Circuit Breakers

DIN rail-mounted equipment protection

To choose a circuit breaker, determine the following:

The normal current load (nominal current) Specify the size of the breaker in amps based on the normal current load.

Possible types of failure

Match the short-circuit and overload protection requirements to the performance characteristics of the breaker.

Rupture capacity

Specify the breaker, knowing the maximum fault current that can be repeatedly (3x minimum) interrupted without failure of the breaker.

Maximum interrupting capacity

Choose the breaker, knowing the maximum current at a given voltage that the breaker can interrupt safely without damage to surrounding components.

The wire size the breaker must accommodate Determine if the breaker can accept the wire sizes required.

How fast the circuit breaker must react to a fault condition Specify a breaker by selecting a speed that avoids

nuisance tripping but protects against component damage.

How many poles are needed

Determine the number of poles needed that are connected electrically and structurally.

Functional requirements of the breaker

Define the requirements for visual inspection, switching, auxiliary circuits or space.

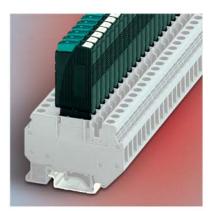

Environmental factors -

temperature, moisture, vibration Determine if there are unusual conditions in which the breaker must operate.

Thermal Miniature and Thermal Magnetic Circuit Breakers

Thermal circuit proctectors use heat-sensitive bimetallic elements that respond to overload electrical currents.

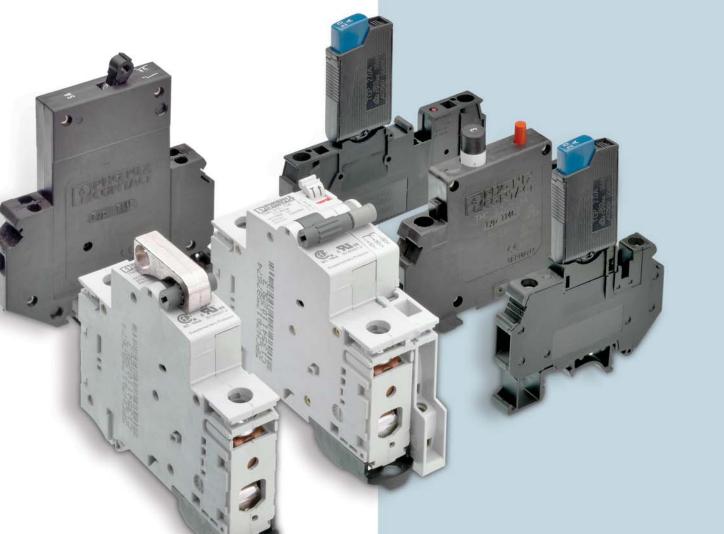

Thermal Miniature Circuit Protectors are compact protectors designed to interrupt an electric current under overload conditions. The protector can accommodate ten nominal currents ranging from 0.10 A to 10 A.

After an overload has occurred, TCP breakers are easily reset by pushing the reset button. The breakers can be plugged into UK 6-FSI/C (screw) or ST 4-FSI/C (spring) terminal blocks for convenient DIN rail mounting.

Thermal Magnetic Circuit Breakers (TMC)

Thermal Magnetic circuit breakers interrupt an electrical current under overload or short-circuit conditions. They have both thermal circuit interruption and magnetic interruption functions. The thermal function uses heat-sensitive bimetallic elements that respond to overload currents. The magnetic function responds to very high current overloads such as those that might occur during short-circuit conditions.

• TMC 42 breakers are available in one- or two-pole configuration for currents ranging from 0.10 to 16 amps. TMC 42 breakers can be snapped directly on a DIN rail. They are reset by pushing a red reset button.

Thermal Miniature Circuit Protection (TCP)

• TMC 60 breakers are available in one-, two-, or three-pole configurations for currents ranging from 0.5 to 63 amps. TMC 60-Series breakers can be snapped directly on a DIN rail. They are reset by moving the toggle switch to the green (activation) position.

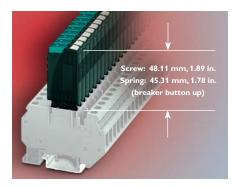

• **TMC 1** breakers are available in one-, two- or three-pole configurations for currents ranging from 0.1 to 32 amps. This high-density breaker has built-in auxiliary contacts. TMC 1 breakers can be snapped directly on a DIN rail. They are reset by moving the toggle switch to the I (activation) position.

Thermal (Miniature) Circuit Protectors (TCP)

TCPs are compact circuit protectors designed to interrupt an electric current under overload conditions. There are ten nominal current ratings available, ranging from $0.10\,\text{A}$ to 10 A.

TCP protectors are trip-free and reset easily after a current interruption by pushing the reset button. The protector can be plugged into UK 6-FSI/C or ST 4-FSI/C fuse base terminal blocks for convenient DIN rail-mounting.

