Kionix®	**± 2g / 4g / 8g Tri-axis Digital Accelerometer Specifications**	**PART NUMBER:** **KX127-1068** **Rev. 1.0** **23-Feb-2018**

Product Description

The KX127-1068 is a tri-axis ±2g, ±4g, or ±8g silicon micromachined accelerometer with integrated Pedometer, 2048-byte buffer, orientation, Directional-Tap™/Double-Tap™, activity detecting, and Free fall algorithms. The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. Acceleration sensing is based on the principle of a differential capacitance arising from acceleration-induced motion of the sense element, which further utilizes common mode cancellation to decrease errors from process variation, temperature, and environmental stress. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit. A separate ASIC device packaged with the sense element provides signal conditioning, and intelligent user-programmable application algorithms. The accelerometer is delivered in a 2 x 2 x 0.9 mm LGA plastic package operating from a 1.71V – 3.6V DC supply. Voltage regulators are used to maintain constant internal operating voltages over the range of input supply voltages. This results in stable operating characteristics over the range of input supply voltages. I^2C or SPI digital protocol is used to communicate with the chip to configure and check for updates to the orientation, Directional-Tap™/Double-Tap™ detection, Free fall detection, Pedometer and activity monitoring algorithms.

Features

- Small footprint: 2 x 2 x 0.9 mm LGA 12-pin package
- User-configurable g-range up to ±8g and Output Data Rate up to 25600Hz
- Integrated pedometer (step counter) with overflow, watermark, and increment interrupts
- High resolution Wake-Up/Back-to-Sleep functions with threshold configurable down to 3.9 mg
- User accessible manufacturer and part ID registers
- Integrated Free fall, Directional-Tap™/Double-Tap™, and Device-orientation Algorithms
- Improved ODR accuracy in Low Power mode over temperature
- Factory Programmed Offset and Sensitivity with improved performance over temperature
- Extra-large embedded 2048-byte FIFO/FILO buffer continues to record data even when being read
- Low Power Consumption with FlexSet™ Performance Optimization
- User-selectable Low Power or High Resolution modes
- Internal voltage regulator
- Digital I^2C up to 3.4MHz and Digital SPI up to 10MHz
- RoHS / REACH compliant
- Excellent temperature performance with high shock survivability
- Self-test Function
- Digital High-Pass Filter Outputs

Product Specifications

Mechanical

(specifications are for operation at 2.5V and T = 25C unless stated otherwise)

Parameters		Units	Min	Typical	Max
Operating Temperature Range		ºC	-40	-	+85
Zero-g Offset		mg		±25	±90
Zero-g Offset Variation from RT over Temp.		mg/ºC		0.2	
Sensitivity[1] (16 bit)	GSEL1=0, GSEL0=0 (± 2g)	counts/g	15401	16384	17367
	GSEL1=0, GSEL0=1 (± 4g)		7700	8192	8684
	GSEL1=1, GSEL0=0 (± 8g)		3850	4096	4342
Sensitivity (Buffer 8-bit mode)[1,2]	GSEL1=0, GSEL0=0 (± 2g)	counts/g	60	64	68
	GSEL1=0, GSEL0=1 (± 4g)		30	32	34
	GSEL1=1, GSEL0=0 (± 8g)		15	16	17
Sensitivity Variation from RT over Temp.		%/ºC		0.01	
Positive Self Test Output change on Activation[4]		g	0.25 (xy) 0.2 (z)	0.5	0.75
Signal Bandwidth (-3dB)		Hz		3500 (xy) 1800 (z)	
Non-Linearity		% of FS		0.6	
Cross Axis Sensitivity		%		2	
Noise[3,5]	RMS	mg		0.7	
	Density	µg/√Hz		130	

Table 1: Mechanical Specifications

Notes:

1. Resolution and acceleration ranges are user selectable via I^2C or SPI.
2. Sensitivity is proportional to BRES in BUF_CNTL2.
3. Noise varies with Output Data Rate (ODR), and the Average Filter Control settings and can be tested using Kionix FlexSet™ Performance Optimization Tool found at http://www.kionix.com/flexset.
4. Requires changing of STPOL bit in INC1 register to 1 prior to performing self-test
5. Measured with ODR=50Hz, IIR_BYPASS=0, LPRO=1 (filter corner frequency set to ODR/2)

Electrical

(specifications are for operation at 2.5V and T = 25C unless stated otherwise)

Parameters		Units	Min	Typical	Max
Supply Voltage (VDD)	Operating	V	1.71	2.5	3.6
I/O Pads Supply Voltage (IO_VDD)		V	1.7		3.6
Current Consumption	High Resolution Mode (RES = 1)	µA		145	
	Low Power Mode[1] (RES = 0)			10	
	Standby			0.9	
Output Low Voltage (IO_VDD < 2V)[2]		V	-	-	0.2 * IO_VDD
Output Low Voltage (IO_VDD ≥ 2V)[2]		V	-	-	0.4
Output High Voltage		V	0.8 * IO_VDD	-	-
Input Low Voltage		V	-	-	0.2 * IO_VDD
Input High Voltage		V	0.8 * IO_VDD	-	-
Start Up Time[3]		ms	2		1300
Power Up Time[4]		ms		20	50
I²C Communication Rate		MHz			3.4
I²C Slave Address (7-bit)				0x1E / 0x1F	
SPI Communication Rate		MHz			10
Output Data Rate (ODR)[5]		Hz	0.781	50	25600
Bandwidth (-3dB)[6]		Hz		ODR/9 or ODR/2	

Table 2: Electrical Specifications

Notes:

1. Current varies with Output Data Rate (ODR) as shown in Figure 2, types and number of enabled digital engines, and the Average Filter Control settings that can be tested using Kionix FlexSet™ Performance Optimization Tool found at http://www.kionix.com/flexset.
2. For I²C communication, this assumes a minimum 1.5kΩ pull-up resistor on SCL and SDA pins.
3. Start up time is from PC1 set to valid outputs. Time varies with Output Data Rate (ODR) and power mode setting. See Figure 1 for details.
4. Power up time is from VDD valid to device boot completion.
5. User selectable through I²C or SPI.
6. User selectable and dependent on ODR. See ODCNTL register description for details.

Power-On Procedure

Proper functioning of power-on reset (POR) is dependent on the specific **VDD, VDD_{LOW}**, **T_{VDD}** (rise time), and **T_{VDD_OFF}** profile of individual applications. It is recommended to minimize **VDD_{LOW}**, and **T_{VDD}**, and maximize **T_{VDD_OFF}**. It is also advised that the **VDD** ramp up time **T_{VDD}** be monotonic. Note that the outputs will not be stable until **VDD** has reached its final value.

To assure proper POR, the application should be evaluated over the customer specified range of VDD, VDD_{LOW}, T_{VDD}, T_{VDD_OFF} and temperature as POR performance can vary depending on these parameters.

Please refer to Technical Note ***TN021 Power-On Procedure*** for more information.

Environmental

Parameters		Units	Min	Typical	Max
Supply Voltage (VDD)	Absolute Limits	V	-0.3	-	3.60
Operating Temperature Range		ºC	-40	-	85
Storage Temperature Range		ºC	-55	-	150
Mech. Shock (powered and unpowered)		g	-	-	5000 for 0.5ms 10000 for 0.2ms
ESD	HBM	V	-	-	2000

Table 3: Environmental Specifications

Caution: ESD Sensitive and Mechanical Shock Sensitive Component, improper handling can cause permanent damage to the device.

These products conform to RoHS Directive 2011/65/EU of the European Parliament and of the Council of the European Union that was issued June 8, 2011. Specifically, these products do not contain any non-exempted amounts of lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) or polybrominated diphenyl ethers (PBDE) above the maximum concentration values (MCV) by weight in any of its homogenous materials. Homogenous materials are “of uniform composition throughout”. The MCV for lead, mercury, hexavalent chromium, PBB, and PBDE is 0.10%. The MCV for cadmium is 0.010%.

Applicable Exemption: *7C-I - Electrical and electronic components containing lead in a glass or ceramic other than dielectric ceramic in capacitors (piezoelectronic devices) or in a glass or ceramic matrix compound.*

These products are also in conformance with REACH Regulation No 1907/2006 of the European Parliament and of the Council that was issued Dec. 30, 2011. They do not contain any Substances of Very High Concern (SVHC-174) as identified by the European Chemicals Agency as of 12 July 2017.

HF

This product is halogen-free per IEC 61249-2-21. Specifically, the materials used in this product contain a maximum total halogen content of 1500 ppm with less than 900-ppm bromine and less than 900-ppm chlorine.

Soldering

Soldering recommendations are available upon request or from www.kionix.com.

Terminology

g

A unit of acceleration equal to the acceleration of gravity at the earth's surface. One thousandth of a g (0.0098 m/s^2) is referred to as 1 milli-g (1 mg).

$$1g = 9.8\frac{m}{s^2}$$

Sensitivity

The sensitivity of an accelerometer is the change in output per unit of input acceleration at nominal VDD and temperature. The term is essentially the gain of the sensor expressed in counts per g (counts/g) or LSB's per g (LSB/g). Occasionally, sensitivity is expressed as a resolution, i.e. milli-g per LSB (mg/LSB) or milli-g per count (mg/count). Sensitivity for a given axis is determined by measurements of the formula:

$$Sensitivity = \frac{(Output@+1g - Output@-1g)}{2g}$$

The sensitivity tolerance describes the range of sensitivities that can be expected from a large population of sensors at room temperature and over life. When the temperature deviates from room temperature (25ºC), the sensitivity will vary by the amount shown in Table 1.

Zero-g offset

Zero-g offset or 0-g offset describes the actual output of the accelerometer when no acceleration is applied. Ideally, the output would always be in the middle of the dynamic range of the sensor (content of the XOUT, YOUT, ZOUT registers = 0x00, expressed as a 2's complement number). However, because of mismatches in the sensor, calibration errors, and mechanical stress, the output can deviate from 00. This deviation from the ideal value is called 0-g offset. The zero-g offset tolerance describes the range of 0-g offsets of a population of sensors over the operating temperature range.

Self-test

Self-test allows a functional test of the sensor without applying a physical acceleration to it. When activated, an electrostatic force is applied to the sensor, simulating an input acceleration. The sensor outputs respond accordingly. If the output signals change within the amplitude specified in Table 1, then the sensor is working properly and the parameters of the interface chip are within the defined specifications.

Functionality

Sense element

The sense element is fabricated using Kionix's proprietary plasma micromachining process technology. This process technology allows Kionix to create mechanical silicon structures which are essentially mass-spring systems that move in the direction of the applied acceleration. Acceleration sensing is based on the principle of a differential capacitance arising from the acceleration-induced motion. Capacitive plates on the moving mass move relative to fixed capacitive plates anchored to the substrate. The sense element is hermetically sealed at the wafer level by bonding a second silicon lid wafer to the device using a glass frit.

ASIC interface

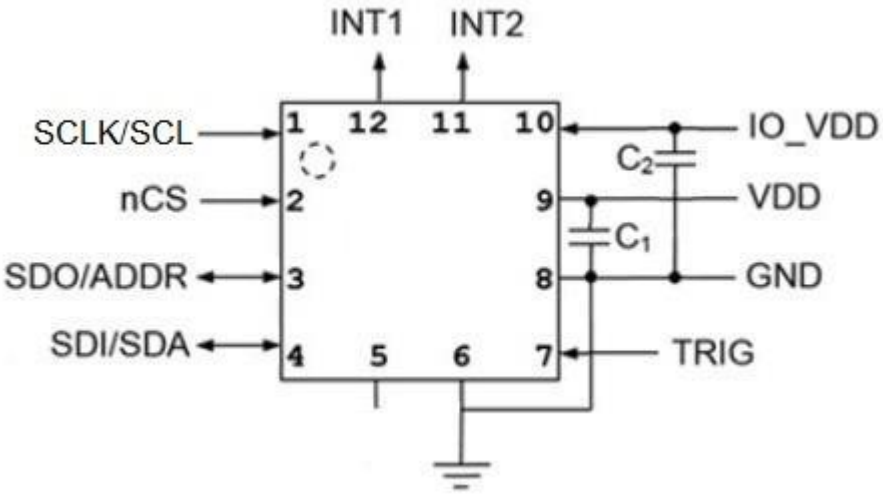
A separate ASIC device packaged with the sense element provides all of the signal conditioning and communication with the sensor. The complete measurement chain is composed by a low-noise capacitance to voltage amplifier which converts the differential capacitance of the MEMS sensor into an analog voltage that is sent through an analog-to-digital converter. The acceleration data may be accessed through the I^2C or SPI digital communications provided by the ASIC. In addition, the ASIC contains all of the logic to allow the user to choose data rates, g-ranges, filter settings, and interrupt logic. Plus, there are two programmable state machines which allow the user to create unique embedded functions based on changes in acceleration.

Factory calibration

Kionix trims the offset and sensitivity of each accelerometer by adjusting gain (sensitivity) and 0-g offset trim codes stored in nonvolatile memory (OTP). Additionally, all functional register default values are also programmed into the nonvolatile memory. Every time the device is turned on or a software reset command is issued, the trimming parameters and default register values are downloaded into the volatile registers to be used during active operation. This allows the device to function without further calibration.

Application Schematic and Pin Description

Application Schematic



Pin Description

Pin	Name	Description
1	SCLK/SCL	SPI and I2C Serial Clock
2	nCS	Chip Select (active LOW) for SPI communication. Connect to IO_VDD for I2C communication. Do not leave floating.
3	SDO/ADDR	Serial Data Out pin during 4 wire SPI communication and part of the device address during I2C communication. Do not leave floating.
4	SDI/SDA	SPI Data input / I2C Serial Data
5	NC	Not Internally Connected - Can be connected to VDD, IO_VDD, GND or leave floating.
6	GND	Ground
7	TRIG	Trigger pin for FIFO buffer control - Connect to GND when not using external trigger option.
8	GND	Ground
9	VDD	The power supply input. Decouple this pin to ground with a 0.1uF ceramic capacitor.
10	IO_VDD	The power supply input for the digital communication bus. Optionally decouple this pin to ground with a 0.1uF ceramic capacitor.
11	INT2	Physical Interrupt 2 (Push-Pull). The pin is in High-Z state during POR and is driven LOW following POR. Leave floating if not used.
12	INT1	Physical Interrupt 1 (Push-Pull). The pin is in High-Z state during POR and is driven LOW following POR. Leave floating if not used.

Digital Interface

The Kionix KX127 digital accelerometer can communicate via the I²C and SPI digital serial interface protocols. This allows for easy system integration by eliminating analog-to-digital converter requirements and by providing direct communication with system micro-controllers.

The serial interface terms and descriptions as indicated in Table 5 will be observed throughout this document.

Term	Description
Transmitter	The device that transmits data to the bus.
Receiver	The device that receives data from the bus.
Master	The device that initiates a transfer, generates clock signals, and terminates a transfer.
Slave	The device addressed by the Master.

Table 5: Serial Interface Terminologies

I²C Serial Interface

As previously mentioned, the KX127 can communicate on an I²C bus. I²C is primarily used for synchronous serial communication between a Master device and one or more Slave devices. The Master, typically a micro controller, provides the serial clock signal and addresses Slave devices on the bus. The KX127 always operates as a Slave device during standard Master-Slave I²C operation.

I²C is a two-wire serial interface that contains a Serial Clock (SCL) line and a Serial Data (SDA) line. SCL is a serial clock that is provided by the Master, but can be held LOW by any Slave device, putting the Master into a wait condition. SDA is a bi-directional line used to transmit and receive data to and from the interface. Data is transmitted MSB (Most Significant Bit) first in 8-bit per byte format, and the number of bytes transmitted per transfer is unlimited. The I²C bus is considered free when both lines are HIGH.

The I²C interface is compliant with high-speed mode, fast mode and standard mode I²C protocols.

