

Automotive Series Serial EEPROMs 125°C SPI BUS ICs BR25xxxxFamily

BR25Hxxx-WC Series (1K 2K 4K 8K 16K 32K)

Description

BR25Hxxx-WC series is a serial EEPROM of SPI BUS interface method.

Features

- High Speed Clock Action Up to 5MHz (Max)
- Wait Function by HOLDB Terminal.
- Part or Whole of Memory Arrays Settable as Read Only Memory Area by Program.
- 2.5 to 5.5V single power source action most suitable for battery use.
- Page Write Mode Useful for Initial Value Write at Factory Shipment.
- Highly Reliable Connection by Au Pad and Au Wire.
- For SPI Bus Interface (CPOL, CPHA)=(0, 0), (1, 1)
- Auto Erase and Auto End Function at Data Rewrite.
- Low Current Consumption
 - > At Write Action (5V) : 1.5mA (Typ)
 - At Read Action (5V) : 1.0mA (Typ)
 - \rightarrow At Standby Action (5V) : 0.1µA (Typ)
- Address Auto Increment Function at Read Action
- Write Mistake Prevention Function
 - > Write Prohibition at Power on.
 - Write Prohibition by Command Code (WRDI).
 - Write Prohibition by WPB Pin.
 - Write Prohibition Block Setting by Status Registers (BP1, BP0)
 - Write Mistake Prevention Function at Low Voltage.
- Data at Shipment Memory Array: FFh, Status
- Register WPEN, BP1, BP0 : 0
- Data Kept for 40 Years.
- Data Rewrite Up to 1,000,000 Times.
 AEC-Q100 Qualified

Absolute Maximum Ratings (Ta=25°C)

Parameter	Symbol	Limits	Unit	Remarks
Impressed Voltage	V _{CC}	-0.3 to +6.5	V	
		0.56 (SOP8)		When using at Ta=25°C or higher, 4.5mW to be reduced per 1°C
Permissible Dissipation	Pd	0.56 (SOP-J8)	W	When using at Ta=25°C or higher, 4.5mW to be reduced per 1°C
Dissipation	0.41 (TSSOP-B8)			When using at Ta=25°C or higher, 3.3mW to be reduced per 1°C
Storage Temperature Range	Tstg	-65 to +150	°C	
Operating Temperature Range	Topr	-40 to +125	°C	
Terminal Voltage	-	-0.3 to V _{CC} +0.3	V	

Caution: Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

Features

1. Status Registers

This IC has status registers. The status registers are of 8 bits and express the following parameters. BP0 and BP1 can be set by write status register command. These 2 bits are memorized into the EEPROM, therefore are valid even when power source is turned off.

Rewrite characteristics and data hold time are same as characteristics of the EEPROM.

WEN can be set by write enable command and write disable command. WEN becomes write disable status when power source is turned off. \overline{R}/B is for write confirmation, therefore cannot be set externally.

The value of status register can be read by read status command.

Status Registers

<u></u>									
Product number	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0

1	0	40h-7Fh	80h-FFh	100h-1FFh	200h-3FFh	400h-7FFh	800h-FFFh
1	1	00h-7Fh	00h-FFh	000h-1FFh	000h-3FFh	000h-7FFh	000h-FFFh

1. WPB Pin

By setting WPB=LOW, write command is prohibited. As for BR25H080/160/320-WC, only when WPEN bit is set "1", the WPB pin functions become valid. And the write command to be disabled at this moment is WRSR. As for BR25H010/ 020/040-WC, both WRITE and WRSR commands are prohibited.

However, when write cycle is in execution, no interruption can be made.

Product number	WRSR	WRITE
BR25H010-WC	Drabibition	Drabibition
BR25H020-WC	Prohibition possible	Prohibition possible
BR25H040-WC	possible	possible
BR25H080-WC	Brabibition possible	Prohibition
BR25H160-WC	Prohibition possible but WPEN bit "1"	impossible
BR25H320-WC		impossible

2. HOLDB Pin

By HOLDB pin, data transfer can be interrupted. When SCK="0", by making HOLDB from "1" into"0", data transfer to EEPROM is interrupted. When SCK = "0", by making HOLDB from "0" into "1", data transfer is restarted.

*=Don't Care Bit.

