4-Bit D-Type Register with Three-State Outputs

The MC14076B 4–Bit Register consists of four D–type flip–flops operating synchronously from a common clock. OR gated output–disable inputs force the outputs into a high–impedance state for use in bus organized systems. OR gated data–disable inputs cause the Q outputs to be fed back to the D inputs of the flip–flops. Thus they are inhibited from changing state while the clocking process remains undisturbed. An asynchronous master root is provided to clear all four flip–flops simultaneously independent of the clock or disable inputs.

Features

- Three-State Outputs with Gated Control Lines
- Fully Independent Clock Allows Unrestricted Operation for the Two Modes: Parallel Load and Do Nothing
- Asynchronous Master Reset
- Four Bus Buffer Registers
- Supply Voltage Range = 3.0 Vdc to 18 Vdc
- Capable of Driving Two Low–Power TTL Loads or One Low–Power Schottky TTL Load Over the Rated Temperature Range
- NLV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC–Q100 Qualified and PPAP Capable
- These Devices are Pb–Free and are RoHS Compliant

MARKING DIAGRAM

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 6 of this data sheet.

MAXIMUM RATINGS (Voltages Referenced to V_{SS}) Symbol Parameter Value Unit DC Supply Voltage Range -0.5 to +18.0 ν VDD Input or Output Voltage Range -0.5 to V_{DD} + 0.5 v Vin, Vout (DC or Transient) Input or Output Current +10mA I_{in}, I_{out} (DC or Transient) per Pin P_D Power Dissipation, per Package (Note 1) 500 mW -55 to +125 °C TA Ambient Temperature Range -65 to +150 °C Storage Temperature Range T_{stg} °C T Lead Temperature 260 (8-Second Soldering)

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Temperature Derating: "D/DW" Packages: -7.0 mW/°C From 65°C To 125°C

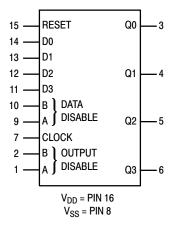

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range $V_{SS} \leq (V_{in} \text{ or } V_{out}) \leq V_{DD}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}). Unused outputs must be left open.

PIN ASSIGNMENT

	1●	16] V _{DD}
DISABLE ¹ B [2	15] R
Q0 [3	14] D0
Q1 [4	13] D1
Q2 [5	12] D2

BLOCK DIAGRAM

FUNCTION TABLE

		Data D	isable	Data	Output
Reset	Clock	A B		D	Q
1	Х	Х	Х	Х	0
0	0	Х	Х	Х	Q _n
0		1	Х	Х	Q _n
0		Х	1	Х	Q _n
0	7	0	0	0	0
0	7	0	0	1	1

When either output disable A or B (or both) is (are) high the output is disabled to the high-impedance state; however sequential operation of the flip-flops is not affected. X = Don't Care.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product Deta labelled "Typ" is not to be used for design purposes but is intended as an indication of the IC's potential performance.
The formulas given are for the typical characteristics only at 25°C.
To calculate total supply current at loads other than 50 pF:

 $I_T(C_L) = I_T(50 \text{ pF}) + (C_L - 50) \text{ Vfk}$

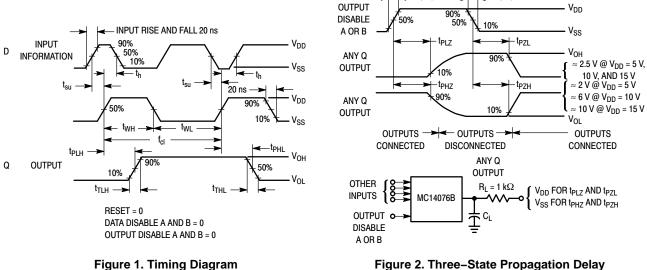

where: I_T is in μA (per package), C_L in pF, $V = (V_{DD} - V_{SS})$ in volts, f in kHz is input frequency, and k = 0.002.
