

# KAI-01150

## 1280 (H) x 720 (V) Interline CCD Image Sensor

### Description

The ON Semiconductor KAI-01150 Image Sensor is a 720p format (1280 x 720 pixel) CCD in a 1/2" optical format. Based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, the sensor features broad dynamic range, excellent imaging performance, and a flexible readout architecture that enables use of 1, 2, or 4 outputs for full resolution readout of 138 frames per second. A vertical overflow drain structure suppresses image blooming and enables electronic shuttering for precise exposure control.

**Table 1. GENERAL SPECIFICATIONS**

Parameter	Typical Value
Architecture	Interline CCD, Progressive Scan
Total Number of Pixels	1364 (H) × 760 (V)
Number of Effective Pixels	1320 (H) × 736 (V)
Number of Active Pixels	1280 (H) × 720 (V)
Pixel Size	5.5 μm (H) × 5.5 μm (V)
Active Image Size	7.04 mm (H) × 3.96 mm (V) 8.08 mm (diag.), 1/2" Optical Format
Aspect Ratio	16:9
Number of Outputs	1, 2, or 4
Charge Capacity	20,000 electrons
Output Sensitivity	34 μV/e <sup>-</sup>
Quantum Efficiency Pan (-ABA, -QBA, -PBA) R, G, B (-FBA, -QBA) R, G, B (-CBA, -PBA)	44% 31%, 37%, 38% 29%, 37%, 39%
Base ISO KAI-01150-ABA KAI-01150-FBA KAI-01150-CBA KAI-01150-PBA	330 170 150 330
Read Noise (f = 40 MHz)	12 e <sup>-</sup> rms
Dark Current Photodiode / VCCD	7 / 140 e <sup>-</sup> /s
Dark Current Doubling Temp Photodiode / VCCD	7°C / 9°C
Dynamic Range	64 dB
Charge Transfer Efficiency	0.999999
Blooming Suppression	> 300 X
Smear	-100 dB
Image Lag	< 10 electrons
Maximum Pixel Clock Speed	40 MHz
Maximum Frame Rate Quad / Dual / Single Output	138 / 69 / 36 fps
Package Options	68 Pin PGA 64 Pin CLCC
Cover Glass	AR Coated, 2-Sides or Clear Glass

NOTE: All Parameters are specified at T = 40°C unless otherwise noted.

**Figure 1. KAI-01150 Interline CCD Image Sensor**

### Features

- Bayer Color Pattern, TRUESENSE Sparse Color Filter Pattern, and Monochrome Configurations
- Progressive Scan Readout
- Flexible Readout Architecture
- High Frame Rate
- High Sensitivity
- Low Noise Architecture
- Excellent Smear Performance
- Package Pin Reserved for Device Identification

### Applications

- Intelligent Traffic Systems
- Security / Surveillance
- Industrial Imaging

### ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

## KAI-01150

The sensor is available with the TRUESENSE Sparse Color Filter Pattern, a technology which provides a 2x improvement in light sensitivity compared to a standard color Bayer part.

The sensor shares common PGA pin-out and electrical configurations with other devices based on the TRUESENSE 5.5 micron Interline Transfer CCD Platform, allowing a single camera design to support multiple members of this sensor family.

### ORDERING INFORMATION

#### Standard Devices

See full datasheet for ordering information associated with devices no longer recommended for new designs.

Output Amplifier Sensitivity	$\Delta V/\Delta N$	–	34	–	μV/e <sup>–</sup>	Design		

1. Per color
2. Value is over the range of 10% to 90% of photodiode saturation.
3. The operating value of the substrate voltage, V<sub>AB</sub>, will be marked on the shipping container for each device. The value of V<sub>AB</sub> is set such that the photodiode charge capacity is 680 mV.
4. At 40 MHz
5. Uses 20LOG (PNe/ n<sub>e-T</sub>)
6. Assumes 5 pF load.

