

Product data sheet

# **1** General description

SC18IS604 is designed to serve as an interface between the standard SPI of a host (microcontroller, microprocessor, chip set, etc.) and the serial  $I^2$ C-bus. This allows the host to communicate directly with other  $I^2$ C-bus devices. SC18IS604 can operate as an  $I^2$ C-bus controller-transmitter or controller-receiver. SC18IS604 controls all the  $I^2$ C-bus specific sequences, protocol, arbitration and timing.

SC18IS604 is a functional replacement for SC18IS600 with exception of:

- New pinout
- Transmit and receive buffer of 255 bytes vs 96 bytes
- Five instead of six GPIOs; no quasi bidirectional mode
- Lower operating supply voltage level (1.71 V vs 2.4 V)
- Temperature range of -40 to +105 °C vs -40 to +85 °C
- Device is rotated 180 degrees in the tape pocket; pin 1 is now in Quadrant 1

## 2 Features and benefits

- SPI slave interface
- SPI Mode 3
- Single primary I<sup>2</sup>C-bus controller
- Five General Purpose Input/Output (GPIO) pins
- 5 V tolerant I/O pins
- High-speed SPI: Up to 1.2 MHz
- Fast-mode I<sup>2</sup>C-bus: 375 kHz
- 255-byte transmit buffer
- 255-byte receive buffer
- 1.71 V to 3.6 V operation
- Deep Power-down mode with SPI CS wake up
- Internal oscillator
- Active LOW interrupt output
- ESD protection exceeds 2000 V HBM per JESD22-A114
- Latch-up testing is done to JEDEC Standard JESD78 that exceeds 100 mA
- Available in TSSOP16 package

# 6 Functional description

SC18IS604 acts as a bridge between a SPI interface and an  $I^2$ C-bus. It allows an SPI master device to communicate with  $I^2$ C-bus target devices. The SPI interface supports Mode 3 of the SPI specification and can operate up to 1.2 Mbit/s.

### 6.1 Internal registers

SC18IS604 provides internal registers for monitoring and control. These registers are shown in <u>Table 4</u>. Register functions are more fully described in the following paragraphs.

| Register<br>address | Register | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3    | Bit 2    | Bit 1    | Bit 0    | R/W | Default<br>value |
|---------------------|----------|-------|-------|-------|-------|----------|----------|----------|----------|-----|------------------|
| 0x00                | IOConfig | IO3.1 | IO3.0 | IO2.1 | IO2.0 | IO1.1    | IO1.0    | IO0.1    | IO0.0    | R/W | 0x00             |

Table 4. Internal registers summary

## 6.2 Register descriptions

### 6.2.1 Programmable IO port configuration register (IOConfig)

Pins GPIO0 to GPIO3 may be configured by software to one of three types. These are: push-pull, open-drain, and input-only. Two configuration bits per pin, located in the IOConfig register, select the IO type for each pin. Each pin has Schmitt-triggered input that also has a glitch suppression circuit. IO4 is input and is not user-configurable.

<u>Table 5</u> shows the configurations for the programmable I/O pins. IOx.1 and IOx.0 correspond to GPIOx.

| Table 5. Pin configurations |
|-----------------------------|
|-----------------------------|

| IOx.1 | IOx.0 | Pin configuration               |
|-------|-------|---------------------------------|
| 0     | 0     | input-only configuration        |
| 0     | 1     | input-only configuration        |
| 1     | 0     | push-pull output configuration  |
| 1     | 1     | open-drain output configuration |

### 6.2.1.1 Open-drain output configuration

The open-drain output configuration turns off all pull-ups and only drives the pull-down transistor of the pin when the pin latch contains a logic 0. To be used as a logic output, a pin configured in this manner must have an external pull-up, typically a resistor tied to  $V_{\text{DD}}$ .

The open-drain pin configuration is shown in Figure 3.

An open-drain pin has a Schmitt-triggered input that also has a glitch suppression circuit.

