Self-powered Time Counter

H7ET

Subminiature Time Counters With Enhanced Appearance and Features

- Large display with 8.6 mm (0.338 in) height
- Available with backlit LCD
- PNP/NPN DC voltage input available
- Seven digits, time range 0 to 3999d23.9h
- Key-protect switch to prevent front resetting
- Selectable time range: 999999.9h or 3999d23.9h and 999h59m59s or 9999h59.9m
- NEMA 4/IP66 front
- Replaceable battery
- New black case

**Note**: Perform switch setting before mounting to a control panel.

Operation

■ OPERATING MODES

- **H7ET Time Counter**
  - Incrementing Operation (Up)

![Diagram of H7ET Time Counter](image)

- **Timer input**
- **Internal clock timer value**
- **Full-scale (if full scale -0.1 (1))**
- **Timer display values**
Dimensions

Unit: mm (inch)

**H7ET-N**

Dimensions with Flush Mounting Bracket

Panel Cutout
- Separate mounting
- Joint mounting

Waterproofing is not possible for joint mounting

- When mounting, insert the Counter into the cutout. Insert the adapter from the back and push in the Counter while making the gap between the front panel and the cutout panel as small as possible. Use screws to secure the Counter. If waterproofing is desired, insert the waterproof packing.
- When several Counters are installed, ensure that the ambient temperature will not exceed specifications.
- The appropriate thickness of the panel is 1 to 5 mm.

Installation

**TERMINAL ARRANGEMENT**

Bottom view: View of the Time Counter rotated horizontally 180°

- Timer input
- Reset input
- Backlight 24 VDC
Connections

1. Contact Input (Input by a Relay or Switch Contact)

2. Solid-state Input

Note: 1. Terminals 2 and 4 (input circuit and reset circuit) are functionally isolated.
2. Select input transistors according to the following:
   - Dielectric strength of the collector ≥ 50 V
   - Leakage current < 1 µA
## PNP/NPN UNIVERSAL DC VOLTAGE INPUT MODEL WITHOUT BACKLIGHT

1. Contact Input (Input by a Relay or Switch Contact)

2. Solid-state Input

   - Open collector of a PNP transistor
   - Open collector of an NPN transistor

Note: 1. Terminals 2 and 4 (input circuit and reset circuit) are functionally isolated.

   2. Select input transistors according to the following:
      - Dielectric strength of the collector ≥ 50 V
      - Leakage current < 1 µA

## AC/DC MULTI-VOLTAGE INPUT MODEL

## NO-VOLTAGE INPUT MODEL

1. Contact Input (Input by a Relay or Switch Contact)

2. Solid-state Input

   - Open collector of a PNP transistor
   - Open collector of an NPN transistor

Note: 1. Terminals 2 and 4 are internally connected.

   2. Select input transistors according to the following:
      - Dielectric strength of the collector ≥ 50 V
      - Leakage current < 1 µA

Note: Use Relays and Switches that have high contact reliability because the current flowing from terminals 1 or 3 is as small as approx. 10 µA. OMRON’s G3TA-IA/ID is recommended as the SSR.
Accessories (Order Separately)

An H7ET is supplied with a mounting bracket and nut. In addition, the Flush Mounting Adapters shown here allow the H7ER to be fitted to existing panel cutouts.

**Y92F-75 FLUSH MOUNTING ADAPTER**
FOR 26 × 45 RECTANGULAR CUTOUT

Must be used with mounting bracket supplied with the Counter

**Y92F-77B FLUSH MOUNTING ADAPTER**
FOR 24.8 × 48.8 RECTANGULAR CUTOUT

Must be used with mounting bracket supplied with the Counter

**Y92S-37 Wire-Wrap Terminal (Set of Two Terminals)**

The wire-wrap terminals have a cross sectional dimension of 1x1 mm. Select one of three gauges of wire from the table at right. Also listed in the table is the appropriate wiring hardware.

Precautions

⚠️ WARNING
This product has a built-in lithium battery. Do not short-circuit the + and - terminals, charge, disassemble, deform, or expose the battery to fire. The battery may explode (break), catch fire, or cause liquid leakage.

⚠️ Caution
Do not use any battery other than the specified one (Y92S-36). Using another battery may cause liquid leakage or breakage, resulting in malfunction or injury.

⚠️ Caution
If a voltage other than the rated one is applied, internal elements may be damaged.
Do not use the Counter in the following places:
• Locations subject to direct sunlight.
• Locations subject to corrosive gases.
• Locations subject to dust.

BEFORE USE
An insulation sheet has been inserted to maintain the quality of the Totalizer in the event of a long period without use. Be sure to remove this sheet before attempting to use the product.
Remove the insulation sheet and press the Reset Key on the front panel of the Counter. (With the H7ET-N,-NV(-H),-NV1(-H), models, “0” or “0.0” will be displayed after 1 s.)
Switch settings on the Counter must be performed before mounting it to a control panel.
Do not use the Counter in locations subject to:
• Severe changes in temperature.
• Condensation as the result of high temperatures.

MOUNTING PRECAUTIONS FOR FLUSH MOUNTING
Although the operating section is watertight (conforming to NEMA4, IP66), rubber packing is provided to avoid water leakage through the gap between the Counter and panel cutout. Unless this rubber packing is tightly squeezed on, water may permeate inside the panel. For this reason, be sure to tighten the screws for fixing the Flush Mounting Bracket.