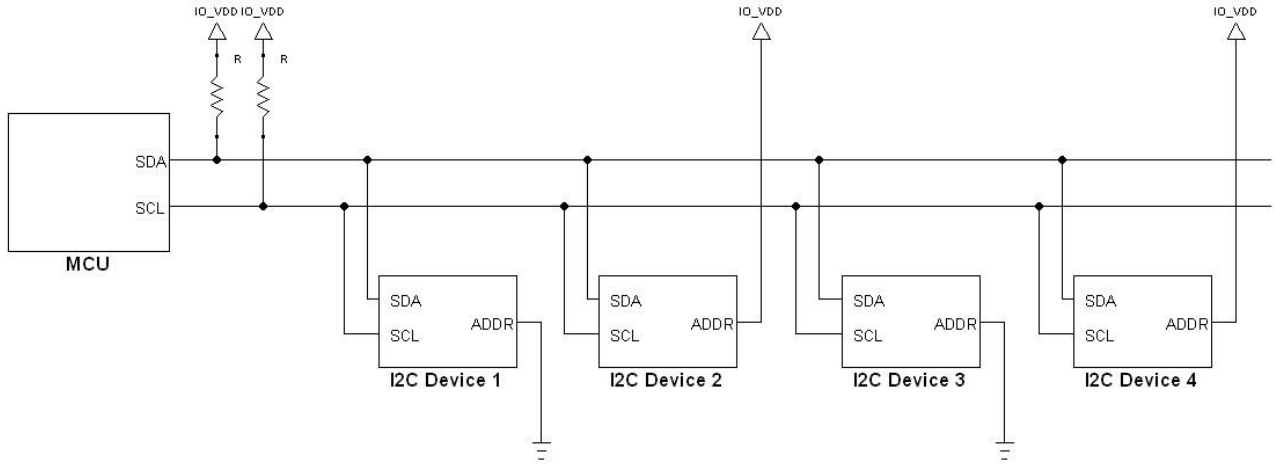
I²C Operation

Transactions on the I²C bus begin after the Master transmits a start condition (S), which is defined as a HIGH-to-LOW transition on the data line while the SCL line is held HIGH. The bus is considered busy after this condition. The next byte of data transmitted after the start condition contains the Slave Address (SAD) in the seven MSBs (Most Significant Bits), and the LSB (Least Significant Bit) tells whether the Master will be receiving data '1' from the Slave or transmitting data '0' to the Slave. When a Slave Address is sent, each device on the bus compares the seven MSBs with its internally stored address. If they match, the device considers itself addressed by the Master. The KX127 Slave Address is comprised of a user programmable part, a factory programmable part, and a fixed part, which allows for connection of multiple accelerometers to the same I²C bus. The Slave Address associated with the KX127 is 00111YX, where the user programmable bit X, is determined by the assignment of ADDR pin to GND or IO_VDD. Also, the factory programmable bit Y is set at the factory. **For KX127-1068, the factory programmable bit Y is fixed to 1** (contact your Kionix sales representative for list of available devices). Table 6 lists possible I²C addresses for KX127-1068. It is possible to have up to four accelerometers on a shared I²C bus as shown in Figure 3 (i.e. two KX127-1068 accelerometers and two additional accelerometers with the factory programmable bit Y set to **0**).

									Y	X	
Description	**Address Pad**	**7-bit Address**	**Address**	**<7>**	**<6>**	**<5>**	**<4>**	**<3>**	**<2>**	**<1>**	**<0>**
I2C Wr	GND	0x1E	0x3C	0	0	1	1	1	1	0	0
I2C Rd	GND	0x1E	0x3D	0	0	1	1	1	1	0	1
I2C Wr	IO_VDD	0x1F	0x3E	0	0	1	1	1	1	1	0
I2C Rd	IO_VDD	0x1F	0x3F	0	0	1	1	1	1	1	1

Table 6: I²C Slave Addresses for KX127-1068

It is mandatory that receiving devices acknowledge (ACK) each transaction. Therefore, the transmitter must release the SDA line during this ACK pulse. The receiver then pulls the data line LOW so that it remains stable LOW during the HIGH period of the ACK clock pulse. A receiver that has been addressed, whether it is Master or Slave, is obliged to generate an ACK after each byte of data has been received. To conclude a transaction, the Master must transmit a stop condition (P) by transitioning the SDA line from LOW to HIGH while SCL is HIGH. The I²C bus is now free. Note that if the KX127 is accessed through I²C protocol before the startup is finished a NACK signal is sent.



I2C Device	Part Number	ADDR Pin	Slave Address	Bit Y (Bit 1 in 7-bit address)
1	KX127-1068	GND	0x1E	Factory Set to 1
2	KX127-1068	IO_VDD	0x1F	Factory Set to 1
3	*KXMMM	GND	0x1C	Factory Set to 0
4	*KXMMM	IO_VDD	0x1D	Factory Set to 0

* KXMMM – contact Kionix sales representative for list of compatible devices

Figure 3: Multiple KX127 Accelerometers on a Shared I^2C Bus

Writing to an 8-bit Register

Upon power up, the Master must write to the KX127's control registers to set its operational mode. Therefore, when writing to a control register on the I^2C bus, as shown Sequence 1, the following protocol must be observed: After a start condition, SAD+W transmission, and the KX127 ACK has been returned, an 8-bit Register Address (RA) command is transmitted by the Master. This command is telling the KX127 to which 8-bit register the Master will be writing the data. Since this is I^2C mode, the LSB of the RA command should always be zero (0). The KX127 acknowledges the RA and the Master transmits the data to be stored in the 8-bit register. The KX127 acknowledges that it has received the data and the Master transmits a stop condition (P) to end the data transfer. The data sent to the KX127 is now stored in the appropriate register. The KX127 automatically increments the received RA commands and, therefore, multiple bytes of data can be written to sequential registers after each Slave ACK as shown in Sequence 2.

****Note**** If a STOP condition is sent on the least significant bit of write data or the following master acknowledge cycle, the last write operation is not guaranteed and it may alter the content of the affected registers.

Reading from an 8-bit Register

When reading data from a KX127 8-bit register on the I^2C bus, as shown in Sequence 3 on the next page, the following protocol must be observed: The Master first transmits a start condition (S) and the appropriate Slave Address (SAD) with the LSB set at '0' to write. The KX127 acknowledges and the Master transmits the 8-bit RA of the register it wants to read. The KX127 again acknowledges, and the Master transmits a repeated start condition (Sr). After the repeated start condition, the Master addresses the KX127 with a '1' in the LSB (SAD+R) to read from the previously selected register. The Slave then acknowledges and transmits the data from the requested register. The Master does not acknowledge (NACK) it received the transmitted data, but transmits a stop condition to end the data transfer. Note that the KX127 automatically increments through its sequential registers, allowing data to be read from multiple registers following a single SAD+R command as shown below in Sequence 4 on the following page. Reading data from a buffer read register is a special case because if register address (RA) is set to buffer read register (BUF_READ) in Sequence 4, the register auto-increment feature is automatically disabled. Instead, the Read Pointer will increment to the next data in the buffer, thus allowing reading multiple bytes of data from the buffer using a single SAD+R command.

****Note**** Accelerometer's output data should be read in a single transaction using the auto-increment feature to prevent output data from being updated prior to intended completion of the read transaction.

Data Transfer Sequences

The following information clearly illustrates the variety of data transfers that can occur on the I²C bus and how the Master and Slave interact during these transfers. Table 7 defines the I²C terms used during the data transfers.

Term	Definition
S	Start Condition
Sr	Repeated Start Condition
SAD	Slave Address
W	Write Bit
R	Read Bit
ACK	Acknowledge
NACK	Not Acknowledge
RA	Register Address
Data	Transmitted/Received Data
P	Stop Condition

Table 7: I²C Terms

Sequence 1: The Master is writing one byte to the Slave.

Master	S	SAD + W		RA		DATA		P
Slave			ACK		ACK		ACK	

Sequence 2: The Master is writing multiple bytes to the Slave.

Master	S	SAD + W		RA		DATA		DATA		P
Slave			ACK		ACK		ACK		ACK	

Sequence 3: The Master is receiving one byte of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			NACK	P
Slave			ACK		ACK			ACK	DATA		

Sequence 4: The Master is receiving multiple bytes of data from the Slave.

Master	S	SAD + W		RA		Sr	SAD + R			ACK		NACK	P
Slave			ACK		ACK			ACK	DATA		DATA		

HS-mode

To enter the 3.4MHz high speed mode of communication, the device must receive the following sequence of conditions from the master: a Start condition followed by a Master code (00001XXX) and a Master Non-acknowledge. Once recognized, the device switches to HS-mode communication. Read/write data transfers then proceed as described in the sequences above. Devices return to the FS-mode after a STOP occurrence on the bus.

Sequence 5: HS-mode data transfer of the Master writing multiple bytes to the Slave.

Speed	FS-mode			HS-mode								FS-mode
Master	S	M-code	NACK	Sr	SAD + W		RA		DATA		P	
Slave						ACK		ACK		ACK		

n bytes + ack.

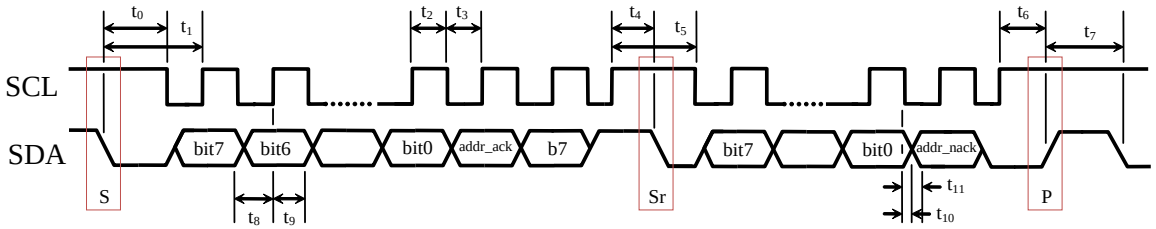
Sequence 6: HS-mode data transfer of the Master receiving multiple bytes of data from the Slave.

Speed	FS-mode			HS-mode				
Master	S	M-code	NACK	Sr	SAD + W		RA	
Slave						ACK		ACK

Speed	HS-mode								FS-mode
Master	Sr	SAD + R					NACK	P	
Slave			ACK	DATA	ACK	DATA			

(n-1) bytes + ack.

I²C Timing Diagram



Number	Description	MIN	MAX	Units
t_0	SDA LOW to SCL LOW transition (Start event)	50	-	ns
t_1	SDA LOW to first SCL rising edge	100	-	ns
t_2	SCL pulse width: HIGH	100	-	ns
t_3	SCL pulse width: LOW	100	-	ns
t_4	SCL HIGH before SDA falling edge (Start Repeated)	50	-	ns
t_5	SCL pulse width: HIGH during a S/Sr/P event	100	-	ns
t_6	SCL HIGH before SDA rising edge (Stop)	50	-	ns
t_7	SDA pulse width: HIGH	25	-	ns
t_8	SDA valid to SCL rising edge	50	-	ns
t_9	SCL rising edge to SDA invalid	50	-	ns
t_{10}	SCL falling edge to SDA valid (when slave is transmitting)	-	100	ns
t_{11}	SCL falling edge to SDA invalid (when slave is transmitting)	0	-	ns
Note	Recommended I²C CLK	2.5	-	µs

Table 8: I²C Timing (Fast Mode)

SPI Communications

4-Wire SPI Interface

The KX127 also utilizes an integrated 4-Wire Serial Peripheral Interface (SPI) for digital communication. The SPI interface is primarily used for synchronous serial communication between one Master device and one or more Slave devices. The Master, typically a micro controller, provides the SPI clock signal (SCLK) and determines the state of Chip Select (nCS). The KX127 always operates as a Slave device during standard Master-Slave SPI operation.

4-wire SPI is a synchronous serial interface that uses two control and two data lines. With respect to the Master, the Serial Clock output (SCLK), the Data Output (SDI or MOSI) and the Data Input (SDO or MISO) are shared among the Slave devices. The Master generates an independent Chip Select (nCS) for each Slave device that goes LOW at the start of transmission and goes back HIGH at the end. The Slave Data Output (SDO) line, remains in a high-impedance (hi-z) state when the device is not selected, so it does not interfere with any active devices. This allows multiple Slave devices to share a master SPI port as shown in Figure 4.

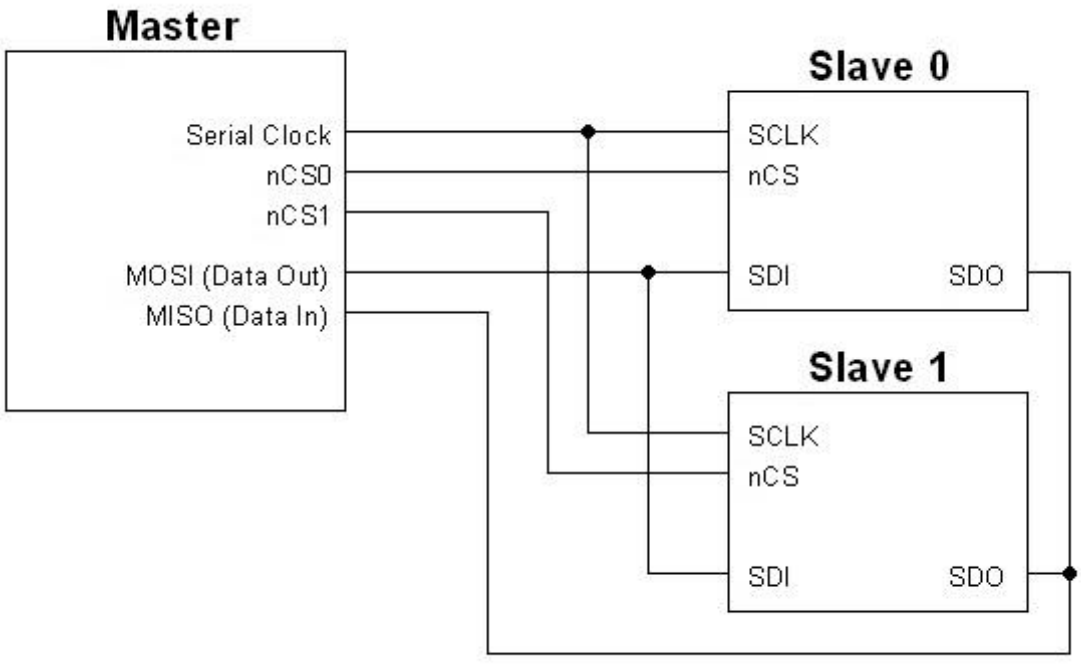


Figure 4. 4-wire SPI Connections

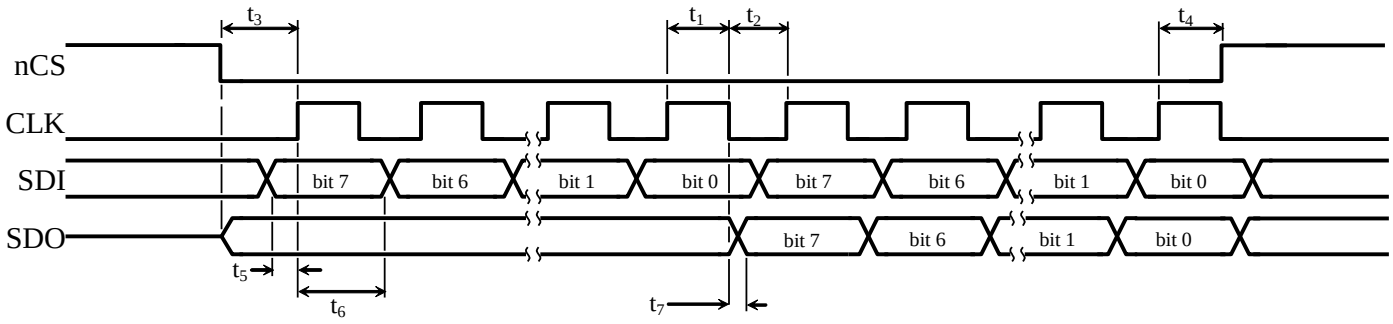
4-Wire SPI Timing Diagram



Number	Description	MIN	MAX	Units
t_1	CLK pulse width: HIGH	45		ns
t_2	CLK pulse width: LOW	45		ns
t_3	nCS LOW to first CLK rising edge	20		ns
t_4	nCS LOW after the final CLK rising edge to nCS HIGH	20		ns
t_5	SDI valid to CLK rising edge	10		ns
t_6	CLK rising edge to SDI invalid	10		ns
t_7	CLK falling edge to SDO valid		35	ns

Table 9: 4-Wire SPI Timing

Notes

1. t_7 is only present during reads.
2. Timings are for VDD of 1.8V to 3.6V with 1kΩ pull-up resistor and maximum 20pF load capacitor on SDO.

4-Wire Read and Write Registers

The registers embedded in the KX127 accelerometer have 8-bit addresses. Upon power up, the Master must write to the accelerometer's control registers to set its operational mode. On the falling edge of nCS, a 2-byte command is written to the appropriate control register. The first byte initiates the write to the appropriate register, and is followed by the user-defined, data byte. The MSB (Most Significant Bit) of the register address byte will indicate "0" when writing to the register and "1" when reading from the register. This operation occurs over 16 clock cycles. All commands are sent MSB first. The host must return nCS HIGH for at least one clock cycle before the next data request. However, when data is being read from a buffer read register (BUF_READ), the nCS signal can remain LOW until the buffer is read. Figure 5 shows the timing diagram for carrying out an 8-bit register write operation.