Device uses a pseudo open-drain mode. The pin cannot be pulled up above  $V_{DD}$ . The

### 6.2.1.2 Input-only configuration

The input-only pin configuration is shown in <u>Figure 4</u>. It is a Schmitt-triggered input that also has a glitch suppression circuit.

### 6.2.1.3 Push-pull output configuration

The push-pull output configuration has the same pull-down structure as the open-drain output mode, but provides a continuous strong pull-up when the pin latch contains a logic 1. The push-pull mode may be used when more source current is needed from a pin output.

The push-pull pin configuration is shown in Figure 5.

pins are not 5 V tolerant when  $V_{DD}$  is grounded.

A push-pull pin has a Schmitt-triggered input that also has a glitch suppression circuit.

### 6.2.2 I/O pins state register (IOState)

When read, this register returns the actual state of all programmable I/O pins. When written, each register bit will be transferred to the corresponding I/O pin programmed as output.

| Bit | Symbol               | Description                                                         |
|-----|----------------------|---------------------------------------------------------------------|
| 7:6 | -                    | reserved                                                            |
| 5   | -                    | Set the logic level on the output pins.                             |
| 4   | GPIO4 <sup>[1]</sup> | Write to this register:                                             |
| 3   | GPIO3                | logic 0 = set output pin to zero<br>logic 1 = set output pin to one |
| 2   | GPIO2                | A read from this register returns states of all pins.               |
| 1   | GPIO1                |                                                                     |
| 0   | GPIO0                |                                                                     |

 Table 6. IOState - I/O pins state register (address 0x01) bit description

[1] GPIO4 is input only, write to it has no effect.

# 6.2.3 I<sup>2</sup>C-bus address register (I2CAdr)

The contents of the register represents the device's own  $I^2C$ -bus address. The most significant bit corresponds to the first bit received from the  $I^2C$ -bus after a START condition. The least significant bit is not used, but should be programmed with a '0'.

I2CAdr is not needed for device operation, but should be configured so that its address does not conflict with an  $I^2$ C-bus device address used by the bus controller.

### 6.2.4 I<sup>2</sup>C-bus clock rates register (I2CClk)

This register determines the  $I^2$ C-bus clock frequency. Various clock rates are shown in <u>Table 7</u> for SC18IS604. The frequency can be determined using <u>Equation 1</u>:

$$I2C-busclock frequency = \frac{15000000}{8 \times I2CClk}$$
(1)

| Table 7. I <sup>2</sup> C-bus c | lock frequency |
|---------------------------------|----------------|
|---------------------------------|----------------|

| sk nequency                          |
|--------------------------------------|
| I <sup>2</sup> C-bus clock frequency |
| 375 kHz                              |
| 268 kHz                              |
| 208 kHz                              |
| 99 kHz                               |
| 7.4 kHz                              |
|                                      |

# 6.2.5 I<sup>2</sup>C-bus timeout register (I2CTO)

The timeout register is used to determine the maximum time that the  $I^2$ C-bus controller is allowed to complete a transfer before setting an  $I^2$ C-bus timeout interrupt.

| Table 8. | I2CTO - | l <sup>2</sup> C-bus | timeout | register | (address | 0x04) | bit description |  |
|----------|---------|----------------------|---------|----------|----------|-------|-----------------|--|
|          |         |                      |         |          |          |       |                 |  |

| Bit | Symbol  | Description   |
|-----|---------|---------------|
| 7:1 | TO[7:1] | timeout value |

SPI to I<sup>2</sup>C-bus bridge

| Table 8. I2CTO - I <sup>2</sup> C-bus timeout register (address 0x04) bit descriptioncontinued |
|------------------------------------------------------------------------------------------------|
|------------------------------------------------------------------------------------------------|

| Bit | Symbol | Description                                                              |
|-----|--------|--------------------------------------------------------------------------|
| 0   | TE     | Enable/disable timeout function<br>logic 0 = disable<br>logic 1 = enable |

The least significant bit of I2CTO (TE bit) is used as a timeout enable/disable. A logic 1 will enable the timeout function.