## DEFECT DEFINITIONS

Table 13. OPERATION CONDITIONS FOR DEFECT TESTING AT 40°C

Description	Condition	Notes
Operational Mode	Two Outputs, Using VOUTa and VOUTc, Continuous Readout	
HCCD Clock Frequency	10 MHz	
Pixels per Line	1520	1
Lines per Frame	480	2
Line Time	154.9 $\mu$ s	
Frame Time	74.4 ms	
Photodiode Integration Time	Mode A: PD_Tint = Frame Time = 74.4 ms, No Electronic Shutter Used Mode B: PD_Tint = 33 ms, Electronic Shutter Used	
VCCD Integration Time	58.9 ms	3
Temperature	40°C	
Light Source	Continuous Red, Green and Blue LED Illumination	4
Operation	Nominal Operating Voltages and Timing	

1. Horizontal overclocking used.
2. Vertical overclocking used.
3. VCCD Integration Time = 380 lines  $\times$  Line Time, which is the total time a pixel will spend in the VCCD registers.
4. For monochrome sensor, only the green LED is used.

Table 14. DEFECT DEFINITIONS FOR TESTING AT 40°C

Description	Definition	Standard Grade	Grade 2	Notes
Major Dark Field Defective Bright Pixel	PD_Tint = Mode A $\rightarrow$ Defect $\geq$ 25 mV or PD_Tint = Mode B $\rightarrow$ Defect $\geq$ 12 mV	10	10	1
Major Bright Field Defective Dark Pixel	Defect $\geq$ 12%	10	10	1
Minor Dark Field Defective Bright Pixel	PD_Tint = Mode A $\rightarrow$ Defect $\geq$ 13 mV or PD_Tint = Mode B $\rightarrow$ Defect $\geq$ 6 mV	100	100	
Cluster Defect (Standard Grade)	A group of 2 to 10 contiguous major defective pixels, but no more than 2 adjacent defects horizontally.	0	N/A	2
Cluster Defect (Grade 2)	A group of 2 to 10 contiguous major defective pixels.	N/A	5	2
Column Defect	A group of more than 10 contiguous major defective pixels along a single column.	0	0	2

1. For the color device (KAI-01150-CBA or KAI-01150-PBA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.
2. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

**Table 15. OPERATION CONDITIONS FOR DEFECT TESTING AT 27°C**

Description	Condition	Notes
Operational Mode	Two Outputs, Using VOUTa and VOUTc, Continuous Readout	
HCCD Clock Frequency	20 MHz	
Pixels per Line	1520	1
Lines per Frame	480	2
Line Time	77.8 $\mu$ s	
Frame Time	37.3 ms	
Photodiode Integration Time (PD_Tint)	Mode A: PD_Tint = Frame Time = 37.3 ms, No Electronic Shutter Used Mode B: PD_Tint = 33 ms, Electronic Shutter Used	
VCCD Integration Time	29.5 ms	3
Temperature	27°C	
Light Source	Continuous Red, Green and Blue LED Illumination	4
Operation	Nominal Operating Voltages and Timing	

1. Horizontal overclocking used.
2. Vertical overclocking used.
3. VCCD Integration Time = 380 lines  $\times$  Line Time, which is the total time a pixel will spend in the VCCD registers.
4. For monochrome sensor, only the green LED is used.

**Table 16. DEFECT DEFINITIONS FOR TESTING AT 27°C**

Description	Definition	Standard Grade	Grade 2	Notes
Major Dark Field Defective Bright Pixel	PD_Tint = Mode A $\rightarrow$ Defect $\geq$ 8 mV or PD_Tint = Mode B $\rightarrow$ Defect $\geq$ 4 mV	10	10	1
Major Bright Field Defective Dark Pixel	Defect $\geq$ 12%	10	10	1
Cluster Defect (Standard Grade)	A group of 2 to 10 contiguous major defective pixels, but no more than 2 adjacent defects horizontally.	0	N/A	2
Cluster Defect (Grade 2)	A group of 2 to 10 contiguous major defective pixels.	N/A	5	2
Column Defect	A group of more than 10 contiguous major defective pixels along a single column.	0	0	2

1. For the color device (KAI-01150-CBA or KAI-01150-PBA), a bright field defective pixel deviates by 12% with respect to pixels of the same color.
2. Column and cluster defects are separated by no less than two (2) good pixels in any direction (excluding single pixel defects).

### Defect Map

The defect map supplied with each sensor is based upon testing at an ambient (27°C) temperature. Minor point defects are not included in the defect map. All defective

pixels are reference to pixel 1, 1 in the defect maps. See Figure 15: Regions of Interest for the location of pixel 1, 1.

