

PFC Direct current resonance type White LED Driver for Large LCD

BD92111F

General Description

BD92111F is a current resonance type LED Driver with frequency-controlled LED current. It can connect to PFC directly and can use half-bridge structure reducing the number of external components. It incorporates some protection functions against fault conditions such as Over-Voltage Protection and LED Open Detection (IS Low Detection).

Features

- 20V High Rating Process
- 1 Channel Push-pull Control
- Current and Voltage Feedback by Driving Frequency
- Adjustable Soft Start
- Adjustable Timer Latch
- Under-Voltage Detection for IC's Power Line
- Output Over-Voltage Protection
- Output Error Signal from FAIL Terminal
- Shift to Save Mode by STB Terminal
- Burst Control by External PWM Signal

Applications

- TV, Computer Display, LCD Backlighting.

Key Specifications

- Operating Power Supply Voltage Range: 8.0V to 18.0V
- Minimum Oscillator Frequency: 65.8kHz
($R_{RT}=22k\Omega, R_{ADJ}=36k\Omega, V_{FB}=3.2V$)
- Operating Current: 2.3mA (Typ)
- Operating Temperature Range: -40°C to +85°C

Package

SOP18

W(Typ) x D(Typ) x H(Max)
 11.20mm x 7.80mm x 2.01mm
 Pin pitch 1.27mm

Absolute Maximum Ratings (Ta = 25°C)

Parameter	Symbol	Rating	Unit
Supply Voltage	V _{CC}	20	V
STB, N2, N1 Terminal Voltage	V _{STB} , V _{N2} , V _{N1}	20	V
RT, FB, IS, VS, PWMCOMP, CP, PWMIN, SS, FAIL, COMP, SDON, COMPSD Terminal Voltage	V _{RT} , V _{FB} , V _{IS} , V _{VS} , V _{PWMCOMP} , V _{CP} , V _{PWMIN} , V _{ADIM} , V _{SS} , V _{FAIL} , V _{COMP} , V _{SDON} , V _{COMPSD}	5.5	V
Power Dissipation	Pd	0.69 (Note 1)	W
Operating Temperature Range	T _{opr}	-40 to +85	°C
Junction Temperature	T _{jmax}	150	°C
Storage Temperature Range	T _{stg}	-55 to +150	°C

(Note 1) Derating is done 5.5 mW/°C for operating above Ta≥25°C (Mount on 1-layer 70.0mm x 70.0mm x 1.6mm board)

Caution: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

Recommended Operating Conditions (Ta= -40°C to +85°C)

Parameter	Symbol	Range	Unit
Power Supply Voltage	V _{CC}	8.0 to 18.0	V
PWMIN Input Frequency Range	f _{PWMIN}	60 to 500	Hz
Oscillation Frequency	f _{OUT}	30 to 200	kHz

External Components Recommended Range (Ta= -40°C to +85°C)

Parameter	Symbol	Range	Unit
RT Connection Resistance	R _{RT}	24 to 160	kΩ
Set up Resistance for operation frequency range	R _{ADJ}	51 ~ OPEN	kΩ
CP Connection Capacitance	C _{CP}	0.01 to 2.2 (Note 2)	μF
SS Connection Capacitance	C _{SS}	0.01 to 0.1 (Note 2)	μF
SDON Connection Capacitance	C _{SDON}	0.01 to 2.2 (Note 2)	μF

(Note 2) Please set connection capacitance above Min value of Recommended Range according to temperature characteristic and DC bias characteristic.

Pin Description

Pin No.	Pin Name	IN/OUT	Function	Rating [V]
1	VCC	IN	Power Supply Pin for IC (Built-In UVLO Function)	-0.3 to +20
2	STB	IN	Power ON/OFF Control Pin for IC Power OFF when STB=L and Power ON when STB=H.	-0.3 to +20
3	GND	IN	Ground Pin for Internal Signal in IC	-
4	RT	OUT	Drive Frequency Setting Pin Basic Frequency is set by the resistor between RT and GND and Drive Frequency Modulation Range is set by the resistor between RT and FB.	-0.3 to +5.5
5	FB	OUT	Error Amplifier Output pin for LED Current feedback and LED Voltage feedback	-0.3 to +5.5
6	IS	IN	Error Amplifier Input pin for LED Current feedback	-0.3 to +5.5
7	VS	IN	Error Amplifier Input pin for LED Open Voltage feedback	-0.3 to +5.5
8	PWMCMP	IN	PWM Comparator Input Pin which controls PWM operation during brightness adjustment. N1 and N2 output stop when PWMCMP=L, and they output Max Duty when PWMCMP=H	-0.3 to +5.5
9	CP	OUT	Timer Latch Setting Pin In abnormal case, 1 μ A (Typ) will be charged to the capacitor connected to CP, and IC becomes latch status after output operation stops at CP>2V(Typ)	-0.3 to +5.5
10	PWMIN	IN	PWM Signal Input Pin for burst brightness adjustment	-0.3 to +5.5
11	SDON	OUT	Enable COMPSD inputs over voltage detection When start up, 1 μ A(Typ) will be charged to connected capacitor. When SDON>2.0V(Typ), it will be possible to detect over voltage.	-0.3 to +5.5
12	SS	OUT	Soft Start timer and COMPSD timer Setting Pin During start-up, 2 μ A (Typ) will be charged to connected capacitor. At SS>2.0V(typ), COMPSD can start to detect. At SS>2.5V (typ), CP can accept charge operation.	-0.3 to +5.5
13	FAIL	OUT	Error Indication Signal Output Pin Normal : L, Error : Open	-0.3 to +5.5
14	COMPSD	IN	Quickly Over Voltage Detection Pin When detecting abnormality, output operation stops and IC becomes latch status after 2 clocks.	-0.3 to +5.5
15	COMP	IN	Detection pin for over voltage	-0.3 to +5.5
16	PGND	IN	Power Ground for external MOSFET drive	-
17	N2	OUT	Output pin for external FET drive circuit (Channel N2)	-0.3 to +20
18	N1	OUT	Output pin for external FET drive circuit (Channel N1)	-0.3 to +20