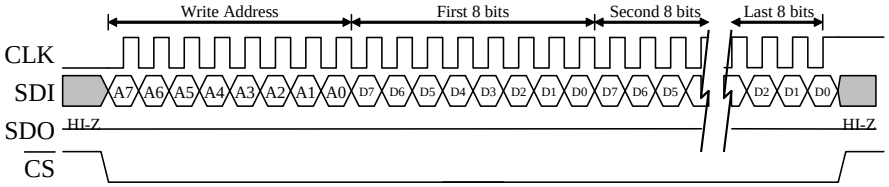


Figure 5: Timing Diagram for 8-Bit Register Write Operation

In order to read an 8-bit register, an 8-bit register address must be written to the accelerometer to initiate the read. The MSB of this register address byte will indicate "0" when writing to the register and "1" when reading from the register. Upon receiving the address, the accelerometer returns the 8-bit data stored in the addressed register. This operation also occurs over 16 clock cycles. All returned data is sent MSB first, and the host must return nCS HIGH for at least one clock cycle before the next data request. Figure 6 shows the timing diagram for an 8-bit register read operation.

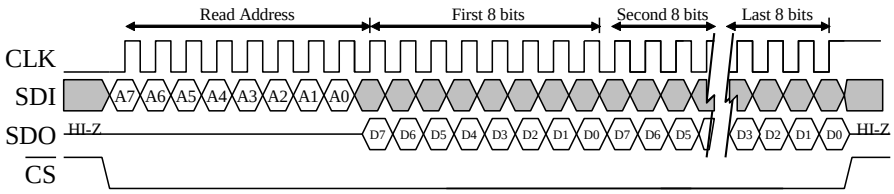

Figure 6: Timing Diagram for 8-Bit Register Read Operation

3-Wire SPI Interface

The KX127 also utilizes an integrated 3-Wire Serial Peripheral Interface (SPI) for digital communication. 3-wire SPI is a synchronous serial interface that uses two control lines and one data line. With respect to the Master, the Serial Clock output (SCLK), the Data Output/Input (SDI) are shared among the Slave devices. The Master generates an independent Chip Select (nCS) for each Slave device that goes LOW at the start of transmission and goes back HIGH at the end. This allows multiple Slave devices to share a master SPI port as shown in Figure 7.

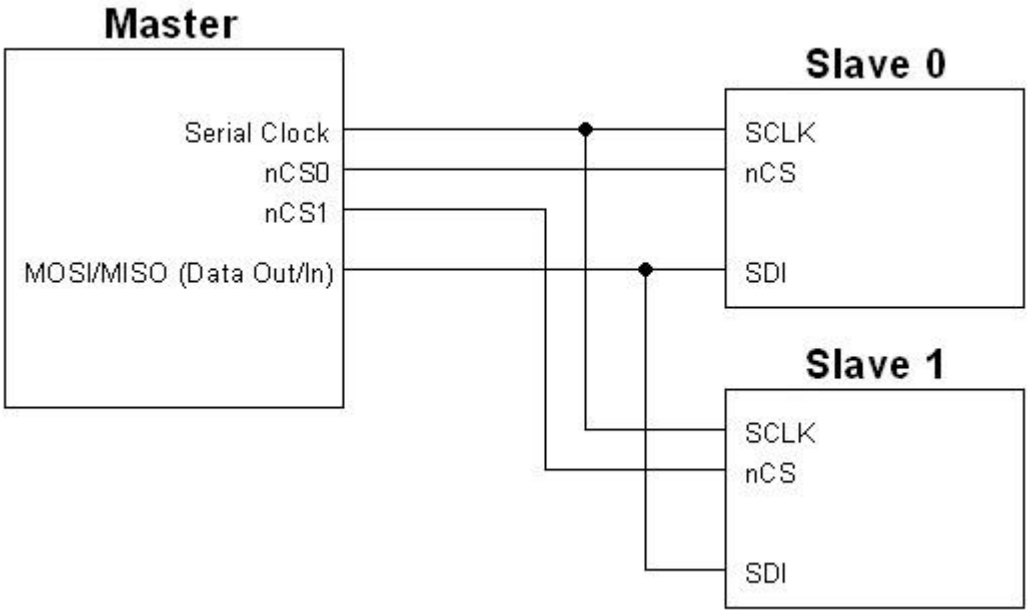

Figure 7: 3-wire SPI Connections

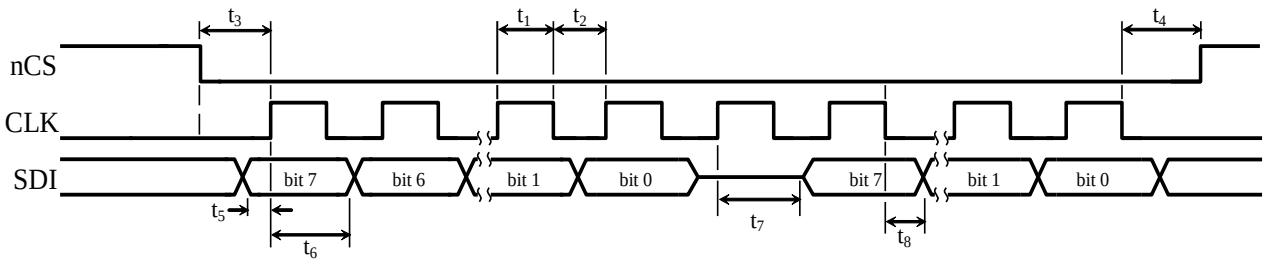
3-Wire SPI Timing Diagram



Number	Description	MIN	MAX	Units
t_1	CLK pulse width: HIGH	45	-	ns
t_2	CLK pulse width: LOW	45	-	ns
t_3	nCS LOW to first CLK rising edge	20	-	ns
t_4	nCS LOW after the final CLK falling edge to nCS HIGH	20	-	ns
t_5	SDI valid to CLK rising edge	10	-	ns
t_6	CLK rising edge to SDI input invalid	10	-	ns
t_7	CLK extra clock cycle rising edge to SDI output becomes valid	-	-	ns
t_8	CLK falling edge to SDI output becomes valid	-	35	ns

Table 10: 3-Wire SPI Timing

Notes

1. t_7 and t_8 are only present during reads
2. Timings are for VDD of 1.8V to 3.6V with 1kΩ pull-up resistor and maximum 20pF load capacitor on SDI.
3. The SDO/ADDR pin is configured in a high-impedance input-state, and must be externally tied to GND or IO_VDD

3-Wire Read and Write Registers

The registers embedded in the KX127 accelerometer have 8-bit addresses. Upon power up, the Master must write to the accelerometer's control registers to set its operational mode. On the falling edge of nCS, a 2-byte command is written to the appropriate control register. The first byte initiates the write to the appropriate register, and is followed by the user-defined, data byte. The MSB (Most Significant Bit) of the register address byte will indicate "0" when writing to the register and "1" when reading from the register. A read operation occurs over 17 clock cycles and a write operation occurs over 16 clock cycles. All commands are sent MSB first. The host must return nCS HIGH for at least one clock cycle before the next data request. However, when data is being read from a buffer read register (BUF_READ), the nCS signal can remain LOW until the buffer is read. Figure 8 shows the timing diagram for carrying out an 8-bit register write operation.

****NOTE**** If a STOP condition is sent on the least significant bit of write data or the following master acknowledge cycle, the last write operation is not guaranteed and it would cause unexpected register write.

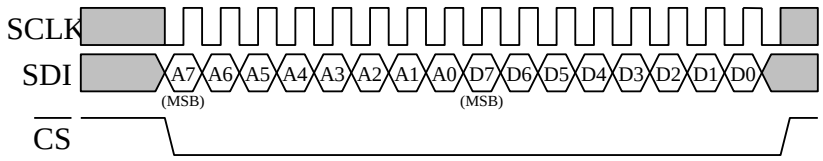


Figure 8: Timing Diagram for 8-Bit Register Write Operation

In order to read an 8-bit register, an 8-bit register address must be written to the accelerometer to initiate the read. The MSB of this register address byte will indicate "0" when writing to the register and "1" when reading from the register. Upon receiving the address, the accelerometer returns the 8-bit data stored in the addressed register. For 3-wire read operations, one extra clock cycle between the address byte and the data output byte is required. Therefore, this operation occurs over 17 clock cycles. All returned data is sent MSB first, and the host must return nCS HIGH for at least one clock cycle before the next data request. Figure 9 shows the timing diagram for an 8-bit register read operation.

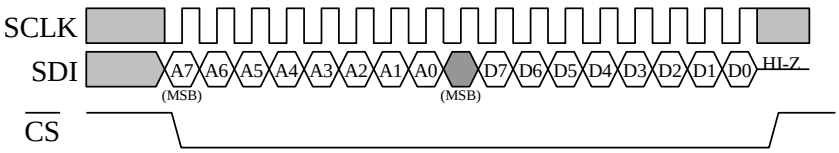

Figure 9: Timing Diagram for 8-Bit Register Read Operation

Embedded Registers

The KX127 has 78 embedded 8-bit registers that are accessible by the user. This section contains the addresses for all embedded registers and describes bit functions of each register. Table 11 provides a listing of the accessible 8-bit registers and their addresses.

Note[1]: In addition of setting PC=1, HPE in CNTL4 needs to be set HIGH to enable high-pass data outputs
Note[2]: Reserved registers should not be written
Note[3]: When changing the contents of these registers, the PC1 bit in CNTL1 must first be set to “0”.

Table 11: Register Map

Register Descriptions

Accelerometer Outputs

These registers contain up to 16-bits of valid acceleration data for each axis. However, the user may choose to read only the 8 MSB thus reading an effective 8-bit resolution. When BRES bit is set to 0 in BUF_CNTL2 register, the 8 MSB is the only data recorded in the buffer. The data is updated every user-defined ODR period, is protected from overwrite during each read, and can be converted from digital counts to acceleration (g) per Table 12. The register acceleration output binary data is represented in 2's complement format. For example, if N = 16 bits, then the Counts range is from -32768 to 32767, and if N = 8 bits, then the Counts range is from -128 to 127.

16-bit Register Data (2's complement)	Equivalent Counts in decimal	Range = ±2g	Range = ±4g	Range = ±8g
0111 1111 1111 1111	32767	+1.99994g	+3.99988g	+7.99976g
0111 1111 1111 1110	32766	+1.99988g	+3.99976g	+7.99951g

Table 12: Acceleration (g) Calculation

MAN_ID

A burst read (reading using the auto-increment) of 4 bytes starting at address 00, returns the manufacturing ID: "K" "i" "o" "n" in ASCII codes "0x4B" "0x69" "0x6F" "0x6E".

R	R	R	R	R	R	R	R
MANID7	MANID6	MANID5	MANID4	MANID3	MANID2	MANID1	MANID0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
					Address: 0x00		

PART_ID

A burst read (reading using the auto-increment) of 2 bytes starting at address 01, returns Who_Am_I value ("WAI") as the first byte (LSB) and a 2nd byte (MSB) that returns silicon specific ID.

R	R	R	R	R	R	R	R
PARTID7	PARTID6	PARTID5	PARTID4	PARTID3	PARTID2	PARTID1	PARTID0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
					Address: 0x01		

Note: A burst read (reading using the auto-increment) of 6 bytes starting at address 00, returns the MAN_ID followed by the 2 bytes of PART_ID

XHP_L

X-axis high-pass filter accelerometer output least significant byte. Data is updated at the ODR frequency determined by OWUF in CNTL3 and is available when HPE bit is set to 1 in CNTL4 register. 2's complement data format is used. Data is protected while reading using auto increment mode.

					Address: 0x0F			

COTR

The Command Test Response (COTR) register is used to verify proper integrated circuit functionality. The value of this register will change from a default value of 0x55 to 0xAA when COTC bit in CNTL2 register is set. After reading 0xAA from this register, the byte value returns to the default value of 0x55 and COTC bit in CNTL2 register is cleared.

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00111011
					Address: 0x11			

Tilt Position Registers

These two registers report previous and current position data that is updated at the user-defined ODR frequency determined by OTP<1:0> in CNTL3. Data is protected during register read. Table 13 describes the reported position for each bit value.

TSCP

The Tilt Status Current Position (TSCP) register reports the current tilt position.

R	R	R	R	R	R	R	R	
0	0	LE	RI	DO	UP	FD	FU	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00100000
					Address: 0x12			

TSPP

The Tilt Status Previous Position (TSPP) register reports previous tilt position.

R	R	R	R	R	R	R	R	
0	0	LE	RI	DO	UP	FD	FU	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00100000
					Address: 0x13			

Bit	Description
LE	Left State (X-)
RI	Right State (X+)
DO	Down State (Y-)
UP	Up State (Y+)
FD	Face-Down State (Z-)
FU	Face-Up State (Z+)

Table 13: Tilt Position

Interrupt Source Registers

These three registers report interrupt state changes. This data is updated when a new interrupt event occurs and each application's result is latched until the interrupt release register is read.

INS1

The Interrupt Source 1 (INS1) register contains 2 step counter interrupts and contains the Tap/Double-Tap™ axis specific interrupts. Data is updated at the ODR settings determined by OTDT<2:0> in CNTL3.

R	R	R	R	R	R	R	R
STPOVI	STPWMI	TLE	TRI	TDO	TUP	TFD	TFU
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
					Address: 0x14		

STPOVI *– Step counter Overflow interrupt. This bit is cleared when the interrupt latch release register (INT_REL) is read*

STPWMI *– Step counter Watermark interrupt. This bit is cleared when either the PED_STPL or PED_STPH step count registers is read.*

Bit	Description
TLE	X Negative (X-) Reported
TRI	X Positive (X+) Reported
TDO	Y Negative (Y-) Reported
TUP	Y Positive (Y+) Reported
TFD	Z Negative (Z-) Reported
TFU	Z Positive (Z+) Reported

Table 14: Directional-Tap™ Reporting

INS2

This register tells which function caused an interrupt.

R	R	R	R	R	R	R	R
FFS	BFI	WMI	DRDY	TDTS1	TDTS0	STPINCI	TPS
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
					Address: 0x15		

FFS *– Free fall. This bit is cleared when the interrupt latch release register (INT_REL) is read.*
FFS = 0 – No Free fall
FFS = 1 – Free fall has activated the interrupt

BFI – *Buffer Full Interrupt. Automatically cleared when at least one sample is read from the buffer or following the write to BUF_CLEAR register.*

BFI = 0 – Buffer is not full
BFI = 1 – Buffer is full

WMI – *The Watermark Interrupt bit is set to 1 when FIFO has filled up to the value stored in the SMP_TH <9:0> bits. when in FIFO, FILO, or Stream mode. Not used in Trigger mode. This bit is automatically cleared when FIFO is read and the SMP_LEV<10:0> returns to a value below the value stored in the SMP_TH <9:0> bits, or following the write to BUF_CLEAR register.*

WMI = 0 – Buffer watermark has not been exceeded
WMI = 1 – Buffer watermark has been exceeded

DRDY – *The Data Ready bit indicates that new acceleration data (0x08 to 0x0D) is available. This bit is cleared when acceleration data is read or the interrupt latch release register (INT_REL) is read.*

DRDY = 0 - new acceleration data not available
DRDY = 1 - new acceleration data available

TDTS1, TDTS0 – *The Tap/Double-Tap™ Status bits indicate whether a tap event has occurred and what kind. The status bits are cleared when interrupt release register INT_REL is read.*

TDTS1	TDTS0	Event
0	0	No Tap
0	1	Single Tap
1	0	Double Tap
1	1	undefined

STPINCI – *The Step counter Increment Interrupt bit is cleared when the interrupt latch release register (INT_REL) is read.*

STPINCI = 1 – Step counter value has incremented
STPINCI = 0 – No step detected

TPS – *The Tilt Position Status bit is cleared when the interrupt release register INT_REL is read.*

TPS = 0 – Position has not changed
TPS = 1 – Position has changed

INS3

The Interrupt Source 3 (INS3) register reports the interrupt status of the Wake-Up and Back-to-Sleep functions, as well as the axis and direction of the Wake-Up detected motion.

R	R	R	R	R	R	R	R
WUFS	BTS	XNWU	XPWU	YNWU	YPWU	ZNWU	ZPWU
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
					Address: 0x16		

WUFS *– The Wake-Up Function Status interrupt bit is cleared when the interrupt latch release register (INT_REL) is read.*

WUFS = 1 – Motion is above the wake-up threshold WUFTH<10:0>
WUFS = 0 – Motion is below the wake-up threshold WUFTH<10:0>

BTS *– Back-to-Sleep interrupt. This bit is cleared when the interrupt latch release register (INT_REL) is read.*

BTS = 1 – Motion is below the back-to-sleep threshold BTSTH <10:0>
BTS = 0 – Motion is above the back-to-sleep threshold BTSTH <10:0>

Bit	Description
XNWU	X Negative (X-) Reported
XPWU	X Positive (X+) Reported
YNWU	Y Negative (Y-) Reported
YPWU	Y Positive (Y+) Reported
ZNWU	Z Negative (Z-) Reported
ZPWU	Z Positive (Z+) Reported

Table 15: Motion Detection Reporting

STAT

The Status Register reports the status of whether the interrupt is present.

