# 74VHC02 Quad 2-Input NOR Gate

## Features

- High Speed: t<sub>PD</sub> = 3.6ns (Typ.) at V<sub>CC</sub> = 5V
- Low power dissipation:  $I_{CC} = 2\mu A$  (Max.) at  $T_A = 25^{\circ}C$
- High noise immunity:  $V_{NIH} = V_{NIL} = 28\% V_{CC}$  (Min.)
- Power down protection is provided on all inputs
- Low noise: V<sub>OLP</sub> = 0.8V (Max.)
- Pin and function compatible with 74HC02

## **General Description**

The VHC02 is an advanced high-speed CMOS 2-Input NOR Gate fabricated with silicon gate CMOS technology. It achieves the high-speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. The internal circuit is composed of 3 stages, including buffer output, which provide high noise immunity and stable output. An input protection circuit insures that 0V to 7V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5V to 3V systems and two supply systems such as battery backup. This circuit prevents device destruction due to mismatched supply and input voltages.

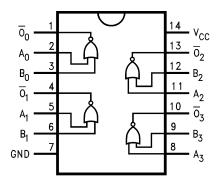

## **Ordering Information**

| Order Number | Package<br>Number | Package Description   |
|--------------|-------------------|---|
| 74VHC02M     | M14A              | 14-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-012, 0.150"<br>Narrow |
| 74VHC02SJ    | M14D              | 14-Lead Small Outline Package (SOP), EIAJ TYPE II, 5.3mm Wide                   |
| 74VHC02MTC   | MTC14             | 14-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 4.4mm Wide     |

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering number.

All packages are lead free per JEDEC: J-STD-020B standard.

#### **Absolute Maximum Ratings**

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

| Symbol           | Parameter                                | Rating                          |
|------------------|--|---------------------------------|
| V <sub>CC</sub>  | Supply Voltage                           | -0.5V to +7.0V                  |
| V <sub>IN</sub>  | DC Input Voltage                         | -0.5V to +7.0V                  |
| V <sub>OUT</sub> | DC Output Voltage                        | –0.5V to V <sub>CC</sub> + 0.5V |
| I <sub>IK</sub>  | Input Diode Current                      | –20mA                           |
| I <sub>OK</sub>  | Output Diode Current                     | ±20mA                           |
| I <sub>OUT</sub> | DC Output Current                        | ±25mA                           |
| I <sub>CC</sub>  | DC V <sub>CC</sub> / GND Current         | ±50mA                           |
| T <sub>STG</sub> | Storage Temperature                      | –65°C to +150°C                 |
| ΤL               | Lead Temperature (Soldering, 10 seconds) | 260°C                           |

## Recommended Operating Conditions<sup>(1)</sup>

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. ON Semiconductor does not recommend exceeding them or designing to absolute maximum ratings.

| Symbol                          | Parameter                 | Rating                |
|---------------------------------|---------------------------|-----------------------|
| V <sub>CC</sub>                 | Supply Voltage            | 2.0V to +5.5V         |
| V <sub>IN</sub>                 | Input Voltage             | 0V to +5.5V           |
| V <sub>OUT</sub>                | Output Voltage            | 0V to V <sub>CC</sub> |

Note:

3.  $C_{PD}$  is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation:  $I_{CC}$  (opr.) =  $C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC} / 4$  (per gate).