Typical Performance Curves

Figure 7. Operating Current vs Power Supply Voltage

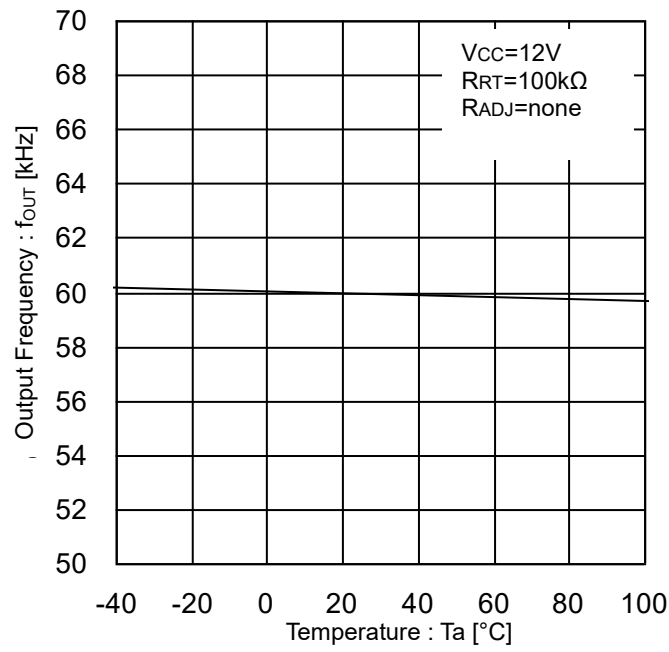

Figure 8. Output Frequency vs Temperature

Figure 9. MAX DUTY vs Temperature

Figure 10. CP time setting current vs Temperature

Pin Function Description

PIN.1 VCC

This is power supply pin for the IC. Normal operation range (Typ) is from 9V to 18V. Please place ceramic capacitor bigger than 0.1μF as bypass capacitor between VCC and GND. It is for noise elimination.

PIN.2 STB

This PIN is for setting of ON/OFF. It is possible to use as reset when shutting down.

Please set the STB terminal voltage below VCC voltage. In addition, please set below 4V if the voltage is applied earlier than VCC.

Depending on input voltage to STB pin, the status of IC might be switched (ON/OFF). Please avoid using between the two status (0.8V to 2.0V)

PIN.3 GND

This is signal system GND for IC inside. Please make it independent from PGND as much as possible (We recommend this because it has less influence with switching noise which comes from short circuit of PGND and GND at connector close to GND pin.

Figure. 11

PIN.4 RT

Set up the charge/discharge current by frequency of IC inside.

By changing the resistance value of resistor between RT pin and GND, it is possible to set up basic drive frequency as following formula;

Basic frequency means output N1, N2 frequency which is determined only with resistor between RT pin and GND.

$$f_{OUT} = \frac{1.217 - (3.32 \times 10^{-5} \times R_{RT}[k\Omega])}{(2.4948 \times 10^{-4}) + (2.5371 \times 10^{-4} \times R_{RT}[k\Omega])} [kHz]$$

Figure. 12 RT Resistance vs Output Frequency

There is a discrepancy between theoretical formula and actual device. For frequency setting, please thoroughly verify it with actual application. In addition, frequency may change upon resistor RADJ which is placed between RT and FB pins

Figure. 13 R_{RT} Resistor connection method

PIN.5 FB

This is output pin for LED current feedback (IS pin) error amplifier and open LED voltage feedback (VS pin) error amplifier. The capacitance between FB and IS (1500pF to 0.01μF) also determines start up time of LED current necessary during phase compensation and brightness adjustment. Capacitance between FB and VS (1500pF to 0.01μF) is for phase compensation of error amplifier.

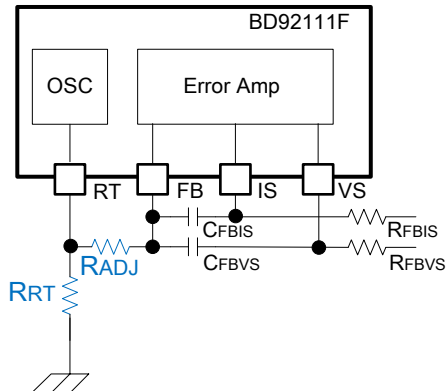

Figure. 14 RRT and RADJ Resistor connection method

Figure. 15 Modulation width of Output Frequency vs R_{ADJ} Resistance

As shown by left graph, by changing resistor R_{ADJ} between FB and RT, it is possible to determine the modulation width of frequency.

Modulation width of frequency determined by the resistor between FB and RT resistor (Theoretical formula : Example)

When $R_{ADJ}=100\text{k}\Omega$, $\Delta f_{OUT}=84.46\text{kHz}$

Figure. 16 Output Frequency vs FB Voltage

Modulation width of frequency determined by the resistor between FB and RT resistor (Theoretical formula : Example)

When $R_{ADJ}=100\text{k}\Omega$, $\Delta f_{OUT}=84.46\text{kHz}$

The basic drive frequency is determined by resistor R_{RT} which is connected from RT pin to GND. The basic frequency is the one at $V_{FB}=1.5\text{V}$, and operation frequency range will be fixed with frequency modulation width that is determined by R_{ADJ} under this condition.

PIN.6 IS

This is input pin of LED current feedback (IS pin) error amplifier. Please set up as normal voltage 1.25V. When IS pin voltage becomes less than 0.625V(Typ), the output will be stopped and latched.

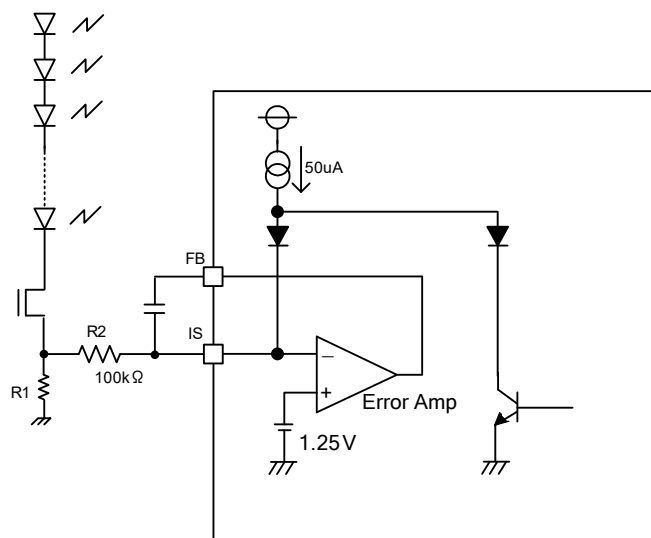

Figure. 17 IS Block Diagram

50µA (Typ) current flows from IS pin to external resistor during OFF period of burst brightness adjustment.