R	R	R	R	R	R	R	R
0	0	0	INT	0	0	0	WAKE
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
					Address: 0x17		

INT *– The INT bit reports the combined (OR) interrupt information of all features. If BFI and WMI bits in INS2 register and STPWMI in INS1 register are 0, the INT bit is set to 0 when INT_REL register is read. If WMI or BFI bit in INS2 register or STPWMI bit in INS1 register are 1, INT bit remains at 1 until these bits are cleared by either FIFO/FILO buffer read in case of WMI/BFI bits or when either the low byte of the step counter (PED_STP_L) or the high byte of the step counter (PED_STP_H) is read in case of STPWMI bit.*

INT = 0 – interrupt event has not occurred
INT = 1 – interrupt event has occurred

WAKE *– The WAKE bit reports the current state of the KX127*

WAKE = 0 –Back-To-Sleep state
WAKE =1 – Wake state

Note: Wake is the default state at power-up, shown in STAT register. For wake engine only operation, set MAN_SLEEP bit to 1 in CNTL5 register to put KX127 in sleep state for the first time.

INT_REL

Interrupt Release (INT_REL) register: Latched interrupt source information reported in INS1, INS2, and INS3 registers is cleared and physical interrupt latched pin is changed to its inactive state when this register is read. However, WMI, BFI bits in INS2 register and STPWMI bit in INS1 register are not cleared by this command. Furthermore, INT bit in STAT will not be cleared by reading this register if WMI or BFI bits in INS2 register or STPWMI bit in INS1 register are set to 1. Read value is dummy.

R	R	R	R	R	R	R	R
0	0	0	0	0	0	0	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
					Address: 0x19		

CNTL1

Control register 1. Read/write control register that controls the main feature set.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
PC1	RES	DRDYE	GSEL1	GSEL0	TDTE	PDE	TPE	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x1A			

PC1 *– The PC1 bit controls the operating mode of the KX127.*

PC1 = 0 − Standby mode
PC1 = 1 − operating mode (Low Power or High Resolution)

RES *– The RES bit determines the performance mode of the KX127. The noise varies with ODR, RES and different LP_CNTL settings possibly reducing the effective resolution. Note that to change the value of this bit, the PC1 bit must first be set to "0".*

RES = 0 – Low Power mode (higher noise, lower current, 16-bit output data)
RES = 1 – High Resolution mode (lower noise, higher current, 16-bit output data)

DRDYE *– The Data Ready Enable bit enables the reporting of the availability of new acceleration data as an interrupt. Note that to change the value of this bit, the PC1 bit must first be set to "0".*

DRDYE = 0 – availability of new acceleration data is not reflected as an interrupt
DRDYE = 1 – availability of new acceleration data is reflected as an interrupt

GSEL1, GSEL0 *– The G-Select bits allow to select the acceleration range of the accelerometer outputs per Table 16. Note that to change the value of this bit, the PC1 bit must first be set to "0".*

GSEL1	GSEL0	Range
0	0	±2g
0	1	±4g
1	X	±8g

Table 16: Selected Acceleration Range

TDTE *– The Tap/Double-Tap™ Enable bit enables the Directional-Tap™ function that will detect single and double tap events. Note that to change the value of this bit, the PC1 bit must first be set to "0".*

TDTE = 0 – Tap/Double-Tap™ disabled
TDTE = 1 – Tap/Double-Tap™ enabled

PDE *– The Pedometer Enable bit enables the pedometer (step-counter) engine. Note that to change the value of this bit, the PC1 bit must first be set to "0".*

PDE = 0 – Pedometer engine disabled
PDE = 1 – Pedometer engine enabled

TPE *– The Tilt Position Enable bit enables the Tilt Position function that will detect changes in device orientation. Note that to change the value of this bit, the PC1 bit must first be set to "0".*

TPE = 0 – Tilt Position function disabled
TPE = 1 – Tilt Position function enabled

CNTL2

The Control 2 (CNTL2) register primarily controls tilt position state enabling. If a tilt direction bit's state is set to one (1), a transition into the corresponding orientation state will generate an interrupt. If it is set to zero (0), a transition into the corresponding orientation state will not generate an interrupt. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
SRST	COTC	LEM	RIM	DOM	UPM	FDM	FUM	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00111111
					Address: 0x1B			

SRST *– The Software Reset bit initiates software reset, which performs the RAM reboot routine. This bit will remain 1 until the RAM reboot routine is finished. Please refer to Technical Note TN021 Power-On Procedure for more information on software reset.*

SRST = 0 – no action
SRST = 1 – start POR / RAM reboot routine

Note for I^2C Communication: Setting SRST = 1 will NOT result in an ACK, since the part immediately enters the RAM reboot routine. NACK may be used to confirm this command.

COTC *– The Command Test Control bit is used to verify proper ASIC functionality.*

COTC = 0 – no action
COTC = 1 – sets COTR register to 0xAA. When COTR register is then read, sets COTC bit to 0 and sets COTR register to 0x55.

LEM, RIM, DOM, UPM, FDM, FUM *– these bits control the tilt axis mask. Per Table 17, if a direction's bit is set to one (1), tilt in that direction will generate an interrupt. If it is set to zero (0), tilt in that direction will not generate an interrupt.*

Bit	Description
LEM	*Left state enable* (X-)
RIM	*Right state enable* (X+)
DOM	*Down state enable* (Y-)
UPM	*Up state enable* (Y+)
FDM	*Face-Down state enable* (Z-)
FUM	*Face-Up state enable* (Z+)

Table 17: Tilt Direction Axis Mask

CNTL3

The Control 3 (CNTL3) register sets the output data rates for Tilt, Directional-Tap™, and the Motion Wake-Up digital engines. The output data rate set in this register and the averaging filter control settings set in LP_CNTL register, will influence overall performance of the digital engines and the power consumption of the accelerometer. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
OTP1	OTP0	OTDT2	OTDT1	OTDT0	OWUF2	OWUF1	OWUF0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	10011000
					Address: 0x1C			

OTP1, OTP0 *– The ODR Tilt bits set the output data rate for the Tilt Position function per Table 18. The default Tilt Position ODR is 12.5Hz.*

OTP1	OTP0	Output Data Rate
0	0	1.563Hz
0	1	6.25Hz
1	0	12.5Hz
1	1	50Hz

Table 18: Tilt Position Function Output Data Rate

OTDT2, OTDT1, OTDT0 *– The ODR Tap/Double-Tap™ bits set the output data rate for the Directional-Tap™ function per Table 19. The default Directional-Tap™ ODR is 400Hz.*

OTDT2	OTDT1	OTDT0	Output Data Rate
0	0	0	50Hz
0	0	1	100Hz
0	1	0	200Hz
0	1	1	400Hz
1	0	0	12.5Hz
1	0	1	25Hz
1	1	0	800Hz
1	1	1	1600Hz

Table 19: Directional-Tap™ Function Output Data Rate

OWUF2, OWUF1, OWUF0 *– The ODR Wake-Up Function bits set the output data rate for the general motion detection function and the high-pass filtered outputs per Table 20.*

The default Motion Wake-Up ODR is 0.781Hz.

Note: OWUF<2:0> setting needs to be less than or equal to OSA<3:0> to avoid irregular resulting acceleration ODR's.

OWUF2	OWUF1	OWUF0	Output Data Rate
0	0	0	0.781Hz
0	0	1	1.563Hz
0	1	0	3.125Hz
0	1	1	6.250Hz
1	0	0	12.5Hz
1	0	1	25Hz
1	1	0	50Hz
1	1	1	100Hz

Table 20: Motion Wake-Up Function Output Data Rate

CNTL4

The Control 4 (CNTL4) register 4 provides more feature set control. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
C_MODE	TH_MODE	WUFE	BTSE	HPE	OBTS2	OBTS1	OBTS0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	01000000
					Address: 0x1D			

C_MODE *– The Counter Mode bit defines debounce counter operation*
C_MODE = 0 – debounce counter is in clear mode
C_MODE = 1 – debounce counter is in decrement mode

TH_MODE *– The Threshold Mode bit defines the type of the wake / back-to-sleep threshold*
TH_MODE = 0 – absolute threshold
TH_MODE = 1 – relative threshold

WUFE *– The Wake-Up Function Enable bit enables the Wake-up engine*
WUFE = 0 – Wake-up engine is disabled
WUFE = 1 – Wake-up engine is enabled

BTSE *– The Back-to-Sleep Enable bit enables the Back-to-Sleep engine*
BTSE = 0 – disabled
BTSE = 1 – enable

HPE *– The High-Pass Enable bit enables the High-pass outputs XHP, YHP, ZHP*
HPE = 0 – high-pass outputs disabled
HPE = 1 – high-pass outputs enabled

OBTS2, OBTS1, OBTS0 *– The ODR Back-To-Sleep bits set the output data rate (per Table 21) at which the back-to-sleep (motion detection) performs its function during wake state.*

The default Back-to-sleep ODR is 0.781Hz.

Note: OBTS<2:0> setting needs to be less than or equal to OSA<3:0> to avoid irregular resulting acceleration ODR's.

OBTS2	OBTS1	OBTS0	Output Data Rate
0	0	0	0.781Hz
0	0	1	1.563Hz
0	1	0	3.125Hz
0	1	1	6.250Hz
1	0	0	12.5Hz
1	0	1	25Hz
1	1	0	50Hz
1	1	1	100Hz

Table 21: Motion Back-to-Sleep Function Output Data Rate

CNTL5

The Control 5 (CNTL5) register provides additional controls for wake-sleep engine. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	0	0	0	0	0	MAN_WAKE	MAN_SLEEP	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000001
					Address: 0x1E			

MAN_WAKE *– The manual wake overwrite bit*

MAN_WAKE = 0 – default
MAN_WAKE = 1 – forces wake state (bit is self-cleared)

MAN_SLEEP *– The manual sleep overwrite bit*

MAN_SLEEP = 0 – default
MAN_SLEEP = 1 – forces sleep state (bit is self-cleared)

Notes:

1. *For having both WUF & BTS engine which has a wake state, if there is a wake interrupt, no additional wake interrupt is received until part is put back to sleep manually (using man_sleep bit) or using the BTS interrupt.*
2. *Wake is the default state at power-up, shown in STAT register. For wake engine only operation, set MAN_SLEEP bit to 1 in CNTL5 register to put KX127 in sleep state for the first time.*

ODCNTL

The ODR Control (ODCNTL) register is responsible for configuring Output Data Rate (ODR) and low-pass filter settings. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
IIR_BYPASS	LPRO	0	0	OSA3	OSA2	OSA1	OSA0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000010
					Address: 0x1F			

***IIR_BYPASS** filter bypass mode*

IIR_BYPASS = 0 – filtering applied (default)

IIR_BYPASS = 1 – filter bypassed. This setting may reduce the resolution of the output data.

***LPRO** low-pass filter roll off control*

LPRO = 0 – filter corner frequency set to ODR/9 (default)

LPRO = 1 – filter corner frequency set to ODR/2

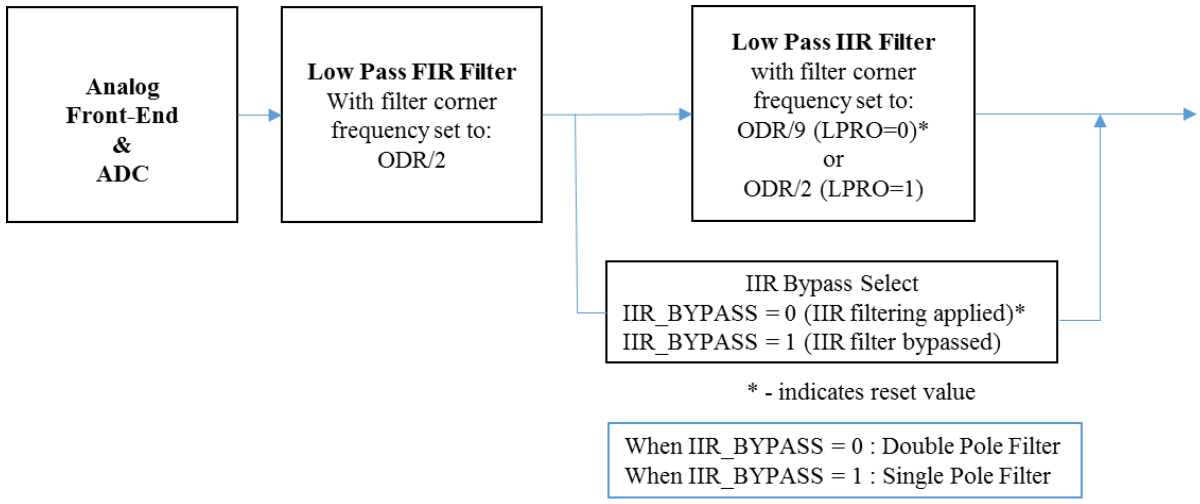

Figure 10: Low-Pass Filter Design and Control Circuitry

OSA3, OSA2, OSA1, OSA0 *– The OSA <3:0> bits set the acceleration output data rate (ODR). The default ODR is 50Hz.*

OSA3	OSA2	OSA1	OSA0	Output Data Rate
0	0	0	0	12.5Hz*
0	0	0	1	25Hz*
0	0	1	0	50Hz*
0	0	1	1	100Hz*
0	1	0	0	200Hz*
0	1	0	1	400Hz**
0	1	1	0	800Hz
0	1	1	1	1600Hz
1	0	0	0	0.781Hz*
1	0	0	1	1.563Hz*
1	0	1	0	3.125Hz*
1	0	1	1	6.25Hz*
1	1	0	0	3200Hz**
1	1	0	1	6400Hz**
1	1	1	0	12800Hz**
1	1	1	1	25600Hz**

Table 22: Accelerometer Output Data Rates (ODR)

* *Low Power* mode available, all other data rates will default to *High Resolution* mode
** 400Hz *High Resolution* mode only (will not output in *Low Power* mode)

INC1

The Interrupt Control 1 (INC1) register controls the settings for the physical interrupt pin INT1, the Self-test function, and 3-wire SPI interface. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
PW11	PW10	IEN1	IEA1	IEL1	Reserved	STPOL	SPI3E	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00010000
					Address: 0x20			

PW1<1:0> *– Pulse interrupt 1 width configuration.*

00 = 50 µsec (10 µsec if OSA > 1600Hz)
*01 = 1 * OSA period*
*10 = 2 * OSA periods*
*11 = 4 * OSA periods*

When PW1 > 0, Interrupt source auto-clearing (ACLR1=1) should be set to keep consistency between the internal status and the physical interrupt.

IEN1 *enables/disables the physical interrupt pin INT1*
IEN1 = 0 – physical interrupt pin is disabled
IEN1 = 1 – physical interrupt pin is enabled

IEA1 *Interrupt active level control for interrupt pin INT1*
IEA1 = 0 – polarity of the physical interrupt pin is active LOW
IEA1 = 1 – polarity of the physical interrupt pin is active HIGH

IEL1 *Interrupt latch control for physical interrupt pin INT1*
IEL1 = 0 – the physical interrupt pin latches until it is cleared by reading INT_REL. (excludes BFI, WMI, STPWMI).
IEL1 = 1 – the physical interrupt pin will transmit one pulse configurable by PWSEL1

STPOL *sets the polarity of Self-test.*
STPOL = 0 – Negative
STPOL = 1 – Positive

SPI3E *sets the 3-wire SPI interface (set to 0 when I^2C communication is used)*
SPI3E = 0 – disabled
SPI3E = 1 – enabled

INC2

The Interrupt Control 2 (INC2) register controls which axis and direction of detected motion can cause an interrupt. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	AOI	XNWUE	XPWUE	YNWUE	YPWUE	ZNWUE	ZPWUE	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00111111
					Address: 0x21			

AOI *– AND-OR configuration on motion detection*
0 – OR combination between selected directions
1 – AND combination between selected axes
Ex. If all directions are enabled,
Active state in OR configuration = (XN || XP || YN || YP || ZN || ZP)
Active state in AND configuration = (XN || XP) && (YN || YP) && (ZN || ZP)

XNWUE *– x negative (x-): 0 = disabled, 1 = enabled*
XPWUE *– x positive (x+): 0 = disabled, 1 = enabled*
YNWUE *– y negative (y-): 0 = disabled, 1 = enabled*
YPWUE *– y positive (y+): 0 = disabled, 1 = enabled*
ZNWUE *– z negative (z-): 0 = disabled, 1 = enabled*
ZPWUE *– z positive (z+): 0 = disabled, 1 = enabled*

INC3

The Interrupt Control 3 (INC3) register controls which axis and direction of Tap/Double-Tap™ can cause an interrupt. If a direction's bit is set to one (1), a single or double tap in that direction will generate an interrupt. If it is set to zero (0), a single or double tap in that direction will not generate an interrupt. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	TMEN	TLEM	TRIM	TDOM	TUPM	TFDM	TFUM	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00111111
					Address: 0x22			

TMEN *– enables/disables alternate tap masking scheme*
TMEN = 0 – alternate tap masking scheme disabled
TMEN = 1 – alternate tap masking scheme enabled
TLEM *– Tilt left state mask: 0 = disabled, 1 = enabled*
TRIM *– Tilt right state mask: 0 = disabled, 1 = enabled*
TDOM *– Tilt down state mask: 0 = disabled, 1 = enabled*
TUPM *– Tilt up state mask: 0 = disabled, 1 = enabled*
TFDM *– Tilt face-down state mask: 0 = disabled, 1 = enabled*
TFUM *– Tilt face-up state mask: 0 = disabled, 1 = enabled*

INC4

The Interrupt Control 4 (INC4) register controls routing of an interrupt reporting to physical interrupt pin INT1. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
FFI1	BFI1	WMI1	DRDYI1	BTSI1	TDTI1	WUFI1	TPI1	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x23			

FFI1 *– Free fall interrupt reported on physical interrupt pin INT1*
FFI1 = 0 – disable
FFI1 = 1 – enable
BFI1 *– Buffer full interrupt reported on physical interrupt pin INT1*
BFI = 0 – disable
BFI = 1 – enable
WMI1 *- Watermark interrupt reported on physical interrupt pin INT1*
WMI1 = 0 – disable
WMI1 = 1 – enable

Note: WMI, BFI, and STPWMI are level triggered interrupt source. If the valid condition persists, and the interrupt stays enabled, the interrupt will block any further interrupts from other sources from triggering the INT1 pin. In order to let other interrupt sources through, WMI/BFI/STPWI needs to be cleared once detected.

