First Sensor

LDE series – digital low differential pressure sensors

The LDE differential low pressure sensors are based on thermal flow measurement of gas through a micro-flow channel integrated within the sensor chip. The innovative LDE technology features superior sensitivity especially for ultra low pressures. The extremely low gas flow through the sensor ensures high immunity to dust contamination, humidity and long tubing compared to other flow-based pressure sensors.

Features

- Ultra-low pressure ranges from 25 to 500 Pa (0.1 to 2 inH_2O)
- Pressure sensor based on thermal micro-flow measurement
- High flow impedance
  - very low flow-through leakage
  - high immunity to dust and humidity
  - no loss in sensitivity using long tubing
- Calibrated and temperature compensated
- Unique offset autozeroing feature ensuring superb long-term stability
- Offset accuracy better than 0.2% FS
- Total accuracy better than 0.5% FS typical
- On-chip temperature sensor
- Analog output and digital SPI interface
- No position sensitivity

Certificates

- Quality Management System according to EN ISO 13485 and EN ISO 9001
- RoHS and REACH compliant

Media compatibility

Air and other non-corrosive gases

Applications

Medical
- Ventilators
- Spirometers
- CPAP
- Sleep diagnostic equipment
- Nebulizers
- Oxygen conservers/concentrators
- Insufflators/endoscopy

Industrial
- HVAC
  - VAV
  - Filter monitoring
  - Burner control
- Fuel cells
- Gas leak detection
- Gas metering
- Fume hood
- Instrumentation
- Security systems

First Sensor

LDE series – digital low differential pressure sensors

Maximum ratings

Parameter		Min.	Max.	Unit
Supply voltage V_S	LDE...3...	2.70	3.60	V_{DC}
	LDE...6...	4.75	5.25	
Output current			1	mA
Soldering recommendations				
Reflow soldering (1, 2)				
Average preheating temperature gradient			1.5	K/s
Time above 217 °C			74	s
Time above 240 °C			30	
Peak temperature			245	°C
Cooling temperature gradient			-1.4	K/s
Wave soldering, pot temperature			260	°C
Hand soldering, tip temperature			370	
Temperature ranges				
Compensated		0	+70	°C
Operating		-20	+80	
Storage		-40	+80	
Humidity limits (non-condensing)			97	%RH
Vibration (3)			20	g
Mechanical shock (4)			500	

Pressure sensor characteristics

Part no.	Operating pressure	Proof pressure (5)	Burst pressure (5)
LDES025U...	0...25 Pa / 0...0.25 mbar (0.1 inH_2O)		
LDES050U...	0...50 Pa / 0...0.5 mbar (0.2 inH_2O)		
LDES100U...	0...100 Pa / 0...1 mbar (0.4 inH_2O)		
LDES250U...	0...250 Pa / 0...2.5 mbar (1 inH_2O)		
LDES500U...	0...500 Pa / 0...5 mbar (2 inH_2O)	2 bar (30 psi)	5 bar (75 psi)
LDES025B...	0...±25 Pa / 0...±0.25 mbar (±0.1 inH_2O)		
LDES050B...	0...±50 Pa / 0...±0.5 mbar (±0.2 inH_2O)		
LDES100B...	0...±100 Pa / 0...±1 mbar (±0.4 inH_2O)		
LDES250B...	0...±250 Pa / 0...±2.5 mbar (±1 inH_2O)		
LDES500B...	0...±500 Pa / 0...±5 mbar (±2 inH_2O)		

Gas correction factors (6)

Gas type	Correction factor
Dry air	1.0
Oxygen (O_2)	1.07
Nitrogen (N_2)	0.97
Argon (Ar)	0.98
Carbon dioxide (CO_2)	0.56

Specification notes

(1) Recommendations only. Actually reflow settings depend on many factors, for example, number of oven heating and cooling zones, type of solder paste/flux used, board and component size, as well as component density. It is the responsibility of the customer to fine tune their processes for optimal results.

(2) Handling instruction: Products are packaged in vacuum sealed moisture barrier bag with a floor life of 168hours (<30C, 60% R.H.). If floor life or environmental conditions have been exceeded prior to reflow assembly, baking is recommended. Recommended bake-out procedure is 72 hours @ 60C.

(3) Sweep 20 to 2000 Hz, 8 min, 4 cycles per axis, MIL-STD-883, Method 2007.

(4) 5 shocks, 3 axes, MIL-STD-883E, Method 2002.4.