Considering Min value of IS source current during burst brightness adjustment, please set that total resistance from IS Pin to GND is more than 32kΩ. When R₂ is 100kΩ in above diagram, please set R₁ + R₂ > 32KΩ.

PIN.7 VS

This is input pin of Open LED voltage feedback (VS pin) error amplifier. It has to be 1.25V during LED is open. When LED is ON, it will be 0.5V to 1.0V. When VS pin becomes over 1.25V, protection circuit will start operation, and if it becomes more than CP timer set up time (Timer Latch), it will shut down.

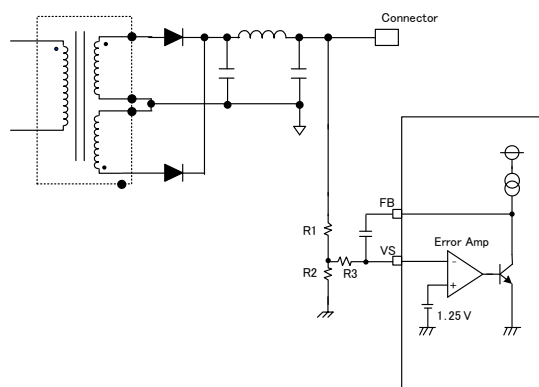

Figure. 18 VS Block Diagram

Please set C₁, C₂, R₁, R₂, and R₃ value to input 1.25V to VS pin during LED bar's connector disconnects.

PIN.8 PWMCOMP

PWMCOMP pin voltage is fixed by DUTY of drive output N1, N2 in comparison with a saw wave of IC inside. This pin has 100µA sink/source current capability and when external capacitor is connected between PWMCOMP and GND, IC will operate PWM at brightness start up stage. When N1 and N2 only drive at MaxDuty, please set PWMCOMP=open.

PIN.9 CP

This pin sets up the time from the point of abnormal detection till shut down (Timer Latch). Having 1μA constant current charges at external capacitor connected to CP pin, it will shut down when it becomes over 2.0V. During soft start, there is no charge to CP external capacitor even fulfilling CP pin charge condition (timer latch). External capacitor is set around 0.01μF to 2.2μF).

$$T_{CP} = C_{CP} \times \frac{V_{CP}}{I_{CP}} = \frac{C_{CP} \times 2.0}{1.0 \times 10^{-6}} = 2.0 \times 10^6 \times C_{CP} \quad [\text{sec}]$$

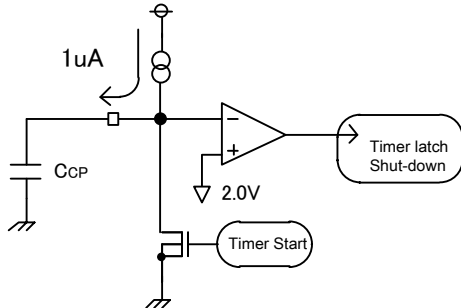

Figure. 19 CP Block Diagram

Figure. 20 Timer Latch Time vs CP Capacitance

PIN.10 PWMIN

By inputting PWM pulse signal at PWMIN pin, it is possible to adjust burst brightness. (High level: over 2.0V, Low level: below 0.8V).

condition	LED condition
PWMIN : 2.0V to 5.0V	Turn On
PWMIN : -0.3V to 0.8V	Turn Off

PIN.11 SDON

This is for the set up of time till COMPSD starts operation when start up. After STB starts to become ON, there will be 1μA constant current charging at external capacitor that is connected to SDON pin. Then if it becomes over 2.0V, it is possible to detect COMPSD. When it is below 2.0V, immediately latch protection current will no operate. External capacitor is around 0.01μF to 2.2μF.

Figure. 21 IS SDON block diagram

$$T_{SDON} = C_{SDON} \times \frac{V_{SDON}}{I_{SDON}} = \frac{C_{SDON} \times 2.0}{1.0 \times 10^{-6}} = 2.0 \times 10^6 \times C_{SDON} \quad [\text{sec}]$$

PIN.12 SS

This is soft start time and SDON time set up pin. Constant current 2.0μA(Typ) is charged to external capacitor (0.01μF to 0.1μF). When soft start is under operation (SS pin voltage is less than 3.0V), timer latch protection circuit by CP charge will not operate.

Where:
C_{SS} is the capacitance of SS pin

Figure. 22 SS Block Diagram

$$T_{SS\text{END}} = C_{SS} \times \frac{V_{SS\text{END}}}{I_{SS}} = \frac{C_{SS} \times 3.0}{2.0 \times 10^{-6}} = 1.5 \times 10^6 \times C_{SS} \quad [\text{sec}]$$

PIN.13 FAIL

This is fail signal output pin of IC. At normal situation, it outputs GND Level and it becomes Open after timer latch in case any abnormality is detected. The pull up voltage during Open must be set less than rated voltage 5.5V of FAIL pin. Please connect about 0.1μF capacitor for noise reduction to FAIL pin.

Condition	FAIL Output
Normal operation	GND Level
Abnormal operation	Open

Figure. 23 FAIL Block Diagram

PIN.14 COMPSD

This is input pin for shut down detection comparator. When SDON pin voltage is over 2.0V(Typ) and COMPSD is 4.0V(Typ), it will latch after the next clock.

PIN.15 COMP

This is input pin for over voltage protection comparator. The detection voltage of comparator is 4.0V(Typ) and will start charging to CP pin after over voltage detection. After CP is charged, it will shut down by timer latch.

PIN.16 PGND

This is Power GND pin for output pin N1, N2 at driver part. Please make it independent from GND (Pin 3) pin on inverter PCB. This pin is not connected to GND pin in IC inside.

