<b>Document Number</b>	RDR-802
<b>Date</b>	September 20, 2020
<b>Revision</b>	1.3

### **Summary and Features**

- InnoSwitch3-Pro - digitally controllable CV/CC QR flyback switcher IC with integrated high-voltage MOSFET, synchronous rectification and FluxLink™ feedback
  - I<sup>2</sup>C Interface enables low pin count USB PD controller (10 pin)
  - Sophisticated telemetry and comprehensive protection features
- USB PD 3.0 with PPS using highly optimized, low pin count USB PD controller WT6635P
- All the benefits of secondary-side control with the simplicity of primary-side regulation
  - Insensitive to transformer variation
- Meets DOE6 and CoC v5 2016 efficiency requirement (>2% efficiency margin)
- Micro stepping of voltages (20 mV) and CC thresholds (50 mA) in compliance with PPS protocol
- Output overvoltage and overcurrent protection
- Integrated thermal protection
- <35 mW no-load input power

**Important Note:**

Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

## 1 Introduction

This document is an engineering report describing a 60 W USB PD power supply with 5 V / 3 A, 9 V / 3 A, 15 V / 3 A, 20 V / 3 A or 3.3 V – 21 V Programmable Power Supply (PPS) output using InnoSwitch3-Pro INN3379C-H302 IC and Weltrend WT6635P USB PD controller. This design shows the high power density and efficiency that is possible due to the high level of integration of the InnoSwitch3-Pro controller providing exceptional performance.

The report contains the power supply specification, schematic diagram, printed circuit board layout, bill of materials, transformer documentation, and performance data.

## 4 Circuit Description

### 4.1 *Input Rectifier and EMI Filter*

Fuse F1 isolates the circuit and provides protection from component failure, and thermistor RT1 limits the inrush current when the power supply is connected to the input AC supply. Varistor RV1 provides safety during high voltage transients in case of input line surge.

Common mode chokes L1 and L2 with capacitors C1, C3, and C23 provide common mode and differential mode noise filtering for EMI attenuation. Bridge rectifier BR1 rectifies the AC line voltage and provides a full wave rectified DC across C2.

Resistors R1 and R2 along with CapZero-2 IC U3 discharges capacitor C1 when the power supply is disconnected from AC mains.

### 4.2 *InnoSwitch3-Pro IC Primary*

One end of the transformer primary is connected to the rectified DC bus and the other end is connected to the drain terminal of the switch inside the InnoSwitch3-Pro IC U1. Resistors R4 and R5 provide input voltage sensing for protection in case of AC input undervoltage or overvoltage.

A low-cost RCD clamp formed by diode D1, resistors R6, R7, R8, R9, and capacitor C4 limits the peak drain-source voltage of U2 at the instant the switch inside U2 turns off. The clamp helps to dissipate the energy stored in the leakage reactance of transformer T1.

The IC is self-starting, using an internal high-voltage current source to charge the BPP pin capacitor C6 when AC is first applied. During normal operation the primary-side block is powered from an auxiliary winding on the transformer T1. The output of the auxiliary (or bias) winding is rectified using diode D2 and filtered using capacitor C5. Resistor R14 limits the current being supplied to the BPP pin of the InnoSwitch3-Pro IC U1. A linear regulator comprising resistor R13, R23, BJT Q1 and Zener diode VR2 ensures sufficient current flows through R14 such that the internal current source of U1 is not required to charge C6 during normal operation.

Zener diode VR1 offers primary sensed output overvoltage protection. In a flyback converter, output of the auxiliary winding tracks the output voltage of the converter. In case of overvoltage at output of the converter, the auxiliary winding voltage increases and causes breakdown of VR1 which then causes excess current to flow into the BPP pin of InnoSwitch3-Pro IC U1. If the current flowing into the BPP pin increases above the  $I_{SD}$  threshold, the InnoSwitch3-Pro controller will latch off and prevent any further increase in output voltage. Resistor R15 limits the current injected to BPP pin when the output overvoltage protection is triggered.

#### 4.3 ***InnoSwitch3-Pro IC Secondary and USB Power Delivery Controller***

The secondary-side of the InnoSwitch3-Pro IC provides output voltage and current sensing and a gate drive to a FET for synchronous rectification. The voltage across the transformer secondary winding is rectified by the secondary-side FET (or SR FET) Q2 and filtered by capacitors C12 and C13. High frequency ringing during switching transients that would otherwise create radiated EMI is reduced via a RCD snubber, R19, R43, C8, and D4.

