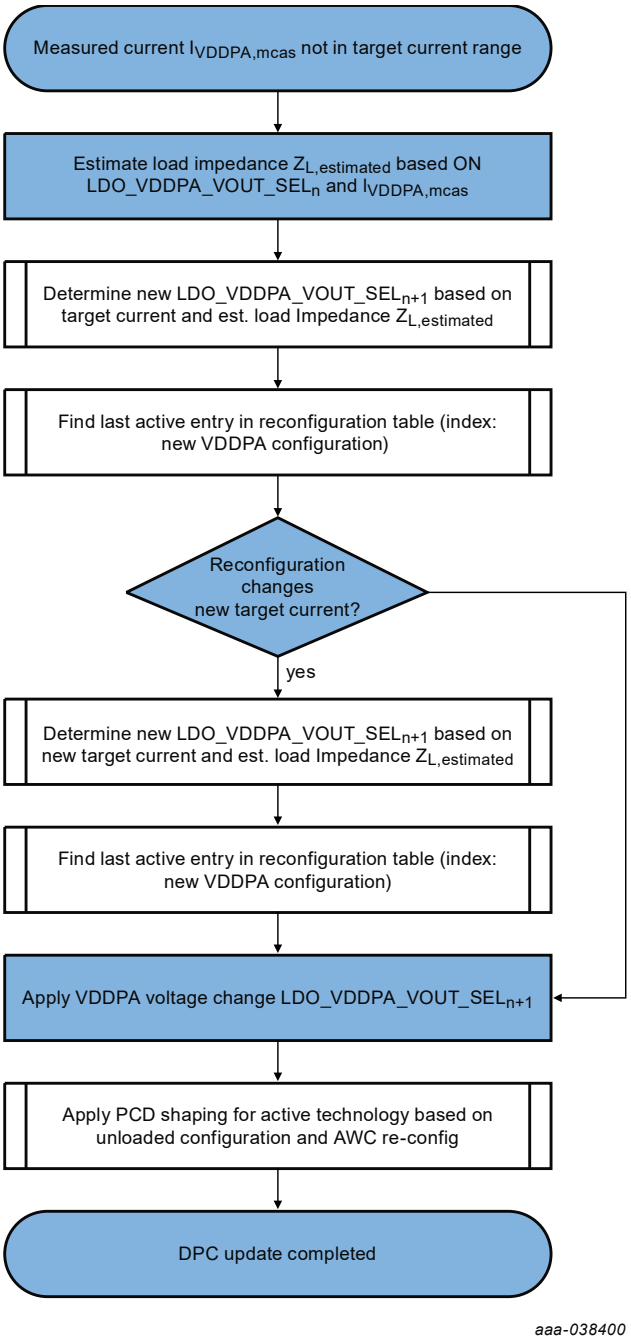

Figure 20. System overview: DPC, AWC and ARC

9.11.1 DPC algorithm

The DPC algorithm is controlling the transmitter current. It is using the following states:

1. Current measurement: Performs VDDPA current measurement
2. New VDDPA: Determine new VDDPA configuration based on measured current VDDPA New (for target current of Itarget) = VDDPA Voltage / VDDPA current * Itarget
3. Update VDDPA: Perform output power update

All information provided in this document is subject to legal disclaimers.

4. Update PCD Shaping: Apply AWC configuration updates for active technology
5. Update RX sensitivity parameter only for short duration

Reconfiguration table includes Relative changes of target current and of waveform parameters adaption for all VDDPA voltage configurations. The VDDPA configuration is implicitly defined by the row index. The first row refers to LDO_VDDPA_VOUT_SEL=0 (represents 1V5).

EXAMPLE:

Unloaded configuration After Field ON:

VDDPA max set to 42 (5.7 V) ·Target current set to 280 mA

Technology B106: amp_mod=200

Falling edge time constant=rising edge time constant=3

Table 8. DPC_LOOKUP_TABLE element, defining the configuration for one dedicated VDDPA voltage

Function	Bit	Description
ENTRY 0	31:0	This is the entry for 1.5 V.
Target current reduction	31:23	ENTRY 0 -LSB - byte 0 Voltage step between DPC entries = 100 mV. Voltage offset start = 1.5 V bEntry_00 = 1V5 ... bEntry_42 = 5V7 Bits[7:0] = Target current reduction in mA (unsigned)
AWC amp mod change	23:16	ENTRY 0 - byte 1 Bits[7:0] = Relative change of modulated amplitude level (signed)
AWC edge time constant for ASK100	15:8	ENTRY 0 - byte 2 Bits[3:0] = ASK100, Relative change of falling edge time constant (signed) Bits[7:4] = ASK100, Relative change of rising edge time constant (signed)
AWC falling edge time constant for ASK10	7:0	ENTRY 0 -MSB - byte 4 Bits[3:0] = ASK10, Relative change of falling edge time constant (signed) Bits[7:4] = ASK10, Relative change of rising edge time constant (signed)

Loaded configuration After Field ON:

DPC regulates from unloaded VDDPA configuration 42 to 31. Consequently, new configuration to be applied based on index entry 31.

Target current stays at 280 mA.

Technology B106: amp_mod=205, falling edge time constant=2, rising edge time constant=0

9.11.2 DPC characteristics

Table 9. Dynamic power control characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
	Minimum hysteresis configured in EEPROM DPC_HYSTERESIS (address 079h)	Depends on application target current	ApplicationTargetCurrent * 0.0609 + 2 mA	-	-	mA
	Max target current configured in EEPROM DPC_TARGET_CURRENT (077h)	Hysteresis as configured in DPC_HYSTERESIS (address 079h)		-	350-Hysteresis	mA

9.12 Adaptive waveshape control (AWC)

Depending on the level of detected detuning of the antenna, wave shaping related register settings can be automatically updated.

Two different waveshaping mechanisms can be used:

1. Firmware based shaping (1,2,3)
2. Lookup table based shaping (4,5,6)

The Firmware based shaping allows to correct rise times and overshoot with linear transition shapes.

The lookup table based shaping allows maximum flexibility and enables to configure almost any possible correction.

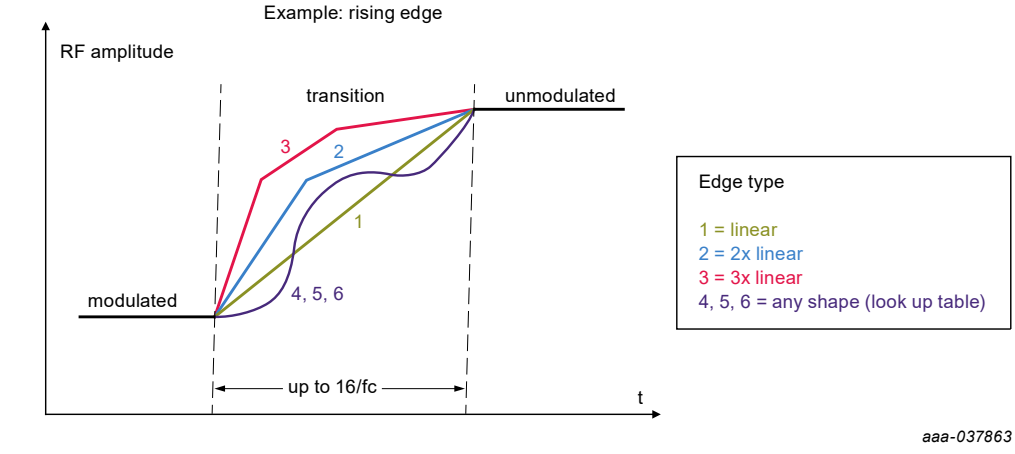

Figure 21. Waveshaping transitions (example falling edge)

The shaping related register settings are stored in a lookup table located in EEPROM, and selected dependent on the actual detected detuning condition.

Each lookup table entry allows the configuration not only of a dedicated wave shaping configuration for the corresponding detuning condition. But allows in addition to configure the wave shaping individually dependent on the actual protocol which is active.

Features of the Adaptive Waveshape Control:

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

- No external components required
- No need to compromise antenna matching to meet waveshape requirements
- Waveshapes automatically adapted according to detected detuning condition
- RF standards define envelope timing and residual carrier parameters required for compliance and interoperability.

The device supports the design of compliant antennas by allowing to actively shaping the style of edge transition for falling and rising edges. The shaping of modulation edges is achieved by selecting one from three edge transition styles:

1. Linear transition between two amplitude levels

2. Two linear transition´s between amplitude levels and

3. Three linear transitions between amplitude levels.

The type of the transition is selected in the EEPROM registers EDGE_TYPE_(protocol), and can be defined independent for each RF protocol and data rate - for both falling and rising edge.

The EEPROM registers EDGE_STYLE_(protocol) define the time constant "s" of falling/ rising edge (depends on edge style).

The EEPROM registers EDGE_LENGTH_(protocol) define the total length of the edge pattern.

The figures below illustrate the edge type for the falling edge.

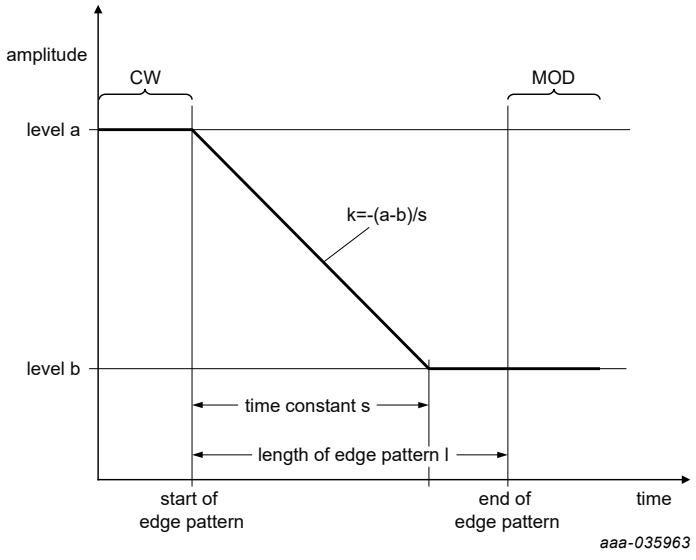

Figure 22. One linear transition (example falling edge)

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

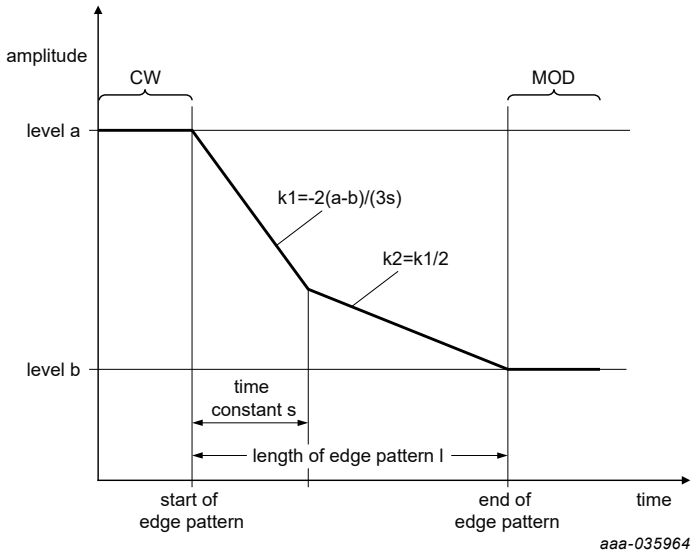

Figure 23. Two linear transitions (example falling edge)

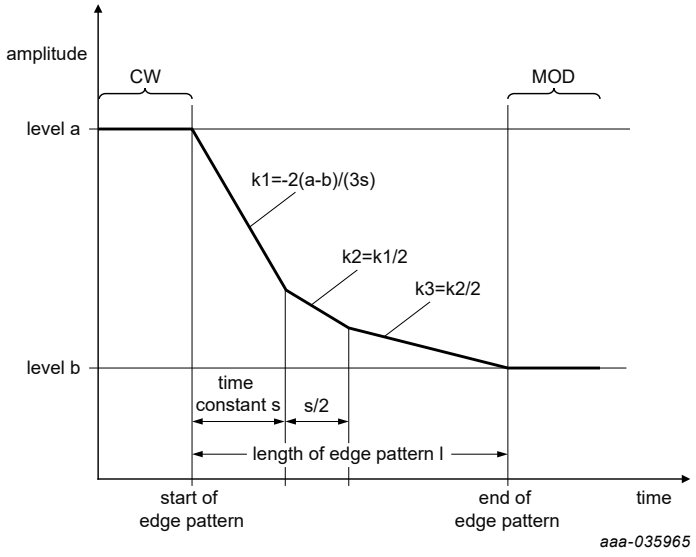

Figure 24. Three linear transitions (example falling edge)

The transition patterns are used as implicit pre-distortion to compensate effects of TX loading circuitry (e.g. resonant circuitry parameters) to the emitted RF envelope.

9.13 Adaptive receiver control (ARC)

Depending on the level of detected antenna detuning, receiver-related register settings can be automatically updated. The receiver-related registers which are allowed to be dynamically controlled are:

DGRM_RSSI_REG (30h) ->DGRM_SIGNAL_DETECT_TH_OVR_VAL

SIGPRO_RM_TECH_REG (22h) ->RM_MF_GAIN,

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

The adaptive receiver control settings override the default RM_MF_GAIN and DGRM_SIGNAL_DETECT_TH_OVR_VAL settings configured by the command LOAD_RF_CONFIGURATION (0Dh).

The ARC algorithm is called when VDDPA voltage changes after DPC. There are two lookup tables used in ARC algorithm i.e VDDPA lookup and ARC lookup. In case of a VDDPA change, an EEPROM lookup (at current protocol and baud rate) is performed. The receiver-related settings i.e RM_MF_GAIN, DGRM_SIGNAL_DETECT_TH_OVR_VAL and IIR_ENABLE are read from EEPROM lookup table and configured in registers.

VDDPA lookup table:

VDDPA lookup table define maximum five voltage ranges. Number of VDDPA voltage ranges used in ARC algorithm is configured in bArcConfig[2:0]. VDDPA voltage output from DPC algorithm is input to VDDPA lookup. VDDPA lookup returns VDDPA_range_index (i.e 0,1,2,3,4).

Table 10. ARC_VDDPA (0139Eh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
13D	ARC VDDPA Setting	7:0	Byte[4] = ARC_VDDPA_0: ARC_VDDPA_3 > VDDPA < ARC_VDDPA_4
13C		7:0	Byte[3] = ARC_VDDPA_0: ARC_VDDPA_2 > VDDPA < ARC_VDDPA_3
13B		7:0	Byte[2] = ARC_VDDPA_0: ARC_VDDPA_1 > VDDPA < ARC_VDDPA_2
13A		7:0	Byte[1] = ARC_VDDPA_0: ARC_VDDPA_0 > VDDPA < ARC_VDDPA_1
139		7:0	Byte[0] = ARC_VDDPA_0: 1.5 > VDDPA < ARC_VDDPA_0

ARC lookup table:

VDDPA index and **RF protocol/datarates** are input to ARC lookup. There are five Receiver settings entries for each protocol and data rates. ARC algorithm select one out of five entries (at current protocol and baud rate) based on VDDPA_range_index.

Following table show ARC settings for Type A-106.

Table 11. ARC_RM_A106 (address 013Eh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
146	RM_RX_ARC_4	15:0	Bit[15] 0: ARC settings always apply 1: ARC settings applicable during FDT, Bits[14:10] = RFU Bit [9] = Enable the IIR filter. Bits[8:7] = MF_GAIN (this value will be applied to the SIGPR_RM_TECH register, applies as soon as the ARC is enabled) Bits[6:0] = DPC_ SIGNAL_DETECT_TH_OVR_VAL (this value will be applied to the DGRM_RSSI register, applies as soon as the ARC is enabled)

All information provided in this document is subject to legal disclaimers.

9.14 Timer

The PN5190B1 implements three different types of timers: 2 general-purpose timers (only general-purpose Timer0 is accessible by the user, Timer1 is used by the PN5190B1 as FDT Timer), 1 wake-up timer and 1 low frequency timer.

General-purpose timer

The PN5190B1 implements two 20-bit wide general-purpose timers - Timer0 and Timer1.

Timer0 can be configured by 2 registers each (TIMER0_CONFIG, TIMER0_RELOAD).

Timer 1 is typically used for as FDT and EMD timer configuration. Configuration can be done from the host but the associated IRQ is handled by the firmware of the PN5190B1. The Timer1 events are consumed by the PN5190B1 FW and respective Time-out status is included as part of the command response.

The general-purpose Timer0 and the FTD Timer1 have a max count of 1.048.575.

The register TIMER0_CONFIG, TIMER0_RELOAD configure if either the 13.56 MHz clock of the RF interface is used as Timer input, or if a divided clock frequency is used as input. These registers configure as well the start conditions for the timer.

The following clock frequencies can be selected for the pre-scaler:

000b - 6.78 MHz counter

001b - 3.39 MHz counter

010b - 1.70 MHz counter

011b - 848 kHz counter

100b - 424 kHz counter

101b - 212 kHz counter

110b - 106 kHz counter

111b - 53 kHz counter

Wake-up timer

The PN5190B1 implements one 10-bit wide wake-up timer.

Max count of the wake-up timer is 1023, inout clock is the LFO CLK = 380 kHz. The max timeout is 269 ms.

The wake-up time is configured via the SWITCH_MODE_STANDBY / SWITCH_MODE_LPCD commands. There is no dedicated register available for this timer. The PN5190B1 enters the standby state by the switch mode command SWITCH_MODE_STANDBY/ SWITCH_MODE_LPCD. The counter value is part of the command and has to be sent as one configuration parameter. The 2-byte parameter value for the standby counter is indicating the counting time in milliseconds. The value needs to be provided in little-endian format.

Low frequency timer

The wakeup-counter for the ULPCD mode has a width of 12bits.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

The input clock for this timer is 1 kHz. ULPCD uses the ULP_STANDBY command, and for this the wake-up timer is feed by the 1 kHz clock. Count down value (12 bits counter; ULFO CLK / 4096 = 0.244 Hz i.e. 1 ms per bit).