The timeout can be computed by the following equation:

$$timeout = \frac{(I2CClock+1)}{15000000} \times ((1 + I2CTO[7:1]) \times 512)$$

Decimal value for I2CClock is from Section 6.2.4 "I2C-bus clock rates register (I2CClk)"

The timeout value is an approximate value.

In the case of arbitration loss, SC18IS604 transmits a START condition when the bus becomes free unless the timeout condition is reached. If the timeout condition is reached, an interrupt is generated on the INT pin. The 'I<sup>2</sup>C-bus timeout' status can be read in I2CStat.

# 6.2.6 I<sup>2</sup>C-bus status register (I2CStat)

This register reports the results of I<sup>2</sup>C-bus transmit and receive transaction between SC18IS604 and an  $I^2$ C-bus target device.

| Register<br>value | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | I <sup>2</sup> C-bus status description                                                                                                                                                                                                            |
|-------------------|-------|-------|-------|-------|-------|-------|-------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0xF0              | 1     | 1     | 1     | 1     | 0     | 0     | 0     | 0     | Transmission successful. SC18IS604 has<br>successfully completed an I <sup>2</sup> C-bus read or write<br>transaction. An interrupt is generated on INT. This<br>is also the default status after reset. No interrupt<br>is generated after reset. |
| 0xF1              | 1     | 1     | 1     | 1     | 0     | 0     | 0     | 1     | $I^2$ C-bus device address not acknowledged. No $I^2$ C-bus target device has acknowledged the target address that has been sent out in an $I^2$ C-bus read or write transaction. An interrupt is generated on INT.                                |
| 0xF2              | 1     | 1     | 1     | 1     | 0     | 0     | 1     | 0     | $I^2$ C-bus device address not acknowledged. An $I^2$ C-bus target has not acknowledged the byte that has just been transmitted by SC18IS604. An interrupt is generated on INT.                                                                    |
| 0xF3              | 1     | 1     | 1     | 1     | 0     | 0     | 1     | 1     | I <sup>2</sup> C-bus busy. SC18IS604 is busy performing an I <sup>2</sup> C-bus transaction, no new transaction should be initiated by the host. No interrupt is generated.                                                                        |

| Table 9. | l <sup>2</sup> C-bus | status |

An interrupt is generated on INT.                                                                                                                                                                                                                                                            |

Table 9. I<sup>2</sup>C-bus status...continued

# 6.3 I<sup>2</sup>C-bus serial interface

I<sup>2</sup>C-bus uses two wires (SDA and SCL) to transfer information between devices connected to the bus, and it has the following features:

- · Bidirectional data transfer between controllers and targets
- Multi-controller bus (no central controller)
- Arbitration between simultaneously transmitting controllers without corruption of serial data on the bus
- Serial clock synchronization allows devices with different bit rates to communicate via one serial bus
- Serial clock synchronization can be used as a handshake mechanism to suspend and resume serial transfer
- The I<sup>2</sup>C-bus may be used for test and diagnostic purposes.

A typical I<sup>2</sup>C-bus configuration is shown in <u>Figure 6</u>. SC18IS604 device provides a byte-oriented I<sup>2</sup>C-bus interface that supports data transfers up to 400 kHz. (Refer to UM10204, "I<sup>2</sup>C-bus specification and user manual".)

# 6.4 Serial Peripheral Interface (SPI)

The host communicates with SC18IS604 via the SPI interface. SC18IS604 operates in Slave mode up to 1.2 MHz.

The SPI interface has four pins: SCLK, MOSI, MISO, and CS.

 SCLK, MOSI and MISO are typically tied together between two or more SPI devices. Data flows from the master to SC18IS604 on the MOSI (Master Out Slave In) pin and

SPI to I<sup>2</sup>C-bus bridge

flows from SC18IS604 to the master on the MISO (Master In Slave Out) pin. The SCLK signal is an input to SC18IS604.

• **CS** is the slave select pin. In a typical configuration, an SPI master selects one SPI device as the current slave. An SPI slave device uses its **CS** pin to determine whether it is selected.

Typical connections are shown in Figure 7.