## TEST DEFINITIONS

### Test Regions of Interest

Image Area ROI: Pixel (1, 1) to Pixel (1320, 736)  
 Active Area ROI: Pixel (21, 9) to Pixel (1300, 728)  
 Center ROI: Pixel (611, 319) to Pixel (710, 418)

Only the Active Area ROI pixels are used for performance and defect tests.

### Overclocking

The test system timing is configured such that the sensor is overclocked in both the vertical and horizontal directions. See Figure 15 for a pictorial representation of the regions of interest.

Figure 15. Regions of Interest

## Tests

### Dark Field Global Non-Uniformity

This test is performed under dark field conditions. The sensor is partitioned into 60 sub regions of interest, each of which is 128 by 120 pixels in size. See Figure 16: Test Sub Regions of Interest. The average signal level of each of the 60 sub regions of interest is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

$$\text{Signal of ROI}[i] = (\text{ROI Average in Counts} - \text{Horizontal Overclock Average in Counts}) \cdot \text{mV per Count}$$

Units : mVpp (millivolts Peak to Peak)

Where  $i = 1$  to 144. During this calculation on the 60 sub regions of interest, the maximum and minimum signal levels are found. The dark field global uniformity is then calculated as the maximum signal found minus the minimum signal level found.

### Global Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate

voltage has been set such that the charge capacity of the sensor is 680 mV. Global non-uniformity is defined as

$$\text{Global Non-Uniformity} = 100 \cdot \left( \frac{\text{Active Area Standard Deviation}}{\text{Active Area Signal}} \right)$$

Units : % rms

Active Area Signal = Active Area Average – Dark Column Average

### Global Peak to Peak Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The sensor is partitioned into 60 sub regions of interest, each of which is 128 by 120 pixels in size. See Figure 16: Test Sub Regions of Interest. The average signal level of each of the 60 sub regions of interest (ROI) is calculated. The signal level of each of the sub regions of interest is calculated using the following formula:

$$\text{Signal of ROI}[i] = (\text{ROI Average in Counts} - \text{Horizontal Overclock Average in Counts}) \cdot \text{mV per Count}$$

Where  $i = 1$  to 60. During this calculation on the 60 sub regions of interest, the maximum and minimum signal levels are found. The global peak to peak uniformity is then calculated as:

$$\text{Global Uniformity} = 100 \cdot \left( \frac{\text{Max. Signal} - \text{Min. Signal}}{\text{Active Area Signal}} \right)$$

Units : % pp

#### Center Non-Uniformity

This test is performed with the imager illuminated to a level such that the output is at 70% of saturation (approximately 476 mV). Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. Defects are excluded for the calculation of this test. This test is performed on the center 100 by 100 pixels of the sensor. Center uniformity is defined as:

$$\text{Center ROI Uniformity} = 100 \cdot \left( \frac{\text{Center ROI Standard Deviation}}{\text{Center ROI Signal}} \right)$$

Units : % rms

Center ROI Signal = Center ROI Average – Dark Column Average

#### Dark Field Defect Test

This test is performed under dark field conditions. The sensor is partitioned into 60 sub regions of interest, each of which is 128 by 120 pixels in size. In each region of interest, the median value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the defect threshold specified in the “Defect Definitions” section.

#### Bright Field Defect Test

This test is performed with the imager illuminated to a level such that the output is at approximately 476 mV.

Prior to this test being performed the substrate voltage has been set such that the charge capacity of the sensor is 680 mV. The average signal level of all active pixels is found. The bright and dark thresholds are set as:

Dark Defect Threshold = Active Area Signal · Threshold

Bright Defect Threshold = Active Area Signal · Threshold

The sensor is then partitioned into 60 sub regions of interest, each of which is 128 by 120 pixels in size. In each region of interest, the average value of all pixels is found. For each region of interest, a pixel is marked defective if it is greater than or equal to the median value of that region of interest plus the bright threshold specified or if it is less than or equal to the median value of that region of interest minus the dark threshold specified.