The max timeout is 4.096 s.

Timer for contactless interface

In addition to the timers above, to guarantee correct protocol timing, a guard period timer is implemented for the RF_EXCHANGE command in reception and transmission mode (TX_WAIT, RX_WAIT counting).

No configuration of this timer is available for the user, setup and counting is managed completely by the hardware. Therefore this timer is not indicated in the timer overview.

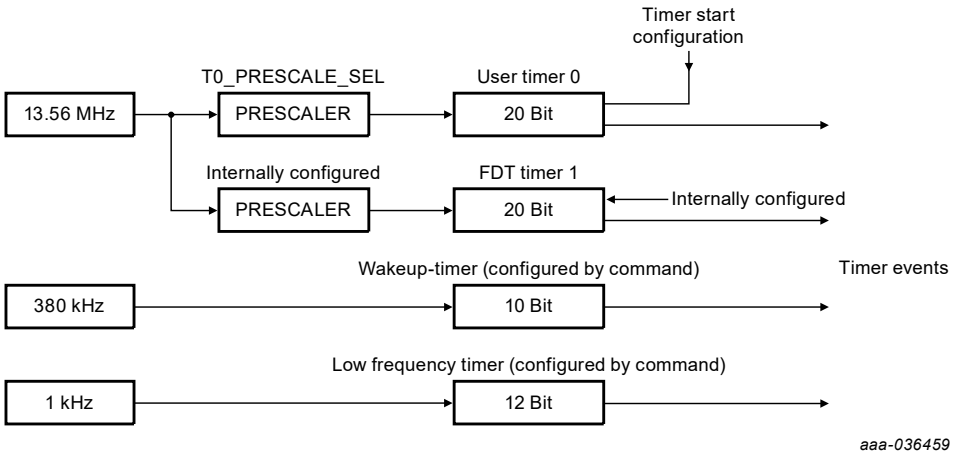

Figure 25. Timer overview

9.15 Energy saving card detection

The low-power card detection (LPCD) and ultra-low power card detection (ULPCD) are an energy-saving card polling configuration for the PN5190B1. During LPCD and ULPCD, a host microcontroller can be set into power-saving mode, as no host controller interaction is required.

A low frequency timer is implemented to drive a wake-up counter, which triggers a periodic activation of the antenna drivers to emit a short pulse which allows to detect a detuning of the antenna. In case of a detected antenna detuning, the system is woken up from power-saving mode. It sends an interrupt signal to the connected host microcontroller to wake up the host microcontroller from power-saving mode and to indicate a change of the antenna detuning condition.

There is no trimming for the Low Frequency Timer required.

The SWITCH_MODE instruction allows entering the LPCD or ULPCD mode with a given standby duration value.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

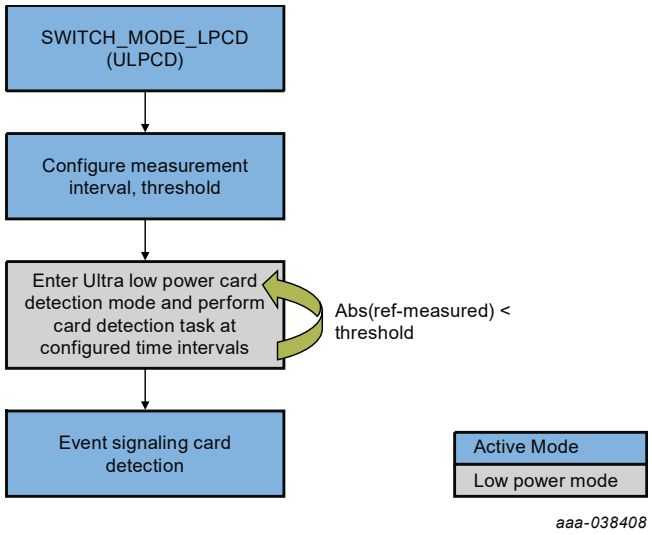

Figure 26. LPCD configuration and card detection loop

9.15.1 Low-power card detection (LPCD)

The low-power card detection (LPCD) is an energy-saving card polling configuration for the PN5190B1. During LPCD, a host microcontroller can be set into power-saving mode, as no host controller interaction is required. The host microcontroller is woken up from power-saving mode by an IRQ send by the PN5190B1.

The LPCD mode offers highest sensitivity at the cost of slightly higher current consumption compared to the ULPCD mode.

A low frequency oscillator (there is no trimming for the low frequency oscillator required) is implemented to drive a wake-up counter, which triggers a periodic activation of the antenna drivers to emit a short RF pulse. This RF pulse allows to detect a detuning of the antenna by presence of conductive objects in proximity of the antenna (card, cell phone, metal).

In case of a detected antenna detuning, the system wakes up from power-saving mode. It sends an interrupt signal to the connected host microcontroller to wake up the host microcontroller from power-saving mode and to indicate a change of the antenna detuning condition.

A low frequency oscillator (LFO) is implemented to drive a wake-up counter, waking-up PN5190B1 from standby mode. This allows implementation of low-power card detection polling loop at application level.

The host microcontroller can then perform a card polling sequence to verify if the technology of the object causing the antenna detuning is supported by the system.

The SWITCH_MODE instruction allows entering the LPCD mode with a given standby duration value.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

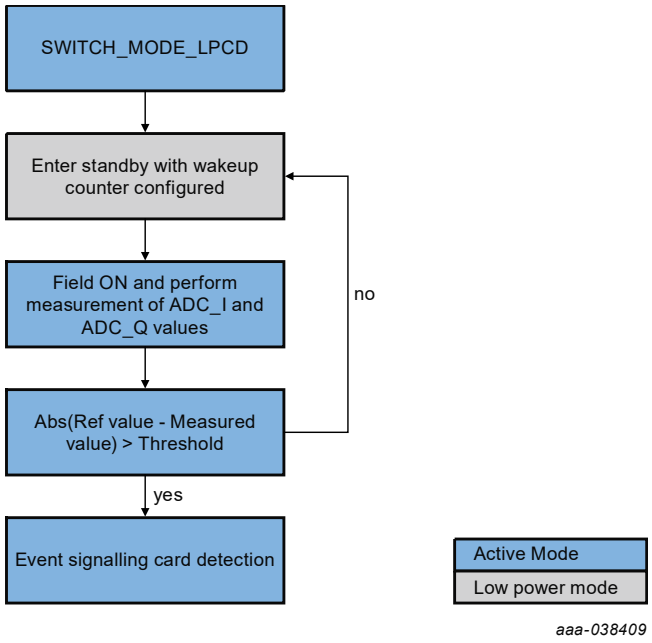

Figure 27. LPCD configuration

The LPCD mode is entered by the host interface command SWITCH_MODE_LPCD (23h), and terminated by the command SWITCH_MODE_NORMAL (20h). In addition, terminating the LPCD mode is possible by toggling a GPIO, by a reset (VEN) of the PN5190B1 or a signal of the RF Level detector.

Before entering the LPCD mode, ADC_I and ADC_Q reference value needs to be determined. This is done during the so called calibration.

LPCD calibration phase

a) An initial calibration measurement is performed to set up the RX chain parameters namely HFATT, DCO_DAC_I_CTRL and DCO_DAC_Q_CTRL values.

b) The next measurement is done using the RX chain parameters that are set up, to arrive at the ADC_I and ADC_Q values which are used as reference values. All following LPCD measurements are done relative to the LPCD calibration measurement.

The LPCD loop itself works in two phases:

First the standby phase is controlled by the wake-up counter (timing defined in the instruction), which defines the duration of the standby of the PN5190B1.

Second phase is the detection-phase. The RF field is switched on for a defined time (EEPROM configuration) and then the ADC_I and ADC_Q values are compared to a reference value.

- If the ADC_I and ADC_Q values exceed the reference value, a LPCD_IRQ is raised to the host. The register configurations done by the host to support a dedicated RF protocol are not restored after wake-up command. The host has to configure the NFC frontend for a dedicated protocol operation to allow a polling for a card.
- If the ADC_I and ADC_Q values do not exceed the thresholds of the reference value, no LPC_IRQ is raised and the IC is set to the first phase (standby mode) again.

These two phases are executed in a loop until:

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

- Card / metal is detected (LPCD_IRQ is raised).

- Reset occurs, which resets all the system configurations. The LPCD is also terminated in this case.

- NSS on host interface

- RF Level Detected

- GPIO toggle

As functionality from FW2.03 onwards, the GPIO1 (general-purpose input/output) pin can be enabled to wake up an external DC-DC from power down for the VDDPA supply. The GPO1 allows setting to high before the transmitter is switched on. This allows the wake-up of an external DC-DC from power down. The GPO1 can be set to low after the RF field is switched off to set an external DC-DC into power-down mode. The time of toggling the GPO1 in relation to the RF-on and RF-off timings can be configured:

EEPROM field LpcdExtDcdcEnable (0xCE0) is used to enable the use of EXT DC-DC during LPCD.

EEPROM field: LpcdExtDcdcDelayToOn (0xCE1) is used to configure the delay to turn on the DC-DC in 8usecs steps.

EEPROM field: LpcdExtDcdcDelayToOff (0xCE2) is used to configure the delay to turn off the DC-DC in 8usecs steps.

The behavior of the generated field is different dependent on the activation state of the DPC function:

- If the DPC feature is not active, the ISO/IEC14443 type A 106 kbit/s settings are used during the sensing time.
- If the DPC is active, the RF_ON command is executed. The RF field is switched on as soon as the timer configured by the SWITCH_MODE command elapses. The RF field is switched on for a duration as defined for an activated DPC. The timer for the LPCD_FIELD_ON_TIME starts to count as soon as the RF_ON command terminates.

Table 12. Low-Power Card Detection: relevant EEPROM configuration

EEPROM address	Name	Description
0492	LPCD_AVG_SAMPLES	Defines how many samples of the I and Q values are used for the averaging. Used to optimize the system to achieve highest detection sensitivity versus false alarms.
0494	LPCD_RSSI_TARGET	Value to be used as the RSSI target in the calibration phase to arrive at the RX chain parameters. This parameter is used to arrive at an optimal target voltage level at RXP.
0496	LPCD_RSSI_HYST	Value to be used as the RSSI hysteresis in the calibration phase to arrive at the RX chain parameters. This is used to avoid oscillations while arriving at the target voltage level at RXP.
049E	LPCD_THRESHOLD	If the difference between the measured value of I/Q and the reference value for I/Q is greater than the threshold on either channels, then a card is detected.
04B5	LPCD_VDDPA	VDDPA voltage when DC-DC (internal or external) or external power source is used to feed TXLDO

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Table 12. Low-Power Card Detection: relevant EEPROM configuration*...continued*

EEPROM address	Name	Description
0013	XTAL_CHECK_DELAY	Interval which is used to check if XTAL is ready (unit is 256/fc, e.g. ~18.8 us). For fastest start up this time, a check is performed at a time slightly higher than the expected startup time of the crystal.

9.15.2 Semi-autonomous mode (LPCD)

LPCD semi-autonomous mode

The LPCD can be invoked by the host in the semi-autonomous mode wherein the ADC_I and ADC_Q values that are measured is returned back to the host.

In this mode, standby is not entered and the difference between the measured and reference values are not checked against the threshold. Nevertheless, the host may check the measured values against a reference and threshold to detect a card and also put the PN5190B1 in standby mode between measurements, using the SWITCH_MODE_STANDBY command.

This mode is especially useful to find optimized settings for the LPCD, since it does not offer no significant current saving.

Table 13. Low-Power Card Detection - semi-autonomous mode: relevant REGISTERS

REGISTER address	Name	Description
0050	LPCD_CALIBRATE_CTRL	Writing to this register triggers the LPCD calibration with the LPCD RSSI_HYSTERESIS and LPCD RSSI_TARGET values. After calibration is completed, calibration status is available in LPCD_ CALIBRATE_STATUS. If the calibration is successful, the I/Q channel values can be read from register IQ_CHANNEL_VALS
0051	IQ_CHANNEL_VALS	Actual I/Q channel value
0053	LPCD_CALIBRATE_STATUS	1: if successful - a new calibration clears this value

9.15.3 Ultra low-power card detection (ULPCD)

The ULPCD (ultra low-power card detection) offers highest current saving. In this mode, the only wake-up sources to escape from the card detection loop are either a detected antenna detuning, a signal on GPIO3 or a reset (RESET_N) of the PN5190B1.

Only the wake-up timer is active during ULP Standby state.

The ULPCD comprises 2 phases:

1. **Calibration phase**
   In this phase, an RF field is established and the field strength(RSSI) for the unloaded state of the antenna is measured to be used during the measurement phase and stored in a low-power persistent register.
2. **Measurement phase**
   In the measurement phase, the card detection activity is performed autonomously by the hardware at configurable time intervals. This configuration is passed as a parameter to the SWITCH_MODE_LPCD command. The RSSI value is measured and compared against the reference value measured in the calibration phase. A card

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

is detected to be in the proximity of the reader when the measured RSSI differs from the reference RSSI by more than a configurable threshold.

The host can set the PN5190B1 into ultra-low power card detection state (ULP Standby state) via the instruction SWITCH_MODE_LPCD.

XTAL_CHECK_DELAY (0013h) allows to optimize the startup of the crystal for the LPCD and ULPCD modes.

The following EEPROM configuration is available:

- ULPCD_VOLTAGE_CTRL (address 4C6h)
- ULPCD_RSSI_GUARD_TIME (04C9h)
- ULPCD_RSSI_SAMPLE_CFG (04CAh)
- ULPCD_THRESH_LVL(04CBh)
- ULPCD_GPIO3 (04CCh) - Allows to abort the ULPCD based on GPIO input.

9.16 Automatic EMD error handling

The PN5190B1 supports a configurable EMD handling according to the ISO14443 or EMVCo standard. To support further extensions or changes of these standards, the EMD block is configurable.

After being configured, the PN5190B1 restarts both the receiver and a timeout timer automatically without host interaction in case of a detected EMD event.

Features of the Automatic EMD Error Handling:

- No real-time constraints
- Less processing load on the host processor
- Configurable, anticipating future specification changes

In addition to the EMD error handling according to ISO14443 and EMVCo, the PN5190B1 implements special features for FeliCa™ preamble processing.

Registers CLIF_RX_EMD_1_CONFIG(0x47) and CLIF_RX_EMD_0_CONFIG(0x48) hold the configurations for the EMD configurations for ISO/IEC14443, and NFC Forum.

EMVCo EMD configuration is supported in the register EMVCO_EMD_CONTROL (0x3).

9.17 Autocoll (card emulation)

The Autocoll state machine performs the time critical activation for Type-A PICC and for NFC-Forum Active and Passive Target activation (card emulation mode).

The PICC state machine supports three configurations:

- Autocoll mode0: Autocoll mode is left when no RF field is present
- Autocoll mode1: Autocoll mode is left when one technology is activated by an external reader. During RFoff, the chip enters standby mode automatically
- Autocoll mode2: Autocoll mode is left when one technology is activated by an external reader. During RFoff, the chip does not enter standby mode.

At start-up, the Autocoll state machine automatically performs a LOAD_RF_CONFIG with the General Target Mode Settings. When a technology is detected during activation, the Autocoll state machine performs an additional LOAD_RF_CONFIG with the corresponding technology.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

The card configuration for the activation is stored in EEPROM. If RandomUID is enabled (EEPROM configuration), a random UID is generated after each RF-off.

For all active target modes, the own RF field is automatically switched on after the initiator has switched off its own filed.