(5) The max. common mode pressure is 5 bar.

(6) For example with a LDES500... sensor measuring CO_2 gas, at full-scale output the actual pressure will be:

$$\Delta P_{eff} = \Delta P_{Sensor} \times \text{gas correction factor} = 500\ Pa \times 0.56 = 280\ Pa$$

ΔP_{eff} = True differential pressure

ΔP_{Sensor} = Differential pressure as indicated by output signal

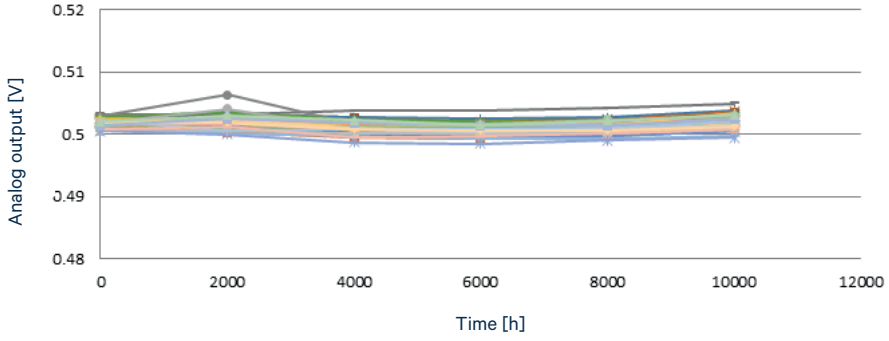

Fig. 2: Offset long term stability for LDE 250 Pa sensors after 10,000 hours @ 85°C powered, equivalent to over 43.5 years @ 25 °C (better than ±2 mV / ±0.125 Pa)

Specification notes (cont.)

(15) Total accuracy is the combined error from offset and span calibration, non-linearity, repeatability and pressure hysteresis

SPI – Serial Peripheral Interface

Note: it is important to adhere to the communication protocol in order to avoid damage to the sensor.

Introduction

The LDE serial interface is a high-speed synchronous data input and output communication port. The serial interface operates using a standard 4-wire SPI bus. The LDE device runs in SPI mode 0, which requires the clock line SCLK to idle low (CPOL = 0), and for data to be sampled on the leading clock edge (CPHA = 0). Figure 5 illustrates this mode of operation.

Care should be taken to ensure that the sensor is properly connected to the master microcontroller. Refer to the manufacturer's datasheet for more information regarding physical connections.

Application circuit

The use of pull-up resistors is generally unnecessary for SPI as most master devices are configured for push-pull mode. If pull-up resistors are required for use with 3 V LDE devices, howeer, they should be greater than 50 kΩ.

There are, however, some cases where it may be helpful to use 33Ω series resistors at both ends of the SPI lines, as shown in Figure 3.

Signal quality may be further improved by the addition of a buffer as shown in Figure 4. These cases include multiple slave devices on the same bus segment, using a master device with limited driving capability and long SPI bus lines.

If these series resistors are used, they must be physically placed as close as possible to the pins of the master and slave devices.

Signal control

The serial interface is enabled by asserting /CS low. The serial input clock, SCLK, is gated internally to begin accepting the input data at MOSI, or sending the output data on MISO. When /CS rises, the data clocked into MOSI is loaded into an internal register.