PIN.17 N2

This is gate drive output pin for Low Side external Nch FET. Normally please connect it to FET gate through about 10Ω resistor. It is for noise reduction. Gate has to be pull-down to source by resistor of 1kΩ to 10kΩ.

PIN.18 N1

This is gate drive output pin for Low Side external Nch FET. Normally please connect it to FET gate through about 10Ω resistor. It is for noise reduction. Gate has to be pull-down to source by resistor of 1kΩ to 10kΩ.

Detection Condition List of the Protection Functions (Typ Condition)

Protect Function	Detection Pin	Detect Condition		Release Condition	Timer Operation	Protection Type
		Detection Condition	SS,SDON			
LED OPEN	IS	IS < 0.625V	SDON>2.0V	IS > 0.625V	2CLK	Latch off
OVP	VS	VS > 1.25V	SS>3.0V	VS < 1.25V	CP	Latch off
COMP	COMP	COMP > 4.0V	SS>3.0V	COMP < 3.8V	CP	Latch off
VCC UVLO	VCC	VCC < 6.0V	-	VCC > 6.5V	-	Restart by release
COMPSD	COMPSD	COMPSD > 4.0V	SDON>2.0V	COMPSD < 3.8V	2CLK	Latch off

To reset the latch type protection, please set STB logic to 'L' once. Otherwise the detection of VCCUVLO is required. The count number in the list is calculated with double of output frequency.

Behavior List of the Protect Function

Protect Function	Operation of the Protect Function		
	N1,N2 Output	SS pin	FAIL pin
LED OPEN	Stop after latch	Low after latch	High after latch
OVP	Stop after latch	Low after latch	High after latch
COMP	Stop after latch	Low after latch	High after latch
VCC UVLO	Stop immediately	Low Immediately	High Immediately
COMPSD	Stop after latch	Low after latch	High after latch