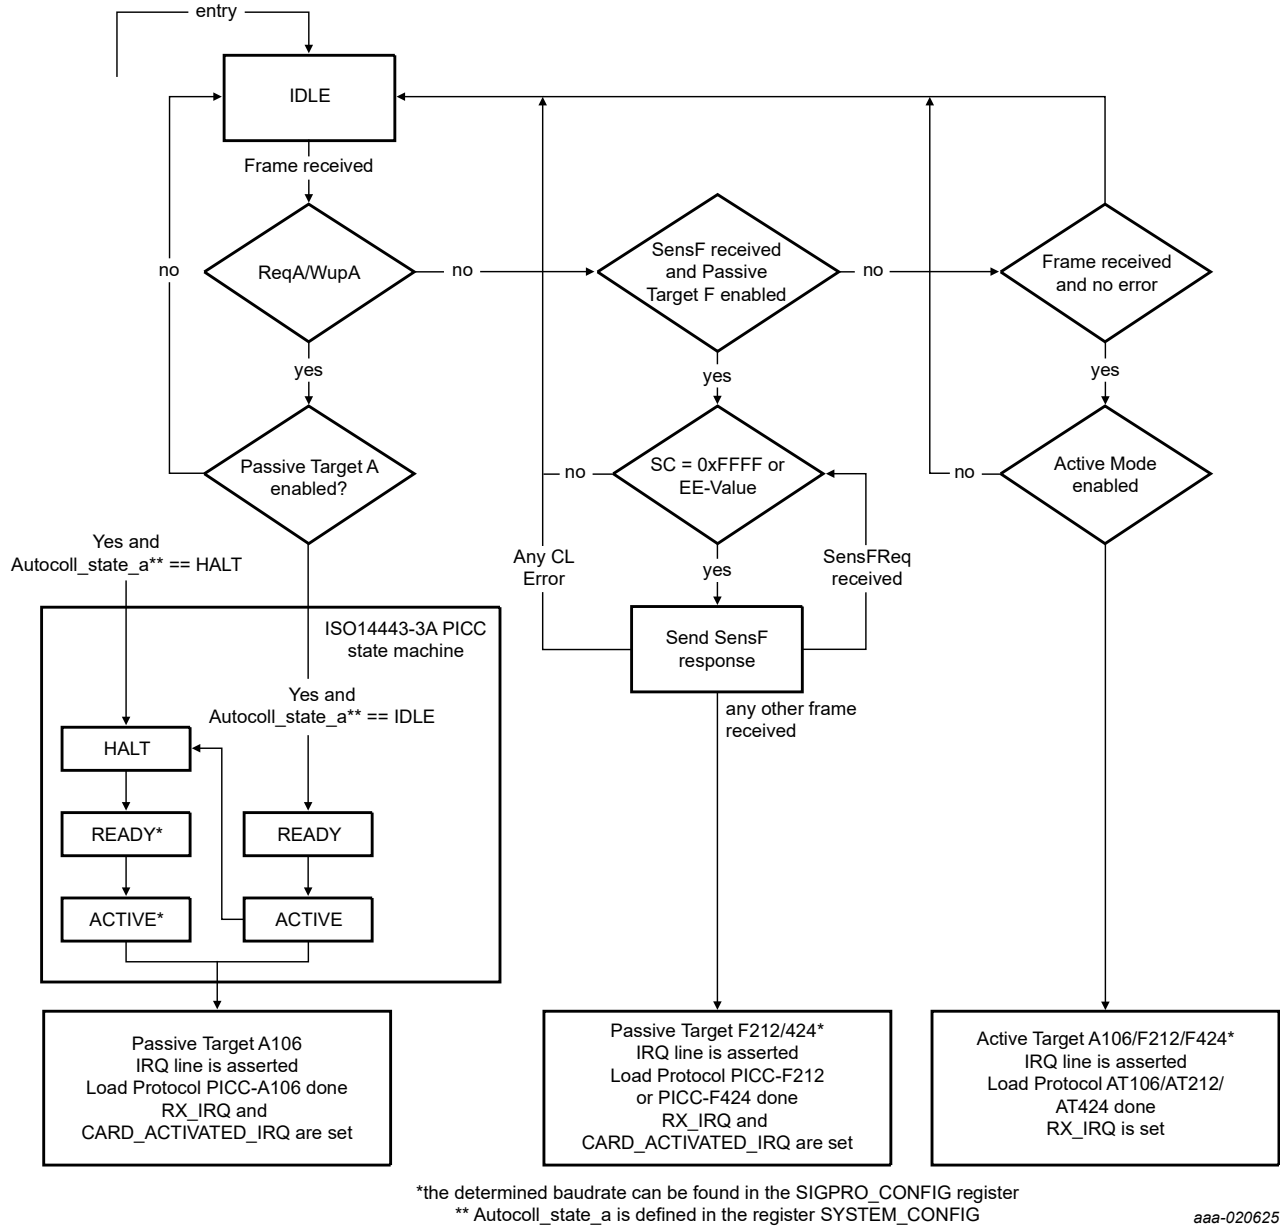

Figure 28. Autocall state machine

9.18 RF-level detection

The PN5190B1 implements an RF level detector (RFLD) and an NFC level detector (NFCLD) which allows to detect the presence of an external RF field.

RF Level Detector:

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

During low-power card detection (LPCD), the RF level detector (RFLD) acts as wake-up source from power-saving mode.

During ultra low-power card detection (ULPCD), a specific ultra low-power RF level detector is used as RF level detector(RFLD). This can be enabled as wake-up source.

The purpose of the RFLD function is to detect any signal at 13.56 MHz in order to wake up the PN5190B1 from power-saving mode.

NFC Level Detector:

The NFC Level detector (NFCLD) is used during full power mode. The NFCLD function is required by NFC Forum to support the "RF collision avoidance".

The sensitivity of the NFCLD sensor can be configured by EEPROM register to meet the NFC Forum requirements.

It can be used as well in card mode to detect an external field.

9.19 Antenna connection

The PN5190B1 allows to connect antennas of different topology and matching to the transmitter.

Standard and recommended tuning of the antenna fitting to most applications is a symmetrical matched antenna connected to TX1, TX2 operating in push-pull operation.

VBAT is connected to VBATPWR.

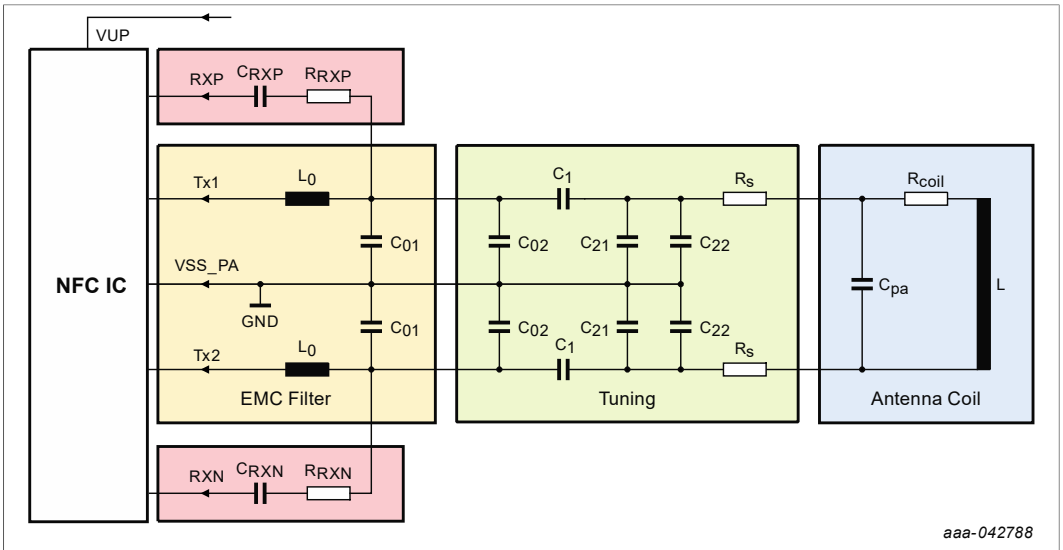

Figure 29. Push-Pull driver configuration

The PN5190B1 allows to operate the TX1, TX2 in common mode as well, which allows to use a single ended antenna. This configuration saves one EMC filter coil.

Note:

*The RSSI Target for SE needs to be calculated as follows and differs from the differential antenna: RSSI Target = Target RX Peak Voltage*1024/ (1.8*2)*

*Example: For a 1.2 V target: DGRM_RSSI_TARGET = 1.2 * 1024 / (1.8*2) = 341d = 0x155*

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

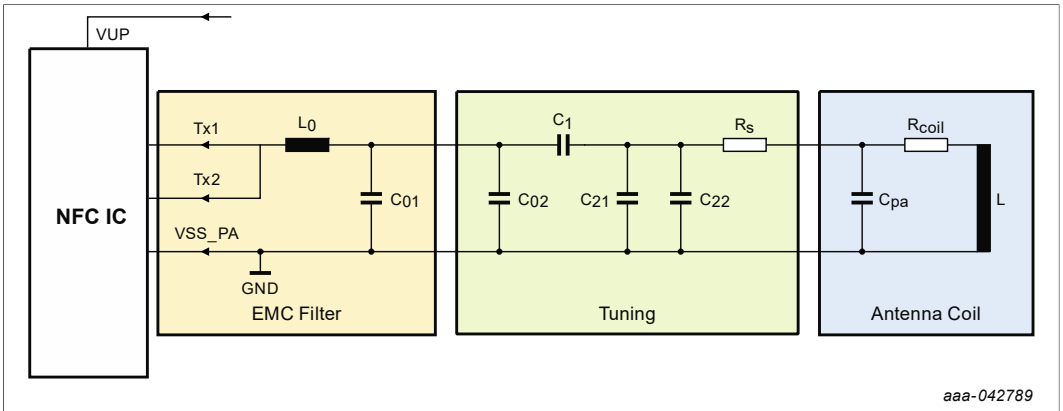

Figure 30. Push-Push driver configuration

The PN5190B1 allows to connect to antennas, one to each of the available driver outputs. The Figure below shows as well the receiver schematics for the RXN which is applicable for the Push-Push deriver configuration as well.

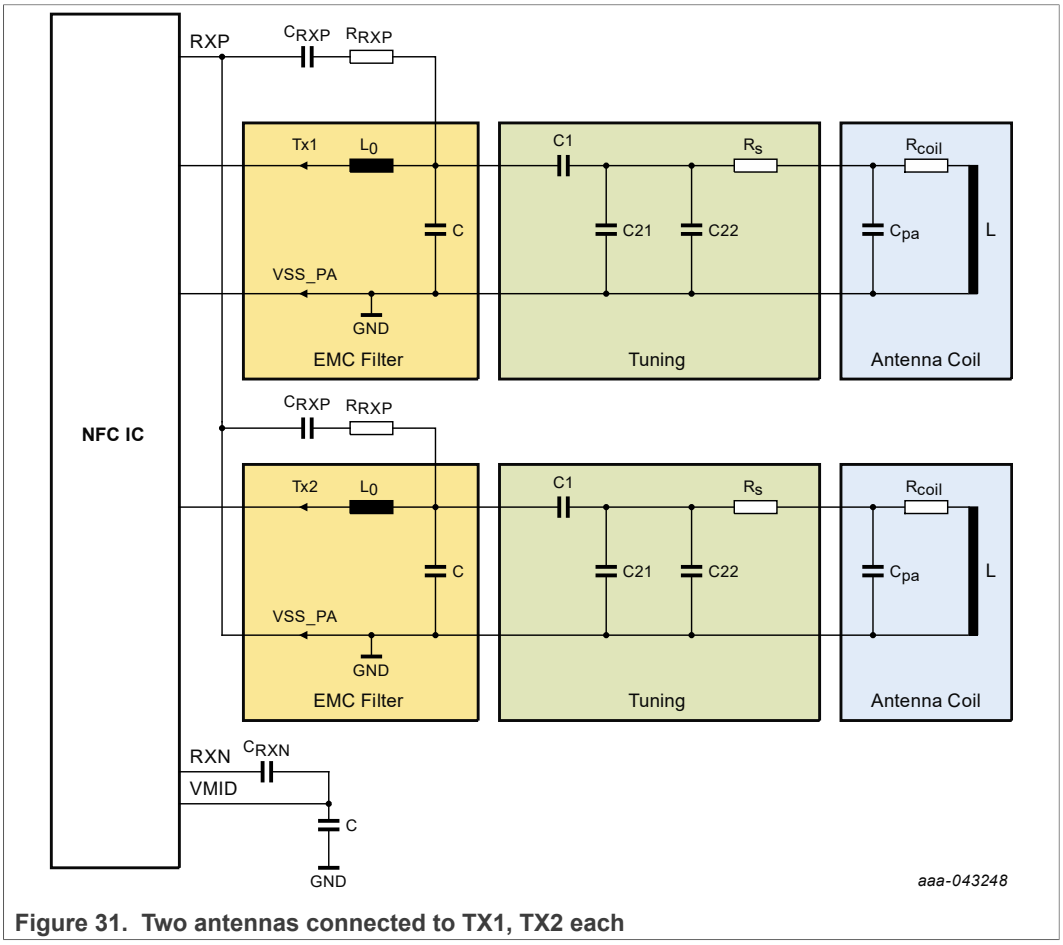

Figure 31. Two antennas connected to TX1, TX2 each

Table 15. Antenna EEPROM configuration

EEPROM (Address)	Bit	Differential Antenna Push-Pull driver TX1, TX2	Single-Ended Push-Push driver TX1, TX2	Single-Ended TX1 driving	Single-Ended TX2 driving
TX_SHAPING_ CONFIG (0x17)	0	0	0	1	1
TX_CLK_MODE_1 (0x19)		0x77	0x77	0x77	0x11
TX_CLK_MODE_2 (0x1A)		0x17	0x17	0x17	0x11

Note:

Recommendation is to use all the settings configured in EEPROM. For CLIF_SS_TX_CFG_REG, the value has to be configured in EEPROM for each technology and baud rate so that the value is loaded after every load protocol.

9.20 Antenna tuning with variable capacitors

The PN5190B1 allows the tuning of the connected antenna based on variable capacitors.

Variable capacitors are devices which allow to change their capacity dependent on a supplied control voltage. Typically, these capacitors are used as serial and parallel capacitors in an antenna matching network.

The PN5190B1 allows to measure a detuning of the connected antenna caused e.g. by surrounding metal and correct the actual detuning by applying an appropriate control voltage on 2 analog outputs.

To correct a potential detuning of the connected antenna, a phase measurement needs to be performed. The following sequence is required to read out the phase information:

Step 1: Disable DPC

Step 2: Perform Type A-106 load protocol

Step 3: Set the VDDPA Voltage as $V_(Vddpa_AAT)$

Step 4: Perform RF ON

Step 5: Read out RXM phase

Step 6: Perform RF OFF

Step 7: Enable DPC

For reading the RXM phase, refer to the related application note. Based on the phase information, a host is able to calculate the DAC output voltages to correct a detuning.

The antenna tuning requires the DPC to be disabled, and is typically not suitable for dynamic tuning e.g. during card communication.

Note:

Since disabling of the DPC requires a modification of the EEPROM is required, care must be taken not to exceed the maximum permitted number of Erase/Write cycles.

All information provided in this document is subject to legal disclaimers.

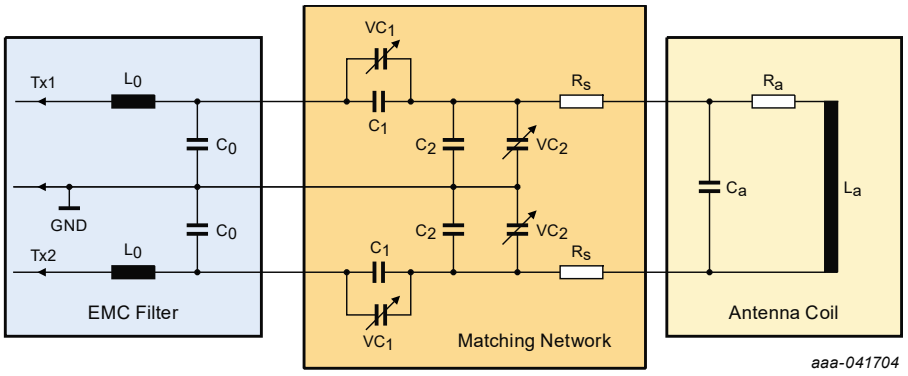

Figure 32. Antenna connection using variable capacitors

9.21 RF debug signals

The following signals are available for debugging purposes:

The test signals are selected by sending a command string to the PN5190B1. The commands CONFIGURE_ TESTBUS_DIGITAL (12h) and CONFIGURE_TESTBUS_ANALOG (13h) are used to configure the dedicated signal on an output pin.

If used, **ADC-Q needs to be routed always to AUX1, ADC-I needs to be routed always to AUX2**

The analog test signals are analog representation of an internal digital value. The internal digital signal is converted by an 8-bit wide DAC to the analog signal.

This overview indicates the signals which are available for debugging purposes (indicated by numbers):

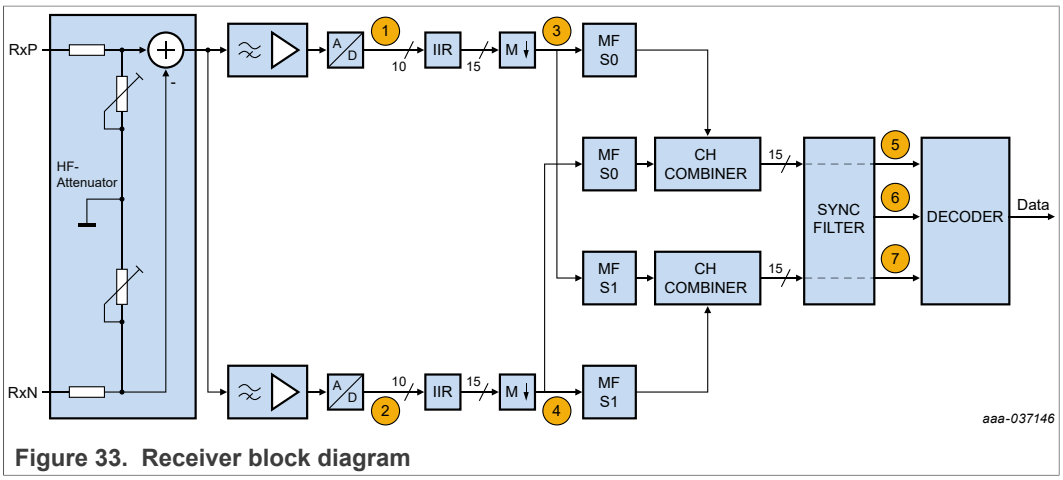

Figure 33. Receiver block diagram

Table 16. DEBUG SIGNALS

Signal	REGISTER	SIGNAL NAME	BITS	Description
ADC Data I Channel (1)	obs_clif_ tbcontrol_ patchbox0	adc_ data_i_i	9:2	Unfiltered I channel signal upper 7 bit of the 10 bit signed unfiltered I channel signal including sign (bit9)

Table 17. TRIGGER SIGNALS

TRIGGER	REGISTER	SIGNAL NAME	BITS	Description
TX Active	obs_clif_txenc1	tx_active_o	1	high level indicates transmission of data Remark: Falling edge can be used to trigger on end of transmission.
RX Enable	obs_clif_sigpro_ rm15	rx_enable_o	1	high level indicates that the reception is ongoing Remark: can be used to trigger on the start /end of reception
RX collision detected	obs_clif_sigpro_ rm14	rm_scoll_o	1	high-level pulse indicates that the collision is detected during reception

9.22 Secure firmware update

The PN5190B1 supports a secure update of the implemented firmware.

The secure firmware download mode is using dedicated commands, but does not require a dedicated physical handling of the SPI interface lines.

The secure firmware download mode is entered by setting a register in non-volatile memory followed by a trigger of the VEN pin.

The firmware binary file which is used to update the PN5190B1 is protected with an RSA signature and AES encryption.

The key length of the RSA is 2048 bits, the public exponent supports any 32-bit integer value.

A pre-computed Montgomery format of signature is used, and the signature hash computation is based on SHA256 algorithm.

This prevents a download of any other software which is not released by NXP.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

An anti-tearing function is implemented in order to detect supply voltage removal or memory fault.

During the secure firmware download, the NFC operation is not available, only the command set defined for the secure firmware download is valid.

Updating the PN5190B1 with the default firmware binaries programs the memories for user configuration with default values. Any previous user configuration will be overwritten. The user has to take care to restore the data of these memories after a secure firmware update.