The gate of Q2 is turned on by secondary-side controller inside IC U1, based on the secondary winding voltage sensed via resistor R16 and fed into the FWD pin of the IC.

In continuous conduction mode of operation, the SR FET is turned off just prior to the secondary-side commanding a new switching cycle from the primary. In discontinuous mode of operation, the SR FET is turned off when the magnitude of the voltage drop across the SR FET falls below a threshold of approximately  $V_{SR(TH)}$ . Secondary-side control of the primary-side power switch avoids any possibility of cross conduction of the two switches and provides extremely reliable synchronous rectifier operation.

The secondary-side of the IC is self-powered from either the secondary winding forward voltage or the output voltage. Capacitor C9 connected to the BPS pin of InnoSwitch3-Pro IC U1 provides decoupling for the internal circuitry.

The output current is sensed by monitoring the voltage drop across resistors R33 and R44. Resistors R20 and R21 add an offset to the sensed output current to provide a positive slope to the CC characteristic. The resulting current measurement is filtered with decoupling capacitor C14 and monitored across the IS and SECONDARY GROUND pins. An internal current sense threshold which is configured via the I<sup>2</sup>C interface up to approximately 32 mV is used to reduce losses. Once the threshold is exceeded, the InnoSwitch3-Pro IC U1 regulates the number of switch pulses to maintain a fixed output current.

During constant current (CC) operation, when the output voltage falls, the secondary side controller inside InnoSwitch3-Pro IC U1 will power itself from the secondary winding directly. During the on-time of the primary-side power switch, the forward voltage that appears across the secondary winding is used to charge the SECONDARY BYPASS pin decoupling capacitor C9 via resistor R16 and an internal regulator. This allows output current regulation to be maintained down to the minimum UV threshold. Below this level the unit enters auto-restart until the output load is reduced.

When the output current is below the CC threshold, the converter operates in constant voltage mode. The output voltage is monitored by the VOUT pin of the InnoSwitch3-Pro IC. Similar with current regulation, the output voltage is also compared to an internal voltage threshold that is set via the I<sup>2</sup>C interface and the controller inside IC U1 regulates

the output voltage by controlling the number of switch pulses. Capacitor C10 is needed between the VOUT pin and the SECONDARY GROUND pin for ESD protection of the VOUT pin.

N-channel MOSFET Q3 functions as the bus switch which connects or disconnects the output of the flyback converter from the USB Type-C receptacle. Q3 is controlled by the VB/D pin on the InnoSwitch3-Pro IC. Resistors R25, R26, and diode D5 are connected across the Source and Gate terminals of the Q3 to provide a discharge path for the bus voltage when the Q3 is turned off. Capacitor C15 is needed at the output for ESD protection.

In this design, WT6635P (U4) is the USB Power Delivery (USB PD) controller. It is powered by the InnoSwitch3-Pro IC through the  $\mu$ VCC pin. USB PD protocol is communicated over either CC1 or CC2 line depending on the orientation in which Type-C plug is connected.

WT6635P communicates with InnoSwitch3-Pro IC through the I<sup>2</sup>C interface using the SCL and SDA lines in which it sets the CV, CC,  $V_{kp}$ , OVA and UVA parameters. These parameters correspond to the output voltage, constant output current, constant output power voltage threshold, output overvoltage threshold, and output undervoltage threshold registers of the InnoSwitch3-Pro IC, respectively. The status of the InnoSwitch3-Pro IC is read by the WT6635P IC from the telemetry registers also using the I<sup>2</sup>C interface.

Capacitor C11 provides decoupling to VCC of the WT6635P IC. Capacitors C19, C20, C21, C16, resistors R37, R38, R41, R42, and TVS D3, D6, D7, and D8 provide protection from ESD to pins CC1, CC2, D- and D+.

Thermistor RT2 is connected to pin GPIO6 of the WT6635P IC to provide temperature detection of the USB Type-C receptacle. Resistor R36 is used by the WT6635P IC to sense the output voltage at the USB Type-C receptacle, which is the voltage after the bus switch Q3. R36 is also used for discharging the capacitor C15 through the GPIO converted as sink after the bus switch Q3 is opened.