## 6.5 SPI message format

## 6.5.1 Write N bytes to I<sup>2</sup>C-bus target device

| SPI hos     | st sends | ;                                              |                               |                |         |                |     |             |     |             |           |
|-------------|----------|------------------------------------------------|-------------------------------|----------------|---------|----------------|-----|-------------|-----|-------------|-----------|
| 0x0<br>COMN |          | NUMBER<br>OF BYTES                             | TARGET ADDRESS<br>+ W         | DATA<br>BYTE 1 |         | DATA<br>BYTE N |     |             |     |             |           |
| CS          |          |                                                |                               |                |         |                |     |             |     |             |           |
| SCLK        |          | 1.<br>I. I. I | ហោយាយ                         | บบบบ           | TT      | UUUU           | uuu |             |     |             |           |
| MOSI        |          | command 0>                                     | 00 X number of by             | /tes D[7:0] X  | arget a | address A[7:1] | XºX | data byte 1 | _X_ | data byte N | 002aab718 |
| Figure 8.   | Write    | N bytes to                                     | I <sup>2</sup> C-bus target d | levice         |         |                |     |             |     |             |           |

The SPI host issues the write command by sending a 0x00 command followed by the total number of bytes (maximum 255 bytes excluding the address) to send and an  $I^2C$ -bus target device address followed by  $I^2C$ -bus data bytes, beginning with the first byte (data byte 1) and ending with the last byte (data byte N). Once the SPI host issues this command, SC18IS604 will access the  $I^2C$ -bus target device and start sending the  $I^2C$ -bus data bytes.

When the  $I^2$ C-bus write transaction has successfully finished, and interrupt is generated on the INT pin, and the 'transaction completed' status can be read in I2CStat.

Note that the third byte sent by the host is the device  $I^2C$ -bus target address. SC18IS604 will ignore the least significant bit so a write will always be performed even if the least significant bit is a '1'.

### 6.5.2 Read N bytes from I<sup>2</sup>C-bus target device

| SPI           | host sends     | 6                                          |                                         |                                         |       |           |  |
|---------------|----------------|--------------------------------------------|-----------------------------------------|-----------------------------------------|-------|-----------|--|
|               | 0x01<br>DMMAND | NUMBER<br>OF BYTES                         | TARGET ADDRESS<br>+ R                   |                                         |       |           |  |
|               |                |                                            |                                         |                                         |       |           |  |
| SC            |                | 1.<br>IIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIII | บบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบ | บบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบบ | กกกกก | 111f      |  |
| M             |                | command 0x                                 | 01 X number of by                       | /tes D[7:0] Xtarget                     |       |           |  |
|               |                |                                            |                                         |                                         | 0     | 002aab719 |  |
| Figure 9. Rea | ad N byt       | es from I <sup>2</sup> C                   | -bus target devi                        | се                                      |       |           |  |

Once the host issues this command, SC18IS604 will start an  $I^2$ C-bus read transaction on the  $I^2$ C-bus to the specified target address. Once the data is received, SC18IS604 will place this data in the receiver buffer, and will generate an interrupt on the INT pin. The 'transaction completed' status can be read in the I2CStat. Note that the data is not returned until a Read Buffer command is performed (see <u>Section 6.5.4</u>).

Note that the third byte sent by the host is the device target address. SC18IS604 will ignore the least significant bit so a read will always be performed even if the least significant bit is a '0'. The maximum number of bytes to be read is 255.

### 6.5.3 I<sup>2</sup>C-bus read after write

| SPI host sends  |                             |                            |                          |                         |     |                         |                          |  |  |  |  |
|-----------------|-----------------------------|----------------------------|--------------------------|-------------------------|-----|-------------------------|--------------------------|--|--|--|--|
| 0x02<br>COMMAND | NUMBER OF<br>WRITE<br>BYTES | NUMBER OF<br>READ<br>BYTES | TARGET<br>ADDRESS<br>+ W | DATA<br>WRITE<br>BYTE 0 | ••• | DATA<br>WRITE<br>BYTE N | TARGET<br>ADDRESS<br>+ R |  |  |  |  |
|                 |                             |                            |                          |                         |     |                         | 002aab720                |  |  |  |  |

Figure 10. I<sup>2</sup>C-bus read after write

Once the host issues this command, SC18IS604 will start a write transaction on the  $I^2$ Cbus to the specified target address. Once the data is written, SC18IS604 will read data from the specified target, place the data in the Receiver Buffer and generate an interrupt on the INT pin. The 'transaction completed' status can be read in I2CStat. Note that the data is not returned until a 'Read Buffer' command is performed.