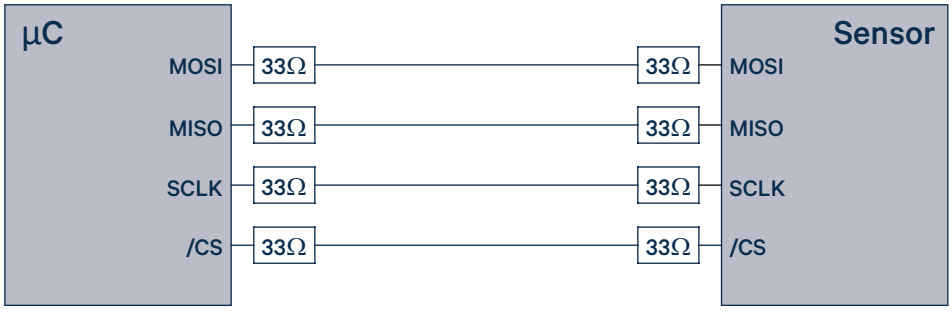

Fig. 3: Application circuit with resistors at both ends of the SPI lines

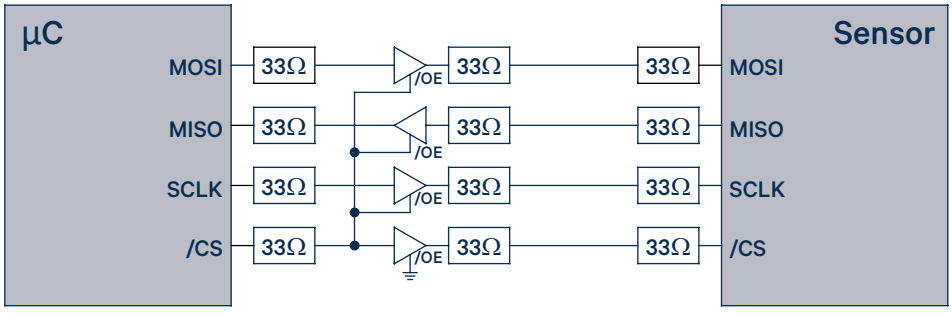

Fig. 4: Application circuit with additional buffer

SPI – Serial Peripheral Interface (cont.)

Note: it is important to adhere to the communication protocol in order to avoid damage to the sensor.

Data read – pressure

When powered on, the sensor begins to continuously measure pressure. To initiate data transfer from the sensor, the following three unique bytes must be written sequentially, MSB first, to the MOSI pin (see Figure 5):

Step	Hexadecimal	Binary	Description
1	0x2D	B00101101	Poll current pressure measurement
2	0x14	B00010100	Send result to data register
3	0x98	B10011000	Read data register

The entire 16 bit content of the LDE register is then read out on the MISO pin, MSB first, by applying 16 successive clock pulses to SCLK with /CS asserted low. Note that the value of the LSB is held at zero for internal signal processing purposes. This is below the noise threshold of the sensor and thus its fixed value does not affect sensor performance and accuracy.

From the digital sensor output the actual pressure value can be calculated as follows:

$$\text{Pressure [Pa]} = \frac{\text{Digital output [counts]}}{\text{Scale factor } \left[\frac{\text{counts}}{\text{Pa}}\right]}$$

For example, for a ±250 Pa sensor (LDES250B…) with a scale factor of 120 a digital output of 30 000 counts (7530'h) calculates to a positive pressure of 250 Pa. Similarly, a digital output of -30 000 counts (8AD0'h) calculates to a negative pressure of -250 Pa.