DRDYI1 *– Data ready interrupt reported on physical interrupt pin INT1*
DRDYI1 = 0 – disable
DRDYI1 = 1 – enable
BTSI1 *– Back-to-Sleep interrupt reported on physical interrupt pin INT1*
BTSI1 = 0 – disable
BTSI1 = 1 – enable
TDTI1 *- Tap/Double Tap interrupt reported on physical interrupt pin INT1*
TDTI1 = 0 – disable
TDTI1 = 1 – enable
WUFI1 *– Wake-Up (motion detect) interrupt reported on physical interrupt pin INT1*
WUFI1 = 0 – disable
WUFI1 = 1 – enable
TPI1 *– Tilt position interrupt reported on physical interrupt pin INT1*
TPI1 = 0 – disable
TPI1 = 1 – enable

INC5

The Interrupt Control 5 (INC5) register controls the settings for the physical interrupt pin INT2. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
PW21	PW20	IEN2	IEA2	IEL2	0	ACLR2	ACLR1	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00010000
					Address: 0x24			

PW2<1:0> *– Pulse interrupt 2 width configuration*
00 = 50 µsec (10 µsec if OSA > 1600Hz)
*01 = 1 * OSA period*
*10 = 2 * OSA periods*
*11 = 4 * OSA periods*

When PW2 > 0, Interrupt source auto-clearing (ACLR2=1) is strongly recommended to keep consistency between the internal status and the physical interrupt.

IEN2 *enables/disables the physical interrupt pin INT2*
IEN2 = 0 – physical interrupt pin is disabled
IEN2 = 1 – physical interrupt pin is enabled

IEA2 *Interrupt active level control for interrupt pin INT2*
IEA2 = 0 – polarity of the physical interrupt pin is active LOW
IEA2 = 1 – polarity of the physical interrupt pin is active HIGH

IEL2 *Interrupt latch control for interrupt pin INT2*
IEL2 = 0 – the physical interrupt pin latches until it is cleared by reading INT_REL. (excludes BFI, WMI, STPWMI).
IEL2 = 1 – the physical interrupt pin will transmit one pulse configurable by PW2

ACLR2 *– Latched interrupt source information(INS1-INS3) is cleared and physical interrupt-1 latched pin is changed to its inactive state at pulse interrupt-2 trailing edge. Note: WMI, BFI, and STPWMI are not auto-cleared by a pulse interrupt trailing edge.*
ACLR2 = 0 – disable
ACLR2 = 1 – enable

ACLR1 *– Latched interrupt source information(INS1-INS3) is cleared and physical interrupt-2 latched pin is changed to its inactive state at pulse interrupt-1 trailing edge. Note: WMI, BFI, and STPWMI are not auto-cleared by a pulse interrupt trailing edge.*
ACLR1 = 0 – disable
ACLR1 = 1 – enable

INC6

The Interrupt Control 6 (INC6) register controls routing of interrupt reporting to physical interrupt pin INT2. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
FFI2	BFI2	WMI2	DRDYI2	BTSI2	TDTI2	WUFI2	TPI2	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x25			

FFI2 *– Free fall interrupt reported on physical interrupt pin INT2*
FFI2 = 0 – disable
FFI2 = 1 – enable
BFI2 *– Buffer full interrupt reported on physical interrupt pin INT2*
BF2 = 0 – disable
BF2 = 1 – enable
WMI2 *- Watermark interrupt reported on physical interrupt pin INT2*
WMI2 = 0 – disable
WMI2 = 1 – enable

Note: WMI, BFI, and STPWMI are level triggered interrupt source. If the valid condition persists, and the interrupt stays enabled, the interrupt will block any further interrupts from other sources from triggering the INT2 pin. In order to let other interrupt sources through, WMI/BFI/STPWI needs to be cleared once detected.

DRDYI2 *– Data ready interrupt reported on physical interrupt pin INT2*
DRDYI2 = 0 – disable
DRDYI2 = 1 – enable
BTSI2 *– Back-to-Sleep interrupt reported on physical interrupt pin INT2*
BTSI2 = 0 – disable
BTSI2 = 1 – enable
TDTI2 *- Tap/Double Tap interrupt reported on physical interrupt pin INT2*
TDTI2 = 0 – disable
TDTI2 = 1 – enable
WUFI2 *– Wake-Up (motion detect) interrupt reported on physical interrupt pin INT2*
WUFI2 = 0 – disable
WUFI2 = 1 – enable
TPI2 *– Tilt position interrupt reported on physical interrupt pin INT2*
TPI2 = 0 – disable
TPI2 = 1 – enable

INC7

The Interrupt Control 7 (INC7) register controls the pedometer (step counter) engine. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
0	STPOVI2	STPWMI2	STPINCI2	0	STPOVI1	STPWMI1	STPINCI1	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x26			

Please note, that the STPWMI is a level triggered interrupt source (same as BFI, WMI). Any mechanism to clear the INS register bits will fail as long as the condition persists. If the condition persists and the STPWMI interrupt stays enabled, the level triggered interrupt will block any further interrupts from other sources from triggering the pin. In order to let other interrupt sources through, STPWMI needs to be set LOW once detected. STPINCI and STPOVI are momentary events that do not persist.

STPOVI2 *– Step counter overflow interrupt reported on physical interrupt pin INT2*
STPOVI2 = 0 – disable
STPOVI2 = 1 – enable

STPWMI2 – *Step counter watermark interrupt reported on physical interrupt pin INT2*
STPWMI2 = 0 – disable
STPWMI2 = 1 – enable

STPINCI2 – *Step counter increment interrupt reported on physical interrupt pin INT2*
STPINCI2 = 0 – disable
STPINCI2 = 1 – enable

STPOVI1 *– Step counter overflow interrupt reported on physical interrupt pin INT1*
STPOVI1 = 0 – disable
STPOVI1 = 1 – enable

STPWMI1 – *Step counter watermark interrupt reported on physical interrupt pin INT1*
STPWMI1 = 0 – disable
STPWMI1 = 1 – enable

STPINCI1 – *Step counter increment interrupt reported on physical interrupt pin INT1*
STPINCI1 = 0 – disable
STPINCI1 = 1 – enable

TILT_TIMER

This register is the initial count register for the tilt position state timer (0 to 255 counts). Every count is calculated as 1/ODR delay period, where the ODR is user-defined per Table 18. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

					Address: 0x28			

DTRE *– enables/disables the double tap interrupt*

DTRE = 0 – do not update INS1 or TDTS<1:0> in INS2 register if double tap occurs.
DTRE = 1 – update INS1 and TDTS <1:0> in INS2 with double tap events.

STRE *– enables/disables single tap interrupt*

STRE = 0 – do not update INS1 or TDTS<1:0> in INS2 register if single tap occurs.
STRE = 1 –update INS1 and TDTS <1:0> in INS2 with single tap events.

TDTC

The Tap/Double-Tap™ Counter (TDTC) register contains counter information for the detection of a double tap event. When the Directional-Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional-Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional-Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional-Tap™ ODR is user-defined per Table 19. The TDTC counts starts at the beginning of the fist tap and it represents the minimum time separation between the first tap and the second tap in a double tap event. More specifically, the second tap event must end outside of the TDTC. The Kionix recommended default value is 0.3 seconds (0x78). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

					Address: 0x29			

TTH

The Tap Threshold High (TTH) register represents the 8-bit jerk high threshold to determine if a tap is detected. The value is compared against the upper 8 bits of the 4g output value (independent of the actual g-range setting of the device). Though this is an 8-bit register, the register value is internally multiplied by two to set the high threshold. This multiplication results in a range of 0 to 510 with a resolution of two counts. The Performance Index (PI) is the jerk signal that is expected to be less than this threshold, but greater than the TTL threshold during single and double tap events. Equation 1 shows how to calculate the Performance Index. The Kionix recommended default value is 203 (0xCB). See *AN078 Getting Started* for recommended settings. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0".

$$X' = X \text{ (current)} - X \text{ (previous)}$$
$$Y' = Y \text{ (current)} - Y \text{ (previous)}$$
$$Z' = Z \text{ (current)} - Z \text{ (previous)}$$

$$PI = |X'| + |Y'| + |Z'|$$

Equation 1: Performance Index

					Address: 0x2A			

TTL

The Tap Threshold Low (TTL) register represents the 8-bit (0– 255) jerk low threshold to determine if a tap is detected. The value is compared against the upper 8 bits of the 4g output value (independent of the actual g-range setting of the device). The Performance Index (PI) is the jerk signal that is expected to be greater than this threshold and less than the TTH threshold during single and double tap events. The Kionix recommended default value is 26 (0x1A). See *AN078 Getting Started* for recommended settings. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0"

FTD

This register contains counter information for the detection of any tap event. When the Directional-Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional-Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional-Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional-Tap™ ODR is user-defined per Table 19. To ensure that only tap events are detected, these time limits are used. A tap event must be above the performance index threshold for at least the low limit (FTDL0 – FTDL2) and no more than the high limit (FTDH0 – FTDH4). The Kionix recommended default value for the high limit is 0.05 seconds and for the low limit is 0.005 seconds (0xA2). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

					Address: 0x2C			

STD

This register contains counter information for the detection of a double tap event. When the Directional-Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional-Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional-Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional-Tap™ ODR is user-defined per Table 19. To ensure that only tap events are detected, this time limit is used. This register sets the total amount of time that the two taps in a double tap event can be above the PI threshold (TTL). The Kionix recommended default value for STD is 0.09 seconds (0x24). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

TLT

This register contains counter information for the detection of a tap event. When the Directional-Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional-Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional-Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional-Tap™ ODR is user-defined per Table 19. To ensure that only tap events are detected, this time limit is used. This register sets the total amount of time that the tap algorithm will count samples that are above the PI threshold (TTL) during a potential tap event. It is used during both single and double tap events. However, reporting of single taps on the physical interrupt pin INT1 or INT2 will occur at the end of the TWS. The Kionix recommended default value for TLT (TDT Latency Timer) is 0.1 seconds (0x28). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to “0”.

TWS

This register contains counter information for the detection of single and double taps. When the Directional-Tap™ ODR is 400Hz or less, every count is calculated as 1/ODR delay period. When the Directional-Tap™ ODR is 800Hz, every count is calculated as 2/ODR delay period. When the Directional-Tap™ ODR is 1600Hz, every count is calculated as 4/ODR delay period. The Directional-Tap™ ODR is user-defined per Table 19. It defines the time window for the entire tap event, single or double, to occur. Reporting of single taps on the physical interrupt pin INT1 or INT2 will occur at the end of this tap window. The Kionix recommended default value for TWS is 0.4 seconds (0xA0). Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

					Address: 0x32			

FFIE – *Free fall engine enable*
FFIE = 0 – Free fall engine disabled
FFIE = 1 – Free fall engine enabled

ULMODE *– Free fall interrupt latch/un-latch control*
ULMODE = 0 – latched
ULMODE = 1 – unlatched

DCRM *– Debounce methodology control*
DCRM = 0 – count up/down
DCRM = 1 – count up/reset

OFFI<2:0> – Output Data Rate at which the Free fall engine performs its function.
The default Free fall ODR is 12.5Hz.

OFFI	Output Data Rate (Hz)
000	12.5
001	25
010	50
011	100
100	200
101	400
110	800
111	1600

Table 23: Free Fall Function Output Data Rate

TILT_ANGLE_LL

Tilt Angle Low Limit: This register sets the low-level threshold for tilt angle detection. The low-level threshold value is compared against the upper 8 bits of the 4g output value (independent of the actual g-range setting of the device). The default tilt angle low level threshold is set to 22° from the horizontal. Note that the minimum suggested tilt angle is 10°. See *AN078 Getting Started* for recommended settings. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00001100
					Address: 0x34			

TILT_ANGLE_HL

Tilt Angle High Limit: This register sets the high-level threshold for tilt angle detection. The high-level threshold is used by an internal algorithm to eliminate dynamic g-variations caused by the device movement. Instead, only static g-variation (gravity) caused by the actual tilt changes are used. The high-level threshold value is compared against the upper 8 bits of the 4g output value (independent of the actual g-range setting of the device). The default tilt angle high level threshold is set to just above 1g plus some margin of error to account for external factors (e.g. device mounting). See *AN078 Getting Started* for recommended settings. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0".

					Address: 0x36			

LP_CNTL

Low Power Control: The Averaging Filter Control setting can be used in the optimization of current and noise performance of the accelerometer and can be tested using Kionix FlexSet™ Performance Optimization Tool. More specifically, this setting determines the number of internal acceleration samples to be averaged in Low Power mode. Also, it determines the number of internal acceleration samples to be averaged for digital engines operation (Directional-Tap™, Tilt, Wake-Up, Back-to-Sleep, Free fall, Pedometer) both in *High Resolution* and *Low Power* modes. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

AVC<2:0> *– Averaging Filter Control. The default setting is 16 samples and was found to work for most case.*

```
000 = No Averaging
001 = 2 Samples Averaged
010 = 4 Samples Averaged
011 = 8 Samples Averaged
100 = 16 Samples Averaged (default)
101 = 32 Samples Averaged
110 = 64 Samples Averaged
111 = 128 Samples Averaged
```

Reserved *– these bits are reserved and their value should not be changed.*

WUFTH, BTSWUFTH and BTSTH

Wake-up Function Threshold (WUFTH), Back-to-Sleep and Wake-Up Function Threshold (BTSWUFTH), and Back-to-Sleep Threshold (BTSTH) registers set the thresholds for Wake-up and Back-to-Sleep engines. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	Address	Register	Reset Value
WUFTH7	WUFTH6	WUFTH5	WUFTH4	WUFTH3	WUFTH2	WUFTH1	WUFTH0	0x3C	WUFTH	10000000

BTSTH7	BTSTH6	BTSTH5	BTSTH4	BTSTH3	BTSTH2	BTSTH1	BTSTH0	0x3E	BTSTH	10000000
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0			

WUFTH<10:0>: Threshold for wake-up interrupt

BTSTH<10:0>: Threshold for Back-to-Sleep interrupt

The threshold values set by WUFTH<10:0> and BTSTH<10:0> are compared to the top 11 bits of the accelerometer 8g output (regardless of GSEL<1:0> setting in CNTL1 register). This results in threshold resolution of 3.9 mg/count per Equation 2.

$$2^{11} \text{ counts} / 8 \text{ g} = 2048 \text{ counts} / 8 \text{ g} = 256 \text{ counts/g or } 3.9 \text{ mg/count}$$

Equation 2: Wake-Up / Back-to-Sleep Resolution Calculations

BTSC

This register is the initial count register for the BTS motion detection timer (0 to 255 counts). Every count is calculated as 1/ODR delay period, where the Back-to-Sleep ODR is user-defined per Table 21. Note that to properly change the value of this register, the PC1 bit in CNTL1 must first be set to "0".

T_P<5:0> – Minimum time interval for a single stride. Values: 0, 1, ...,63.