If this is not intended, special firmware versions are available which do not overwrite the configuration. If the standard firmware file is named e.g. FW 2.00, the name of the firmware which does not overwrite existing settings is then FW 2.F0. (The "F" is indicating the non overwrite version)

The PN5190B1 checks if the new major version number is equal or higher than the current one. In case the major version number of the new firmware to be installed is smaller than the already installed version number of the firmware, the secure firmware update is rejected. Downgrading major firmware versions is therefore not possible. Upgrading and therefore increasing major firmware versions is always possible.

In case of any failure or exception during the download (e.g. caused by a communication error or power-off), the PN5190B1 remains in the secure firmware download mode until a full firmware update sequence has been performed successfully.

Features of the automatic secure firmware update:

- Works without download request pin
- No special implementation of SPI interface handling
- Maximum integrity: Only encrypted and signed firmware images download possible
- Updating the firmware overwrites existing all previous EEPROM configurations.

9.23 SPI host interface

The interface of the PN5190B1 to a host microcontroller is based on a SPI interface.

The maximum SPI speed is 15 Mbit/s and fixed to CPOL = 0 and CPHA = 0. Only a half-duplex data transfer is supported. There is no chaining allowed, meaning that the whole instruction has to be sent or the whole receive buffer has to be read out. The whole transmit buffer shall be written at once as well. No NSS assertion is allowed during data transfer.

The SPI host interface is designed to support the typical interface supply voltages of 1.8 V and 3.3 V of CPUs. A dedicated supply input which defines the host interface supply voltage independent from other supplies is available (pin VDDIO).

There is no external pull-up / pull-down resistor required, the SPI pads are automatically configured by the PN5190B1.

Only a voltage of 1.8 V or 3.3 V is supported, but no voltage in the range of 1.95 V to 2.4 V.

Note: The Voltage on pin VDDIO must always be smaller or equal to the Voltage on pin VBAT.

Master in slave out (MISO)

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

The MISO line is configured as an output in a slave device. It is used to transfer data from the slave to the master, with the most significant bit sent first. The MISO signal is put into 3-state mode when NSS is high.

Master out slave in (MOSI)

The MOSI line is configured as an input in a slave device. It is used to transfer data from the master to a slave, with the most significant bit sent first.

Serial clock (SCK)

The serial clock is used to synchronize data movement both in and out of the device through its MOSI and MISO lines.

Not slave select (NSS)

The slave select input (NSS) line is used to select a slave device. It shall be set to low before any data transaction starts and must stay low during the transaction.

9.24 Host interface commands

9.24.1 Logical command layer

PN5190B1 has two main modes of operation to communicate with the host controller:

1. TLV-command response-based communication

2. HDLL-based communication, used when device is triggered to enter the “download mode”, to update its firmware.

The description of the transport layer in the next chapters is limited to TLV-based command-response communication.

For more information, see [3].

9.24.1.1 Logical frame definition

A SPI frame starts with the falling edge of NSS and ends with the rising edge of NSS.

SPI is per physical definition full duplex but PN5190B1 uses SPI in a half-duplex mode.

SPI mode is limited to CPOL 0 and CPHA 0 with a max clock speed of 15 MHz.

Every SPI frame is composed of a 1-byte header and n-bytes of body.

9.24.1.2 Logical flow definition

The HOST always sends as a first byte the flow indication byte whether it wants to write or read data from the PN5190B1.

In case of a read request and no data is available, the response contains 0xFF.

The data after the flow indication byte is one or several messages.

For every NSS assertion, the first byte is always a HEADER (flow indication byte), it can be either 0x7F/0xFF with respect to write/read operation.

9.24.1.3 Logical message type definition

A host controller communicates with PN5190B1 using messages which are transported within SPI frames.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

There are three different message types:

- Command
- Response
- Event

Commands are only sent from host controller to PN5190B1 responses.

Events are only sent from PN5190B1 to host controller.

Allowed sequences and rules:

- Command is always acknowledged by a response
- Host Controller is not allowed to send another command before receiving a response to a previous command, except in concatenation
- Events may be sent asynchronously at any time (NOT interleaved within a command/response pair)
- EVENT messages are never combined with the RESPONSE messages within one frame.

9.24.1.4 Logical message format

Type (T) => 1 byte

Bit[7] Message Type

0: COMMAND or RESPONSE message

1: EVENT message

Bit[6:0]: Instruction Code

Length (L) => 2 bytes (large endian format)

Length of the message body

Value (V) => N bytes

Value/data of the TLV (Command Parameters / Response data) based on Length field (Large endian format)

9.24.1.5 Split frame definition

COMMAND message must be sent in one SPI frame RESPONSE and EVENT messages can be read in multiple SPI frames, e.g., to read out the length byte.

RESPONSE and EVENT messages can be read in single SPI frame but delayed by NO-CLOCK in between, e.g., to read out the length byte.

9.24.2 Host interface command list

PN5190B1 command/response list

0x28 - 0x3F	-	RFU
0x40	-	RFU
0x41	No	PRBS_TEST
0x41 - 0x50	-	RFU

9.24.3 EVENTS INDICATED BY INTERRUPT

Normal events are indicated over IRQ.

These normal events can be either

- always enabled - Host is always notified
- controlled by Host – Host is notified if the respective Event Enable bit is set in the register (EVENT_ENABLE).

Low-level interrupts from the peripheral IPs including the CLIF are completely handled within the firmware and host will be notified only of the events listed in the events section.

The Firmware implements two event registers as RAM registers that can be written / Read using WRITE_REGISTER / READ_REGISTER commands.

Two registers do exist to handle the events from a host microcontroller: EVENT_ENABLE and EVENT_STATUS:

- EVENT_ENABLE => register, enables/disables specific event notifications
- EVENT_STATUS => content of this register is part of the event message payload

Events are auto-cleared once the event message is read-out by the host.

Events are asynchronous in nature and are notified to the host if they are enabled within event register.

Following is the list of events available to the host as part of event message:

Table 19. IRQ EVENT LIST

BIT	EVENT	Always enabled	Value/Description
31..12	RFU	-	-
11	CTS_EVENT	N	
10	IDLE_EVENT	Y	
9	LP_CALIBRATION_EVENT	Y	
8	LPCD_EVENT	Y	
7	AUTOCOLL_EVENT	Y	
6	TIMER0_EVENT	N	
5	TX_OVERCURRENT_EVENT	N	

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Table 19. IRQ EVENT LIST *...continued*

BIT	EVENT	Always enabled	Value/Description
4	RFON_DET_EVENT	N	
3	RFOFF_DET_EVENT	N	
2	STANDBY_PREV_EVENT	Y	
1	GENERAL_ERROR_EVENT	Y	
0	BOOT_EVENT	Y	

Note that no two events are clubbed except in case of errors. In case of errors during the operation, functional event (e.g. BOOT_EVENT, AUTOCALL_EVENT etc.) and GENERAL_ERROR_EVENT will be set.

9.24.4 EVENTS INDICATED ON GPIO

Temperature events are possible to be indicated by a GPIO to speed up the notification to a host.

The EEPROM register ENABLE_GPIO0_ON_OVERTEMP (0054h) allows enabling the indication of a temperature event on GPIO0.

No other event can be routed to a GPIO.

9.25 Register description

The default setting of a bit within a register is indicated by the "*". Value indicates the allowed range for the bits of a symbol.

9.25.4 EVENT_STATUS (0002h)

Table 23. EVENT_STATUS register (address 0002h) bit description

Bit	Symbol	Access	Value	Description
31:12	RFU	r	0*,1	-
11	CTS_EVENT			Indicated the availability of CTS Event
10	IDLE_EVENT			Indicated the availability of IDLE event.
9	LP_CALIBRATION_EVENT			Indicated the availability of LP Calibration event
8	LPCD_EVENT			Indicated the availability of LPCD event.
7	AUTOCOLL_EVENT	r/w	0*,1	Indicated the availability of Autocoll event
6	TIMER0_EVENT	r/w	0*,1	Indicated the availability of Timer0 event

All information provided in this document is subject to legal disclaimers.

Table 23. EVENT_STATUS register (address 0002h) bit description*...continued*

Bit	Symbol	Access	Value	Description
5	TX_OVERCURRENT_ERROR_EVENT	r/w	0*,1	Indicated the availability of transmitter over current error. This bit is set, when the current on the TX driver is higher than the defined threshold in the EEPROM. Upon this condition, the field is automatically switched OFF before the notification to the host.
4	RFON_DET_EVENT	r/w	0*,1	Indicated the availability of RF ON detected.
3	RFOFF_DET_EVENT	r/w	0*,1	Indicated the availability of Standby Prevention reason.
2	STANDBY_PREV_EVENT	r/w	0*,1	Indicated the availability of Standby Prevention reason.
1	GENERAL_ERROR_EVENT	r/w	0*,1	Indicated the availability of General Error event.
0	BOOT_EVENT	r/w	0*,1	Indicated the availability of Boot event.

9.25.5 EMD_CONTROL (0003h)

To activate the EMVCo EMD handling of the PN5190B1, the following bits of the register need to be set as follows:

0001b: EMD_ENABLE

1b: EMD_TRANSMISSION_ERROR_ABOVE_NOISE_THRESHOLD_IS_NO_EMD

0001b: EMD_NOISE_BYTES_THRESHOLD

Table 24. EMD_CONTROL register (address 0003h) bit description

Bit	Symbol	Access	Value	Description
31:12	RFU	rw	0*,1	-
11:10	EMD_RM_EMD_SENSITIVITY	rw	0*,1	RM EMD SENSITIVITY value that will be applied to SIGPRO_RM_CONFIG, At layer 4, when EMD is enabled, the value of EMD_RM_SENSITIVITY can be lowered to ensure robust EMD suppression, if during the layer 3 activation, the value of EMD_RM_SENSITIVITY in the protocol area is set to a high value to ensure collision detection and resolution when multiple typeA cards are presented at close distance to the antenna.
9:8	EMD_TRANSMISSION_TIMER_USED	rw	0*,1	Timer used for RF communication.
7	EMD_MISSING_CRC_IS_PROTOCOL_ERROR_TYPE_B	rw	0*,1	Missing CRC treated as protocol error in » case of Type B based communication P » case of Type B based communication
6	EMD_MISSING_CRC_IS_PROTOCOL_ERROR_TYPE_A	rw	0*,1	Missing CRC treated as protocol error in » case of Type A based communication P » case of Type A based communication

All information provided in this document is subject to legal disclaimers.

Table 24. EMD_CONTROL register (address 0003h) bit description*...continued*

Bit	Symbol	Access	Value	Description
5:2	EMD_NOISE_BYTES_THRESHOLD	rw	0*,1	Defines the threshold under which transmission errors are treated as noise. Note: CRC bytes are NOT included/counted!
1	EMD_TRANSMISSION_ERROR_ABOVE_NOISE_THRESHOLD_IS_NO_EMD	rw	0*,1	Transmission errors with received byte length >= EMD_NOISE_BYTES_THRESHOLD is never treated as EMD (can be used for versions below EMVCo3.0)
0	EMD_ENABLE	rw	0*,1	EMD handling enabled If this register is enabled by setting EMVCO_EMD_ENABLE=1, the registers EMD_0_CONFIG and EMD_1_CONFIG is ignored for the EMVCO_EMD function.

9.25.6 FELICA_EMD_CONTROL (0004h)

Table 25. FELICA_EMD_CONTROL register (address 0004h) bit description

Bit	Symbol	Access	setting for FeliCa EMD handlir	Value	Description
31:24	FELICA_EMD_RC_BYTE_VALUE	rw	0	0*,1	FeliCa RC byte value that needs to be received does not treat the frame as EMD
23:16	FELICA_EMD_LENGTH_BYTE_MAX	rw	0	0*,1	Maximum Length byte value that needs to be received does not treat the frame as EMD
15:8	FELICA_EMD_LENGTH_BYTE_MIN	rw	0	0*,1	Minimum Length byte value that needs to be received does not treat the frame as EMD
7:5	RESERVED	rw	0	0*,1	-
6	FELICA_EMD_LOG_ENABLE	rw	0 or 1	0*1	Log Enable bit to send RX Status during EMD
5	FELICA_EMD_RC_CHECK_ON_CRC_CORRECT_ENABLE	rw	0 or 1	0*1	RC byte check enabled for FeliCa EMD handling on complete RF Frame when there is no Integrity Error observed
4	FELICA_EMD_INTEGRITY_ERR_CHECK_ENABLE	rw	1	0*,1	FeliCa EMD handling enabled when integrity error is set
3	FELICA_EMD_PROTOCOL_ERR_CHECK_ENABLE	rw	1	0*,1	FeliCa EMD handling enabled when protocol error is set
2	FELICA_EMD_RC_CHECK_ENABLE	rw	0	0*,1	FeliCa RC byte check enabled for FeliCa EMD handling
1	FELICA_EMD_LEN_CHECK_ENABLE	rw	0	0*,1	FeliCa Length byte check enabled for FeliCa EMD handling
0	FELICA_EMD_ENABLE	rw	1	0*,1	FeliCa EMD handling enabled

Recommended value for FeliCa EMD handling: 00FF0019h

9.25.7 RX_STATUS (0005h)

Table 26. RX_STATUS register (address 0005h) bit description

Bit	Symbol	Access	Value	Description
31:27	RFU	r	0*,1	-
26:20	RX_COLL_POS	r	0*,1	Status indicating the bit position of the first collision detected in the data bit. The value is valid only when RX_COLLISION_DETECTED==1. The value of the RX_BIT_ALIGN is also taken into account (RX_ COLL_POS = physical bit position in the flow + RX_ BIT_ALIGN value). Indicates the collision position in the first 8 bytes only. Can be used during the TypeA/ICODE/EPC anti-collision procedure.0x00 - first bit 0x01 - second bit...0x7F - 128th bit. The status register is not updated by the collision detected on stop or parity bit.
19:17	RX_NUM_LAST_BITS	r	0*,1	Indicating the number of valid bits in the last byte received. 0: all bits are valid 1: 1 bit is valid …. 7: - 7 bits are valid This is generally used during ISO/IEC14443 type A anti-collision
16:13	RX_NUM_FRAMES_RECEIVED	r	0*,1	Indicates the number of frames received. The value is updated after every normal frame reception in RX_ MULTIPLE mode. The value is valid only if the bit RX_MULTIPLE_ ENABLE==’1’.
12:0	RX_NUM_BYTES_RECEIVED	r	0*,1	Number of bytes received on the RF interface. This field is not relevant when RX_MULTIPLE_ ENABLE=='1'.

9.25.8 RX_STATUS_ERROR (0006h)

Table 27. RX_STATUS_ERROR register (address 0006h) bit description

Bit	Symbol	Access	Value	Description
31:30	RFU	r	0*,1	
29	EMD_DETECTED_IN_RXDEC	r/w	0*,1	The high level indicates that the EMD was detected (in the SigPro or in the RxDecoder or in both) during the reception.
28	EMD_DETECTED_IN_SIGPRO	r/w	0*,1	The high level indicates that the EMD was detected on the Physical layer (in the SigPro) during the reception.
27	EXT_RFOFF_DETECTED	r/w	0*,1	The high level indicates that the received frame length violated the configured minimum limit.
26	RX_FRAME_MAXLEN_VIOL	r/w	0*,1	The high level indicates that the received frame length is less or equal to the expected CRC field length.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Table 27. RX_STATUS_ERROR register (address 0006h) bit description*...continued*

Bit	Symbol	Access	Value	Description
25	RX_FRAME_MINLEN_VIOL	r/w	0*,1	The high level indicates that the last received character in the frame has less than 8 bits.
24	RX_FRAME_LE_CRC	r/w	0*,1	The high level indicates that the last received character in the frame has 8 data bits but the expected parity bit is absent.
23	RX_NOT_FULL_BYTE	r/w	0*,1	The high level indicates that the last received character in the frame has 8 data bits but the expected stop bit is absent.
22	RX_MISSING_PARBIT_ DETECTED	r/w	0*,1	The high level indicates that the collision was detected on the parity bit position.
21	RX_MISSING_STOPBIT_ DETECTED	r/w	0*,1	The high level indicates that the collision was detected on the stop bit position.
20	RX_COLLISION_PARBIT_ DETECTED	r/w	0*,1	The high level indicates that the collision was detected during the frame reception.
19	RX_COLLISION_STOPBIT_ DETECTED	r/w	0*,1	The high level indicates that the frame reception was stopped by SGP_MSG_RXOVER_* message reception.
18	RX_COLLISION_DETECTED	r/w	0*,1	The high level indicates that the collision was detected during the frame reception.
17	RX_STOP_ON_RXOVER	r/w	0*,1	The high level indicates that the frame reception was stopped by SGP_MSG_RXOVER_* message reception.
16	RX_STOP_ON_RFOFF	r/w	0*,1	The high level indicates that the frame reception was interrupted by external RF-field vanishing event.
15	RX_STOP_ON_ERR	r/w	0*,1	The high level indicates that the frame reception was stopped by detected communication error event.
14	RX_STOP_ON_LEN	r/w	0*,1	The high level indicates that the frame reception was normally stopped by byte counter expiration event. Relates to the protocols where the LEN field is used in the frame format (FeliCa RM/CM, FWEC RM/CM).
13	RX_STOP_ON_INVPAR	r/w	0*,1	The high level indicates that the frame reception was normally stopped by the inverted parity detection event. Relates to the TypeA RM 212-848 kbit/s modes. 12 RX_STOP_ON_PATTERN R 0h The high level indicates that the frame reception was normally stopped by EOF pattern detection event. Relates to the TypeB RM/CM, B prime RM/ CM modes.
12	RX_STOP_ON_PATTERN	r/w	0*,1	The high level indicates that the frame reception was normally stopped by EOF pattern detection event. Relates to the TypeB RM/CM, B prime RM/ CM modes.

All information provided in this document is subject to legal disclaimers.