Example for major bright field defective pixels:

- Average value of all active pixels is found to be 476 mV.
- Dark defect threshold:  $476 \text{ mV} \cdot 12 \% = 57 \text{ mV}$ .
- Bright defect threshold:  $476 \text{ mV} \cdot 12 \% = 57 \text{ mV}$ .
- Region of interest #1 selected. This region of interest is pixels 21, 9 to pixels 148, 128.
  - ♦ Median of this region of interest is found to be 470 mV.
  - ♦ Any pixel in this region of interest that is  $\geq (470 + 57 \text{ mV})$  527 mV in intensity will be marked defective.
  - ♦ Any pixel in this region of interest that is  $\leq (470 - 57 \text{ mV})$  413 mV in intensity will be marked defective.
- All remaining 60 sub regions of interest are analyzed for defective pixels in the same manner.

#### Test Sub Regions of Interest

## OPERATION

### Absolute Maximum Ratings

Absolute maximum rating is defined as a level or condition that should not be exceeded at any time per the

description. If the level or the condition is exceeded, the device will be degraded and may be damaged. Operation at these values will reduce MTTF.

**Table 17. ABSOLUTE MAXIMUM RATINGS**

Description	Symbol	Minimum	Maximum	Unit	Notes
Operating Temperature	T <sub>OP</sub>	-50	70	°C	1
Humidity	RH	5	90	%	2
Output Bias Current	I <sub>OUT</sub>	-	60	mA	3
Off-Chip Load	C <sub>L</sub>	-	10	pF	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Noise performance will degrade at higher temperatures.
- T = 25°C. Excessive humidity will degrade MTTF.
- Total for all outputs. Maximum current is -15 mA for each output. Avoid shorting output pins to ground or any low impedance source during operation. Amplifier bandwidth increases at higher current and lower load capacitance at the expense of reduced gain (sensitivity).

**Table 18. ABSOLUTE MAXIMUM VOLTAGE RATINGS BETWEEN PINS AND GROUND**

Description	Minimum	Maximum	Unit	Notes
VDD <sub>α</sub> , VOUT <sub>α</sub>	-0.4	17.5	V	1
RD <sub>α</sub>	-0.4	15.5	V	1
V1B, V1T	ESD - 0.4	ESD + 24.0	V	
V2B, V2T, V3B, V3T, V4B, V4T	ESD - 0.4	ESD + 14.0	V	
H1S <sub>α</sub> , H1B <sub>α</sub> , H2S <sub>α</sub> , H2B <sub>α</sub> , H2SL <sub>α</sub> , R <sub>α</sub> , OG <sub>α</sub>	ESD - 0.4	ESD + 14.0	V	1
ESD	-10.0	0.0	V	
SUB	-0.4	40.0	V	2

- α denotes a, b, c or d.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*

### Power-Up and Power-Down Sequence

Adherence to the power-up and power-down sequence is critical. Failure to follow the proper power-up and power-down sequences may cause damage to the sensor.

#### Notes:

1. Activate all other biases when ESD is stable and SUB is above 3 V.
2. Do not pulse the electronic shutter until ESD is stable.
3. VDD cannot be +15 V when SUB is 0 V.
4. The image sensor can be protected from an accidental improper ESD voltage by current limiting the SUB current to less than 10 mA. SUB and VDD must always be greater than GND. ESD must always be less than GND. Placing diodes between SUB, VDD, ESD and ground will protect the sensor from accidental overshoots of SUB, VDD and ESD during power on and power off. See the figure below.

**Figure 17. Power-Up and Power-Down Sequence**

The VCCD clock waveform must not have a negative overshoot more than 0.4 V below the ESD voltage.

**Figure 18. VCCD Clock Waveform**

Example of external diode protection for SUB, VDD and ESD.  $\alpha$  denotes a, b, c or d.