SELF_TEST

Self-Test: When 0xCA value is written to this register, the MEMS self-test function is enabled. Electrostatic-actuation of the accelerometer, results in a DC shift of the X, Y and Z axis outputs. Writing 0x00 to this register will return the accelerometer to normal operation.

**Note, this is a write-only register. Read back value from this register will always be 0x00.

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x5A			

SMP_TH[9:0] Sample Threshold *– determines the number of samples that will trigger a watermark interrupt or will be saved prior to a trigger event. When BRES=1, the maximum number of samples is 342. When BRES=0, the maximum number of samples is 683. The minimum number of samples must be greater than or equal to 2.*

Note: SMP_TH[9:8] bits are located in BUF_CNTL2 register.

Buffer Model	Sample Function
Bypass	None
FIFO	Specifies how many buffer sample are needed to trigger a watermark interrupt.
Stream	Specifies how many buffer samples are needed to trigger a watermark interrupt.
Trigger	Specifies how many buffer samples before the trigger event are retained in the buffer.
FILO	Specifies how many buffer samples are needed to trigger a watermark interrupt.

Table 24: Sample Threshold Operation by Buffer Mode

BUF_CNTL2

The Buffer Control 2 (BUF_CNTL2) register controls sample buffer operation. Note that to properly change the value of this register, the PC1 bit in CNTL1 register must first be set to "0".

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
BUFE	BRES	BFIE	0	SMP_TH9	SMP_TH8	BM1	BM0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x5B			

BUFE *controls activation of the sample buffer.*
BUFE = 0 – sample buffer inactive
BUFE = 1 – sample buffer active

Note: Disabling the sample buffer (BUFE = 0) will clear the buffer. The buffer will also be cleared (1) following write to BUF_CLEAR register and/or (2) after setting PC1 bit in CNTL1 register to 0 (standby mode).

BRES *determines the resolution of the acceleration data samples collected by the sample buffer.*
BRES = 0 – 8-bit samples are accumulated in the buffer
BRES = 1 – 16-bit samples are accumulated in the buffer

BFIE *buffer full interrupt enable bit*
BFIE = 0 – buffer full interrupt is disabled
BFIE = 1 – buffer full interrupt is enabled and updated in INS2

BM1, BM0 *selects the operating mode of the sample buffer per Table 25*

BM1	BM0	Mode	Description
0	0	FIFO	The buffer collects 683 sets of 8-bit low resolution values or 342 sets of 16-bit high resolution values and then stops collecting data, collecting new data only when the buffer is not full.
0	1	Stream	The buffer holds the last 683 sets of 8-bit low resolution values or 342 sets of 16-bit high resolution values. Once the buffer is full, the oldest data is discarded to make room for newer data.
1	0	Trigger	When a trigger event occurs, the buffer holds the last data set of SMP_TH[9:0] samples before the trigger event and then continues to collect data until full. New data is collected only when the buffer is not full.
1	1	FILO	The buffer holds the last 683 sets of 8-bit low resolution values or 342 sets of 16-bit high resolution values. Once the buffer is full, the oldest data is discarded to make room for newer data. Reading from the buffer in this mode will return the most recent data first.

Table 25: Selected Buffer Mode

BUF_STATUS_1 and BUF_STATUS_2

Buffer Status: These register reports the status of the sample buffer. Note that BUF_STATUS_1 and BUF_STATUS_2 registers may have a delay of up to 1 µsec to update the sample level after a buffer read.

R	R	R	R	R	R	R	R	**BUF_STATUS_1**
SMP_LEV7	SMP_LEV6	SMP_LEV5	SMP_LEV4	SMP_LEV3	SMP_LEV2	SMP_LEV1	SMP_LEV0	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x5C			

R	R	R	R	R	R	R	R	**BUF_STATUS_2**
BUF_TRIG	0	0	0	SMP_LEV11	SMP_LEV10	SMP_LEV9	SMP_LEV8	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x5D			

SMP_LEV [11:0] Sample Level: *reports the number of data bytes that have been stored in the sample buffer. When BRES=1, this count will increase by 6 for each 3-axis sample in the buffer. When BRES=0, the count will increase by 3 for each 3-axis sample. If this register reads 0, no data has been stored in the buffer.*

BUF_TRIG *reports the status of the buffer's trigger function if this mode has been selected.*
A trigger event is the combined interrupt events of
BUF_TRIG = FFS | TDTS1 | TDTS0 | WUFS | TPS | STPWMI |TRIG
This bit is also gets cleared after writing to BUF_CLEAR register. This will prevent Buffer Full interrupt from firing while TRIG pin remains de-asserted.

BUF_CLEAR

Latched buffer status information and the entire sample buffer are cleared when any data is written to this register. This causes the sample level bits SMP_LEV[11:0] to be cleared in BUF_STATUS_1 and BUF_STATUS_2 registers. In addition, if the sample buffer is set to Trigger mode, the BUF_TRIG bit in BUF_STATUS_2 is cleared too. Finally, the BFI and WMI bits in INS2 will be cleared and physical interrupt latched pin will be changed to its inactive state.

W	W	W	W	W	W	W	W	
X	X	X	X	X	X	X	X	Reset Value
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	00000000
					Address: 0x5E			

BUF_READ

Buffer output register: Data in the buffer can be read while continuing to fill according to the BRES and BM<1:0> settings in BUF_CNTL2. To prevent any data loss, data must be read on a single byte basis or as complete datasets (6 bytes for 16-bit samples and 3 bytes for 8-bit samples as set by BRES bit in BUF_CNTL2) using auto-increment (burst read). In STREAM, TRIGGER (before the trigger event), and FILO modes any burst read of the buffer shall last no longer than the current 1/ODR cycle minus 30µsec (1/ODR-30µsec) for asynchronous reads and no longer than twice the current 1/ODR cycle minus 30µsec (2*(1/ODR)-30µsec) for synchronous reads. In FIFO mode, there is no restriction other than the buffer must not run out of space. Output data is in 2's Complement format.

Embedded Applications

Orientation Detection Feature

The orientation detection feature of the KX127 will report changes in face up, face down, ± vertical and ± horizontal orientation. This intelligent embedded algorithm considers very important factors that provide accurate orientation detection from low cost tri-axis accelerometers. Factors such as: hysteresis, device orientation angle and delay time are described below as these techniques are utilized inside the KX127

Hysteresis

A 45° tilt angle threshold seems like a good choice because it is halfway between 0° and 90°. However, a problem arises when the user holds the device near 45°. Slight vibrations, noise and inherent sensor error will cause the acceleration to go above and below the threshold rapidly and randomly, so the screen will quickly flip back and forth between the 0° and the 90° orientations. This problem is avoided in the KX127 by choosing a 30° threshold angle. With a 30° threshold, the screen will not rotate from 0° to 90° until the device is tilted to 60° (30° from 90°). To rotate back to 0°, the user must tilt back to 30°, thus avoiding the screen flipping problem. This example essentially applies ± 15° of hysteresis in between the four screen rotation states. Table 26 shows the acceleration limits implemented for ϕ_T =30°.

Orientation	X Acceleration (g)	Y Acceleration (g)
0°/360°	$-0.5 < a_x < 0.5$	$a_y > 0.866$
90°	$a_x > 0.866$	$-0.5 < a_y < 0.5$
180°	$-0.5 < a_x < 0.5$	$a_y < -0.866$
270°	$a_x < -0.866$	$-0.5 < a_y < 0.5$

Table 26: Acceleration at the four orientations with ± 15° of hysteresis

The KX127 allows the user to change the amount of hysteresis in between the four screen rotation states. By simply writing to the HYST_SET register, the user can adjust the amount of hysteresis up to ± 45°. The plot in Figure 11 shows the typical amount of hysteresis applied for a given digital count value of HYST_SET.

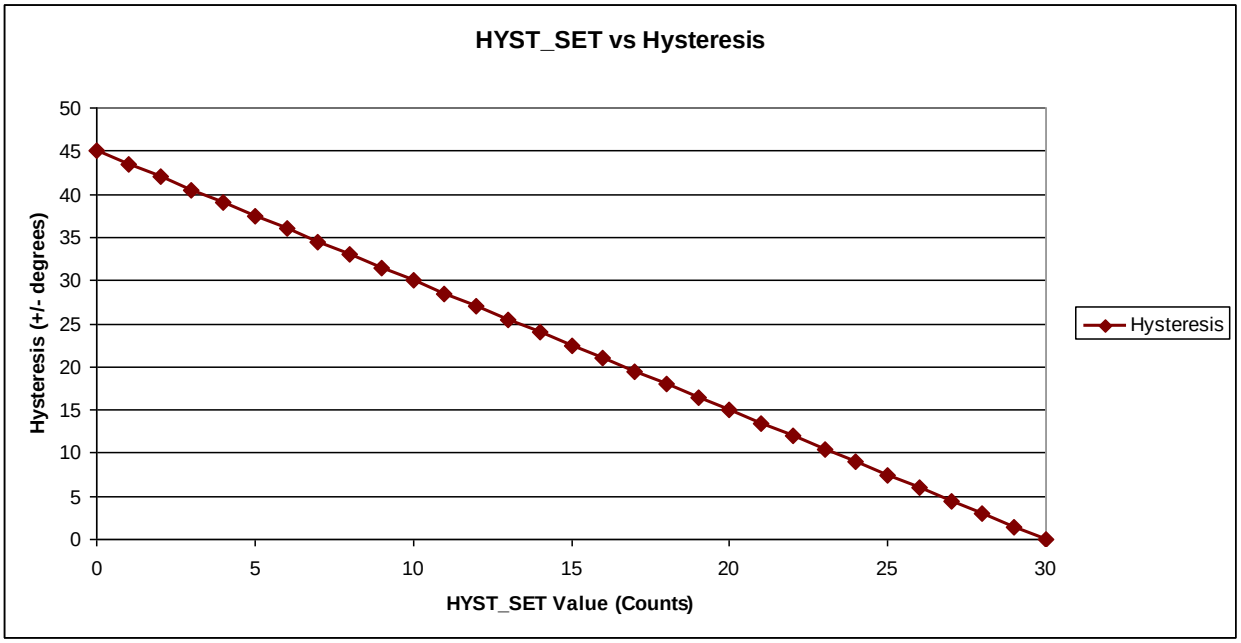

Figure 11: HYST_SET vs Hysteresis

Device Orientation Angle (aka Tilt Angle)

To ensure that horizontal and vertical device orientation changes are detected, even when it isn't in the ideal vertical orientation – where the angle θ in Figure 12 is 90°, the KX127 considers device orientation angle in its algorithm.

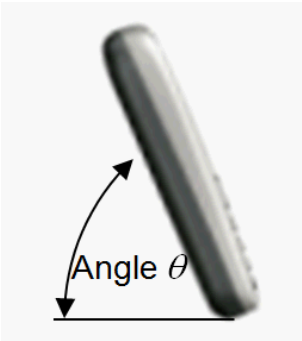

Figure 12: Device Orientation Angle

As the angle in Figure 12 is decreased, the maximum gravitational acceleration on the X-axis or Y-axis will also decrease. Therefore, when the angle becomes small enough, the user will not be able to make

the screen orientation change. When the device orientation angle approaches 0° (device is flat on a desk or table), a_x = a_y = 0g, a_z = +1g, and there is no way to determine which way the screen should be oriented, the internal algorithm determines that the device is in either the face-up or face-down orientation, depending on the sign of the z-axis. The KX127 will only change the screen orientation when the orientation angle is above the factory-defaulted/user-defined threshold set in the TILT_ANGLE_LL register. Equation 3 can be used to determine what value to write to the TILT_ANGLE_LL register to set the device orientation angle. The value for TILT_ANGLE_HL is preset at the factory but can be adjusted in special cases (e.g. to reduce the effect of transient g-variation such as when device is being moved rather than just being rotated).

$$\text{TILT\_ANGLE\_LL (counts)} = \sin\theta * (32\ \text{(counts/g)})$$

Equation 3: Tilt Angle Threshold

Tilt Timer

The 8-bit register, TILT_TIMER can be used to qualify changes in orientation. The KX127 does this by incrementing a counter with a size that is specified by the value in TILT_TIMER for each set of acceleration samples to verify that a change to a new orientation state is maintained. A user defined Tilt Position output data rate (ODR) as set by OTP<1:0> bits in CNTL3 register, determines the time period for each sample. Equation 4 shows how to calculate the TILT_TIMER register value for a desired delay time.

$$\text{TILT\_TIMER (counts)} = \text{Delay Time (sec)} \times \text{Tilt Position ODR (Hz)}$$

Equation 4: Tilt Position Delay Time

Motion Interrupt Feature Description

The Motion interrupt feature of the KX127 reports qualified changes in the high-pass filtered acceleration based on the Wake-Up Threshold (WUFTH) and Back-to-Sleep Threshold (BTSTH). If the high-pass filtered acceleration on any axis is greater than the user-defined Wake-Up Threshold (WUFTH), the device has transitioned from an inactive state to an active state. On the other hand, if the high-pass filtered acceleration on any axis is less than the user-defined Back-to-Sleep Threshold (BTSTH), the device has transitioned from an active state to an inactive state. Equation 5 shows how to calculate the WUFTH and BTSTH register values for a desired wake-up and back-to-sleep thresholds. The wake-up engine function is independent of the user selected g-range and resolution.

WUFTH (counts) = Wake-Up Threshold (g) x 256 (counts/g)

BTSTH (counts) = Back-to-Sleep Threshold (g) x 256 (counts/g)

Equation 5: Wake-Up/Back-to-Sleep Threshold

An 8-bit raw unsigned value represents a counter that permits the user to qualify each active/inactive state change. Note that each Wake-Up Function Counter (WUFC) count qualifies 1 (one) user-defined Wake-Up Function ODR period as set by OWUF<2:0> bits in CNTL3 register. Similarly, each Back-to-Sleep Counter (BTSC) count qualifies 1 (one) user-defined Back-to-Sleep function ODR period as set by OBTS<2:0> bits in CNTL4 register. Equation 6 shows how to calculate the WUFC and BTSC register values for a desired Wake-Up and Back-to-Sleep delay times.

WUFC (counts) = Wake-Up Delay Time (sec) x Wake-up Function ODR (Hz)

BTSC (counts) = Back-to-Sleep Delay Time (sec) x Back-to-Sleep Function ODR (Hz)

Equation 6: Wake-Up and Back-to-Sleep counts

Wake-Up function

While the part is in inactive state, the algorithm evaluates differential measurement between each new acceleration data point with the preceding one and evaluates it against the Wake-Up Function Threshold (WUFTH). When the differential measurement is greater than WUFTH, the Wake-up function counter (WUFC) starts the count. Differential measurements are now calculated based on the difference between the current acceleration and the acceleration when the counter started. The part will report that motion has occurred at the end of the count assuming each differential measurement has remained above the threshold. If at any moment during the count the differential measurement falls below the threshold, the counter will stop the count and the part will remain in inactive state.

To illustrate how the algorithm works, consider the Figure 13 that shows the latched response of the motion detection algorithm with the Wake-up Function Counter (WUFC) set to 10 counts. Note how the difference

between the acceleration sample marked in *red* and the one marked in *green* resulted in a differential measurement represented with *orange* bar being above the Wake-Up Function Threshold (WUFTH). At this point, the Wake-up Function Counter (WUFC) begins to count number of counts stored in WUFC register and the wake-up algorithm will evaluate the difference between each new acceleration measurement and the measurement marked in *green* that will remain a reference measurement for the duration of the counter count. At the end of the count, assuming all differential measurements were larger than Wake-Up Function Threshold (WUFTH), as is the case in the example showed in Figure 13, a motion event will be reported.