Table 27. RX_STATUS_ERROR register (address 0006h) bit description*...continued*

Bit	Symbol	Access	Value	Description
11	RX_STOP_ON_ANTICOLL	r/w	0*,1	The high level indicates that the frame reception was normally stopped by collision detected on data bit position. Relates to the bit-oriented frame reception in TypeA RM 106 kbit/s mode during the anti-collision procedure.
10	RX_CRC_ERROR	r/w	0*,1	The high level indicates that the CRC error is detected in the received frame.
9	RX_LEN_ERROR	r/w	0*,1	The high level is set if the received frame is shorter than the length stated in the received frame LEN field OR if the LEN parameter in the received frame violates the configured [RX_FRAME_MINLEN:RX_FRAME_MAX LEN] limits. Can assert only in the mode where the LEN field is used in the frame format (FeliCa RM/CM, FWEC RM/CM).
8	RX_SIGPRO_ERROR	r/w	0*,1	The high level indicates that the communication error/errors were detected during the frame reception on physical layer(in the SigPro).
7	RX_PARITY_ERROR	r/w	0*,1	The high level indicates that the parity error was detected during the frame reception.
6	RX_STOPBIT_ERROR	r/w	0*,1	The high level indicates that the stop bit error (‘0’ level instead of ‘1’ on the stop bit position) was detected during the frame reception.
5	RX_WRITE_ERROR	r/w	0*,1	The high level indicates that the error acknowledge status was received on the CLIF-system interface during the received frame transmission to the System RAM.
4	RX_BUFFER_OVFL_ERROR	r/w	0*,1	The high level indicates that the data payload length in the received frame exceeds the 28 bytes limit. Relates to the PollReq procedure in the FeliCa RM mode only.
3	RX_LATENCY_ERROR	r/w	0*,1	The high level indicates that the write request flow was corrupted due to traffic congestion on the system interface during the received frame transmission to the System RAM.
2	RX_DATA_INTEGRITY_ERROR	r/w	0*,1	The high level indicates that the data integrity corruption (parity/CRC/etc error) was detected in the received frame.
1	RX_PROTOCOL_ERROR	r/w	0*,1	The high level indicates that the protocol requirements violation (stop bit error, missing parity bit, not full byte received, etc) was detected in the received frame.
0	RX_CL_ERROR	r/w	0*,1	The high level indicates that some protocol/data integrity erorr/errors were detected during the frame reception

9.25.9 CLIF_STATUS (0007h)

Table 28. CLIF_STATUS register (address 0007h) bit description

Bit	Symbol	Access	Value	Description
31:30	RFU	r	0*,1	-
29	CRC_OK	r	0*,1	This bit indicates the status of the actual CRC calculation. If 1 the CRC is correct. meaning the CRC register has the value 0 or the residue value if inverted CRC is used. Note: This flag should only be evaluated at the end of a communication
28	RX_SC_DETECTED	r	0*,1	Status signal indicating that a subcarrier is detected.
27	RX_SOF_DETECTED	r	0*,1	Status signal indicating that a SOF has been detected.
26	TX_RF_STATUS	r	0*,1	If set to 1 this bit indicates that the drivers are turned on. meaning an RF-Field is created by the device itself.
25	RF_DET_STATUS	r	0*,1	If set to 1 this bit indicates that an external RF-Field is detected by the RF level detectors (after digital filtering)
24	ADC_Q_CLIPPING	r	0*,1	Indicates that the Q-Channel ADC has clipped (value 0 or 63), This bit is reset with Rx-reset (enabling of receiver).
23	ADC_I_CLIPPING	r	0*,1	Indicates that the I-Channel ADC has clipped (value 0 or 63), This bit is reset with Rx-reset (enabling of receiver).
22:12	RFU	r	0*,1	-
11	TX_NO_DATA_ERROR	r	0*,1	This error flag is set to 1. in case a transmission is started but no data is available (register NumBytesToSend == 0).
10:8	RF_ACTIVE_ERROR_CAUSE	r	0*,1	This status flag indicates the cause of an NFC-Active error. Note: These bits are only valid when the RF_ ACTIVE_ERROR_IRQ is raised and will be cleared as soon as the bit TX_RF_ENABLE is set to 1. 0* No Error. reset value 1 External field was detected on within TIDT timing 2 External field was detected on within TADT timing 3 No external field was detected within TADT timings 4 Peer did switch off RF Field without but no RX event was raised (no data received) 5 - 7 Reserved.
7:6	RFU	r	0*,1	-
5	RX_ENABLE	r	0*,1	This bit indicates if the RxDecoder is enabled. If 1 the RxDecoder was enabled and is now ready for data reception
4	TX_ACTIVE	r	0*,1	This bit indicates activity of the TxEncoder. If 1 a transmission is ongoing otherwise the TxEncoder is in idle state.
3	RX_ACTIVE	r	0*,1	This bit indicates activity of the RxDecoder. If 1 a data reception is ongoing. otherwise the RxDecoder is in idle state.

Table 28. CLIF_STATUS register (address 0007h) bit description*...continued*

Bit	Symbol	Access	Value	Description
2:0	RF_EXCHANGE_STATE	r	0*,1	These registers hold the command bits 0* IDLE state 1 WaitTransmit state 2 Transmitting state 3 WaitReceive state 4 WaitForData state 5 Receiving state 6 LoopBack state 7 reserved

9.25.10 RF_EXCHANGE_CONTROL (0008h)

To meet the ISO14443A FDT with an accuracy of 1 carrier clock cycle, there is support implemented to synchronize the guard time pre-scaler to the modified Miller envelope pulses (end of pulse). For adjustment, there is a 7-bit wide configuration register - TX_BITPHASE - which is allows to adjust the FDT in the range of 0 to 128 carrier clock cycles. As defined in the ISO14443 the adjustment is different, depending on the data bit value of the data stream. For correct bit grid calculation, the pre-scaler must be set to a value corresponding exactly to one etu - for 106 kbit/s this corresponds to 0x7F. Otherwise the FdT will be incorrect.

Table 29. RF_EXCHANGE_CONTROL register (address 0008h) bit description

Bit	Symbol	Access	Value	Description
31:16	RFU	r	0*,1	-
15:8	TX_BITPHASE	r/w	0*,1	Defines the number of 13.56 MHz cycles used for adjustment of TX_WAIT to meet the FDT. This is applicable for CardMode only.
7:3	RFU	r/w	0*,1	-
2	RX_MULTIPLE_ENABLE	r/w	0*,1	If this bit is set to 1. the receiver is reactivated after the end of a reception.
1:0	RFU	r/w	0*,1	-

9.25.11 TX_SYMBOL01_MOD (0009h)

Table 30. TX_SYMBOL01_MOD register (address 0009h) bit description

Bit	Symbol	Access	Value	Description
31:24	RFU	rw	0*,1	-
23:16	TX_S01_MODWIDTH	rw	0*,1	Specifies the length of a pulse for sending data of symbol 0/1. The length is given by the number of carrier clocks + 1.
15:9	RFU	rw	0*,1	-
8	TX_S01_MILLER_ENABLE	rw	0*,1	If set to 1. pulse modulation is applied according to modified miller coding.
7:5	TX_S01_INV_ENV	rw	0*,1	If set to 1. the output envelope is inverted.

All information provided in this document is subject to legal disclaimers.

Table 35. TX_SYMBOL_CONFIG register (address 000Eh) bit description...*continued*

Bit	Symbol	Access	Value	Description
22:19	TX_SYMBOL0_BURST_LEN	r/w	0*,1	Specifies the number of bits issued for symbol 0 burst. The 3 bits encode a range from 8 to 256 bit length: 0000b 8 bit 0001b 12 bit 0010b 16 bit 0011b 24 bit 0100b 32 bit 0101b 40 bit 0110b 48 bit 0111b 64 bit 1000b 80 bit 1001b 96 bit 1010b 112 bit 1011b 128 bit 1100b 160 bit 1101b 192 bit 1110b 224 bit 1111b 256 bit
18	TX_SYMBOL0_BURST_TYPE	r/w	0*,1	Specifies the type of the burst of Symbol0 (logical zero / logical one)
17	TX_SYMBOL0_BURST_ONLY	r/w	0*,1	If set to 1. Symbol0 consists only of a burst and no symbol pattern
16	TX_SYMBOL0_BURST_ ENABLE	r/w	0*,1	If set to 1. the burst of Symbol0 of the length defined in bit field SYMBOL0_BURST_LEN is enabled
15:13	TX_SYMBOL3_LEN	r/w	0*,1	Specifies the number of valid bits of the symbol definition of Symbol3. The range is from 1 bit (value 0000) to 8 bit (value 111)
12:10	TX_SYMBOL2_LEN	r/w	0*,1	Specifies the number of valid bits of the symbol definition of Symbol2. The range is from 1 bit (value 0000) to 8 bit (value 111)
9:5	TX_SYMBOL1_LEN	r/w	0*,1	Specifies the number of valid bits of the symbol definition of Symbol1. The range is from 1 bit (value 0000) to 31 bits (value 11110)
4:0	TX_SYMBOL0_LEN	r/w	0*,1	Specifies the number of valid bits of the symbol definition of Symbol0. The range is from 1 bit (value 0000) to 31 bits (value 11110)

9.25.17 TX_FRAME_CONFIG (000Fh)

Table 36. TX_FRAME_CONFIG register (address 000Fh) bit description

Bit	Symbol	Access	Value	Description
31:19	RFU	r	0*,1	-
18:16	TX_DATA_CODE_TYPE	r/w	0*,1	Specifies the type of encoding of data to be used 000b No special code 001b 1 out of 4 code [ICODE SLI] 010b 1 out of 256 code [ICODE SLI] 011b Pulse interval encoding (PIE) [ICODE EPC-V2] 100b 2bit tupple code (intended only for test purpose) 101-111b Reserved
15:13	TX_STOPBIT_TYPE	r/w	0*,1	Enables the stop bit (logic 1) and extra guard time (logic 1). The value 0 disables transmission of stop-bits. 000b no stop-bit. no EGT 001b stop-bit. no EGT 010b stop-bit + 1 EGT 011b stop-bit + 2 EGT 100b stop-bit + 3 EGT 101b stop-bit + 4 EGT 110b stop-bit + 5 EGT 111b stop-bit + 6 EGT
12	TX_STARTBIT_ENABLE	r/w	0*,1	If set to 1. a start-bit (logic 0) will be sent
11	TX_MSB_FIRST	r/w	0*,1	If set to 1. data bytes are interpreted MSB first for data transmission
10	TX_PARITY_LAST_INV_ ENABLE	r/w	0*,1	If set to 1. the parity bit of last sent data byte is inverted

Table 36. TX_FRAME_CONFIG register (address 000Fh) bit description*...continued*

Bit	Symbol	Access	Value	Description
9	TX_PARITY_TYPE	r/w	0*,1	Defines the type of the parity bit 0 Even Parity is calculated 1 Odd parity is calculated
8	TX_PARITY_ENABLE	r/w	0*,1	If set to 1. a parity bit is calculated and appended to each byte transmitted. If the Transmission Of Data Is Enabled and TX_NUM_BYTES_2_SEND is zero. then a NO_DATA_ERROR occurs.
7:5	RFU	r	0*,1	-
4	TX_DATA_ENABLE	r/w	0*,1	If set to 1. transmission of data is enabled otherwise only symbols are transmitted.
3:2	TX_STOP_SYMBOL	r/w	0*,1	Defines which pattern symbol is sent as frame stop-symbol 00b No symbol is sent 01b Symbol1 is sent 10b Symbol2 is sent 11b Symbol3 is sent
1:0	TX_START_SYMBOL	r/w	0*,1	Defines which symbol pattern is sent as frame start-symbol 00b No symbol pattern is sent 01b Symbol0 is sent 10b Symbol1 is sent 11b Symbol2 is sent

9.25.18 TX_DATA_MOD (0010h)

Table 37. TX_DATA_MOD register (address 0010h) bit description

Bit	Symbol	Access	Value	Description
31:25	RFU	r	0*,1	-
24	TX_ICODE_DATA_MODWIDTH_ ENABLE	r/w	0*,1	Enables modulation width of icode data. Width of modulation is defined by the TX_DATA_MODWIDTH field. When 1, we should have TX_DATA_ENV_ TYPE=0 and TX_DATA_INV_ENV=0
23:16	TX_DATA_MODWIDTH	r/w	0*,1	Specifies the length of a pulse for sending data with miller pulse modulation enabled. The length is given by the number of carrier clocks + 1.
15:9	RFU	r	0*,1	-
8	TX_DATA_MILLER_ENABLE	r/w	0*,1	If set to 1 pulse modulation is applied according to modified miller coding
7	TX_DATA_INV_ENV	r/w	0*,1	If set to 1 the output envelope is inverted
6:4	TX_DATA_ENV_TYPE	r/w	0*,1	Specifies the type of envelope used for transmission of data packets. The selected envelope type is applied to the pseudo bit stream. 000b Direct output 001b Manchester code 010b Manchester code with subcarrier 011b BPSK 100b RZ (pulse of half bit length at beginning of second half of bit) 101b RZ (pulse of half bit length at beginning of bit) 110b Manchester tupple coding 111b RFU
3	TX_DATA_SC_FREQ	r/w	0*,1	Specifies the frequency of the subcarrier. 0 424 kHz 1 848 kHz
2:0	TX_DATA_BIT_FREQ	r/w	0*,1	Specifies the frequency of the bit-stream. 000b -> 1.695 MHz. 001b -> Reserved. 010b -> 26 kHz. 011b -> 53 kHz. 100b -> 106 kHz. 101b -> 212 kHz. 110b -> 424 kHz. 111b -> 848 kHz.

9.25.19 TX_WAIT (0011h)

To guarantee correct protocol timing a guard period timer is implemented for the RF_EXCHANGE command in reception and transmission mode.

These guard times are not available for Transmit or Receive command.

The guard time TX_WAIT is started after the end of a reception no matter if the frame is correct or erroneous.

It is not started in case the reception is restarted because of an EMD-event or in case the RX_MULTIPLE_ENABLE bit is set to 1 the TX_WAIT.

In case the register flag TX_WAIT_RFON_ENABLE is set to 1 the guard time timer is started when the devices own RF-Field was switched on.

It is possible to disable the guard time tx_wait by setting the register TX_WAIT_VALUE to 00h.

TX_WAIT can be used for 2 different purposes:

1. It can be used to prevent start of transmission before a certain period has expired - even if FW already finished data processing and set the START_SEND bit. This behavior is mainly intended for reader mode to guaranteed PICC to PCD frame delay time (FDT).

2. TX_WAIT time can be used to start the transmission at an exactly defined time.

Table 38. TX_CLIF_WAIT register (address 0011h) bit description

Bit	Symbol	Access	Value	Description
31:28	RFU	r	0*,1	-
27:8	TX_WAIT_VALUE	r/w	0*,1	Defines the tx_wait timer reload value. Note: If set to 00000h the tx_wait timer guard time is disabled Note: This bit is set by HW a protocol is detected in automatic mode detection
0	TX_WAIT_PRESCALER	r/w	0*,1	Defines the prescaler reload value for the tx_wait timer. Note: This bit is set by HW a protocol is detected in automatic mode detection

9.25.20 TX_CRC_CONFIG (0012h)

Table 39. TX_CRC_CONFIG (address 0012h) bit description

Bit	Symbol	Access	Value	Description
31:16	TX_CRC_PRESET_VALUE	r/w	0*-FFFFh	Arbitrary preset value for the TX-Encoder CRC calculation.
15:7	RFU	r/w	0	Reserved
6	TX_CRC_BYTE2_ENABLE	r/w	0*,1	If set; the CRC is calculated from the second byte onwards (intended for HID). This option is used in the TX-Encoder.
5:3	TX_CRC_PRESET_SEL	r/w	000-101b	Preset values of the CRC register for the TX-Encoder. For a CRC calculation using 5 bits, only the LSByte is used.
			000b*	0000h, reset value
			001b	6363h

All information provided in this document is subject to legal disclaimers.

Table 50. DGRM_BBA register (address 002Dh) bit description*...continued*

Bit	Symbol	Access	Value	Description
13:11	DGRM_BBA_MAX_VAL	r/w	0*,1	Defines the maximum value of BBA gain. 5: +24dB 4: +18dB 3: +12dB 2: +6dB 1: 0dB 0: -6dB
10:8	DGRM_BBA_INIT_VAL	r/w	0*,1	Defines initial value of BBA gain. 5: +24dB 4: +18dB 3: +12dB 2: +6dB 1: 0dB 0: -6dB
7:0	RFU	r	0*,1	-

9.25.32 DGRM_RSSI (0030h)

This register is updated dynamically by the firmware if the DPC is enabled.

Table 51. DGRM_RSSI register (address 0030h) bit description

Bit	Symbol	Access	Value	Description
31:30	RFU			-
29	DGRM_SIGNAL_DETECT_TH_OVR	r/w	0*,1	Enables the override of signal detect threshold. Override value is set based on DGRM_SIGNAL_DETECT_TH_OVR_VAL.
28:23	RFU	r/w	0*,1	-
22:17	DGRM_RSSI_HYST	r/w	0*,1	Hysteresis value for RSSI target
16:7	DGRM_RSSI_TARGET	r/w	0*,1	RSSI target value
6:0	DGRM_SIGNAL_DETECT_TH_OVR_VAL	r/w	0*,1	Defines the override value for signal detect threshold when DGRM_SIGNAL_DETECT_TH_OVR is set. These bits are modified dynamically by the ARC algorithm based on the DPC voltage. Only if the ARC is disabled, the value written during LOAD_RF_CONFIGURATION(0x0D) is retained throughout the RF Field session.

9.25.33 RX_CRC_CONFIG (0031h)

Table 52. RX_CRC_CONFIG register (address 0031h) bit description

Bit	Symbol	Access	Value	Description
31:16	RX_CRC_PRESET_VALUE	r	0*,1	Arbitrary preset value for the Rx-Decoder CRC calculation.
15:8	RFU	r/w	0*,1	-
7	RX_FORCE_CRC_WRITE	r/w	0*,1	If set. the Rx-Decoder will send to the RAM the CRC bits as well.