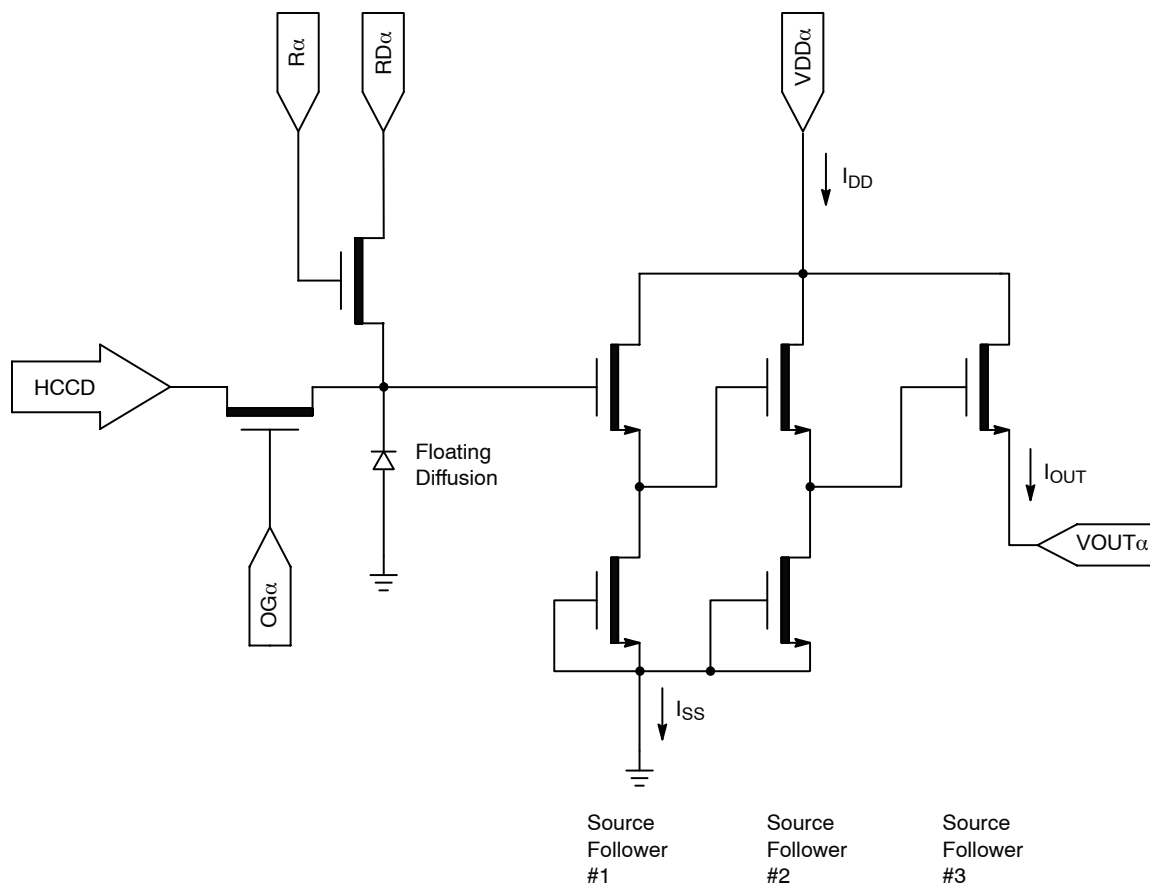

**Figure 19. Example of External Diode Protection**

## DC Bias Operating Conditions

### Table 19. DC BIAS OPERATING CONDITIONS

Description	Pins	Symbol	Min.	Nom.	Max.	Unit	Max. DC Current	Notes
Reset Drain	RD $\alpha$	RD	11.8	12.0	12.2	V	10 $\mu$ A	1
Output Gate	OG $\alpha$	OG	−2.2	−2.0	−1.8	V	10 $\mu$ A	1
Output Amplifier Supply	VDD $\alpha$	V <sub>DD</sub>	14.5	15.0	15.5	V	11.0 mA	1, 2
Ground	GND	GND	0.0	0.0	0.0	V	−1.0 mA	
Substrate	SUB	V <sub>SUB</sub>	5.0	V <sub>AB</sub>	V <sub>DD</sub>	V	50 $\mu$ A	3, 8
ESD Protection Disable	ESD	ESD	−9.5	−9.0	V <sub>X_L</sub>	V	50 $\mu$ A	6, 7, 9
Output Bias Current	VOU $\alpha$	I <sub>OUT</sub>	−3.0	−7.0	−10.0	mA	–	1, 4, 5