## 7.5 Transformer Construction

<b>Winding preparation</b>	Make slot with 3.0mm width on bottom secondary flange of the bobbin item [2]. Position the bobbin item [2] on the mandrel such that the primary side of the bobbin is on the left side. Winding direction is clock-wise direction for forward direction.
<b>WD1 1<sup>st</sup> Primary</b>	Start at pin 4, wind 18 turns of wire item [3] in 1 layer, with tight tension, from left to right. At the last turn, bring the wire back to left, and leave enough length of wire-floating for WD6-2 <sup>nd</sup> Primary.
<b>Insulation</b>	1 layer of tape item [7].
<b>WD2: Bias &amp; WD3: Shield1</b>	Use 2 wires item [4] start at pin 1 for Bias winding, also use 2 wires same item [4] start at pin 3 for Shield1 winding. Wind all 4 wires in parallel, at the 10 <sup>th</sup> turn: - bring 2 wires for Bias winding to the left and terminate at pin 3, - cut short 2 wires for Shield1 Winding as No-Connect.
<b>Insulation</b>	1 layer of tape item [7].
<b>WD4 Secondary</b>	Start at left slot of secondary side, use 2 wires item [5], leaving ~ 40.0mm floating, and mark as FL1. Wind 5 bifilar turns in 1 layer, from left to right, at the last turn exit the wires at right slot, also leaving ~ 30.0mm floating, and mark FL2. Repeat the same winding above on top previous winding, also mark start and finish ends as FL1 and FL2.
<b>Insulation</b>	1 layer of tape item [7].
<b>WD5 Shield2</b>	Start at pin 3, wind 14 tri-filar turns of wire item [4], from left to right. At the last turn, cut short to leave as No-Connect.
<b>Insulation</b>	1 layer of tape item [7].
<b>WD6 2<sup>nd</sup> Primary</b>	Use floating wire from WD1-1 <sup>st</sup> Primary, wind 17 turns from right to left and finish at pin 2.
<b>Insulation</b>	1 layer of tape item [7]. Bring 4 wires marked as FL1 to the right and secure with 2 layers of tape item [7].
<b>Finish</b>	Gap core halves to get 458uH. Place tape item [8] on both sides and for both core halves ( <i>see pictures below</i> ). Apply glue item [10] at center legs of cores. Solder pin 3 with bus-wire item [6] then lean along core halves and secure with tape. Apply epoxy item [11] between cores to body of the transformer. Varnish with item [12]. Place 2 layers of tape item [9] at the bottom then wrap up to the body of transformer, and tape around 1 turn of tape item [7]. ( <i>See pictures below</i> ).

#### 8.1.3 Material List

Item	Description
[1]	Toroidal Core: 35T0375-10H, PI#: 32-00275-00.
[2]	Triple Insulated Wire: #26 AWG, Triple Coated.
[3]	Magnet Wire: #26 AWG, Double Coated.

## 8.1.4 Winding Instructions

Mark the start end of the winding as 1 and wind 10 turns of Item [2] on Item [1]. Mark the end of this winding as 2

Repeat the same procedure as above for the other winding using Item [3], making sure that the start/end and the direction of winding is the same as the first winding. Varnish using Item [4]. Mark the start of this winding as 3 and the end as 4.

<b>Core effective Inductance Index</b>		5950 nH/N <sup>2</sup>
<b>Leakage Inductance</b>	Pins 1 - 4, with pins 2 - 3 shorted.	80 $\mu$ H $\pm$ 10%

### 8.2.3 Material List

<b>Item</b>	<b>Description</b>
[1]	Toroid: FERRITE INDUCTOR TOROID T14 x 8 x 5.5, PI#: 32-00286-00.
[2]	Divider: Cable Tie, Panduit - Fish Paper, Insulating Cotton Rag, 0.010" Thick, PI#: 66-00042-00.
[3]	Magnet Wire: #29 AWG Heavy Nyleze.
[4]	Epoxy: Devon, 5mins Epoxy; or Equivalent.

## 8.2.4 Winding Instructions

**Figure 12** – 18 mH CMC Illustration Image.

- Place 2 pieces of cable tie Item [2] on to toroid Item [1] to divide 2 equal sections.
- Use 4 ft of wire Item [3], start as 1, wind 55 turns in 2 layers in a half section of toroid, and end as 4.
- Do the same for another half of Toroid, start as 2 and end as 3.
- Pull up 2 notches of cable ties to be in line with toroid body (to save space), and apply Epoxy Item [4] where leads floating.