All information provided in this document is subject to legal disclaimers.

Table 52. RX_CRC_CONFIG register (address 0031h) bit description*...continued*

Bit	Symbol	Access	Value	Description
6	RX_CRC_ALLOW_BITS	r/w	0*,1	If activated the frame with length =< CRC_length will be always sent to the System RAM as is, without CRC bits removal.
5:3	RX_CRC_PRESET_SEL	r/w	0*,1	Preset value of the CRC register for the Rx-Decoder. For a CRC calculation using 5bits only the LSByte is used. 000b* 0000h reset value. Note that this configuration is set by the Mode detector for FeliCa. 001b 6363h Note that this configuration is set by the Mode detector for ISO14443 type A. 010b A671h 011b FFFFh Note that this configuration is set by the Mode detector for ISO14443 type B. 100b 0012h 101b E012h 110b RFU 111b Use arbitrary preset value RX_CRC_PRESET_VALUE
2	RX_CRC_TYPE	r/w	0*,1	Controls the type of CRC calculation for the Rx-Decoder 0* 16bit CRC calc
1	RX_CRC_INV	r/w	0*,1	Controls the comparison of the CRC checksum for the Rx-Decoder 0*: Not inverted CRC value: 0000h reset value. Note that this bit is cleared by the Mode detector for ISO14443 type A and FeliCa. 1: Inverted CRC value: F0B8h Note that this bit is set by the Mode detector for ISO14443 type B
0	RX_CRC_ENABLE			If set. the Rx-Decoder will check the CRC for correctness. Note that this bit is set by the Mode Detector when ISO14443 type B. or FeliCa (212 kBd or 424 kBd) is detected.

9.25.34 RX_WAIT (0032h)

To guarantee correct protocol timing a guard period timer is implemented for the RF_EXCHANGE command in reception and transmission mode.

These guard times are not available for Transmit or Receive command.

The guard time RX_WAIT is started after the end of a transmission. The guard time RX_WAIT can be disabled by setting the register RX_WAIT_VALUE to 00h meaning the receiver is immediately enabled.

Table 53. RX_WAIT register (address 0032h) bit description

Bit	Symbol	Access	Value	Description
31:28	RFU	r	0*,1	-
27:8	RX_WAIT_VALUE	r/w	0*,1	Defines the rx_wait timer reload value. Note: If set to 00000h the rx_wait guard time is disabled

All information provided in this document is subject to legal disclaimers.

9.25.41 TIMER0_RELOAD (003Eh)

Table 60. TIMER0_RELOAD register (address 003Eh) bit description

Bit	Symbol	Access	Value	Description
31:20	RFU	r	0*,1	-
19:0	T0_RELOAD_VALUE	r/w	0*,1	Reload value of the timer T0.

9.25.42 TIMER1_CONFIG (003Fh)

Timer 1 is typically used for the FDT configuration. Configuration can be done from the host but the associated IRQ is handled by the firmware of the PN5190B1.

Table 61. TIMER1_CONFIG register (address 003Fh) bit description

Bit	Symbol	Access	Value	Description
31	RFU	r	0*,1	-
30	T1_STOP_ON_RX_STARTED	r/w	0*,1	T1_STOP_EVENT: If set. the timer T1 is stopped when a data reception begins (1st bit is received).
29	T1_STOP_ON_TX_STARTED	r/w	0*,1	T1_STOP_EVENT: If set. the timer T1 is stopped when a data transmission begins.
28	T1_STOP_ON_RF_ON_EXT	r/w	0*,1	T1_STOP_EVENT: If set. the timer T1 is stopped when the external RF field is detected.
27	T1_STOP_ON_RF_OFF_EXT	r/w	0*,1	T1_STOP_EVENT: If set. the timer T1 is stopped when the external RF field vanishes.
26	T1_STOP_ON_RF_ON_INT	r/w	0*,1	T1_STOP_EVENT: If set. the timer T1 is stopped when the internal RF field is turned on.
25	T1_STOP_ON_RF_OFF_INT	r/w	0*,1	T1_STOP_EVENT: If set. the timer T1 is stopped when the internal RF field is turned off.
24	T1_STOP_ON_RX_ENDED	r/w	0*,1	T1_STOP_EVENT: If set the timer T1 is stopped when an activity on RX is detected.
23:18	RFU	r	0*,1	-
17	T1_START_ON_RX_STARTED	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when a data reception begins (1st bit is received).
16	T1_START_ON_RX_ENDED	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when a data reception ends.
15	T1_START_ON_TX_STARTED	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when a data transmission begins.
14	T1_START_ON_TX_ENDED	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when a data transmission ends.
13	T1_START_ON_RF_ON_EXT	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when the external RF field is detected.
12	T1_START_ON_RF_OFF_EXT	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when the external RF field is not detected anymore.
11	T1_START_ON_RF_ON_INT	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when an internal RF field is turned on.

Table 61. TIMER1_CONFIG register (address 003Fh) bit description *...continued*

Bit	Symbol	Access	Value	Description
10	T1_START_ON_RF_OFF_INT	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when an internal RF field is turned off.
9	T1_START_ON_TX_ FRAMESTEP	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started when an activity on Frame step is detected.
8	T1_START_NOW	r/w	0*,1	T1_START_EVENT: If set. the timer T1 is started immediately.
7	RFU	r	0*,1	-
6	T1_ONE_SHOT_MODE	r/w	0*,1	When set to 1, the counter value does not reload again until the counter value has reached zero
5:3	T1_PRESCALE_SEL	r/w	0*,1	Controls input frequency/period of the timer T0 when the prescaler is activated in T1_MODE_SEL. 000b - 6.78 MHz counter 001b - 3.39 MHz counter 010b - 1.70 MHz counter 011b - 848 kHz counter 100b - 424 kHz counter 101b - 212 kHz counter 110b - 106 kHz counter 111b - 53 kHz counter
2	T1_MODE_SEL	r/w	0*,1	If set. the timer T1 is started the prescaler for the timer T1 is enabled. 0* Prescaler is disabled: the timer frequency matches CLIF clock frequency (13.56 MHz). 1 Prescaler is enabled: the timer operates on the prescaler signal frequency (chosen by T1_ PRESCALE_SEL).
1	T1_RELOAD_ENABLE	r/w	0*,1	If set to 0.the timer T1 will stop on expiration. 0* After expiration the timer T1 will stop counting. i.e. remain zero. reset value. 1 After expiration the timer T1 will reload its preset value and continue counting down.
0	T1_ENABLE	r/w	0*,1	Enables the timer T1

9.25.43 TIMER1_RELOAD (0040h)

Table 62. TIMER1_RELOAD register (address 0040h) bit description

Bit	Symbol	Access	Value	Description
31:20	RFU	r	0*,1	-
19:0	T1_RELOAD_VALUE	r/w	0*,1	Reload value of the timer T1.

9.25.44 ANA_STATUS (0041h)

Table 63. ANA_STATUS register (address 0041h) bit description

Bit	Symbol	Access	Value	Description
31:21	RFU	rw	0.1	-

All information provided in this document is subject to legal disclaimers.

Table 63. ANA_STATUS register (address 0041h) bit description*...continued*

Bit	Symbol	Access	Value	Description
20:11	ADC_DATA_I	rw	0.1	RX adc I output for validation purposes
10:1	ADC_DATA_Q	rw	0.1	RX adc Q output for validation purposes
0	PLL_LOCK_STATUS	rw	0.1	PLL lock status indicator

9.25.45 ANA_RX_CTRL (0043h)

Table 64. ANA_RX_CTRL register (address 00434h) bit description

Bit	Symbol	Access	Value	Description
31:7	RFU	rw	0.1	-
6	RX_MIXER_SE_MODE_EN	rw	0.1	enable signal for selecting single ended mode
5:0	RFU	rw	0.1	-

9.25.46 ANACTRL_TX_CONFIG (0044h)

Table 65. ANACTRL_TX_CONFIG register (address 0044h) bit description

Bit	Symbol	Access	Value	Description
31:	RFU	rw	0.1	-
5:4	TX_INVP_RM	rw	0.1	shift driver waves of 180 degrees in RM. Index 0: TX1; index 1: TX2
3:2	RFU	rw	0.1	-
1	TX_PWM_MODE_RM	rw	0.1	PWM scheme for RM: 0: TX1/2 3-levels (If at least either clk_mode_tx1 or clk_mode_tx2 is set on a clocked mode) 1: TX1/2 2-levels with differentiated pulses
0	RFU	rw	0.1	-

9.25.47 EMD_1_CFG (0047h)

This register allows to configure the ISO14443 and NFC-Forum EMD handling.

This register shall not be modified in case EMVCO or FeliCa EMD is activated.

Table 66. EMD_1_CFG register (address 0047h) bit description

Bit	Symbol	Access	Value	Value for ISO/ IEC14443 EMD handling	Value for NFC Forum EMD handling	Description
31:0	EMD_1_Configuration	r/w		0000 FF03h	0000 FF04h	0000 FF03h EMD ISO 0000 FF04h EMD NFC Forum

9.25.48 EMD_0_CONFIG (0048h)

This register allows to configure the ISO14443 and NFC-Forum EMD handling.

This register shall not be modified in case EMVCO or FeliCa EMD is activated.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Table 67. EMD_0_CONFIG register (address 0048h) bit description

Bit	Symbol	Acces	Value	Value for ISO/ IEC1444 EMD handling	Value for NFC Forum EMD handlin	Description
31:0	EMD_0_Configuration			176003 FFh	1F600 3FFh	Default value for ISO14443 and NFC Forum

9.25.49 LPCD_CALIBRATE_CTRL (00050h)

This register is used for LPCD semi autonomous mode. Writing to this register triggers the LPCD calibration with the RSSI_HYSTERESIS and RSSI_TARGET values as given in bits 23:16 and 15:0. After calibration is completed, calibration status is available in LPCD_CALIBRATE_STATUS. If the calibration is successful, the I/Q channel values can be read from register IQ_CHANNEL_VALS (51h).

Table 68. LPCD_CALIBRATE_CTRL register (address 0050h) bit description

Bit	Symbol	Access	Value	Description
31	RFU	r	0*,1	-
30	FREEZE_VALUE	r/w	0*,1	Write RSSI_TARGET and RSSI_HYSTERESIS into LPCD_CALIBRATE_CTRL: 1. **FREEZE_VALUE = 0:** This calibrates the Semi autonomous LPCD. The calibration status can be checked in bit 31 of CALIBRATE_STATUS register (0x53). 2. **FREEZE_VALUE = 1:** This writes the RSSI_TARGET and RSSI_HYSTERESIS into the EEPROM LPCD_RSSI_TARGET (0x494) and LPCD_RSSI_HYSTERESIS (0x496).
29:24	RFU	r	0*,1	-
23:16	RSSI_HYSTERESIS	r/w	0*,1	Value to be set in DGRM_RSSI_HYST used for calibration
15:0	RSSI_TARGET	r/w	0*,1	Value to be set in DGRM_RSSI_TARGET used for calibration

9.25.50 IQ_CHANNEL_VALS (00051h)

Table 69. IQ_CHANNEL_VALS register (address 0051h) bit description

Bit	Symbol	Access	Value	Description
31:16	Q_CHANNEL_VAL	r	-	Q Channel value
15:0	I_CHANNEL_VAL	r	-	I Channel value

9.25.51 PAD_CONFIG (0052h)

Table 70. PAD_CONFIG register (address 0052h) bit description

Bit	Symbol	Access	Value	Description
31:7	RFU	rw		-

All information provided in this document is subject to legal disclaimers.

Table 70. PAD_CONFIG register (address 0052h) bit description*...continued*

Bit	Symbol	Access	Value	Description
6	AUX3_OUTPUT_VAL	rw		Output value for AUX3 0: Low 1: High
5	AUX2_OUTPUT_VAL	rw		Output value for AUX2 0: Low 1: High
4	AUX1_OUTPUT_VAL	rw		Output value for AUX1 0: Low 1: High
3	GPIO3_OUTPUT_VAL	rw		Output value for GPIO3 0: Low 1: High
2	GPIO2_OUTPUT_VAL	rw		Output value for GPIO2 0: Low 1: High
1	GPIO1_OUTPUT_VAL	rw		Output value for GPIO1 0: Low 1: High
0	GPIO0_OUTPUT_VAL	rw		Output value for GPIO0 0: Low 1: High

On PN5190B1 only output functionality is available on GPIO's.

9.25.52 CALIBRATE_STATUS (00053h)

Table 71. CALIBRATE_STATUS register (address 0053h) bit description

Bit	Symbol	Access	Value	Description
31	LPCD_CALIBRATION_STATUS	r	-	Calibration Status 0 - Calibration Not Done, 1- Calibration Done
30:1	RFU	r	-	-
0	TXNOV_CALIBRATION_STATUS			Calibration Status 0 - Calibration Not Done, 1- Calibration Done

9.25.53 TXLDO_VDDPA_CONFIG (00054h)

If DPC is disabled, the VDDPA supply voltage can be set with this register. These register settings are overruled by the DPC.

This register does allow to read the actual VDDPA supply voltage independent from having the DPC enabled/disabled, this allows to read-out the actual transmitter supply voltage.

All information provided in this document is subject to legal disclaimers.

Table 75. DAC register (address 0057h) bit description*...continued*

Bit	Symbol	Access	Value	Description
11:8	TUNING_DAC_1_RANGE			Reference voltage of the DAC, allows to increase the resolution in case a limited output voltage is required. For max output voltage, 0x000 need to be configured (3.8 V) x000=2V x001=3V x011=3.45V x111=3.8V
7:1	TUNING_DAC_1_VALUE			Output voltage of DAC1 according to 1/128 * <TUNING_DAC_1_VALUE> * <Range in V>
0	TUNING_DAC_1_PD			0=DAC Turned off, 1=DAC enabled

9.25.57 PMU_ANA_SMPS_CTRL_REG (00058h)

Table 76. PMU_ANA_SMPS_CTRL_REG register (address 0058h) bit description

Bit	Symbol	Access	Value	Description
31:30	RFU			-
29:27	SMPS_MAXDT_SEL			SMPS max duty cycle value, valid when SMPS_MAX_DTC_BYPASS is set
26	SMPS_MAXDT_SEL_BYPASS			SMPS max duty cycle lookup table bypass
25:24	SMPS_GM			SMPS Gm setup
23:22	SMPS_RSENSE			SMPS Rsense setup
21:20	SMPS_SOFT_START			SMPS Soft Start setup
19:17	SMPS_SAWTOOTHGEN			SMPS Sawtooth generator setup
16:14	RFU			-
13:12	SMPS_PROT_UNDERSHOOT_VTH			SMPS
11:10	SMPS_REG_SPARE_0			SMPS
9:7	SMPS_PID			SMPS PID filter setup
6:1	SMPS_VDDBOOST_VOUT_SEL			SMPS Output voltage selection
0	SMPS_EN			SMPS enable

9.25.58 RXM_FREQ (00059h)

Table 77. RXM_FREQ register (address 0059h) bit description

Bit	Symbol	Access	Value	Description
31	RXM_FREQ_REG_VALID	r	-	CLIF_RXM_FREQ_REG fields are valid
30:25	RFU	r	-	-
24:16	RXM_FREQ	r	-	frequence difference between the last two consecutive measures at 1.7 MHz (multiple of 13.56MHz/4096). Signed. 2-Complement coded
15:9	RFU	r	-	-

All information provided in this document is subject to legal disclaimers.

Table 77. RXM_FREQ register (address 0059h) bit description*...continued*

Bit	Symbol	Access	Value	Description
0:8	RXM_PHASE	r	-	phase value

9.25.59 RXM_RSSI (0005Ah)

Table 78. RXM_RSSI register (address 005Ah) bit description

Bit	Symbol	Access	Reset Value	Description
31	RFU	r	-	-
22	RXM_RSSI_FROZEN	r	-	The RSSI value is not currently updated
21	RXM_FRQ_OK	r	-	The carrier frequency detected is OK.
20	RXM_RSSI_REG_VALID	r	-	CLIF_RXM_RSSI_REG fields are valid
19:14	RXM_HFATT	r	-	HFAtt latched with RSSI
13:0	RXM_RSSI	r	-	RSSI value

9.25.60 TEMP_SENSOR (005Bh)

Table 79. TEMP_SENSOR register (address 005Bh) bit description

Bit	Symbol	Access	Value	Description
31:16	-	r	0*,1	RFU
15-0	TEMP_SENSOR_DATA	r	0*,1	Indicates the current temperature of the chip in degree celsius. This is the actual temperature data of the sensor which is used for the overheat protection. Maximum temperature readable will be the maximum temperature threshold configured in EEPROM TEMP_WARNING address 0x14.

9.25.61 TX_NOV_CALIBRATE_AND_STORE (005Dh)

Table 80. TX_NOV_CALIBRATE_AND_STORE register (address 005Dh) bit description

Bit	Symbol	Access	Value	Description
31:30	RFU	rw	0*,1	-
0	TX_NOV_CALIBRATE_AND_STORE_VAL	rw		Calibrates the TX NOV and stores the resulting value in EEPROM

9.25.62 DPC_CONFIG (005Eh)

Table 81. DPC_CONFIG register (address 005Eh) bit description

Bit	Symbol	Access	Value	Description
31	DPC_REG_ACCESS	r/w	0*,1	This bit is used to control the access to the register. 1: access allowed. This bit needs to be SET to enable/disable the functionality of bit 0.
30:1	RFU	r/w	0*,1	-

9.26 EEPROM configuration description

The settings done in EEPROM are used for basic configuration which does not change frequently. Typically it is performed once during trimming or configuration of a product. The EEPROM has a limited number of erase/write cycles that can be performed. This means, that configurations that change frequently must be performed in standard registers which do not keep their value during reset and power-off.

This section describes the EEPROM configuration of the PN5190B1.

Writing to the EEPROM has to be performed with Read-Modify-Write for all memory addresses which contain RFU bits.

