Capacitance-Digital-Converter LSI for Electrostatic Capacitive Touch Sensors

Overview

The LC717A10PJ is a high-performance and low-cost capacitance-digital-converter LSI for electrostatic capacitive touch sensor, especially focused on usability.

It has 16 channels capacitance-sensor input. This makes it ideal for use in the products that need many switches. Since the calibration function and the judgment of ON/OFF are automatically performed in LSI internal, it can make development time more short. A detection result (ON/OFF) for each input can be read out by the serial interface (I^2C^{M} compatible bus or SPI).

Also, measurement value of each input can be read out as 8-bit digital data. Moreover, gain and other parameters can be adjusted using serial interface.

Features

- Detection System: Differential Capacitance Detection (Mutual Capacitance Type)
- Input Capacitance Resolution: Can Detect Capacitance Changes in the Femto Farad Order
- Measurement Interval (16 Differential Inputs):
 - 30 ms (Typ) (at Initial Configuration)
 - 6 ms (Typ) (at Minimum Interval Configuration)
- External Components for Measurement: Not Required
- Current Consumption:
 - 570 μ A (Typ) (V_{DD} = 2.8 V)
 - 1.3 mA (Typ) (V_{DD} = 5.5 V)
- Supply Voltage: 2.6 V to 5.5 V
- Detection Operations: Switch
- Interface: I²C Compatible Bus or SPI Selectable

ORDERING INFORMATION

See detailed ordering and shipping information on page 12 of this data sheet.

Specifications

Table 1. ABSOLUTE MAXIMUM RATINGS ($T_A = 25^{\circ}C$, $V_{SS} = 0$ V)

Parameter	Symbol	Ratings	Unit	Remarks
Supply Voltage	V _{DD}	-0.3 to +6.5	V	
Input Voltage	V _{IN}	–0.3 to V _{DD} + 0.3	V	(Note 1)
Output Voltage	V _{OUT}	–0.3 to V _{DD} + 0.3	V	(Note 2)
Power Dissipation	P _{d max}	160	mW	$T_A = +105^{\circ}C$, Mounted on a substrate (Note 3)
Peak Output Current	l _{OP}	±8	mA	Per a Pin Duty Ratio 50% (Note 2)
Total Output Current	I _{OA}	±40	mA	LSI Outputs Total Value Duty Ratio 25% (Note 2)

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Apply to Cin0 to 15, Cref, CrefAdd, nRST, SCL, SDA, SA0, SA1, SCK, SI, nCS.

2. Apply to Cdrv, SDA, SO, INTOUT.

3. Single-layer glass epoxy board (76.1 \times 114.3 \times 1.6t mm).

Table 2. RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Conditions	Min	Тур	Max	Unit	Remarks
Operating Supply Voltage	V _{DD}		2.6	-	5.5	V	
Supply Ripple + Noise	V _{PP}		-	-	±40	mV	(Note 4)
Operating Temperature	T _{opr}		-40	25	105	°C	

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

Inserting a high-valued capacitor and a low-valued capacitor in parallel between V_{DD} and V_{SS} is recommended. In this case, the small-valued capacitor should be at least 0.1 μF, and is mounted near the LSI.

Table 3. ELECTRICAL CHARACTERISTICS

 $(V_{SS} = 0 \text{ V}, V_{DD} = 2.6 \text{ to } 5.5 \text{ V}, T_A = -40 \text{ to } +105^{\circ}\text{C}$, Unless otherwise specified, the Cdrv drive frequency is $f_{CDRV} = 143 \text{ kHz}$, and the Long Interval Time is $T_{IVAL} = 101 \text{ ms}$. Not tested at low temperature before shipment.)