TCP Feature	тср	Glass Fuses
Convenience	Reset with reset button when overload is resolved	Storing, ordering and locating issues
Deterioration	Virtually no aging	Age with eventual failure at normal loads

Hot-swappable	May be removed or replaced under load	Not applicable
Controlled trip	Avoids nuisance trips due to high in-rush currents	Not applicable

Technical data for TCP

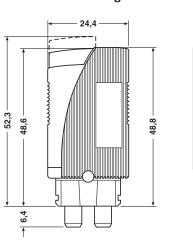

The time/current characteristic curve depends on the ambient temperatures. To avoid a premature or late switch-off, the nominal current of the circuit breaker must be multiplied with a temperature factor.

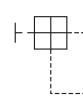

Ambient temperature	°F	-4	14	32	73.4	104	122	140
	°C	-20	-10	0	23	40	50	60
Temperature factor		0.76	0.84	0.92	1	1.08	1.16	1.24

NOTE: If the TCP circuit protectors are mounted side-by-side with less than the minimum of 1 mm of space for air movement, then do not exceed 80 percent of their rating.

Thermal Magnetic Circuit Breakers - UL 1077

TMC 60 Series for mounting on 35 mm DIN rail

Overview

The TMC 60 Series provides supplemental overload and short-circuit protection. An interrupt capacity of 10 kAIC at 480 / 277 V AC and DC ratings make the series ideal for a wide range of applications.

These DIN rail-mountable circuit breakers are available in one-, two- and three-pole configurations. An auxiliary contact in S- or H-function status output is also available. The TMC 60 Series is UL recognized, CSA approved and carries the CE mark.

Typical Application

Circuit protection for power supplies, UPS, controller I/O points, relay/contactor coils, control circuits, appliances and motor circuits.

The signal contact (function S) status provides the automatic trip status of the protection device. The auxiliary (H function) provides the OPEN/ $\ensuremath{\mathsf{CLOSED}}$ status of the protective device. A test button on the front of the auxiliary switch simulates functions S or H. The test button also acts as a reset for the trip signal (function S) contacts.

Thermal Magnetic Circuit Breaker (TMC)

TMC 1/2/3

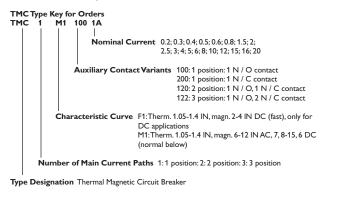

One-, two- and three-pole thermal magnetic circuit breakers with trip-free, snap action mechanism and toggle actuation (S-type: IEC 934). Breaker has a universal mounting foot so it can be snapped on both NS 35 and NS 32 mounting rail profiles. Available with auxiliary contact $(1 \times N / O \text{ or } 1 \times N / C)$ for status signaling. Two- and three-pole models are internally linked to ensure that all poles trip in the event of an overload on one pole, even if the actuator is held in the ON position. This circuit breaker can be supplied in current ratings to 32 A with a choice of characteristic curves. All screw terminals are recessed for safety.

TMC 42 Series

(1) Thermal Magnetic – Thermal provides overload protection; magnetic provides short-circuit protection.

(2) Interrupting capacity is the maximum fault current that can be repeatedly (3x minimum) interrupted without failure of the breaker.

(3) Self-limiting means that internal resistance is high enough to restrict the flow of current to a level that will not harm the circuit breaker.

(4) Maximum current at a given voltage at which the circuit breaker can interrupt safely without damage to surrounding components.

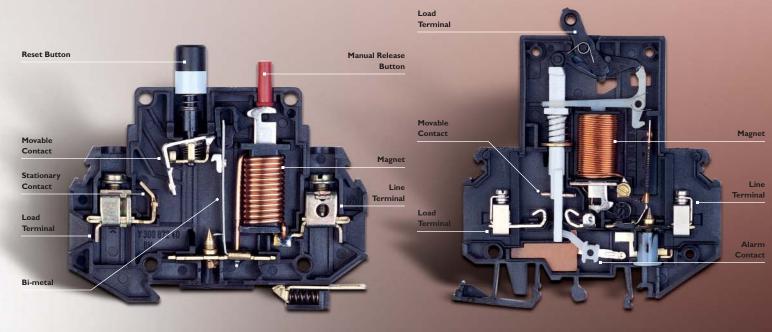

(5) Review trip curve for precise trip behavior of the breaker.

(6) N/O means auxiliary contacts are open and N/C means auxiliary contacts are closed when main terminal contacts are open.

(7) Trip-free means the breaker contacts cannot be forced or held closed during any fault condition (overloads or short circuits).

(8) Tease-free means breaker contacts cannot be forced close enough for current to arc (and potentially weld together) under a fault condition.

(9) A bus bar can connect to the supply terminal and can feed a series of breakers.