1.  $\alpha$  denotes a, b, c or d.
2. The maximum DC current is for one output.  $I_{DD} = I_{OUT} + I_{SS}$ . See Figure 20.
3. The operating value of the substrate voltage,  $V_{AB}$ , will be marked on the shipping container for each device. The value of  $V_{AB}$  is set such that the photodiode charge capacity is the nominal  $P_{Ne}$  (see Specifications).
4. An output load sink must be applied to each VOUT pin to activate each output amplifier.
5. Nominal value required for 40 MHz operation per output. May be reduced for slower data rates and lower noise.
6. Adherence to the power-up and power-down sequence is critical. See Power Up and Power Down Sequence section.
7. ESD maximum value must be less than or equal to V1\_L + 0.4 V and V2\_L + 0.4 V.
8. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.
9. Where  $V_{x\_L}$  is the level set for V1\_L, V2\_L, V3\_L, or V4\_L in the application.

### Figure 20. Output Amplifier

## AC Operating Conditions

Table 20. CLOCK LEVELS

Description	Pins (Note 1)	Symbol	Level	Min.	Nom.	Max.	Unit	Capacitance (Note 2)
Vertical CCD Clock, Phase 1	V1B, V1T	V1_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V1_M	Mid	-0.2	0.0	0.2		
		V1_H	High	11.5	12.0	12.5		
Vertical CCD Clock, Phase 2	V2B, V2T	V2_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V2_H	High	-0.2	0.0	0.2		
Vertical CCD Clock, Phase 3	V3B, V3T	V3_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V3_H	High	-0.2	0.0	0.2		
Vertical CCD Clock, Phase 4	V4B, V4T	V4_L	Low	-8.2	-8.0	-7.8	V	6 nF (Note 6)
		V4_H	High	-0.2	0.0	0.2		
Horizontal CCD Clock, Phase 1 Storage	H1S $\alpha$	H1S_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	90 pF (Note 6)
		H1S_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Phase 1 Barrier	H1B $\alpha$	H1B_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	60 pF (Note 6)
		H1B_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Phase 2 Storage	H2S $\alpha$	H2S_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	90 pF (Note 6)
		H2S_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Phase 2 Barrier	H2B $\alpha$	H2B_L	Low	-5.2 (Note 7)	-4.0	-3.8	V	60 pF (Note 6)
		H2B_A	Amplitude	3.8	4.0	5.2 (Note 7)		
Horizontal CCD Clock, Last Phase (Note 3)	H2SL $\alpha$	H2SL_L	Low	-5.2	-5.0	-4.8	V	20 pF (Note 6)
		H2SL_A	Amplitude	4.8	5.0	5.2		
Reset Gate	R $\alpha$	R_L (Note 4)	Low	-3.5	-2.0	-1.5	V	16 pF (Note 6)
		R_H	High	2.5	3.0	4.0		
Electronic Shutter (Note 5)	SUB	VES	High	29.0	30.0	40.0	V	400 pF (Note 6)

- $\alpha$  denotes a, b, c or d.
- Capacitance is total for all like named pins.
- Use separate clock driver for improved speed performance.
- Reset low should be set to -3 V for signal levels greater than 40,000 electrons.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.
- Capacitance values are estimated.
- If the minimum horizontal clock low level is used (-5.2 V), then the maximum horizontal clock amplitude should be used (5.2 V amplitude) to create a -5.2 V to 0.0 V clock. If a 5 V clock driver is used, the horizontal low level should be set to -5.0 V and the high level should be a set to 0.0 V.

The figure below shows the DC bias (V<sub>SUB</sub>) and AC clock (V<sub>ES</sub>) applied to the SUB pin. Both the DC bias and AC clock are referenced to ground.

Figure 21. DC Bias and AC Clock Applied to the SUB Pin

### Device Identification

The device identification pin (DevID) may be used to determine which ON Semiconductor 5.5 micron pixel interline CCD sensor is being used.

Table 21.

Description	Pins	Symbol	Min.	Nom.	Max.	Unit	Max. DC Current	Notes
Device Identification	DevID	DevID	4,000	5,000	6,000	$\Omega$	50 $\mu$ A	1, 2, 3

1. Nominal value subject to verification and/or change during release of preliminary specifications.
2. If the Device Identification is not used, it may be left disconnected.
3. After Device Identification resistance has been read during camera initialization, it is recommended that the circuit be disabled to prevent localized heating of the sensor due to current flow through the R<sub>DeviceID</sub> resistor.