### 6.5.4 Read buffer

When the host issues a Read Buffer command, SC18IS604 will return the data in the Read Buffer on the MISO pin. Note that the Read Buffer will be overwritten if an additional 'Read N bytes' or a 'Read after write' command is executed before the Read Buffer command.

## 6.5.5 I<sup>2</sup>C-bus write after write

| SPI host sends  |                      |                      |                         |                |  |                |                         |                |  |                |  |
|-----------------|----------------------|----------------------|-------------------------|----------------|--|----------------|-------------------------|----------------|--|----------------|--|
| 0x03<br>COMMAND | NUMBER OF<br>BYTES 1 | NUMBER OF<br>BYTES 2 | TARGET 1<br>ADDRESS + W | DATA<br>BYTE 1 |  | DATA<br>BYTE N | TARGET 2<br>ADDRESS + W | DATA<br>BYTE 1 |  | DATA<br>BYTE M |  |

| Figure 12.      | Write after          | write                |                         |                |  |                |                         |                |  |                |  |

When the host issues this command, SC18IS604 will first write N data bytes to the I<sup>2</sup>Cbus target 1 device followed by a write of M data bytes to the I<sup>2</sup>C-bus target 2 device.

### 6.5.6 SPI configuration

### Table 10. SPI configuration

| SPI configuration | Data order          |
|-------------------|---------------------|
| 0x81              | LSB first           |
| 0x42              | MSB first (default) |

The SPI configuration command can be used to change the order in which the bits of SPI data byte are sent on the SPI bus. In the LSB first configuration (SPI configuration data is 0x81), bit 0 is the first bit sent of any SPI byte. In MSB first (SPI configuration data is 0x42), bit 7 is the first bit sent. <u>Table 10</u> shows the two possible configurations that can be programmed.

### 6.5.7 Write to SC18IS604 internal registers

A Write Register function is initiated by sending a 0x20 command followed by an internal register address to be written (see <u>Section 6.1</u>). The register data byte follows the register address. Only one register can be accessed in a single transaction. There is no auto-incrementing of the register address.

### 6.5.8 Read from SC18IS604 internal register

A Read Register function is initiated by sending a 0x21 command followed by an internal register address to be read (see <u>Section 6.1</u>) and a dummy byte. The data byte of the read register is returned by SC18IS604 on the MISO pin. Only one register can be accessed in a single transaction. There is no auto-incrementing of the register address.

Note that write and read from internal registers are processed immediately as soon as SC18IS604 determines the intended register.

### 6.5.9 Deep Power-down mode

SC18IS604 can be placed in a low-power mode where the internal oscillator is stopped and it will no longer respond to SPI messages. Enter the Power-down mode by sending the power-down command (0x30) followed by the two defined bytes, which are 0x5A followed by 0xA5. If the exact message is not received, the device will not enter the power-down state.

 $\overline{CS}$  should be placed in a HIGH state after sending the Deep Power-down mode sequence. To exit the power-down state,  $\overline{CS}$  should be brought LOW. After leaving the power-down state,  $\overline{CS}$  can once again be used as the chip selection function.