**Notes:**

- (Overvoltage Line) Warning: We find that there is sufficient margin above the data sheet specified breakdown voltage at normal operating voltage of 265 VAC. This warning is for abnormal operating conditions and can be ignored.

2. The Off time warning indicates that the power adapter will be power limited for the worst-case tolerance conditions at 85VAC and valley of the DC bus ripple. Acceptance is based on power adapter meeting required ripple performance.

#### Assembly Illustrations

Use proper flush cutters such as shown in this picture to have all pin of PCB to be flush cut in order to avoid any pins poking into the thermal pads. (see illustration beside for reference ).

Insert item [6] into this slot to create better isolation between pin and trace as shown in the left side image.

Place item [7] with glue on the PCB where the transformer will be sitting on.

 <p>Tape Item [9]</p>	<p>Place 1 layer of tape Item [9] at inner edge of heat spreader Item [1].</p>
 <p>Windows for ICs</p>	<p>Prepare Item [4].</p>
	<p>Prepare 2 pieces of Item [5].</p>

	<p>Place Item [2] onto PCB, align its windows with ICs of PCB, and tape 4 sides to PCB with tape Item [8].</p>
	<p>Use 1 piece Item [5], peel the clear plastic cover to show the sticky side and attach this side to one side heat spreader Item [1]. Wrap around 3 edges with tape Item [8]. Repeat for other side of heat spreader with other piece Item [5].</p>

Insert board into heat spreader assembly.

Place whole set onto bottom half of the case and snap top half in place.

## 13 Performance Data

### Notes

- 1: Voltages measured on the PCB end
- 2: Measurements taken at room temperature (approximately 24 °C)
- 3: Some power supply designs are made with enclosures and/or heat spreaders to achieve the desired form factor. In such situations, these designs are tested with enclosure and any additional heat spreaders as indicated in the report. Although the DER boards are shipped without any enclosures and /or heat spreaders, the report should be reviewed carefully regarding test conditions used for assessment of performance. Unless otherwise specified, the DER boards can be evaluated without enclosures or heat spreaders though some performance results such as EMI, temperature rise of components and efficiency may vary.

## 14 Thermal Performance in Open Case

**Note 1:** For plastic enclosed adapters, this design requires use of a metallic heat spreader and suitable thermally conductive insulator pads to ensure sufficiently low temperature of the InnoSwitch-3 Pro IC and Transformer. The performance data below is for open case operation and does not use the heat spreader for cooling.

### 14.1 Output: 5 V / 3 A (85 VAC)

 Ambient: 26.3 °C.  
 Bx1: InnoSwitch3-Pro = 126.6 °C.  
 Bx2: SR FET = 90.5 °C.

Note 2: To bring down the high temperature of the InnoSwitch3-Pro and SRFET ICs below 100 °C, a thermal insulator pad and heat spreader as described in section 11 in this report needs to be used.

Note 3: These measurements are made with no heat spreader and unit will thermally shutdown if left in operation under this condition for extended period of time.

14.8 **Output: 20 V / 3 A (265 VAC)**

## 16 Output Ripple Measurements

### 16.1 *Ripple Measurement Technique*

For DC output ripple measurements, a modified oscilloscope test probe must be utilized in order to reduce spurious signals due to pick-up. Details of the probe modification are provided in the Figures below.

The 4987BA probe adapter is affixed with two capacitors tied in parallel across the probe tip. The capacitors include one (1) 0.1  $\mu\text{F}$ /50 V ceramic type and one (1) 47  $\mu\text{F}$ /50 V aluminum electrolytic. The aluminum electrolytic type capacitor is polarized, so proper polarity across DC outputs must be maintained (see below).

## 20 Electrostatic Discharge

The unit was tested with  $\pm 8$  kV to  $\pm 16.5$  kV air discharge and  $\pm 8.8$  kV contact discharge at the positive and negative nodes of the output with 10 strikes for each condition.

A test failure was defined as a temporary interruption of output (Auto-restart), even if it is self-recoverable or needs operator intervention to recover, or a complete loss of function which is not recoverable.