Application Example

Introduce an application example with BD92111F

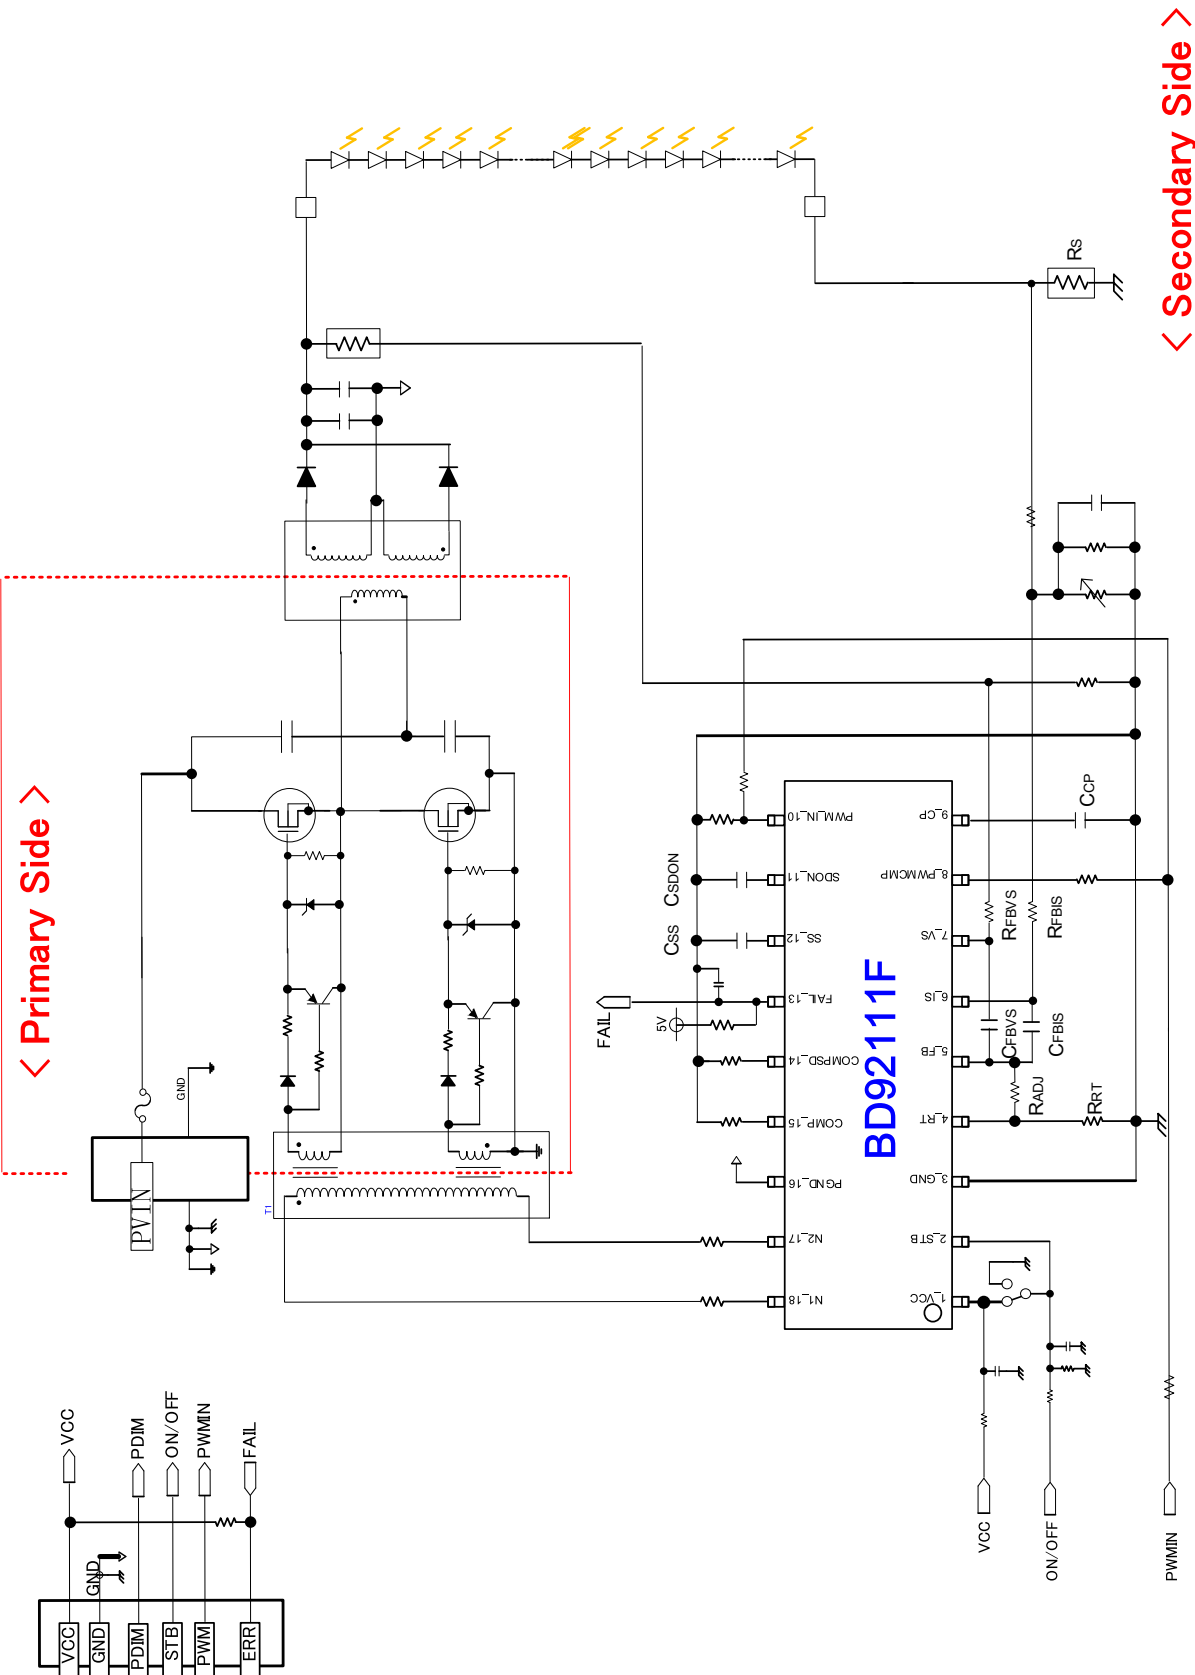

Figure. 24 Application Example

Timing Chart

When it Detects Quick Detection Type Error

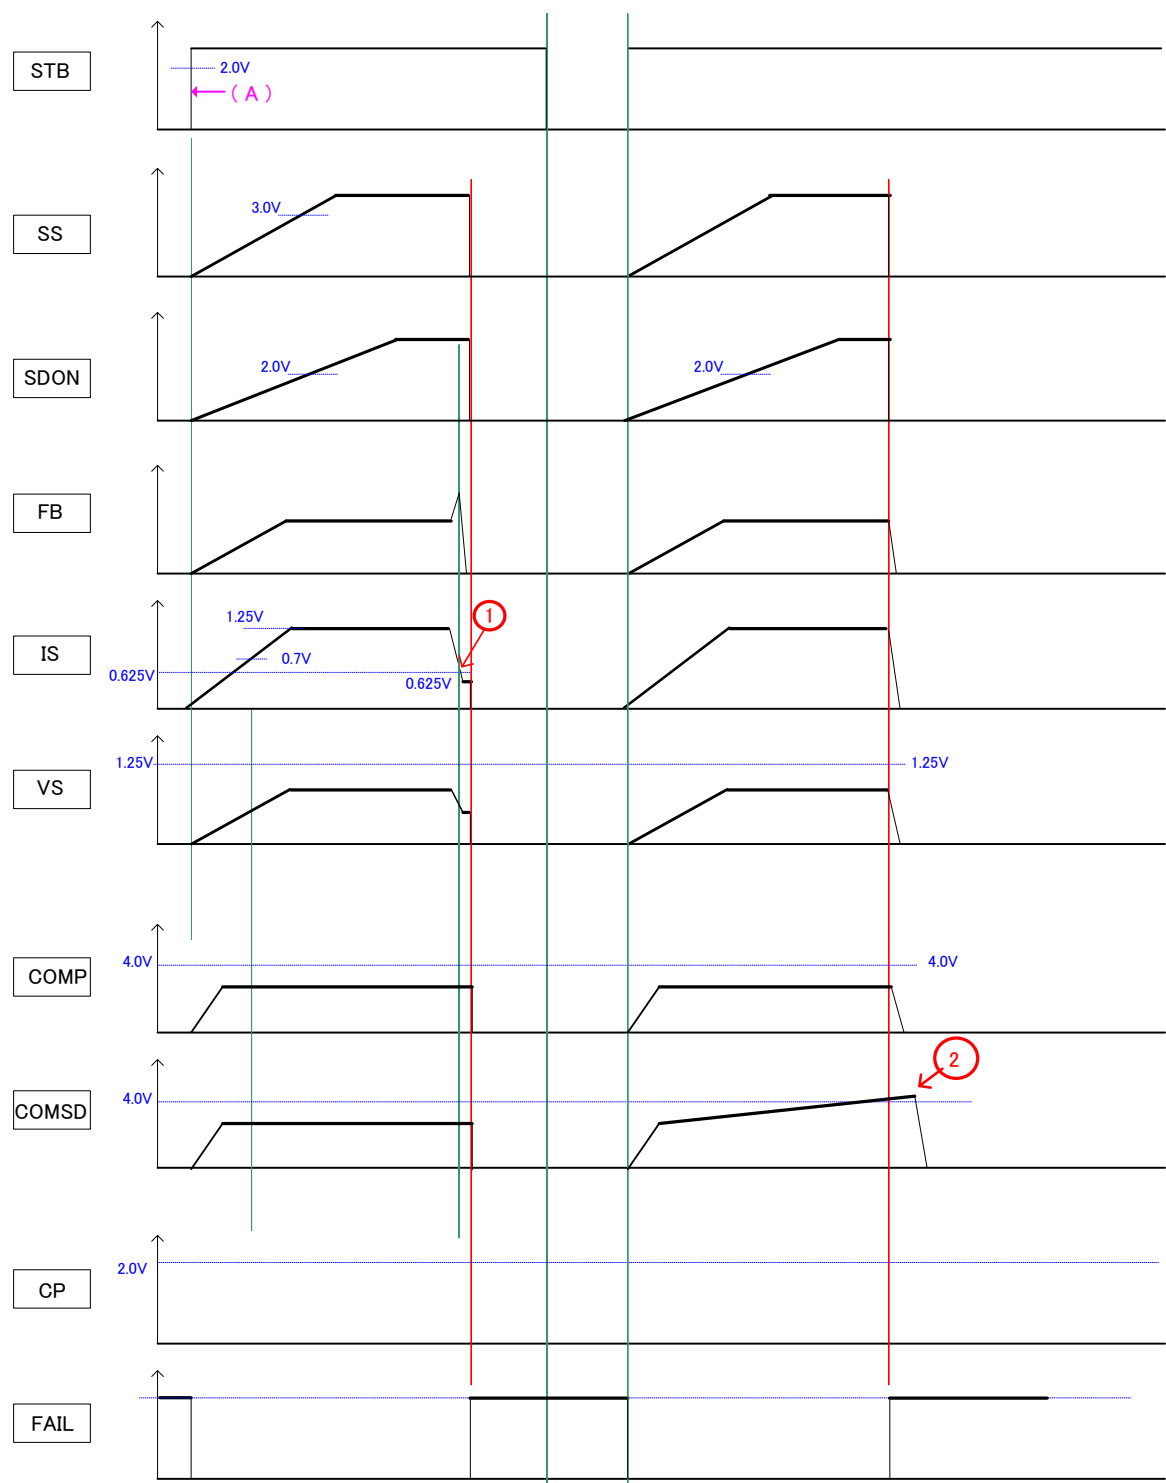

Figure. 25 Timing Chart 1

[The explanation of quick abnormal detection]
Due to the timing of ① to② in the above chart, the IC detects malfunction and starts the output-mute latch without CP Charge . For ① to②, the malfunction is detected according to the conditions in the table shown below.

No.	Content of Abnormal Detection	Condition of Abnormal Detection
①	Abnormal LED current detection	IS<0.625V
②	COMPSD Over Voltage detection	COMPSD≥ 4.0V