### 6.5.10 Read version function ID

A new command 0xFE was included with SC18IS604 as a diagnostic tool when bringing up the bridge to verify SPI parameters are correct. This command places a version string in the SPI read buffer. The string contains the part number and a version string. The interrupt pin is set and the version string can be read with command 0x06. The string is in the form "SC18IS604 1.0.0"

The total length is 16 bytes and includes a 00h null terminator. Values in the read buffer past the null terminator remain from the previous operation. The example above yields these hex values in the first 16 locations in the read buffer: 0x53 0x43 0x31 0x38 0x49 0x53 0x36 0x30 0x34 0x20 0x31 0x2e 0x30 0x2e 0x30 0x00

| T <sub>stg</sub>           | storage temperature                            |                                                    |            | -65  | +150 | °C   |
| VI                         | input voltage                                  | 5 V tolerant I/O<br>pins; V <sub>DD</sub> ≥ 1.71 V | [3]<br>[4] | -0.5 | +5.4 | V    |
|                            |                                                | 3 V tolerant I/O -<br>all pins                     | [5]        | -0.5 | +3.6 | V    |
| I <sub>OH(I/O)</sub>       | HIGH-level output current per input/output pin |                                                    |            | -    | 8    | mA   |
| I <sub>OL(I/O)</sub>       | LOW-level output current per input/output pin  |                                                    |            | -    | 20   | mA   |
| I <sub>I/O(tot)(max)</sub> | maximum total I/O current                      |                                                    |            | -    | 120  | mA   |
| P <sub>tot</sub> /pack     | total power dissipation per package            |                                                    | [6]        | -    | 1.5  | W    |

[1] This product includes circuitry specifically designed for the protection of its internal devices from the damaging effects of excessive static charge. Nonetheless, it is suggested that conventional precautions be taken to avoid applying greater than the rated maximum.

Parameters are valid over the operating temperature range unless otherwise specified. All voltages are with respect to V<sub>SS</sub> unless otherwise noted.
 Applies to all 5 V tolerant I/O pins except the 3 V tolerant pin MISO

[4] Including the voltage on outputs in 3-state mode.

[5] V<sub>DD</sub> present or not present.

[6] Based on package heat transfer, not device power consumption.

# 8 Static characteristics

# 12 Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

### 12.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 12.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- · Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

### 12.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- · Solder bath specifications, including temperature and impurities

### 12.4 Reflow soldering

Key characteristics in reflow soldering are:

SC18IS604

© NXP B.V. 2021. All rights reserved.

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 25</u>) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 16 and Table 17

### Table 16. SnPb eutectic process (from J-STD-020D)

| Package thickness (mm) | Package reflow temperature (°C)<br>Volume (mm <sup>3</sup> ) |       |  |  |
|------------------------|--------------------------------------------------------------|-------|--|--|
|                        |                                                              |       |  |  |
|                        | < 350                                                        | ≥ 350 |  |  |
| < 2.5                  | 235                                                          | 220   |  |  |
| ≥ 2.5                  | 220                                                          | 220   |  |  |

### Table 17. Lead-free process (from J-STD-020D)

| Package thickness (mm) | Package reflow temperature (°C)<br>Volume (mm <sup>3</sup> ) |             |        |  |  |
|------------------------|--------------------------------------------------------------|-------------|--------|--|--|
|                        |                                                              |             |        |  |  |
|                        | < 350                                                        | 350 to 2000 | > 2000 |  |  |
| < 1.6                  | 260                                                          | 260         | 260    |  |  |
| 1.6 to 2.5             | 260                                                          | 250         | 245    |  |  |
| > 2.5                  | 250                                                          | 245         | 245    |  |  |

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see <u>Figure 25</u>.

SPI to I<sup>2</sup>C-bus bridge

For further information on temperature profiles, refer to Application Note AN10365 "Surface mount reflow soldering description".

### 15.1 Data sheet status

| Document status <sup>[1][2]</sup> | Product status <sup>[3]</sup> | Definition                                                                            |
|-----------------------------------|-------------------------------|---------------------------------------------------------------------------------------|
| Objective [short] data sheet      | Development                   | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet    | Qualification                 | This document contains data from the preliminary specification.                       |
| Product [short] data sheet        | Production                    | This document contains the product specification.                                     |

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <a href="http://www.nxp.com">http://www.nxp.com</a>.

### **15.2 Definitions**

**Draft** — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

## **15.3 Disclaimers**

Limited warranty and liability - Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors. In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without

notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products. NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**Product data sheet** 

## SPI to I<sup>2</sup>C-bus bridge

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications. In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever

customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