9.26.11 XTAL_TIMEOUT (0011h)

Table 108. XTAL_TIMEOUT (address 0011h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
11	Configuration for the XTAL startup procedure	7:0	Timeout for XTAL to be ready (in *128us), if the timeout happens, an XTAL error event will be raised. This configuration does not speed up the boot time.

9.26.12 CLK_INPUT_FREQ (0012h)

Table 109. CLK_INPUT_FREQ (address 0012h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
12	Configuration for the PLL input clock frequency	7:4	RFU
		3:0	0010b: 24 MHz 0011b: 32 MHz 0100b: 48 MHz 1000b: XTAL 27.12 MHz All others: RFU

9.26.13 XTAL_CHECK_DELAY (0013h)

Correct Crystal clocking is detected by locking the crystal to the PLL. This allows the system to start quick independent from the crystal startup time. High-quality crystals will start up typically fast and allow by this optimized current consumption, e.g, during ULPCD.

A user needs to find an optimized balance between retry numbers of checking for a proper locking and the interval for checking for a locked PLL.

This allows to configure a timeout value for locking the crystal to the PLL. The timeout value is defined by **Retry_number** x **Interval**. If the timeout is reached, a clock error is raised.

Table 110. XTAL_CHECK_DELAY (address 0013h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
13	**Retry_number**	7:5	Max Number of retries before a clock error is raised
	Interval	4:0	Interval which is used to check if XTAL is ready (unit is 256/fc, e.g. ~18.8 us). This is the time to try to lock the PLL, a stable crystal clock is required for locking. If the PLL is not locked, a next retry to lock the PLL will be done after this interval. This value can be used to optimize the startup time dependent on the crystal characteristics. This is important, e.g., for optimization of the LPCD and ULPCD.

All information provided in this document is subject to legal disclaimers.

9.26.14 TEMP_WARNING (0014h)

Table 111. TEMP_WARNING (address 0014h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
14	CLIF & PMU temperature warning	7:6	PMU high threshold (0: disabled, 1:114degC, 2:125degC, 3:130degC)
		5:4	PMU low threshold (0: disabled, 1:114degC, 2:125degC, 3:130degC)
		3:2	high threshold (0: disabled, 1:114 °C, 2:125 °C, 3:130 °C) - in case temp sensor is triggered, transmitter and TX_LDO are shut down, system goes in low-power mode - default is 130 °C. This event is not indicated by an IRQ to the host, instead GPIO0 with configurable high/low polarity is used to indicate this critical event (Register PAD_CONFIG 0x52). To enable this event on GPIO0, the EEPROM configuration ENABLE_GPIO0_ON_ OVERTEMP (0016h) must be set.
		1:0	low threshold (0: disabled, 1:114 °C, 2:125 °C, 3:130 °C) - in case temperature sensed is lower than threshold, system wakes up from low-power mode, a temp wake-up event is issued to the host - default is 114 °C. This event is not indicated by an IRQ to the host, instead GPIO0 with configurable high/low polarity is used to indicate this critical event (Register PAD_CONFIG 0x52). To enable this event on GPIO0, the EEPROM configuration ENABLE_GPIO0_ON_ OVERTEMP (0016h) must be set.

9.26.15 ENABLE_GPIO0_ON_OVERTEMP (0016h)

Table 112. ENABLE_GPIO0_ON_OVERTEMP (address 0016h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
16	RFU	7..1	-
	Set/Clear GPIO0 during over temperature.	0	If set, the GPIO0 is used to indicate a temperature event. The temperature warning levels are configured in the Register TEMP_WARNING (0014h).

9.26.16 TX_SHAPING_CONFIG (0017h)

Table 113. TX_SHAPING_CONFIG (address 0017h) EEPROM configuration register bit description

Address (hex)	Function	Bit	Description
17		7:1	RFU
		0	TX_PWM_MODE_RM: CLIF_ANACTROL_TX_CONFIG_REG<1> defining 3-levels (0) or 2-levels operational mode

9.26.17 TX_INV_RM (0018h)

Table 202. DPC_TARGET_CURRENT (address 077h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
77	DPC Configuration	15:0	VDDPA target current in mA. The target current +/- hysteresis defines the limiting maximum current for the DPC. This configuration shall not exceed 350 mA - hysteresis.

Note: *The resulting current that is driven by the transmitter can be further reduced based on the current reduction lookup table entries.*

9.26.106 DPC_HYSTERESIS_LOADING (079h)

The hysteresis (DPC_HYSTERESIS_LOADING, DPC_HYSTERESIS_UNLOADING) together with the target current (DPC_TARGET_CURRENT) defines the current limit, at which the DPC automatically decreases or increases the VDDPA.

The VDDPA is automatically reduced, as soon as the current exceeds the DPC_TARGET_CURRENT + DPC_HYSTERESIS_LOADING, and the VDDPA is automatically increased again, as soon as the current is below DPC_TARGET_CURRENT – DPC_HYSTERESIS_UNLOADING.

Table 203. DPC_HYSTERESIS_LOADING (address 079h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
79	DPC Configuration	7:0	Absolute difference of measured transmitter current (target current incl. current reduction) in mA that triggers a DPC update event during loading.

Note: *If the hysteresis is configured too small, it might cause an oscillation of the transmitted field.*

Note: *In most application, the default values work well and do not need to be modified.*

9.26.107 DPC_HYSTERESIS_UNLOADING (07Ch)

The hysteresis (DPC_HYSTERESIS_LOADING, DPC_HYSTERESIS_UNLOADING) together with the target current (DPC_TARGET_CURRENT) defines the current limit, at which the DPC automatically decreases or increases the VDDPA.

The VDDPA is automatically reduced, as soon as the current exceeds the DPC_TARGET_CURRENT + DPC_HYSTERESIS_LOADING, and the VDDPA is automatically increased again, as soon as the current is below DPC_TARGET_CURRENT – DPC_HYSTERESIS_UNLOADING.

Table 204. DPC_HYSTERESIS_UNLOADING (address 07Ch) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
7C	DPC Configuration	7:0	Absolute difference of measured transmitter current (target current incl. current reduction) in mA that triggers a DPC update event during unloading.

Note: *If the hysteresis is configured too small, it might cause an oscillation of the transmitted field.*

9.26.108 DPC_TXLDOVDDPALow (007Dh)

Table 205. DPC_TXLDOVDDPALow (address 007Dh) EEPROM configuration register bit description

Address (hex)	Function	Bit	Description
7D	DPC Configuration	7:0	VDDPA Low Limit for RDON

9.26.109 DPC_TXGSN (007Eh)

Table 206. DPC_TXGSN (address 007Eh) EEPROM configuration register bit description

Address (hex)	Function	Bit	Description
7E	DPC Configuration	7:0	for tx1_gsn < 20: resistance = 10 Ohm / (tx1_gsn + 1) for tx1_gsn >= 20: resistance = 0.5 Ohm

9.26.110 DPC_RDON_Control (007Fh)

Table 207. DPC_RDON_Control (address 007Fh) EEPROM configuration register bit description

Address (hex)	Function	Bit	Description
7F	DPC Configuration	7:0	00: Disabled 01: RdON Control 02-FF: RFU

9.26.111 DPC_InitialRDOn_RFOn (0080h)

Table 208. DPC_InitialRDOn_RFOn (address 0080h) EEPROM configuration register bit description

Address (hex)	Function	Bit	Description
80	DPC Configuration	7:0	Initial GSP TX1/TX2 value during FieldON

9.26.112 DPC_GUARD_TIME (087h)

Table 209. DPC_GUARD_TIME (address 087h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
87	DPC guard time configuration	7:0	Guard time before TX and after RX. 1unit = 1us. The DPC regulation is done once before TX and once after RX. The guard time parameter is the time between DPC regulation completion and TX start. The guard time parameter is the time between RX stop and DPC regulation start. The guard time is always enabled for TX

Note: *Recommendation is not to modify the default value.*

Address (hex)	Function	Bit	Description
1A2	RM_RX_ARC_0	15:0	Bit[15] 0: ARC settings always apply 1: ARC settings applicable during FDT and DPC change Bit [14]: 1: ARC Enabled for this Tech and Baudrate. 0: ARC disabled for this Tech and Baudrate Bits[13:10] = RFU Bit [9] = Enable the IIR filter. Bits[8:7] = MF_GAIN (this value will be applied to the SIGPR_RM_TECH register, applies as soon as the ARC is enabled) Bits[6:0] = DPC_ SIGNAL_DETECT_TH_OVR_VAL (this value will be applied to the DGRM_RSSI register, applies as soon as the ARC is enabled)

Note: *The IIR settings define an all pass filter with approximately -10 dB gain. This can be used to limit the LMA sensitivity of the RX.*

Note: *Bit15 of all RM_RX_ARC_n is recommended to be "0" always.*

9.26.129 ARC_RM_V_26 (01ACh)

This is the setting for type V 26.

9.26.141 SENSE_RES (02B3h)

Table 238. SENSE_RES (address 02B3) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2B3	AUTOCOLL configuration	16:0	ATQA in order byte 0, byte 1
		16:8	Byte1
		7:0	Byte0

9.26.142 NFC_ID1 (02B5h)

Table 239. SIGNAL_SCALING_CONFIG (address 2B5h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2B5	AUTOCOLL configuration		If Random UID is disabled (EEPROM address 0x2CB), the content of these addresses is used to generate a Fixed UID. The order is byte 0, Byte 1, Byte 2; Byte3 - which is the first NFCID1 byte - is fixed to 08h, the check byte is calculated automatically
		23:16	Byte2
		15:8	Byte1:
		7:0	Byte0:

9.26.143 SEL_RES (02B8h)

Table 240. SEL_RES (address 2B8h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2B8	AUTOCOLL configuration	7:0	Response to Select: SAK

9.26.144 FELICA_POLL_RES (02B9h)

The FeliCa response is configured by 18 bytes.

Table 241. FELICA_POLL_RES (address 02B9) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2B9	AUTOCOLL configuration	15:0	FeliCa Polling response (2 bytes (shall be 01h, FEh) + 6 bytes NFCID2 + 8 bytes Pad + 2 bytes system code)
		47:0	NFCID2
		63:0	PAD
		15:0	system code

All information provided in this document is subject to legal disclaimers.

9.26.145 RANDOM_UID_ENABLE (02CBh)

Table 242. RANDOM_UID_ENABLE (address 2CBh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2CB	RFU	7:1	-
	Random UID Enable	0	0: Use UID stored in EEPROM 1: Randomly generate the UID in which the first byte is fixed and the remaining 3 bytes are random A new random number is generated after each RF-OFF to RF-ON.

9.26.146 MFC_AUTH_TIMEOUT (02CCh)

Table 243. MFC_AUTH_TIMEOUT (address 2CCh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2CC	RFU	15:0	Timeout value in micro seconds used for Auth1 and Auth2 stages during MIFARE Classic Authenticate

9.26.147 RSSI_TIMER (02DAh)

Configuration for Card Emulation mode only.

Table 244. RSSI_TIMER (address 2DAh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2DA	RSSI_TIMER	15:0	Default: 423

9.26.148 RSSI_TIMER_FIRST_PERIOD (02DCh)

Table 245. RSSI_TIMER_FIRST_PERIOD (address 2DCh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2DC	RSSI	15:0	First period duration after Rffield ON. Unit is 128/fc (106 kHz) if set to 0 it means that feature is not used 0D2 => ~2 ms

9.26.149 RSSI_CTRL_00_AB (02DEh)

Table 246. RSSI_CTRL_00_AB (address 2DEh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
2DE	RSSI	7:6	Bits [6:7] = RFU
		5:0	Bits [0:5] = (APC_ID_REF_AB) ID of APC_TX entry that is equiv to RSSI = 0 (for Type AB)

All information provided in this document is subject to legal disclaimers.

Table 250. LPCD_AVG_SAMPLES (address 0492h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
492	LPCD setting	7	Defining how many samples of the I and Q values are used for the averaging. Average of samples in power of 2 0->1 sample 1->2 samples 2->4 samples 3->8 samples 4->16 samples 5-> 32 samples

9.26.154 LPCD_RSSI_TARGET (0494h)

Table 251. LPCD_RSSI_TARGET (address 0494h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
494	LPCD setting	7	Value to be set in register DGRM_RSSI_REG_DGRM_RSSI_TARGET Typically the same values from the Type A106 LOAD_RF_CONFIGURATION(0x0D) (DGRM_RSSI register) are used

9.26.155 LPCD_RSSI_HYST (0496h)

Table 252. LPCD_RSSI_HYST (address 0496h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
496	LPCD setting	7	Value to be set in CLIF_DGRM_RSSI_REG_DGRM_RSSI_HYST Typically the same values from the Type A106 LOAD_RF_CONFIGURATION(0x0D) (DGRM_RSSI register) are used

9.26.156 LPCD_CONFIG (0497h)

Table 253. LPCD_CONFIG (address 0497h) EEPROM configuration register bit description

Address (hex)	Function	Bit	Description
497	RFU	15:6	-
		5	Immediate RF OFF before TXLDO shutdown to save power 0 - Disable 1 - Enable
		4	VDDPA fast discharge 0 - Disable 1 - Enable
		3	TX Drivers 0 - Enable Single driver 1 - Enable both drivers
	Acquisition channels:	2:0	0:1 = RFU 2 = Magnitude 3 = I and Q 4 =M, I and Q 5:7 = RFU

Address (hex)	Function	Bit	Description
4BF	RFU	2:0	-

9.26.161 ULPCD_TIMING_CTRL (04C2h)

Table 258. ULPCD_TIMING_CTRL (address 4C2h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
4C2	RFON_GUARD_TIME	7:4	RFON guard time: (RFON_GUARD_TIME + 2) * LFO-Freq (380 kHz) Guard time: Time between RF-ON and first sampling of data
	RFU	3:0	-

9.26.162 ULPCD_VOLTAGE_CTRL (04C6h)

Table 259. ULPCD_VOLTAGE_CTRL (address 4C6h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
4C6	ULPCD configuration	7:5	RFU
		4:2	RFU
		1	TX_SUPPLY by VUP_TX 0: VUP externally supplied (2.8 V to 6.0 V) 1: VUP supplied by PN5190B1 itself (pin VUP_TX connected to VBAT/VBATPWR)
		0	RFU

9.26.163 ULPCD_RSSI_GUARD_TIME (04C9h)

Table 260. ULPCD_RSSI_GUARD_TIME (address 4C9h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
4C9	ULPCD RSSI sampling guard time	15	RFU
		14:0	This is the time between consecutive RSSI samples: Range: 0 - 127 in micro seconds

9.26.164 ULPCD_RSSI_SAMPLE_CFG (04CAh)

Table 261. ULPCD_RSSI_SAMPLE_CFG (address 4CAh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
4CA	ULPCD configuration	7:0	Number of RSSI Samples which are internally averaged: 0: 4 samples, 1: 8 samples 2: 16 samples 3: 32 samples

All information provided in this document is subject to legal disclaimers.

9.26.165 ULPCD_THRESH_LVL(04CBh)

Table 262. ULPCD_THRESH_LVL (address 4CBh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
4CB	ULPCD configuration	8:0	RSSI Threshold level Range 0 - 31 If the difference between the measured RSSI value and the reference (which is derived during calibration) is greater than the threshold, then a card is detected.

9.26.166 ULPCD_GPIO3 (04CCh)

Table 263. ULPCD_GPIO3 (address 4CCh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
4CC	RFU	7:1	-
4CC	ULPCD GPIO3 configuration	0	GPIO3 abort polarity configuration. If PN5190B1 is using the ULPCD, GPIO3 cannot be used for any other purpose than aborting the ULPCD. 1: high-level aborts ULPCD 0: low-level aborts ULPCD

9.26.167 TXIRQ_GuardTime (0559h)

Table 264. FELICA_POLL_RES (address 0559) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
559	TXIRQ_ GuardTime	31:0	0 - Disabled 0x1-0xFFFFF (Enabled - 1 unit corresponds to 1 us) Maximum timeout of 1.048 s

9.26.168 FDT_default_val (055Dh)

Table 265. FDT_default_val (address 055D) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
55D	FDT_default_val	31:0	0x00 - Disabled others - enabled (1 unit is 18.86us) Default fixed to 5.5 secs

9.26.169 RXIRQ_GuardTime (0561h)

Table 266. RXIRQ_GuardTime (address 0561h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
55D	RXIRQ_ GuardTime	31:0	0x00 Disabled 0x1-0xFFFFF (Enabled - 1 unit corresponds to 1 us) Maximum timeout of 1.048 s Default value = 0xF4240 (1 s)

9.26.170 NFCLD_RFLD_Valid (006D3h)

Table 267. NFCLD_RFLD_Valid (address 06D3h) EEPROM configuration register bit description

Addres (hex)	Function	Bit	Description
6D3	RFU	7:1	-
	RFLD_ CALIBRATE	0	This bit allows to calibrate the RFLD / NFCLD. This calibration is required only once in the lifetime of the chip for increased RFLD / NFCLD accuracy, independent from the value of this bit (0 or 1). Clearing this bit (0) will calibrate the RFLD /RFLD during the next boot-up, precondition for the proper calibration is an unloaded condition and no external field applied. After calibration this bit is set (1) and indicates that the RFLD /RFLD Threshold is a valid data.

9.26.171 CurrentSensorTrimConfig (0ABCh)

Table 268. CurrentSensorTrimConfig (address 0CACh) EEPROM configuration bit description

Addres (hex)	Function	Bit	Description
ABC	RFU	7:1	-
	Current_Sensor_ Calib_Bypass	0	1: current sensor calibration offset is used by DPC; 0: Current sensor calibration offset is bypassed by DPC

Note: *The default value should only be modified for debug purpose.*

9.26.172 CORRECTION_ENTRY_TABLE (0BDAh)

Table 269. CORRECTION_ENTRY_TABLE (address 0BDAh) EEPROM configuration bit description

Addres (hex)	Function	Bit	Description
0BDA	sCorrection_Entry0	15:0	The correction that is applied when lookup table based shaping with scaling is enabled. Range is -128 to +127, sCorrection_Entry0 corresponds to correction applied at VDDPA = 1V5, Correction_Entry42 corresponds to correction applied at VDDPA = 5V7 For each entry: BYTE 0: Bits[7:0] = define the correction which is applied for ASK100 BYTE 1: Bits[15:8] = define the correction which is applied for ASK10
BAF	sCorrection_Entry1	15:0	
BB1	sCorrection_Entry2	15:0

Table 270. RTRANS_FTRANS_TABLE (address C03h) EEPROM configuration bit description*...continued*

Address (hex)	Function	Bit	Description
C7B	FTRANS2	31:0	These values apply in case EDGE_STYLE = 3 is configured for the falling edge
C7F	FTRANS3	31:0	These values apply in case EDGE_STYLE = 3 is configured for the falling edge

This table applies only, if the transmitter shaping configuration is (EDGE_TYPE_xx) 4, 5, or 6.