Parameter	Symbol	Conditions	Min	Тур	Max	Unit	Remarks
Capacitance Detection Resolution	N		-	-	8	bit	
Output Noise RMS	N _{RMS}	Minimum gain setting	-	-	±1.0	LSB	(Notes 5, 7)
Input Offset Capacitance Adjustment Range	Coff _{RANGE}		-	±8.0	-	pF	(Notes 5, 7)
Input Offset Capacitance Adjustment Resolution	Coff _{RESO}		-	8	-	bit	
Cin Offset Drift	Cin _{DRIFT}	Minimum gain setting	-	-	±8	LSB	(Note 5)
Cin Detection Sensitivity	Cin _{SENSE}	Minimum gain setting	0.052	-	0.108	LSB/fF	(Note 6)
Cin Pin Leak Current	I _{Cin}	Cin = Hi–Z	-	±25	±500	nA	
Cin Allowable Parasitic Input Capacitance	Cin _{SUB}	Cin against V _{SS}	-	-	30	pF	(Notes 5, 7)
Cdrv Drive Frequency	f _{CDRV}		100	143	186	kHz	
		V _{DD} = 5 V ±3%, 54.8 kHz setting	50.4	59.45	68.5	kHz	(Note 5)
nRST Minimum Pulse Width	t _{NRST}		1	-	-	μs	
Power-on Reset Time	t _{POR}		-	-	20	ms	
Power-on Reset Operation Condition: Hold Time	tPOROP		10	-	_	ms	(Note 5)

Table 3. ELECTRICAL CHARACTERISTICS (continued)

 $(V_{SS} = 0 V, V_{DD} = 2.6 \text{ to } 5.5 V, T_A = -40 \text{ to } +105^{\circ}C$, Unless otherwise specified, the Cdrv drive frequency is $f_{CDRV} = 143 \text{ kHz}$, and the Long Interval Time is T_{IVAL} = 101 ms. Not tested at low temperature before shipment.)

Parameter	Symbol	Conditions	Min	Тур	Max	Unit	Remarks
Power-on Reset Operation Condition: Input Voltage	V _{POROP}		-	-	0.1	V	(Note 5)
Power-on Reset Operation Condition: Power Supply Rise Rate	t _{VDD}	0 V to V _{DD}	1	_	_	V/ms	(Note 5)
Long Interval Time	T _{IVAL}		40	101	162	ms	
Pin Input Voltage	V _{IH}	High input	0.8 V _{DD}	-	-	V	(Note 8)
	V _{IL}	Low input	-	-	0.2 V _{DD}		
Pin Output Voltage	V _{OH}	High output (I _{OH} = +3 mA)	0.8 V _{DD}	-	-	V	(Note 9)
	V _{OL}	Low output (I _{OL} = -3 mA)	-	-	0.2 V _{DD}		
	V _{OH}	V_{DD} = 5 V ±3%, High output (I _{OH} = +3 mA)	0.96 V _{DD}	-	-	V	(Notes 5, 9)
	V _{OL}	$V_{DD} = 5 V \pm 3\%,$ Low output $(I_{OL} = -3 mA)$	-	-	0.02 V _{DD}		
SDA Pin Output Voltage	V _{OL} I ² C	SDA Low output (I _{OL} = -3 mA)	-	-	0.4	V	
Pin Leak Current	I _{LEAK}		-	-	±1	μA	(Note 10)
Current Consumption	I _{DD}	When initial setting and non-touch V _{DD} = 2.8 V	-	570	980	μΑ	(Note 5)
		When initial setting and non-touch V _{DD} = 5.5 V	-	1.3	2.2	mA	
		Short interval mode (short interval time is set to 5 ms) V _{DD} = 5.5 V	-	4.2	6.5	mA	
Current Consumption	I _{STBY}	During Sleep process	-	0.1	70	μA	

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

5. Design-guaranteed values (not tested before shipment).

6. Measurements conducted using the test mode in the LSI.

7. $T_A = +25^{\circ}$ C. 8. Apply to nRST, SCL, SDA, SA0, SA1, SCK, SI, nCS. 9. Apply to Cdrv, SO, INTOUT. 10. Apply to nRST, SCL, SDA, SA0, SA1, SCK, SI, nCS.

Table 4. I²C COMPATIBLE BUS TIMING CHARACTERISTICS

(V_{SS} = 0 V, V_{DD} = 2.6 to 5.5 V, T_A = -40 to +105°C, Not tested at low temperature before shipment.)