When it Detects Timer Latch Type Error

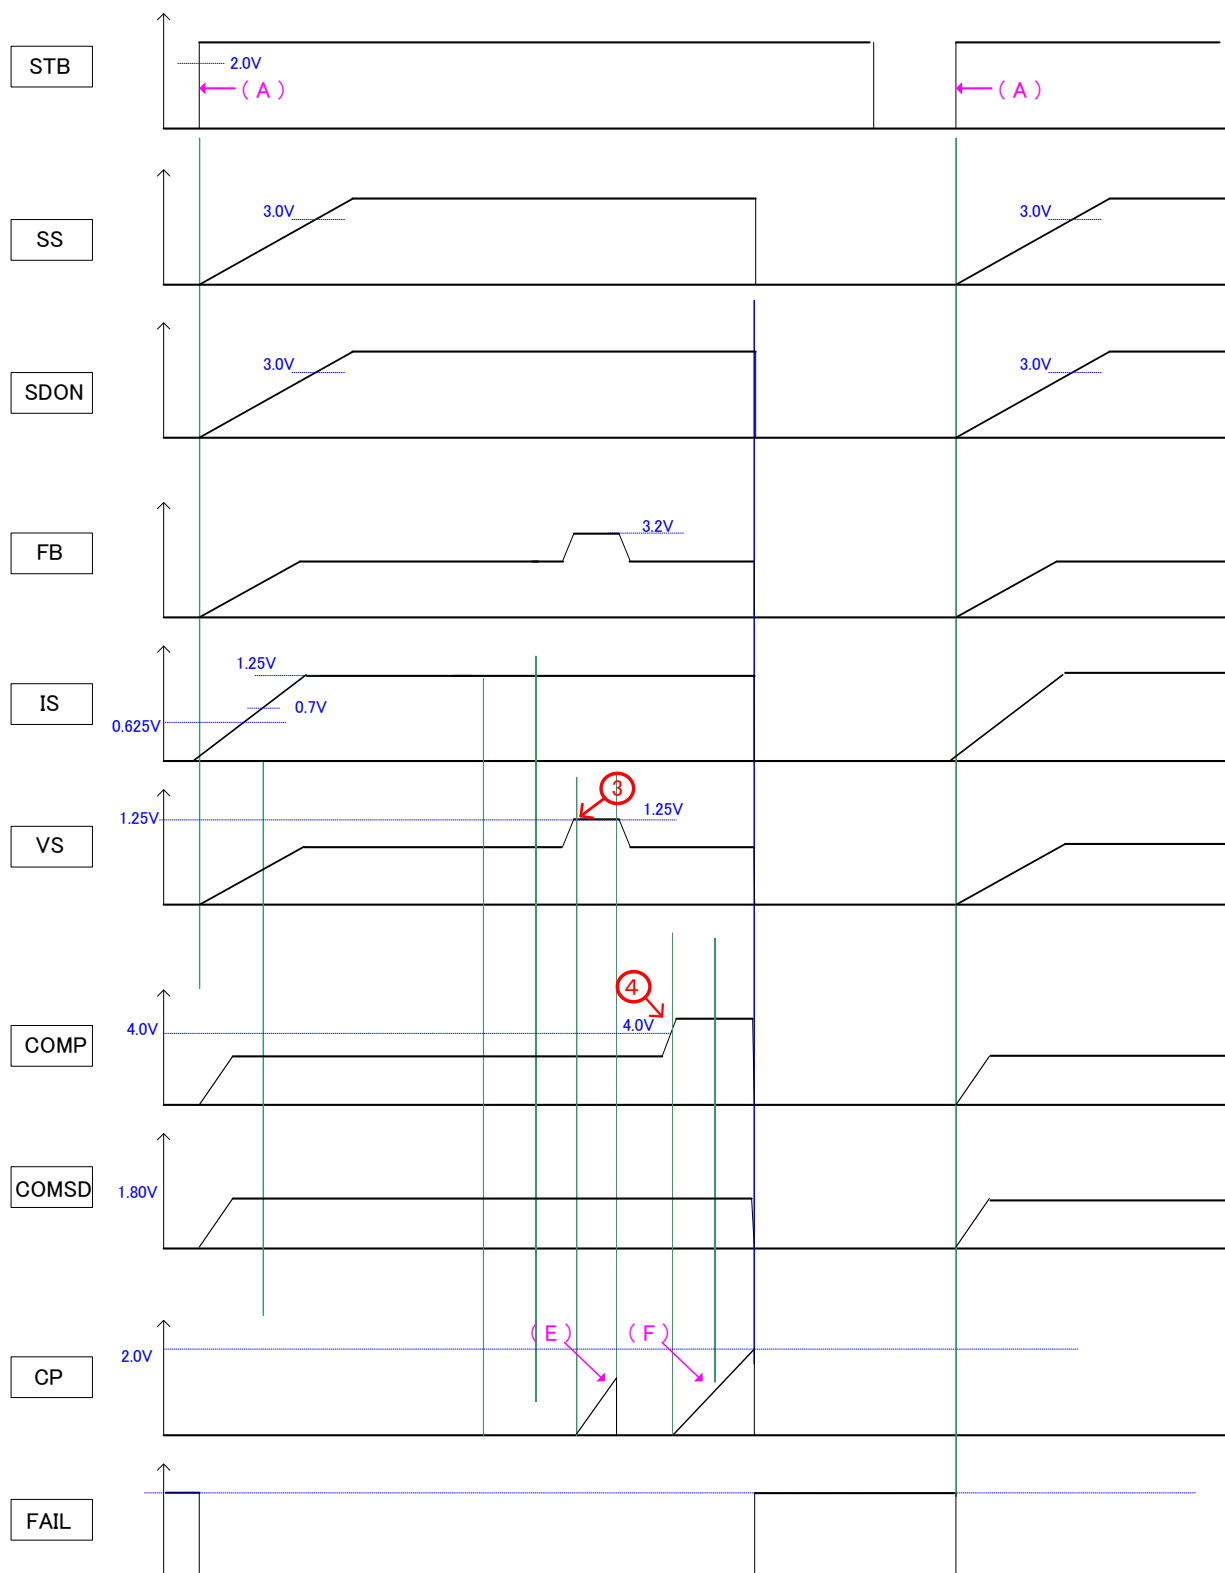

Figure. 26 Timing Chart 2

[The explanation of Time latch type error detection]

Due to the timing of ③ and ④ in the above chart, the IC detects abnormal and starts the timer latch charging. For ③ and ④, the abnormal is detected according to the conditions in the table shown below.

No.	Content of Abnormal Detection	Condition of Abnormal Detection
③	Abnormal LED voltage detection	VS ≥ 1.25V
④	Over voltage detection (multipurpose protection function)	COMP ≥ 4.0V (release at COMP < 3.8V)

Output Timing Chart

BD92111F outputs the signal that operates the Push-Pull or Half-Bridge which is made up of Nch FET. The output timing of drive signal is shown in the following chart