Which of the entries RTRANS0..3 (rising transition) / FTRANS0..3 (falling transition) is applied, is defined by the EDGE_STYLE.

9.26.174 CFG_NOV_CAL (0C83h)

TX non-overlap feature - defines the non-overlap time of TX1, TX2.

Table 271. CFG_NOV_CAL (address 0083h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
1	RFU	7:2	-
	CALIBRATION_TYPE	1:0	00 = No calibration performed, needs to be updated to 01 or 10 before the first RF on of the chip is performed 01 = Enable FW calibration after every cold boot 10 = Use calibration value coming from EEPROM NOV_CAL_VAL1, NOV_CAL_VAL2 **(Default)** 11 = RFU

9.26.175 NOV_CAL_VAL1 (0C84h)

Table 272. NOV_CAL_VAL1 (address 0C84h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
1	VddpaCalVal1	7	It defines the VDDPA value that FW will use to perform NOV calibration group #1. value = 03h (1.8 V) value = 0Dh (2.8 V) See "TxLdoVddpaHigh" parameter for list of voltage

9.26.176 NOV_CAL_VAL2 (0C85h)

Table 273. NOV_CAL_VAL2 (0C85h) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
1	VddpaCalVal2	7	It defines the VDDPA value that FW will use to perform NOV calibration group #2. default value = 15h (3.6 V) default value = 24h (5.1 V) See "TxLdoVddpaHigh" parameter for list of voltage

All information provided in this document is subject to legal disclaimers.

Table 278. ARC_RM_A106_FDT (address 0C9Dh) EEPROM configuration bit description

Address (hex)	Function	Bit	Description
CA5	RM_RX_ARC_ FDT_4	15:0	Bit[15]: RFU Bit [14]: Has to be always "0" Bits[13:10] = RFU Bit [9] = Enable the IIR filter. Bits[8:7] = MF_GAIN (this value will be applied to the SIGPR_RM_TECH register, applies as soon as the ARC is enabled) Bits[6:0] = DPC_ SIGNAL_DETECT_TH_OVR_VAL (this value will be applied to the DGRM_RSSI register, applies as soon as the ARC is enabled)
CA3	RM_RX_ARC_ FDT_3	15:0	Bit[15]: RFU Bit [14]: Has to be always "0" Bits[13:10] = RFU Bit [9] = Enable the IIR filter. Bits[8:7] = MF_GAIN (this value will be applied to the SIGPR_RM_TECH register, applies as soon as the ARC is enabled) Bits[6:0] = DPC_ SIGNAL_DETECT_TH_OVR_VAL (this value will be applied to the DGRM_RSSI register, applies as soon as the ARC is enabled)
CA1	RM_RX_ARC_ FDT_2	15:0	Bit[15]: RFU Bit [14]: Has to be always "0" Bits[13:10] = RFU Bit [9] = Enable the IIR filter. Bits[8:7] = MF_GAIN (this value will be applied to the SIGPR_RM_TECH register, applies as soon as the ARC is enabled) Bits[6:0] = DPC_ SIGNAL_DETECT_TH_OVR_VAL (this value will be applied to the DGRM_RSSI register, applies as soon as the ARC is enabled)
C9F	RM_RX_ARC_ FDT_1	15:0	Bit[15]: RFU Bit [14]: Has to be always "0" Bits[13:10] = RFU Bit [9] = Enable the IIR filter. Bits[8:7] = MF_GAIN (this value will be applied to the SIGPR_RM_TECH register, applies as soon as the ARC is enabled) Bits[6:0] = DPC_ SIGNAL_DETECT_TH_OVR_VAL (this value will be applied to the DGRM_RSSI register, applies as soon as the ARC is enabled)
C9D	RM_RX_ARC_ FDT_0	15:0	Bit[15]: RFU Bit [14]: Has to be always "0" Bits[13:10] = RFU Bit [9] = Enable the IIR filter. Bits[8:7] = MF_GAIN (this value will be applied to the SIGPR_RM_TECH register, applies as soon as the ARC is enabled) Bits[6:0] = DPC_ SIGNAL_DETECT_TH_OVR_VAL (this value will be applied to the DGRM_RSSI register, applies as soon as the ARC is enabled)

Note: *For ISO14443-A: In case ARC is disabled, it requires DPC_ SIGNAL_DETECT_TH_OVR_VAL larger than 0x50 (with MF_GAIN = 2 (default))*

Note: *For ISO14443-A: In case Bit[15] is configured to 0, it requires DPC_ SIGNAL_DETECT_TH_OVR_VAL larger than 0x50 (with MF_GAIN = 2 (default)) if the ARC is enabled.*

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Note: *The IIR settings define an all pass filter with approximately -10 dB gain. This can be used to limit the LMA sensitivity of the RX.*

10 Limiting values

Table 290. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{DD(VUP_TX)}$	supply voltage on pin VUP_TX	-	-0.3	5.8	V
$V_{DD(VBAT)}$	supply voltage on pin VBAT	-	-0.3	5.8	V
$V_{DD(VDDIO)}$	supply voltage on pin VDDIO	on pin VDDIO, power supply for host interface and GPIOs	-0.3	3.8	V
$V_{DD(VDDPA)}$	supply voltage on pin VDDPA	maximum limiting values for $I_{DD(VDDPA)}$ and $T_{j(max)}$ not violated	-	6.0	V
$V_{i(RXP)}$	input voltage on pin RXP	-	-0.3	+ 2.0	V
$V_{i(RXN)}$	input voltage on pin RXN	-	-0.3	+ 2.0	V
V_{ESD}	electrostatic discharge voltage	human body model (HBM)[1]	-2000	2000	V
		charge device model (CDM)[2]	-500	+500	V
$T_{j(max)}$	junction temperature	-	-	125	°C
T_{stg}	storage temperature	no supply voltage applied	-55	+150	°C

[1] According to ANSI/ESDA/JEDEC JS-001
[2] According to ANSI/ESDA/JEDEC JS-002

Stress above one or more of the limiting values may cause permanent damage to the device or limit the lifetime.

Product might not behave according to specification.

All information provided in this document is subject to legal disclaimers.

11 Characteristics

This chapter describes the electrical characteristics for the usage of the product.

Functionality according to this specification and compliancy to referred standards is guaranteed if the device is operated within the limits.

For further information, refer to the PQP (product qualification package) which summarizes the results of the characterization and qualification performed.

11.1 Thermal characteristics

Table 291. Operating conditions

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
T_{amb}	ambient operating temperature	in still air with exposed pins soldered on a 4 layer JEDEC PCB, transmitter output current up to 350 mA	-40	+25	+85	°C
		in still air with exposed pins soldered on a 4 layer JEDEC PCB, TX current = 120 mA @ VDDPA=3.6 V	-40	+25	+105	°C

Table 292. Thermal characteristics HVQFN40 package

Symbol	Parameter	Conditions	Typ	Unit
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air with exposed pad soldered on a 4 layer JEDEC PCB, package HVQFN40	44.2	K/W
$R_{th(j-c)}$	thermal resistance from junction to case	-	24.2	K/W

Table 293. Thermal characteristics VFBGA64 package

Symbol	Parameter	Conditions	Typ	Unit
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air with exposed pad soldered on a 4 layer JEDEC PCB, package VFBGA64	53	K/W
$R_{th(j-c)}$	thermal resistance from junction to case	-	22	K/W

Table 294. Junction Temperature

Symbol	Parameter	Conditions	Min	Max	Unit
T_{j_max}	maximum junction temperature	-	-	+125	°C

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Table 295. Thermal Shutdown Temperature

Symbol	Parameter	Conditions	Typ	Unit
$T_{shutdown}$	shutdown of chip due to high temperature detected by temp sensor	-	125	°C

11.2 Static characteristics

Table 296. Supply voltage

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{DD(VBAT_PWR)}$	supply voltage on pin VBAT_PWR (DC-DC input pin)	DC-DC disabled	2.4	-	5.5	V
		DC-DC enabled	2.8	-	4.8	V
$V_{DD(VUP_TX)}$	supply voltage on pin VUP_TX (TX_LDO input pin)	Remark: If DC-DC is used, its output $V_{DD(BOOST)}$ Min is limited to 3.1 V	2.4	-	6.0	V
$V_{DD(VDDPA)}$	supply voltage on pin VDDPA (input of the transmitter power amplifier)	-	1.5	-	5.7	V
$V_{DD(VBAT)}$	supply voltage on pin VBAT (analog and digital supply)	VBAT >= VDDIO	2.4	-	5.5	V
$V_{DD(VDDIO)}$	supply voltage on pin VDDIO (supply for host interface and GPIOs)	typical 1.8 V interface supply voltage	1.62	-	1.98	V
		typical 3.3 V interface supply voltage	2.4	-	3.6	V
$V_{I(RXP)}$	input voltage on pin RXP	-	-0.5	-	1.8	V
$V_{I(RXN)}$	input voltage on pin RXN	-	-0.5	-	1.8	V

Note: The voltage on pin VDDIO must always be smaller or equal to the voltage on pin VBAT.

Table 297. Current consumption in active mode

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DD(VBAT)}$	system supply		-	-	20	mA
$I_{DD(VDDIO)}$		This current depends on the output current of peripherals. At no time, the sum of the maximum output currents shall exceed $I_{DD(VDDIO)}$ max	-	-	30	mA
$I_{DD(BOOST_IN)}$	DC-DC boost supply	average input current	-	-	1.0	A
		peak input current (short peak)	-	-	1.7	A
$I_{DD(VUP_TX)}$	input supply for transmitter LDO	-	-	-	350	mA
$I_{DD(VDDPA)}$	RF power amplifier (transmitter) current	supplied via VUP_TX (TX_LDO active)	-	-	350	mA

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Table 297. Current consumption in active mode*...continued*

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
		supplied without DC-DC and without TXLDO active	-	-	400	mA

Table 298. Current consumption during power-saving modes

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{OFF\ Plus\ Mode\ (VDDIO+VBAT)}$	sum of supply current on pin VDDIO and VBAT in OFF Plus mode	25 °C ambient operating temperature	-	5	-	µA
$I_{OFF\ Plus\ ULFO\ Mode\ (VDDIO+VBAT)}$	sum of supply current on pin VDDIO and VBAT in OFF Plus mode, ULFO active (ULPCD during RF-OFF)	25 °C ambient operating temperature	-	5	-	µA
$I_{hard\ power\ down\ (VDDIO+VBAT)}$	sum of supply current on pin VDDIO and VBAT in hard power-down mode	25 °C ambient operating temperature	-	40	105	µA
$I_{standby\ (VDDIO+VBAT)}$	sum of supply current on pin VDDIO and VBAT in standby mode	25 °C ambient operating temperature	-	45	110	µA
$I_{suspend\ (VBAT)}$	supply current on pin VBAT in suspend mode	25 °C ambient operating temperature	-	2.5	-	mA
$I_{ULPCD\ (VDDIO+VBAT)}$	sum of supply current on pin VDDIO and VBAT in ULPCD (Ultra Low-Power Card Detection) mode	25 °C ambient operating temperature, VBAT supply voltage 3.3 V, antenna matching 50 R, 3.3 V antenna supply voltage, 3x RF-on per second	-	22	-	µA
$I_{LPCD\ (VDDIO+VBAT)}$	sum of supply current on pin VDDIO and VBAT in LPCD (Enhanced Low-Power Card Detection with highest sensitivity) mode, without DC-DC used	25 °C ambient operating temperature, VBAT supply voltage 3.3 V, antenna matching 50 R, 3.3 V antenna supply voltage, 3x RF-on per second	-	240	-	µA

Table 299. Overcurrent detection function [1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{DD(VUP_TX)}$	current of overcurrent detection becoming active	-	450	550	650	mA

[1] Please refer to the Errata sheet if the device is used with smaller or equal than FW2.1.

This is a safety feature only. A design shall not functionally rely on this feature since the operating conditions will be violated if the overcurrent detection becomes active.

All information provided in this document is subject to legal disclaimers.

16 Surface mount reflow soldering

For information on surface mount, reflow soldering and component handling please refer to the related application note.

This application note provides guidelines for the board mounting and handling of NXP Semiconductor packages:

https://www.nxp.com/docs/en/application-note/AN10365.pdf

All information provided in this document is subject to legal disclaimers.

17 Handling information

Moisture Sensitivity Level (MSL) evaluation has been performed according to *SNW-FQ-225B rev.04/07/07 (JEDEC J-STD-020C)*.

An MSL corresponds to a certain out-of-bag time (or floor life). If semiconductor packages are removed from their sealed dry-bags and not soldered within their out-of-bag time, they must be baked prior to reflow soldering, in order to remove any moisture that might have soaked into the package.

For MSL3:

168h out-of-pack floor life at maximum ambient temperature, conditions < 30 °C / 60 % RH.

For MSL2:

- 1 year out-of-pack floor life at maximum ambient temperature, conditions < 30 °C° / 60 % RH.

For MSL1:

- No out-of-pack floor live spec. required. Conditions: <30 °C° / 85 % RH.

CAUTION	
	This device is sensitive to ElectroStatic Discharge (ESD). Observe precautions for handling electrostatic sensitive devices. Such precautions are described in the *ANSI/ESD S20.20, IEC/ST 61340-5, JESD625-A* or equivalent standards.

All information provided in this document is subject to legal disclaimers.

21 Abbreviations

Table 319. Abbreviations

Acronym	Description
ADC	analog-to-digital converter
AGC	automatic gain control
ARC	adaptive receiver control
AWC	adaptive waveshape control
CLIF	contactless interface
DAC	digital-to-analog converter
DC-DC	switch-mode voltage regulator which uses an inductor to store and transfer energy to the output, used for a power supply voltage conversion. PN5190B1 integrates a step-up/boost converter
DPC	dynamic power control
EMD	electromagnetic disturbance
GPIO	general-purpose input output
HPD	hard power down
LDO	low dropout regulator
LPCD	low-power card detection
MISO	SPI interface Master In Slave Out
MOSI	SPI interface Master Out Slave In
NSS	SPI interface active-low slave-select signal
OS	operating system
PCB	printed-circuit board
PCD	power card detection
PICC	proximity inductive coupling card
RF	radio frequency
RSSI	receiver signal strength indicator
SCK	SPI interface serial clock
SCL	I^2C interface serial clock
SPI	serial peripheral interface
TFT	display technology: thin-film transistor-display
TX	transmit
UID	Unique identifier of a card, used during anti-collision sequence to select one out of multiple cards.
ULPCD	ultra low-power card detection

Table 320. Revision history

Document ID	Release date	Data sheet status	Supersedes
PN5190B1 v. 3.2	20211117	Product data sheet	PN5190B1 v. 3.1
Modifications:	• Section 9.8: TEMP_WARNING address corrected to 14h • Section 9.26.4: TXLDO_CONFIG description updated with Overcurrent enable and TxLdo current limiter • Section 9.25.4: EVENT_STATUS and Section 9.25.3 EVENT_ENABLE register: TEMP_ERROR_EVENT corrected to / replaced by TX_OVERCURRENT_ERROR_EVENT (bit 5) • Section 9.5.3.9: Power configuration corrected		
PN5190B1 v. 3.1	20210907	Product data sheet	PN5190B1 v. 3.0
Modifications:	• Description for FW2.3 added • General update and clarifications added • Description for SE antenna configurations added		
PN5190B1 v. 3.0	20210421	Product data sheet	PN5190B1 v. 1.0
Modifications:	• General update • Data sheet status changed to "Product data sheet"		
PN5190B1 v. 1.0	20210322	Objective data sheet	-
Modifications:	• First official released version

24 Legal information

24.1 Data sheet status

Document status[1][2]	Product status[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.
[2] The term 'short data sheet' is explained in section "Definitions".
[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

24.2 Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

24.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

All information provided in this document is subject to legal disclaimers.

© NXP B.V. 2021. All rights reserved.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately.

Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at PSIRT@nxp.com) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

24.4 Licenses

Purchase of NXP ICs with ISO/IEC 14443 type B functionality

RATP/Innovatron Technology

This NXP Semiconductors IC is ISO/IEC 14443 Type B software enabled and is licensed under Innovatron's Contactless Card patents license for ISO/IEC 14443 B.

The license includes the right to use the IC in systems and/or end-user equipment.

Purchase of NXP ICs with NFC technology — Purchase of an NXP Semiconductors IC that complies with one of the Near Field Communication (NFC) standards ISO/IEC 18092 and ISO/IEC 21481 does not convey an implied license under any patent right infringed by implementation of any of those standards. Purchase of NXP Semiconductors IC does not include a license to any NXP patent (or other IP right) covering combinations of those products with other products, whether hardware or software.

24.5 Trademarks

Notice: All referenced brands, product names, service names, and trademarks are the property of their respective owners.

NXP — wordmark and logo are trademarks of NXP B.V.

DESFire — is a trademark of NXP B.V.

FeliCa — is a trademark of Sony Corporation.

ICODE and I-CODE — are trademarks of NXP B.V.

I2C-bus — logo is a trademark of NXP B.V.

MIFARE — is a trademark of NXP B.V.

MIFARE Classic — is a trademark of NXP B.V.

MIFARE Plus — is a trademark of NXP B.V.

MIFARE Ultralight — is a trademark of NXP B.V.

NTAG — is a trademark of NXP B.V.