Parameter	Symbol	Pin Name	Conditions	Min	Тур	Max	Unit	Remarks
SCL Clock Frequency	f _{SCL}	SCL		-	-	400	kHz	
START Condition Hold Time	t _{HD;STA}	SCL, SDA		0.6	_	-	μs	
SCL Clock Low Period	t _{LOW}	SCL		1.3	-	-	μs	
SCL Clock High Period	t _{HIGH}	SCL		0.6	-	-	μs	
Repeated START Condition Setup Time	t _{SU;STA}	SCL, SDA		0.6	-	-	μs	(Note 11)

nCS Standby Pulse Width	t _{CPH}	nCS		300	-	-	ns	
				90	-	_	ns	(Note 12)
Output High Impedance Time from nCS	t _{СНZ}	nCS, SO		-	_	80	ns	(Note 12)

Table 5. SPI BUS TIMING CHARACTERISTICS (continued)

(V_{SS} = 0 V, V_{DD} = 2.6 to 5.5 V, T_A = -40 to +105 °C, Not tested at low temperature before shipment.)

Parameter	Symbol	Pin Name	Conditions	Min	Тур	Мах	Unit	Remarks
Output Data Determination Time	t _v	SCK, SO		-	-	100	ns	
				-	-	80	ns	(Note 12)
Output Data Hold Time	t _{HD;SO}	SCK, SO		100	_	-	ns	
				0	-	-	ns	(Note 12)
Output Low Impedance Time	t _{CLZ}	SCK, SO		100	-	-	ns	
ITOTIL SCK Clock				0	_	-	ns	(Note 12)

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

12. Design-guaranteed values (not tested before shipment).

Dynamic Offset Calibration Function to Correct C_{IN} Offset Drift

When measurement data at a certain channel are consecutively within the execution range of dynamic offset calibration (4 to touch threshold, or -128 to -4) for the period of time corresponding to a value, dynamic offset calibration is performed and the reference value at the channel is gradually corrected to 0.

The figure below shows the operation when the measured value began to drift in the positive direction from the central value gradually.

The examples of settings to 8 times the dynamic offset calibration carried count.

*When measurement data is out of the execution range of dynamic calibration, the plus side's dynamic offset calibration execution count number is immediately reset to "0".

Figure 1.

Power-On Reset (POR)

When power is turned on, power-on reset is enabled inside the LSI and its state is released after a certain power-on reset time, t_{POR} . Power-on reset operation condition: Power supply rise rate t_{VDD} must be at least 1 V/ms. Since INTOUT pin changes from "High" to "Low" at the same time as the released of power-on reset, it is possible to verify the timing of release of power-on reset externally.

During power-on reset, Cin, Cref and CrefAdd are unknown.

Figure 2.

I²C Compatible Bus Data Timing

I²C Compatible Bus Communication Formats

• Write format (data can be written into sequentially incremented addresses)

START	Slave Address	Write=L	ACK	Register Address (N)	ACK	Data written to Register Address (N)	ACK	Data written to Register Address (N+1)	ACK	STOP
			Slave	Fig	Slave	4	Slave		Slave	

• Read format (data can be read from sequentially incremented addresses)

START	Slave Address	Write=L	ACK	Register Address (N)	ACK]				
			Slave		Slave					
RESTART	Slave Address	Read=H	ACK	Data read from Register Address (N)	ACK	Data read from Register Address (N+1)	ACK	Data read from Register Address (N+2)	NACK	с вто
			Slave		Maste	r	Maste	r	Maste	ər

I²C Compatible Bus Slave Address

Selection of four kinds of addresses is possible through the SA0 and SA1 terminals.

Table 6.

SA1 Pin Input	SA0 Pin Input	7-bit Slave Address	Binary Notation	8-bit Slave Address
Low	Low	0x16	00101100b (Write)	0x2C
			00101101b (Read)	0x2D

SPI Data Timing (SPI Mode 0 / Mode 3)

SPI Communication Formats (Example of Mode 0)

• Write format (data can be written into sequentially incremented addresses while preserving nCS = L)

• Read format (data can be read from sequentially incremented addresses while preserving nCS = L)

Block Diagram

Figure 9. Simplified Block Diagram

LC717A10PJ is capacitance-digital-converter LSI capable of detecting changes in capacitance in the order of femto Farads. It consists of an oscillation circuit that generates the system clock, a power-on reset circuit that resets the system when the power is turned on, a multiplexer that selects the input channels, a two-stage amplifier that

detects the changes in the capacitance and outputs analog-amplitude values, a A/D converter that converts the analog-amplitude values into digital data, an I^2C compatible bus or a SPI that enables serial communication with external devices and a control logic that controls the entire chip.