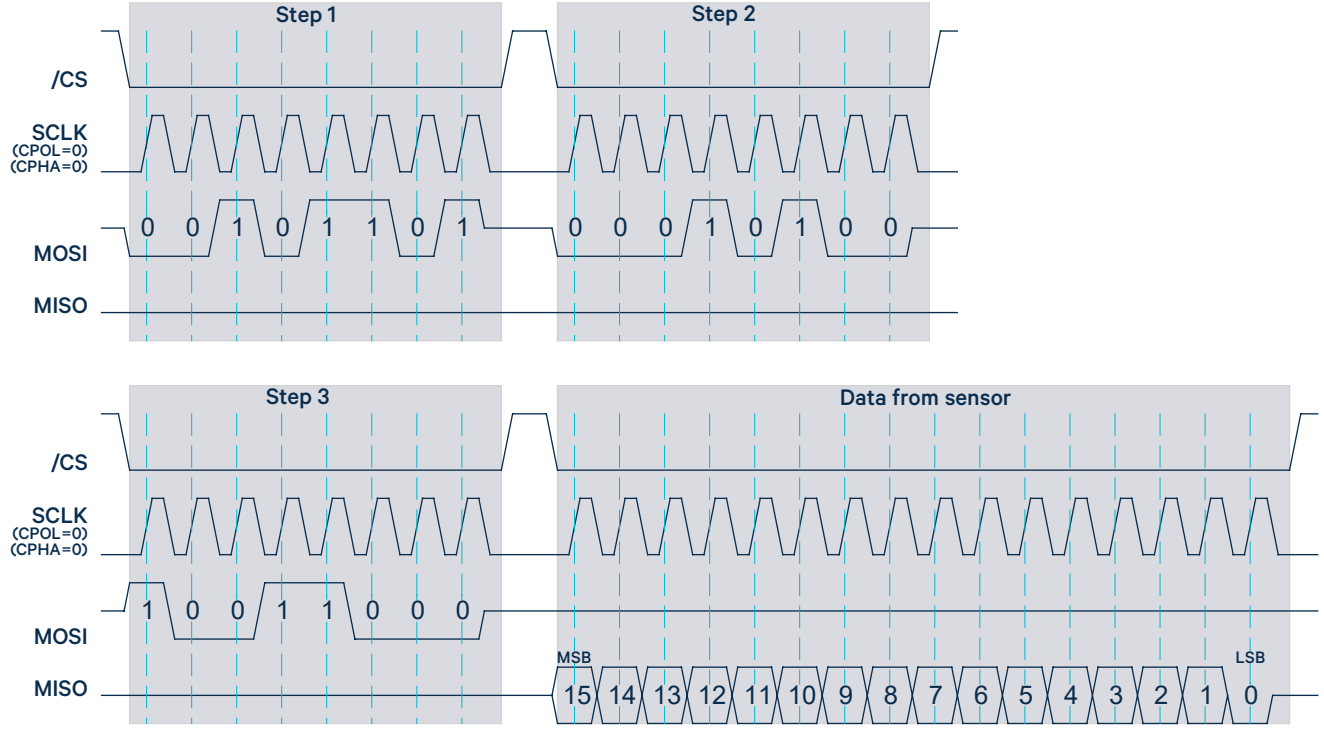

Fig. 5: SPI data transfer

SPI – Serial Peripheral Interface (cont.)

Data read – temperature

The on-chip temperature sensor changes 95 counts/°C over the operating range. The temperature data format is 15-bit plus sign in two's complement format. To read temperature, use the following sequence:

Step	Hexadecimal	Binary	Description
1	0x2A	B00101010	Poll current temperature measurement
2	0x14	B00010100	Send result to data register
3	0x98	B10011000	Read data register

From the digital sensor output, the actual temperature can be calculated as follows:

$$\text{Temperature [°C]} = \frac{\text{TS - TS}_0\ \text{[counts]}}{\text{Scale factor}_{TS}\left[\frac{\text{counts}}{\text{°C}}\right]} + \text{T}_0\ \text{[°C]}$$

where
TS is the actual sensor readout;
TS_0 is the sensor readout at known temperature T_0 (13);
Scale $factor_{TS}$ = 95 counts/°C

Specification notes (cont.)
(16) To be defined by user. The results show deviation (in °C) from the offset calibrated temperature.

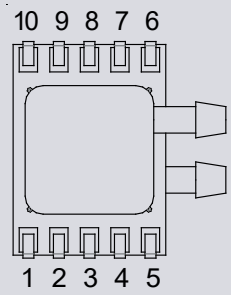
Electrical connection(18)

There are three use cases that will change the manner in which the LDE series device is connected in-circuit:
Case 1: Reading of pressure measurement as a digital (SPI) signal;
Case 2: Reading of pressure measurement as an analog (voltage) signal;
Case 3: Pin-to-pin compatible drop-in replacement for LBA series devices (5 V LDE devices only).



Pin	Function	Case 1: Digital signal output	Case 2: Analog signal output	Case 3: LBA drop-in replacement (5 V only)
1	Reserved	NC	NC	GND
2	V_S	+5V/+3V	+5V/+3V	+5V
3	GND	GND	GND	GND
4	Vout	NC	High impedance analog input (e.g. op-amp, ADC)	High impedance analog input (e.g. op-amp, ADC)
5	Vout	NC		
6	SCLK	Master device SCLK	GND	GND
7	MOSI	Master device MOSI	GND	GND
8	MISO	Master device MISO	GND	GND
9	/CS	Master device (/CS)	V_S	GND
10	Reserved	NC	NC	GND

Ordering information

Series	Pressure range		Calibration		Housing	Output	Grade
LDE	S025	25 Pa (0.1 inH_2O)	B	Bidirectional	E [SMD, 2 ports, same side]	3 [Non-ratiometric, 3 V supply]	S [High]
	S050	50 Pa (0.2 inH_2O)	U	Unidirectional	F [DIP, 2 ports, same side]	6 [Non-ratiometric, 5 V supply]	
	S100	100 Pa (0.4 inH_2O)					
	S250	250 Pa (1 inH_2O)					
	S500	500 Pa (2 inH_2O)					

Order code example: LDES250BF6S

Specification notes (cont.)
(18) The maximum voltage applied to pin 1 and pins 6 through 10 should not exceed V_S+0.3 V.