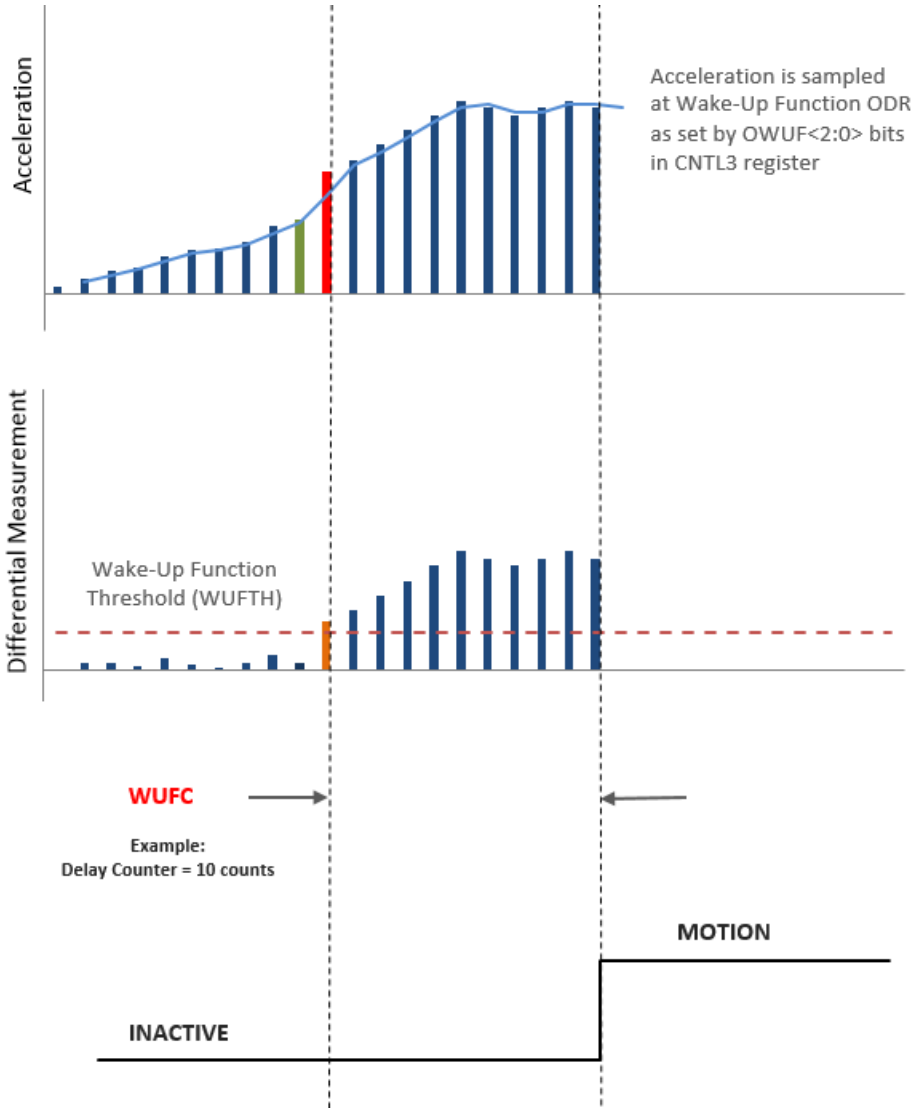

Figure 13: Latched Motion Interrupt Response with WUFC

Back-to-Sleep function

While the part is in active state, the algorithm evaluates differential measurement between each new acceleration data point with the preceding one and evaluates it against the Back-to-Sleep Threshold (BTSTH). When the differential measurement is less than BTSTH threshold, the Back-to-Sleep Counter (BTSC) starts the count. Differential measurements are now calculated based on the difference between the current acceleration and the acceleration when the counter started. The part will report that motion has not occurred at the end of the count assuming each differential measurement has remained below the threshold. If at any moment during the count the differential measurement goes above the threshold, the counter will stop the count and the part will remain in active state.

Figure 14 shows the latched response of the motion detection algorithm with Back-to-Sleep Counter (BTSC) set to 10 counts. Note how the difference between the acceleration sample marked in *red* and the one marked in *green* resulted in a differential measurement represented with *orange* bar being below the Back-to-Sleep Threshold (BTSTH). At this point, the counter begins to count number of counts stored in BTSC register and the back-to-sleep algorithm will evaluate the difference between each new acceleration measurement and the measurement marked in *green* that will remain a reference measurement for the duration of the counter count. At the end of the count, assuming all differential measurements were below Back-to-Sleep Threshold (BTSTH), as is the case in the example showed in Figure 14, an inactive mode will be reported.

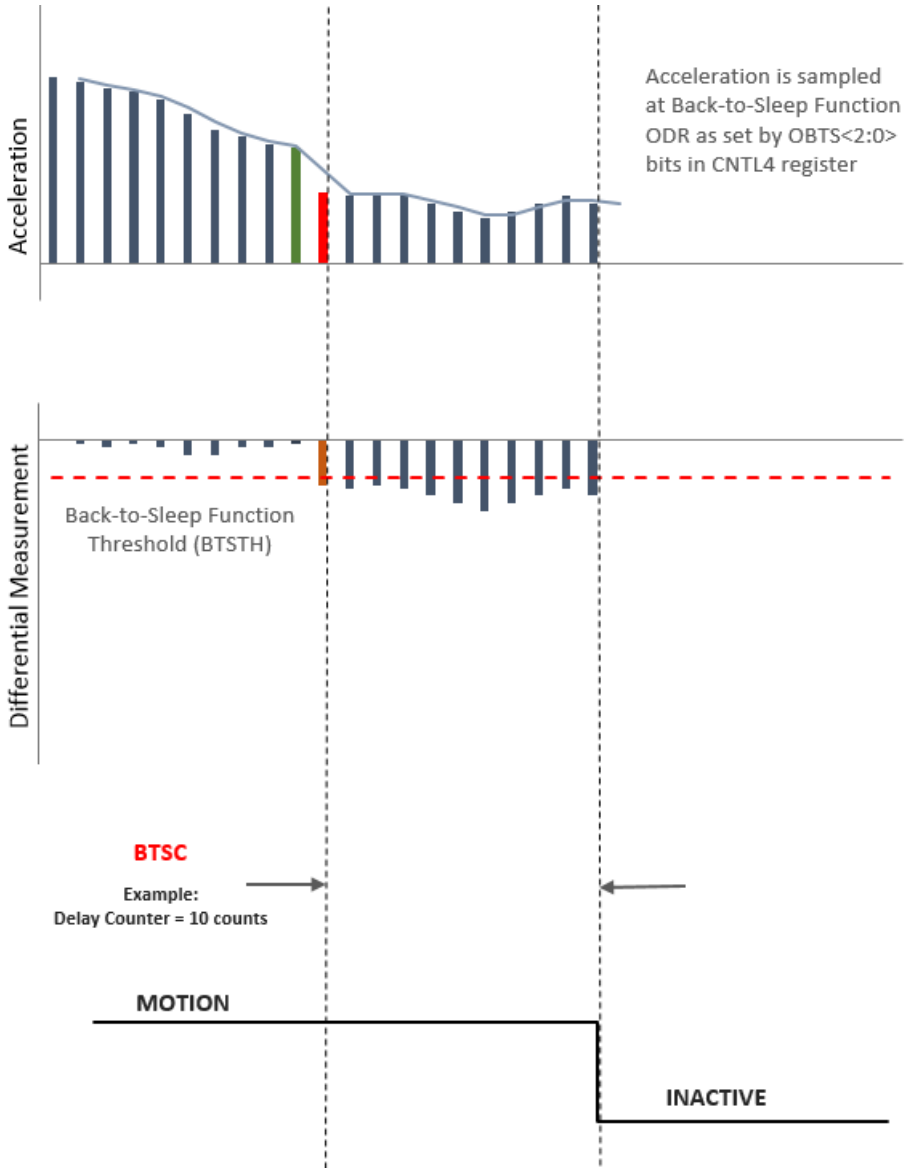

Figure 14: Latched Motion Interrupt Response with BTSC

Directional-Tap Detection Feature Description

The Directional-Tap™ Detection feature of the KX127 recognizes single and double tap inputs and reports the acceleration axis and direction that each tap occurred. Eight performance parameters, as well as a user-selectable ODR are used to configure the KX127 for a desired tap detection response.

Performance Index

The Directional-Tap™ detection algorithm uses low and high thresholds to help determine when a tap event has occurred. A tap event is detected when the previously described jerk summation exceeds the low *threshold (TTL) for more than the tap detection low limit, but less than the tap detection high limit as contained* in FTD. Samples that exceed the high limit (TTH) will be ignored. Figure 15 shows an example of a single tap event meeting the performance index criteria.

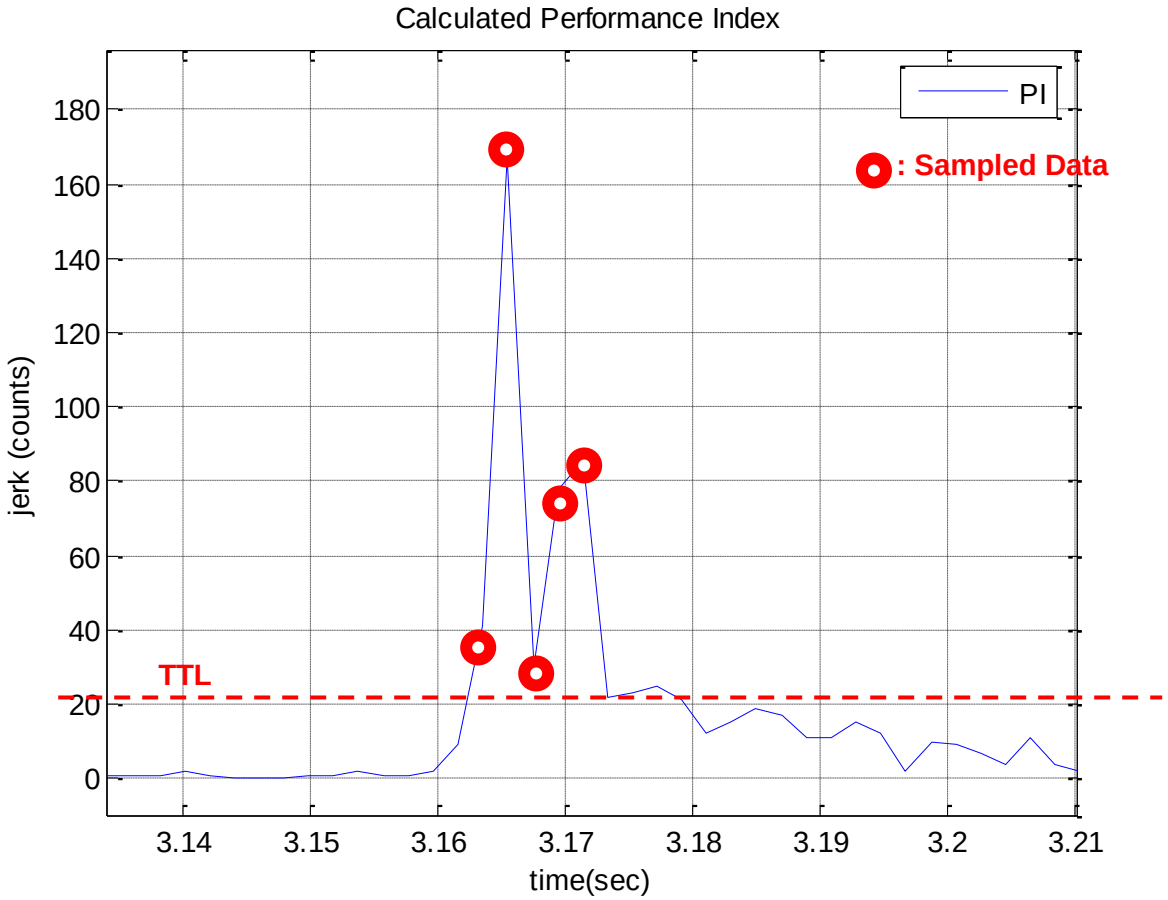

Figure 15: Jerk Summation vs Threshold

Single Tap Detection

The latency timer (TLT) sets the time period that a tap event will only be characterized as a single tap. A second tap has to occur outside of the latency timer. If a second tap occurs inside the latency time, it will be ignored as it occurred too quickly. The single tap will be reported at the end of the TWS. Figure 16 shows a single tap event meeting the PI, latency and window requirements.

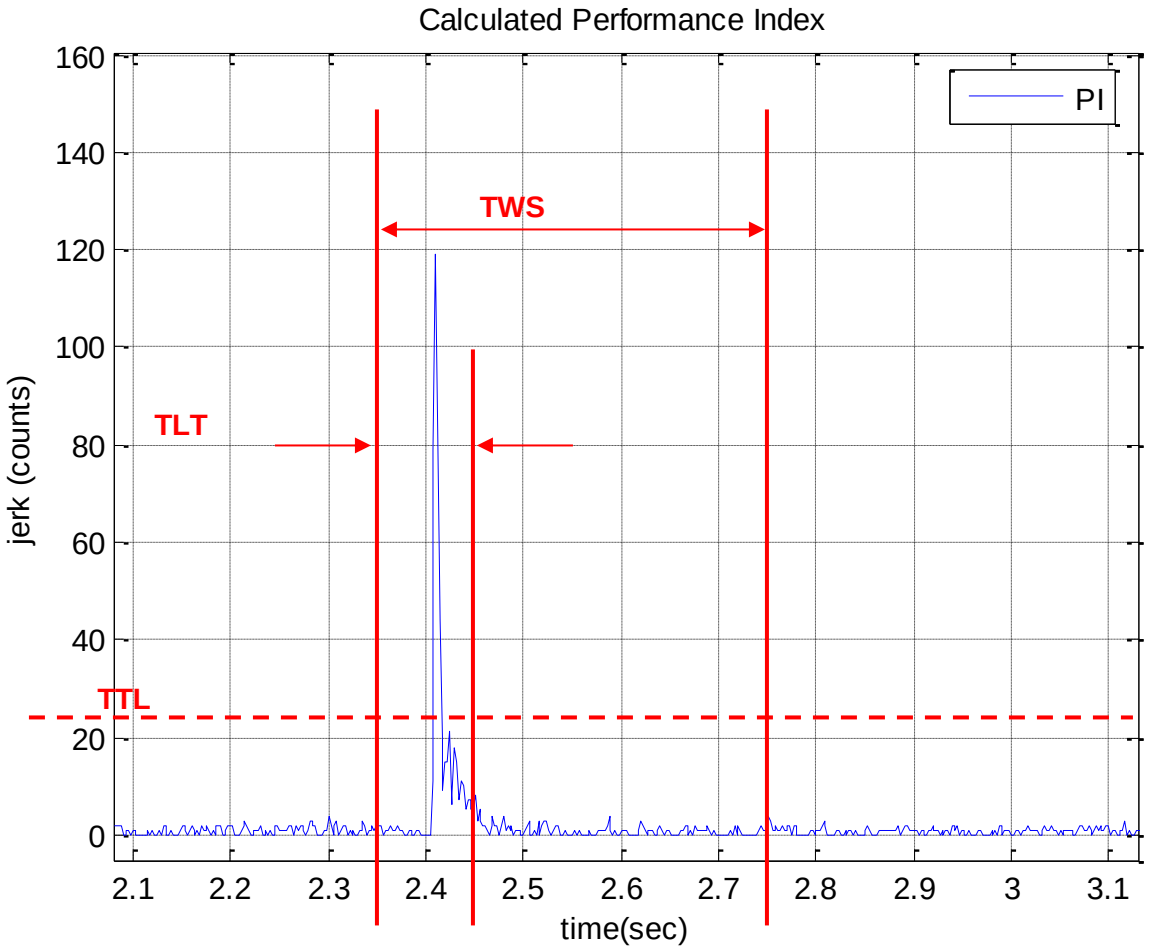

Figure 16: Single Directional-Tap™ Timing

Double-Tap Detection

An event can be characterized as a double tap if the second tap crosses the performance index (TTL) inside the TWS period and ends outside the TDTC. This means that the TDTC determines the minimum time separation that must exist between the two taps of a double tap event. Similar to the single tap, the first tap event must exceed the performance index for the time limit contained in FTD. Also, the duration when the first and second events combined exceed the performance index should not exceed STD. The double tap will be reported at the end of the second TLT. Figure 17 shows a double tap event meeting the PI, latency and window requirements.