nRST	I	External reset signal inverting input	
SA1	I	Slave address selection (I ² C)	Vss m
SDA/SI	I/O	Data input and output (I ² C) / Data input (SPI)	
			V _{SS} <i>m</i>

Table 8. PIN FUNCTION (continued)

Pin Name	I/O	Pin Functions	Pin Type
SA0/SO	I/O	Slave address selection (I ² C) / Data output (SPI)	V _{DD} R V _{SS} m Buffer
V _{DD}		Power supply (2.6 V to 5.5 V) (Note 14)	
V _{SS}		Ground (Earth) (Notes 14, 15)	

14. Inserting a high-valued capacitor and a low-valued capacitor in parallel between V_{DD} and V_{SS} is recommended. In this case, the small-valued capacitor should be at least 0.1 μ F, and is mounted near the LSI.

15. When V_{SS} terminal is not grounded in battery-powered mobile equipment, detection sensitivity may be degraded.

Details of Pin Functions

Cin0 to Cin15

These are the capacitance-sensor-input pins. These pins are used by connecting them to the touch switch pattern. Cin and the Cdrv wire patterns should be close to each other. By doing so, Cdrv and Cin patterns are capacitively coupled. Therefore, LSI can detect capacitance change near each pattern as 8-bit digital data.

However, if the shape of each pattern or the capacitively coupled value of Cdrv is not appropriate, it may not be able to detect the capacitance change correctly.

In this LSI, there is a two-stage amplifier that detects the changes in the capacitance and outputs analog-amplitude values. Cin0 to Cin15 are connected to the inverting input of the 1st amplifier.

During measurement process, channels other than the one being measured are all in "Low" condition.

Leave the unused terminals open.

Cref, CrefAdd

These are the reference-capacitance-input pins. These are used by connecting to the wire pattern like Cin pins or are used by connecting any capacitance between this pin and Cdrv pin.

In this LSI, there is a two-stage amplifier that detects the changes in the capacitance and outputs analog-amplitude values. Cref is connected to the non-inverting input of the 1st amplifier.

Due to the parasitic capacitance generated in the wire connections of Cin pins and their patterns, as well as the one generated between the wire patterns of Cin and Cdrv pins, Cref may not detect capacitance change of each Cin pin accurately. In this case, connect an appropriate capacitance between Cref and Cdrv to detect capacitance change accurately. However, if the difference between the parasitic capacitance of each Cin pin is extremely large, it may not detect capacitance change in each Cin pin correctly.

CrefAdd can be used as additional terminal for Cref. Leave the CrefAdd open if not in used.

Cdrv

It is the output pin for capacitance sensors drive. It outputs the pulse voltage which is needed to detect capacitance at Cin0 to Cin15.

Cdrv and Cin wire patterns should be close to each other so that they are capacitively coupled.

INTOUT

It is the interrupt-output pin. It is used by connecting to a main microcomputer if necessary, and use as interrupt signal. (High Active).

Leave the terminal open if not in used.

SCL/SCK

Clock input (I^2C) /Clock input (SPI). It is the clock input pin of the I^2C compatible bus or the SPI depending on the mode of operation.

nCS

Interface selection/Chip-select-inverting input (SPI). Selection of I²C compatible bus mode or SPI mode is through this terminal. After initialization, the LSI is automatically in I²C compatible bus mode. To continually use I²C compatible bus mode, fix nCS pin to "High". To switch to SPI mode after LSI initialization, change the nCS input "High" \rightarrow "Low". The nCS pin is used as the chip-select-inverting input pin of SPI, and SPI mode is kept until LSI is again initialized.

nRST

It is the external-reset-signal-inverting-input pin. When nRST pin is "Low", LSI is in the reset state.

Each pin (Cin0 to 15, Cref, CrefAdd) is "Hi-Z" during reset state.

SDA/SI

Data input and output $(I^2C)/Data$ input (SPI). It is the data input and output pin of the I^2C compatible bus or the data input pin of the SPI depending on the mode of operation.

SA0/SO

Slave address selection $(I^2C)/Data$ output (SPI). It is the slave address selection pin of the I^2C compatible bus or the data output pin of the SPI depending on the mode of operation.

SA1

Slave address selection (I²C). It is the slave address selection pin of the I²C compatible bus.

When SPI mode, connect to the SA1 pin to GND.