Screw for the Flush Mounting Bracket
The wider side must face the panel.
Adapter
Adapter screw section
0.5 to 1 mm
Panel
Tighten the screw until the distance is within the range shown above.
RESET INPUT AND COUNT INPUT

The H7ET operates using a Battery. If the H7ET is connected to a device that has +V and OUT terminals that are connected with a diode as shown in the circuit diagram, the circuit indicated by the arrow 1 or 2 will be formed when the device is turned OFF. As a result, the H7ET may be reset or count by one. Such devices should not be connected to the H7ER.

If an excessive voltage is applied to the count or reset input terminals, the internal elements may be damaged. Ensure that the following voltages are not exceeded:
- PNP/NPN universal voltage input model: 30 VDC
- AC/DC voltage input model:
  - At count input: 240 VAC (peak voltage: 338V)
  - At reset input: 3 VDC (no-voltage input)
- No-voltage input model: 3 VDC

Do not remove the outer case when voltage is being applied to the power supply terminals or to the input terminals.

The input for the H7E□-NFV□ is a high-impedance circuit so influence from an induced voltage may result in malfunction. When the input signal wiring is longer than 10 m (stray capacitance of 120 pF/m, at room temperature), a CR filter or a bleeder resistor should be connected.

COUNT INPUT OR RESET INPUT TO MORE THAN ONE H7ET COUNTER AT A TIME

PNP/NPN Universal DC Voltage Input

Note: H (Reset ON) level must be 4.5 V minimum.
\[ H = \frac{4.7}{(k\Omega)} \cdot N + V \]
\[ H = \frac{4.7}{(k\Omega)} \cdot N + R \]

No-voltage Input

Note: 1. The leakage current of the transistor used for input must be less than 1 µA.
2. The forward voltage of the diode must be as low as possible (i.e., 0.1 V maximum with an I jes of 20 µA) so the voltage between terminals 3 and 4 will be 0.5 V when the reset input is ON.

INPUT AND POWER SUPPLY

Do not apply voltage on the Counter if the Counter is a model that operates with no-voltage input, or the internal circuit of the Counter may be damaged.
Do not connect any single input signal in parallel to Counter models operating with no-voltage input and those operating with voltage input, to avoid malfunction.

When connecting a sensor to the Counter that operates with no-voltage input, make sure that the sensor has open collector output.

The operation of the Counter may be affected if the line voltage of the power supply exceeds 500 pF (about 10 m, with parallel wires of 2 x 2 mm). Keep all wires as short as possible. When using shielded wire, stray capacitance may occur.

When connecting an open collector input from a transistor to the Counter that operates with no-voltage input, make sure that the leakage current of the transistor is 5 µA maximum.

When connecting count input from an SSR to the Counter that operates with AC/DC voltage input, use OMRON’s G3TA-IA or G3TA-ID SSR. Otherwise, make sure that the leakage current of the SSR is 0.1 mA maximum or connect a bleeder resistor in parallel to the input circuit of the Counter.

BACKLIGHT POWER SUPPLY

To reduce variation in the brightness of the backlight when using more than one H7ET with a backlight, use the same power supply for all the backlights.

When connecting the DC power supply for the backlights, be sure to connect the polarities correctly.

INPUT VERIFICATION WITH THE H7ET TIME COUNTER

The decimal point of the LCD blinks every other second while an input signal is being applied. If the decimal point is not blinking, the input signal is not being received correctly. Check the input signal connections.
UNIT LABEL FOR TIME COUNTER AND TACHOMETER

A unit label has been packed with the Counter. Use in accordance with the application.

BATTERY REPLACEMENT

Remove the wiring when replacing the Battery. Do not come in contact with any item to which high voltage is being applied. Doing so may result in electric shock.

Before changing the Battery, be sure that you are not carrying any static electric charge.

Procedure for replacing the Battery (refer to the diagrams below):

1. Using the tool, pry open the lift-tab on the case. (1)
2. Pull the body out of its outer case. (2)
3. Lift the Battery up by the edge and remove it. (3)
   When removing the Battery, do not come in contact with the display area or any internal parts.
4. Wipe the back of the new Battery before inserting it.
5. Ensure that the + and - terminals are correctly oriented.
6. After replacing the Battery, re-insert the body into its case. (4)
   Check that the case is securely held in by the lift-tab.
7. Press the Reset Key before use (not necessary for H7ET-N,-NV,-NV1). (5)

When the internal Battery nears expiration, the display may flicker.

EN/IEC STANDARDS

The counter input, reset input, and backlight power supply terminals of the no-voltage input or PNP/NPN universal DC voltage input models (H7E□-N,-N1, H7E□-NV(-H),-NV1(-H)) are not isolated.

A SELV power supply conforming to Appendix H of IEC61010-1 should be used for the counter input, reset input and backlight power supply terminals. A SELV power supply is a power supply for which the input and output have double or reinforced insulation, and for which the output voltage is 30 Vrems with 42.4 V peak or 60 VDC max. (Only the H7E□-NV□-H has a backlight.)

The terminals for counter input and reset input for AC/DC multi-voltage input models have basic insulation.

Connect the reset input terminals to a device that does not have exposed current-carrying parts and has basic insulation for 240 VAC.