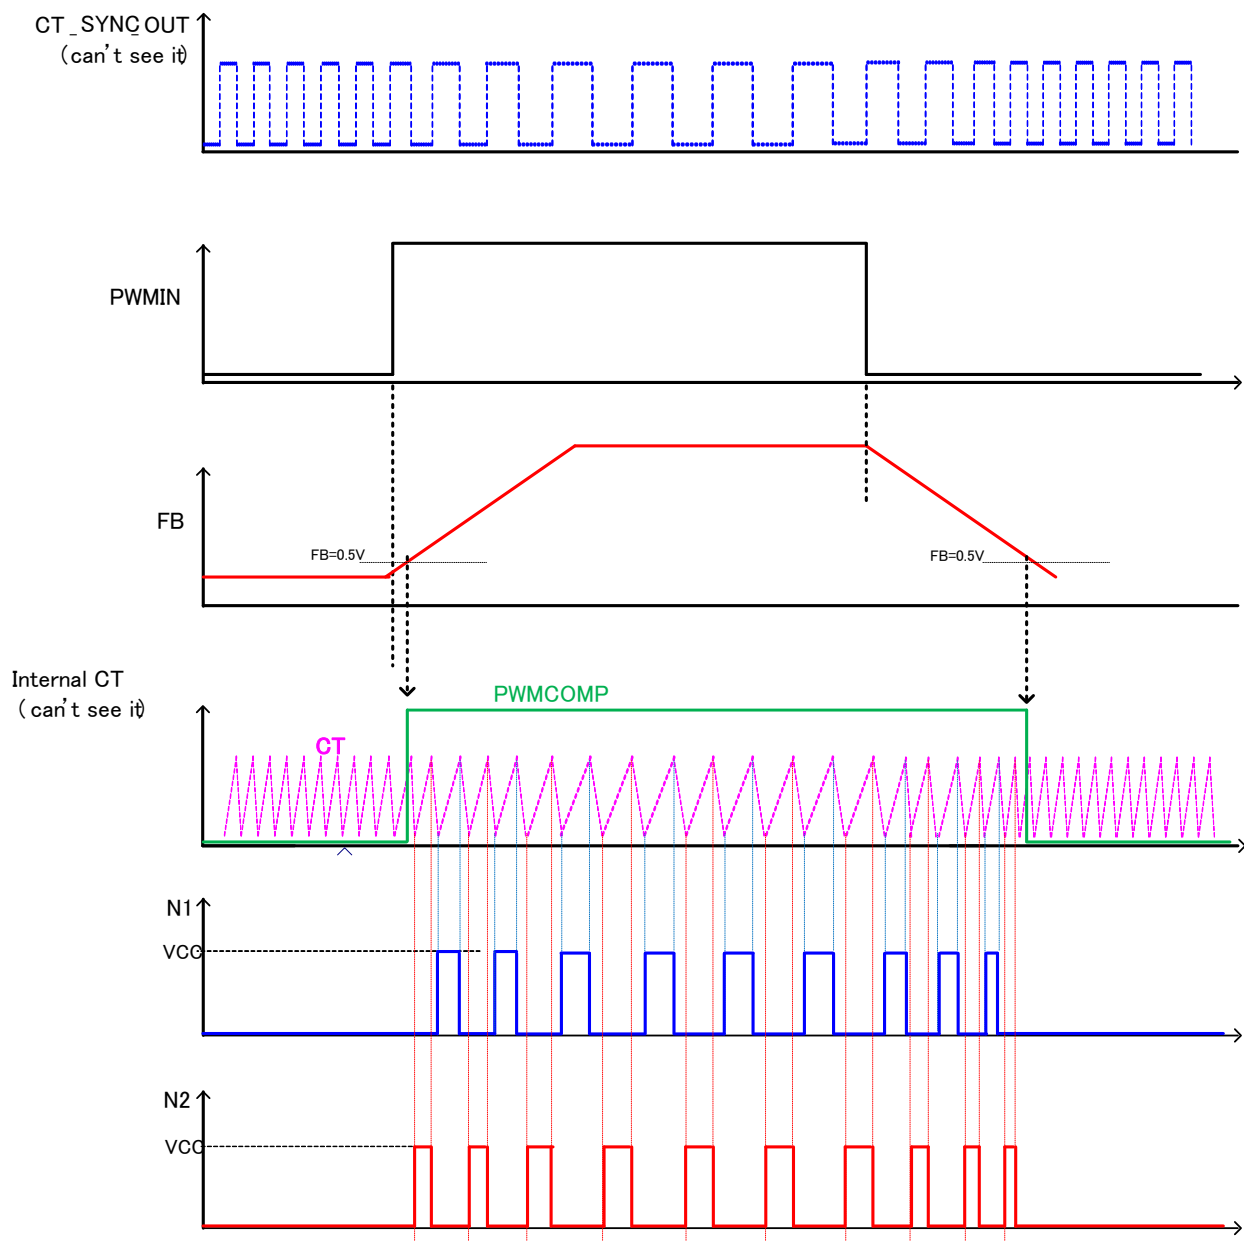

Figure. 27 Output Timing Chart

Operational Notes

1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Thermal Consideration

Should by any chance the power dissipation rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the Pd rating.

6. Recommended Operating Conditions

These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

8. Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

Operational Notes – continued

10. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

11. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

12. Regarding the Input Pin of the IC

This monolithic IC contains P⁺ isolation and P substrate layers between adjacent elements in order to keep them isolated. P-N junctions are formed at the intersection of the P layers with the N layers of other elements, creating a parasitic diode or transistor. For example (refer to figure below):

When GND > Pin A and GND > Pin B, the P-N junction operates as a parasitic diode.

When GND > Pin B, the P-N junction operates as a parasitic transistor.

Parasitic diodes inevitably occur in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions that cause these diodes to operate, such as applying a voltage lower than the GND voltage to an input pin (and thus to the P substrate) should be avoided.

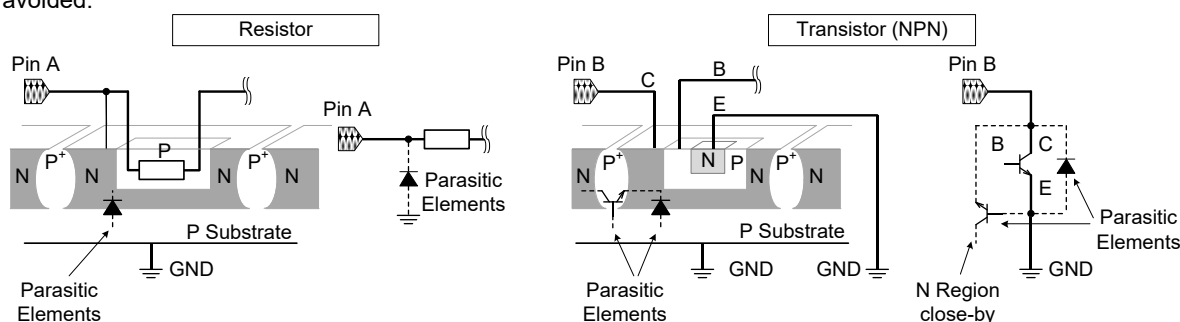

Figure xx. Example of monolithic IC structure

13. Ceramic Capacitor

When using a ceramic capacitor, determine the dielectric constant considering the change of capacitance with temperature and the decrease in nominal capacitance due to DC bias and others.

14. Thermal Shutdown Circuit(TSD)

This IC has a built-in thermal shutdown circuit that prevents heat damage to the IC. Normal operation should always be within the IC's power dissipation rating. If however the rating is exceeded for a continued period, the junction temperature (T_j) will rise which will activate the TSD circuit that will turn OFF all output pins. When the T_j falls below the TSD threshold, the circuits are automatically restored to normal operation.

Note that the TSD circuit operates in a situation that exceeds the absolute maximum ratings and therefore, under no circumstances, should the TSD circuit be used in a set design or for any purpose other than protecting the IC from heat damage.

15. Over Current Protection Circuit (OCP)

This IC incorporates an integrated over current protection circuit that is activated when the load is shorted. This protection circuit is effective in preventing damage due to sudden and unexpected incidents. However, the IC should not be used in applications characterized by continuous operation or transitioning of the protection circuit.

Notice

Precaution on using ROHM Products

- Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment ^(Note 1), transport equipment, traffic equipment, aircraft/spacecraft, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

JAPAN	USA	EU	CHINA
CLASS III	CLASS III	CLASS II b	CLASS III
CLASS IV		CLASS III	

- ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
 - Installation of protection circuits or other protective devices to improve system safety
 - Installation of redundant circuits to reduce the impact of single or multiple circuit failure
- Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc. prior to use, must be necessary:
 - Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - Sealing or coating our Products with resin or other coating materials
 - Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - Use of the Products in places subject to dew condensation
- The Products are not subject to radiation-proof design.
- Please verify and confirm characteristics of the final or mounted products in using the Products.
- In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.
- Confirm that operation temperature is within the specified range described in the product specification.
- ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

- When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

Precautions Regarding Application Examples and External Circuits

1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - [a] the Products are exposed to sea winds or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [b] the temperature or humidity exceeds those recommended by ROHM
 - [c] the Products are exposed to direct sunshine or condensation
 - [d] the Products are exposed to high Electrostatic
2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

A two-dimensional barcode printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.
2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).
3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution

1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.
2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.
3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