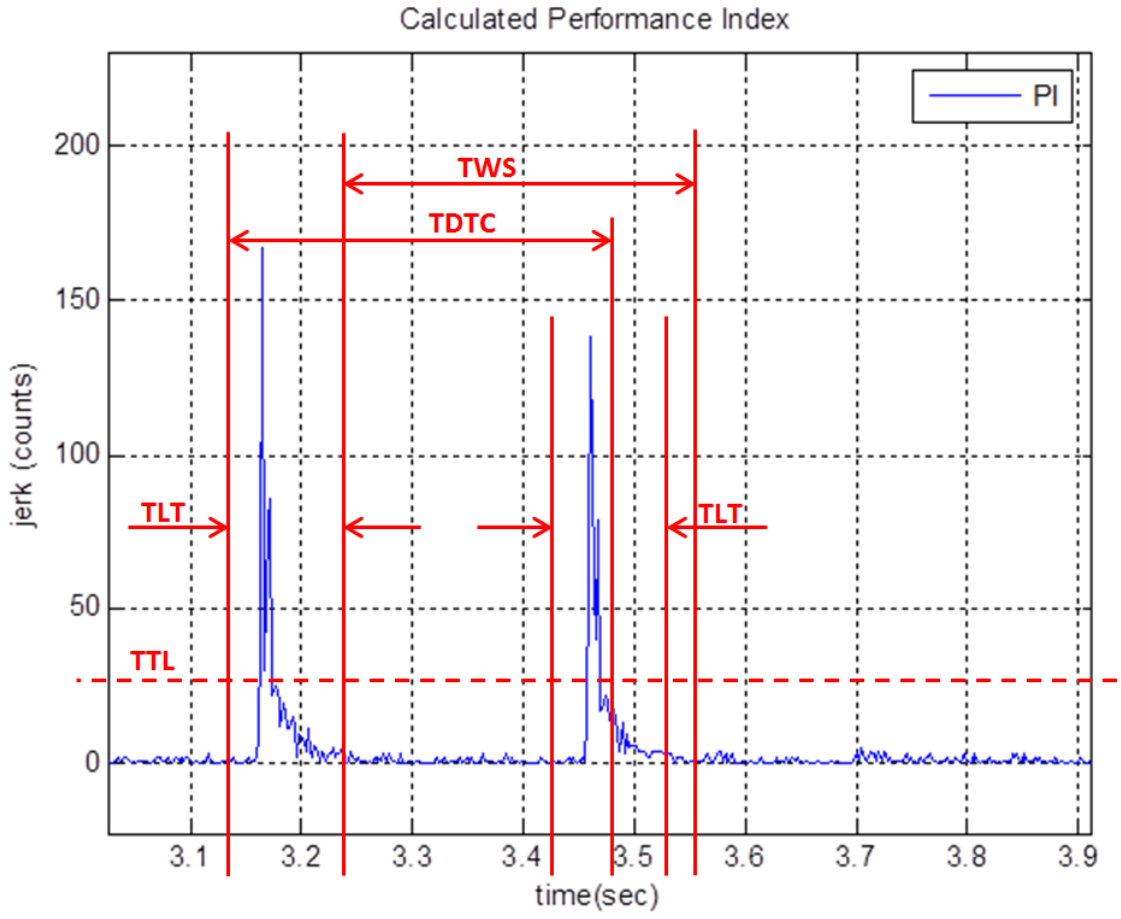

Figure 17: Double-Tap™ Timing

Free fall Detect

The KX127 features a Free fall interrupt that sends a flag through the INT1 or the INT2 output pins when the accelerometer senses a Free fall event. The interrupt event is also reflected on the INT (bit 4) of the STAT and FFS (bit 7) of the INS2 registers. A Free fall event is evident when all three accelerometer axes simultaneously fall below a certain acceleration threshold for a set amount of time. The KX127 gives the user the option to define the acceleration threshold value through the FFTH 8-bit register where 256 counts cover the g range of the accelerometer. This value is compared to the top 8 bits of the accelerometer 8g output value (independent of the actual g-range setting of the device). Equation 7 shows how to calculate the FFTH register value for a desired Free fall threshold. The threshold of 0.5g is a good starting point.

FFTH (counts) = Free fall Threshold (g) x 16 (counts/g)

Equation 7: Free fall Threshold

Through the Free Fall Counter (FFC), the user can set the amount of time all three accelerometer axes must simultaneously remain below the FFTH acceleration threshold before the Free fall interrupt flag is sent through the INT1 or the INT2 output pins. This delay/debounce time is defined by the available 0 to 255 counts, which represent accelerometer samples taken at the Free fall ODR defined by OFFI<2:0> bits in the FFCNTL register. Every count is calculated as 1/ODR delay period. Equation 8 shows how to calculate the FFC register value for a desired Free fall delay. The delay of 0.32 sec is a good starting point.

FFC (counts) = Free fall delay (sec) x Free fall ODR (Hz)

Equation 8: Free fall Threshold

When the Free fall interrupt is enabled the part must not be in a physical state that would trigger the Free fall interrupt or the delay will not be correct for the present Free fall.

Typical Freefall Interrupt Example (nonLatching)

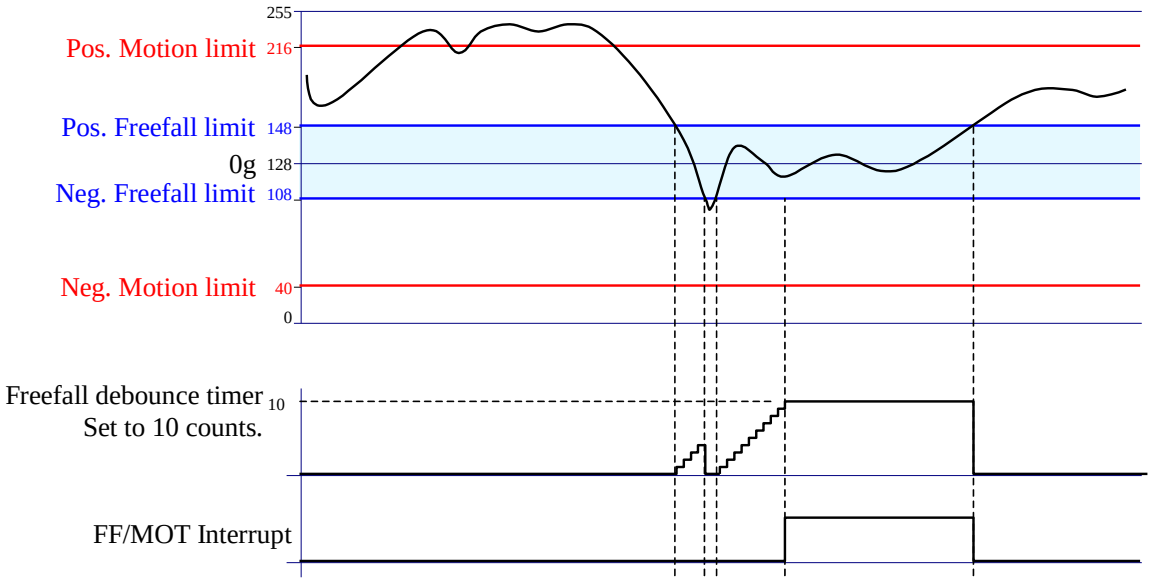

Figure 18: Typical Free fall Interrupt Example (FFCNTL ULMODE = 1)

Typical Freefall Interrupt Example (Latching)

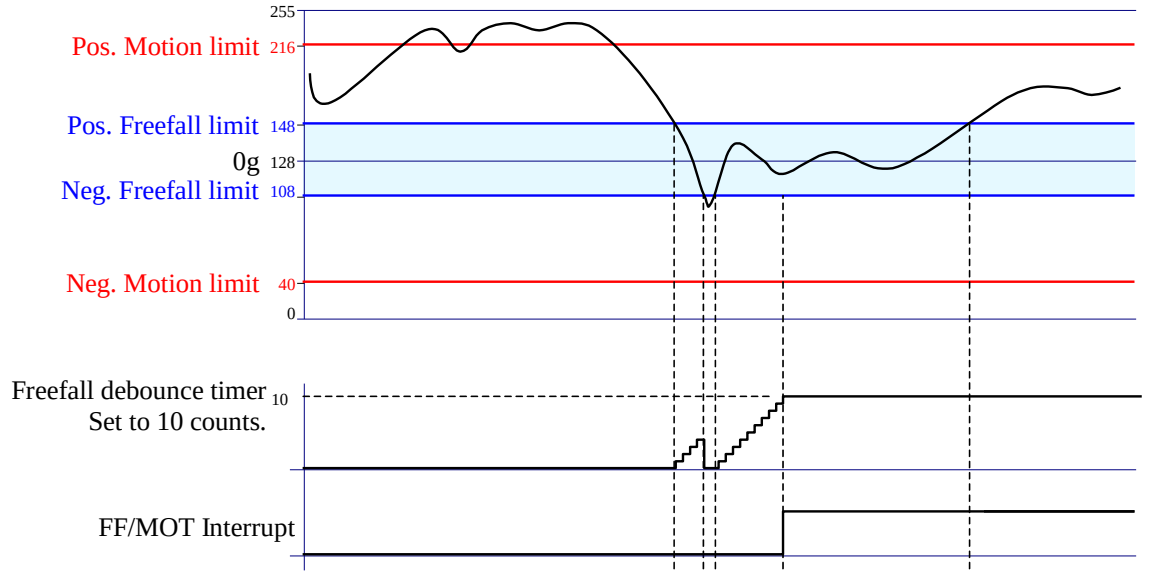

Figure 19: Typical Free fall Interrupt Example (FFCNTL ULMODE = 0)

Sample Buffer Feature Description

The sample buffer feature of the KX127 accumulates and outputs acceleration data based on how it is configured. There are 4 buffer modes available, and samples can be accumulated at either low (8-bit) or high (16-bit) resolution. Acceleration data is collected at the ODR specified by OSA[3:0] in the ODCNTL register. Each buffer mode accumulates data, reports data, and interacts with status indicators in a slightly different way.

FIFO Mode

Data Accumulation

Sample collection stops when the buffer is full.

Data Reporting

Data is reported with the oldest byte of the oldest sample first (X_L or X based on resolution).

Status Indicators

A watermark interrupt occurs when the number of samples in the buffer reaches the Sample Threshold. The watermark interrupt stays active until the buffer contains less than this number of samples. This can be accomplished through clearing the buffer or explicitly reading greater than SMPX samples (calculated with Equation 9).

BUF_RES=0:
SMPX = SMP_LEV[11:0] /3 – SMP_TH[9:0]

BUF_RES=1:
SMPX = SMP_LEV[11:0] /6 – SMP_TH[9:0]

Equation 9: Samples Above Sample Threshold

Stream Mode

Data Accumulation

Sample collection continues when the buffer is full; older data is discarded to make room for newer data.

Data Reporting

Data is reported with the oldest sample first (uses FIFO read pointer).

Status Indicators

A watermark interrupt occurs when the number of samples in the buffer reaches the Sample Threshold. The watermark interrupt stays active until the buffer contains less than this number of samples. This can be accomplished through clearing the buffer or explicitly reading greater than SMPX samples (calculated with Equation 9).

Trigger Mode

Data Accumulation

When a physical interrupt is caused by one of the digital engines or when a logic high signal occurs on the TRIG pin, the trigger event is asserted and SMP_TH[9:0] samples prior to the event are retained. Sample collection continues until the buffer is full.

Data Reporting

Data is reported with the oldest sample first (uses FIFO read pointer).

Status Indicators

When a physical interrupt occurs and there are at least SMP_TH[9:0] samples in the buffer, BUF_TRIG in BUF_STATUS_2 is asserted.

FILO Mode

Data Accumulation

Sample collection continues when the buffer is full; older data is discarded to make room for newer data.

Data Reporting

Data is reported with the newest byte of the newest sample first (Z_H or Z based on resolution).

Status Indicators

A watermark interrupt occurs when the number of samples in the buffer reaches the Sample Threshold. The watermark interrupt stays active until the buffer contains less than this number of samples. This can be accomplished through clearing the buffer or explicitly reading greater than SMPX samples (calculated with Equation 9).

Buffer Operation

The following diagrams illustrate the operation of the buffer conceptually. Actual physical implementation has been abstracted to offer a simplified explanation of how the different buffer modes operate. Figure 20 represents a high-resolution 3-axis sample within the buffer. Figure 21 – Figure 29 represent a 10-sample version of the buffer (for simplicity), with Sample Threshold set to 8.

Regardless of the selected mode, the buffer fills sequentially, one byte at a time. Figure 20 shows one 6-byte data sample. Note the location of the FILO read pointer versus that of the FIFO read pointer.

	Index	Byte	
	0	X_L	←-- FIFO read pointer
	1	X_H	
	2	Y_L	
	3	Y_H	
	4	Z_L	
	5	Z_H	←-- FILO read pointer
buffer write pointer --→	6		

Figure 20: One Buffer Sample

Regardless of the selected mode, the buffer fills sequentially, one sample at a time. Note in Figure 21 the location of the FILO read pointer versus that of the FIFO read pointer. The buffer write pointer shows where the next sample will be written to the buffer.

	Index	Sample	
	0	Data0	← FIFO read pointer
	1	Data1	
	2	Data2	← FILO read pointer
buffer write pointer →	3		
	4		
	5		
	6		
	7		← Sample Threshold
	8		
	9		

Figure 21: Buffer Filling

The buffer continues to fill sequentially until the Sample Threshold is reached. Note in Figure 22 the location of the FILO read pointer versus that of the FIFO read pointer.

	Index	Sample	
	0	Data0	← FIFO read pointer
	1	Data1	
	2	Data2	
	3	Data3	
	4	Data4	
	5	Data5	
	6	Data6	← FILO read pointer
buffer write pointer →	7		← Sample Threshold
	8		
	9		

Figure 22: Buffer Approaching Sample Threshold

In FIFO, Stream, and FILO modes, a watermark interrupt is issued when the number of samples in the buffer reaches the Sample Threshold. In trigger mode, this is the point where the oldest data in the buffer is discarded to make room for newer data.

	Index	Sample	
	0	Data0	← FIFO read pointer
	1	Data1	
	2	Data2	
	3	Data3	
	4	Data4	
	5	Data5	
	6	Data6	
	7	Data7	← Sample Threshold/FILO read pointer
buffer write pointer →	8		
	9		

Figure 23: Buffer at Sample Threshold

In trigger mode, data is accumulated in the buffer sequentially until the Sample Threshold is reached. Once the Sample Threshold is reached, the oldest samples are discarded when new samples are collected. Note in Figure 24 how Data0 was thrown out to make room for Data8.

	Index	Sample	
	0	Data1	← Trigger read pointer
	1	Data2	
	2	Data3	
	3	Data4	
	4	Data5	
	5	Data6	
	6	Data7	
Trigger write pointer →	7	Data8	← Sample Threshold
	8		
	9		

Figure 24: Additional Data Prior to Trigger Event

After a trigger event occurs, the buffer no longer discards the oldest samples, and instead begins accumulating samples sequentially until full. The buffer then stops collecting samples, as seen in Figure 25. This results in the buffer holding SMP_TH[9:0] samples prior to the trigger event, and SMPX samples after the trigger event.

Index	Sample	
0	Data1	← Trigger read pointer
1	Data2	
2	Data3	
3	Data4	
4	Data5	
5	Data6	
6	Data7	
7	Data8	← Sample Threshold
8	Data9	
9	Data10	

Figure 25: Additional Data after Trigger Event

In FIFO, Stream, FILO, and Trigger (after a trigger event has occurred) modes, the buffer continues filling sequentially after the Sample Threshold is reached. Sample accumulation after the buffer is full depends on the selected operation mode. FIFO and Trigger modes stop accumulating samples when the buffer is full, and Stream and FILO modes begin discarding the oldest data when new samples are accumulated.

Index	Sample	
0	Data0	← FIFO read pointer
1	Data1	
2	Data2	
3	Data3	
4	Data4	
5	Data5	
6	Data6	
7	Data7	← Sample Threshold
8	Data8	
9	Data9	← FILO read pointer

Figure 26: Buffer Full

After the buffer has been filled in FILO or Stream mode, the oldest samples are discarded when new samples are collected. Note in Figure 27 how Data0 was thrown out to make room for Data10.

Index	Sample	
0	Data1	← FIFO read pointer
1	Data2	
2	Data3	
3	Data4	
4	Data5	
5	Data6	
6	Data7	
7	Data8	← Sample Threshold
8	Data9	
9	Data10	← FILO read pointer

Figure 27: Buffer Full – Additional Sample Accumulation in Stream or FILO Mode

In FIFO, Stream, or Trigger mode, reading one sample from the buffer will remove the oldest sample and effectively shift the entire buffer contents up, as seen in Figure 28.

Index	Sample	
0	Data1	← FIFO read pointer
1	Data2	
2	Data3	
3	Data4	
4	Data5	
5	Data6	
6	Data7	
7	Data8	← Sample Threshold
8	Data9	← FILO read pointer
buffer write pointer → 9		

Figure 28: FIFO Read from Full Buffer

In FILO mode, reading one sample from the buffer will remove the newest sample and leave the older samples untouched, as seen in Figure 29**.**

Index	Sample	
0	Data0	← FIFO read pointer
1	Data1	
2	Data2	
3	Data3	
4	Data4	
5	Data5	
6	Data6	
7	Data7	← Sample Threshold
8	Data8	← FILO read pointer
buffer write pointer → 9		

Figure 29: FILO Read from Full Buffer

Appendix

The following Notice is included to guide the use of Kionix products in its application and manufacturing processes. Kionix, Inc., is a ROHM Group company. For purposes of this Notice, the name “ROHM” would also imply Kionix, Inc.

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment (Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASSⅢ	CLASSⅢ	CLASSⅡb	CLASSⅢ
CLASSⅣ		CLASSⅢ	

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
   [a] Installation of protection circuits or other protective devices to improve system safety
   [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
   [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
   [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
   [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl_2, H_2S, NH_3, SO_2, and NO_2
   [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
   [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
   [f] Sealing or coating our Products with resin or other coating materials
   [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
   [h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of Ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
   [b] the temperature or humidity exceeds those recommended by ROHM
   [c] the Products are exposed to direct sunshine or condensation
   [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.