### Recommended Circuit

Note that V1 must be a different value than V2.

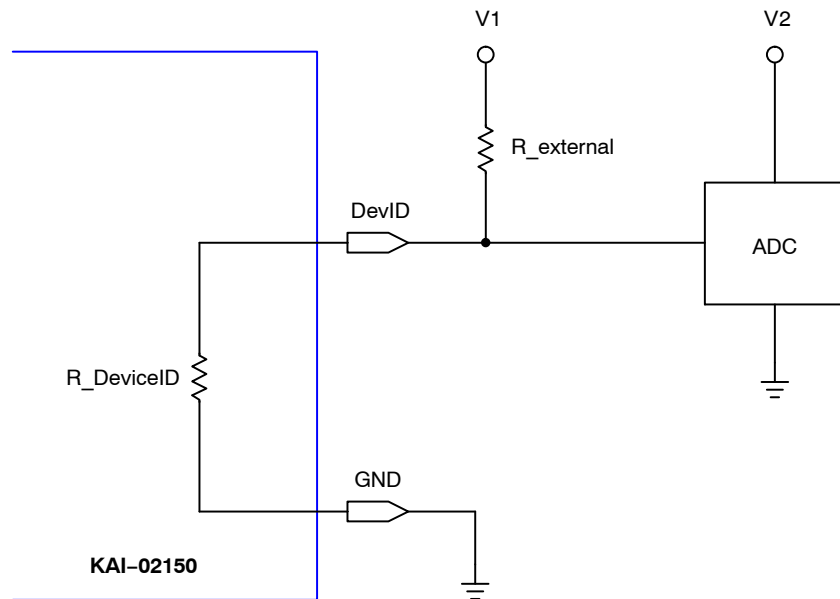

Figure 22. Device Identification Recommended Circuit

Rd	P7	P7 (Note 1) or Off (Note 3)	P7 (Note 1) or Off (Note 3)	P7 (Note 1) or Off (Note 3)

#Lines/Frame (Minimum)	380	760	380	760
#Pixels/Line (Minimum)	693		1386	

1. For optimal performance of the sensor. May be clocked at a lower frequency. If clocked at a lower frequency, the frequency selected should be a multiple of the frequency used on the a and b register.
2. H2SLx follows the same pattern as H2Sx. For optimal speed performance, use a separate clock driver.
3. Off = +5 V. Note that there may be operating conditions (high temperature and/or very bright light sources) that will cause blooming from the unused c/d register into the image area.

### Photodiode Transfer Timing

A row of charge is transferred to the HCCD on the falling edge of V1 as indicated in the P1 pattern below. Using this timing sequence, the leading dummy row or line is combined with the first dark row in the HCCD. The “Last Line” is dependent on readout mode – either 380 or 760 minimum counts required. It is important to note that, in

general, the rising edge of a vertical clock (patterns P1–P4) should be coincident or slightly leading a falling edge at the same time interval. This is particularly true at the point where P1 returns from the high (3<sup>rd</sup> level) state to the mid-state when P4 transitions from the low state to the high state.

**Figure 23. Photodiode Transfer Timing**

### Line and Pixel Timing

Each row of charge is transferred to the output, as illustrated below, on the falling edge of H2SL (indicated as

P6 pattern). The number of pixels in a row is dependent on readout mode – either 693 or 1386 minimum counts required.

**Figure 24. Line and Pixel Timing**

*Pixel Timing Detail*

**Figure 25. Pixel Timing Detail**

*Frame/Electronic Shutter Timing*

The SUB pin may be optionally clocked to provide electronic shuttering capability as shown below. The

resulting photodiode integration time is defined from the falling edge of SUB to the falling edge of V1 (P1 pattern).

## STORAGE AND HANDLING

Table 24. STORAGE CONDITIONS

Description	Symbol	Minimum	Maximum	Units	Notes
Storage Temperature	T <sub>ST</sub>	-55	80	°C	1
Humidity	RH	5	90	%	2

1. Long-term storage toward the maximum temperature will accelerate color filter degradation.
2. T = 25°C. Excessive humidity will degrade MTTF.