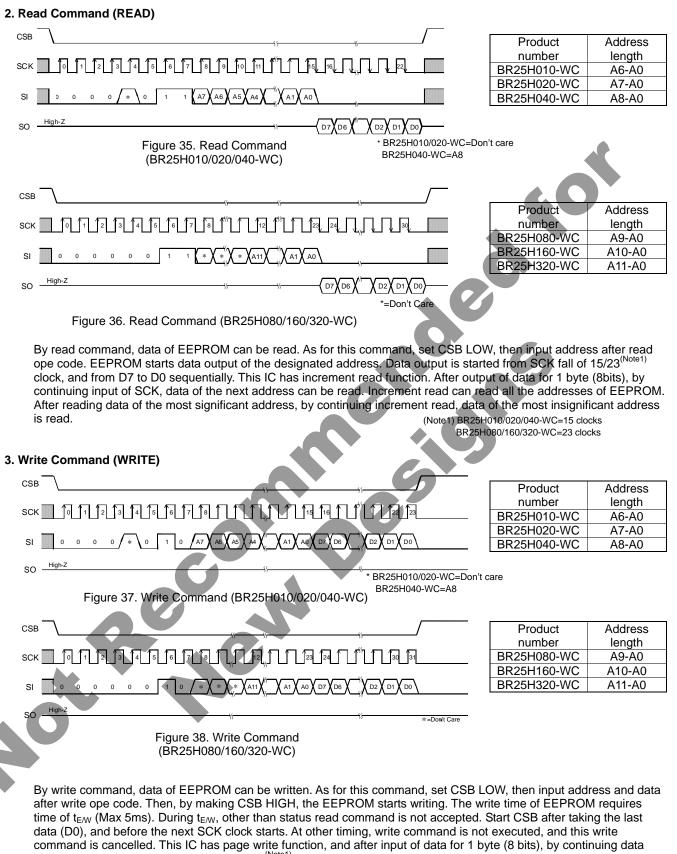

Timing Chart

1. Write Enable (WREN) / Disable (WRDI) Cycle

This IC has write enable status and write disable status. It is set to write enable status by write enable command, and it is set to write disable status by write disable command. As for these commands, set CSB LOW, and then input the respective ope codes. The respective commands accept command at the 7-th clock rise. Even with input over 7 clocks, command becomes valid.

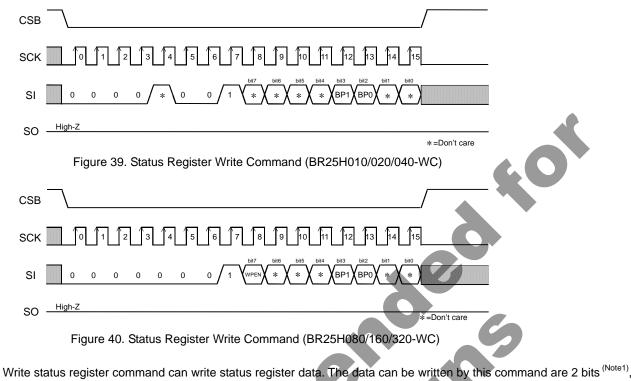

When to carry out write and write status register command, it is necessary to set write enable status by the write enable command. If write or write status register command is input in the write disable status, commands are cancelled. And even in the write enable status, once write and write status register command is executed, it gets in the write disable status. After power on, this IC is in write disable status.

command is cancelled. This IC has page write function, and after input of data for 1 byte (8 bits), by continuing data input without starting CSB, data up to $16/32^{(Note1)}$ bytes can be written for one $t_{E/W}$. In page write, the insignificant $4/5^{(Note2)}$ bit of the designated address is incremented internally at every time when data of 1 byte is input and data is written to respective addresses. When data of the maximum bytes or higher is input, address rolls over, and previously input data is overwritten. (Note1) BR25H010/020/040-WC=16 bytes at maximum

(Note1) BR25H010/020/040-WC=16 bytes at maximum BR25H080/160/320-WC=32 bytes at maximum (Note2) BR25H010/020/040-WC=Insignificant 4 bits BR25H080/160/320-WC=Insignificant 5 bits

4. Status Register Write / Read Command

white status register command can write status register data. The data can be written by this command are 2 bits (x, y), that is, BP1 (bit3) and BP0 (bit2) among 8 bits of status register. By BP1 and BP0, write disable block of EEPROM can be set. As for this command, set CSB LOW, and input ope code of write status register, and input data. Then, by making CSB HIGH, EEPROM starts writing. Write time requires time of t_{EW} as same as write. As for CSB rise, start CSB after taking the last data bit (bit0), and before the next SCK clock starts. At other timing, command is cancelled. Write disable block is determined by BP1 and BP0, and the block can be selected from 1/4 of memory array, 1/2, and entire memory array. (Refer to the write disable block setting table.)

To the write disabled block, write cannot be made, and only read can be made. (Note1) 3bits including BR25H080/160/320-WC WPEN (bit7)

Figure 42. Status Register Read Command (BR25H080/160/320-WC)

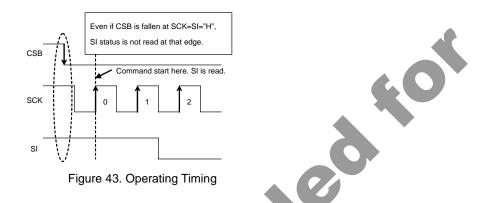

At Standby

1. Current at Standby

Set CSB "H", and be sure to set SCK, SI, WPB, HOLDB input "L" or "H". Do not input intermediate electric potantial.

2. Timing

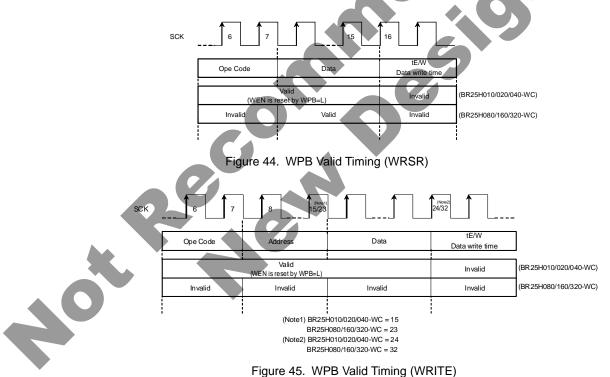

As shown in Figure 43., at standby, when SCK is "H", even if CSB is fallen, SI status is not read at fall edge. SI status is read at SCK rise edge after fall of CSB. At standby and at power ON/OFF, set CSB "H" status.

WPB Cancel Valid Area

WPB is normally fixed to "H" or "L" for use, but when WPB is controlled so as to cancel write status register command and write command, pay attention to the following WPB valid timing.

While write or write status register command is executed, by setting WPB = "L" in cancel valid area, command can be cancelled. The area from command ope code before CSB rise at internal automatic write start becomes the cancel valid area. However, once write is started, any input cannot be cancelled. WPB input becomes Don't Care, and cancellation becomes invalid.

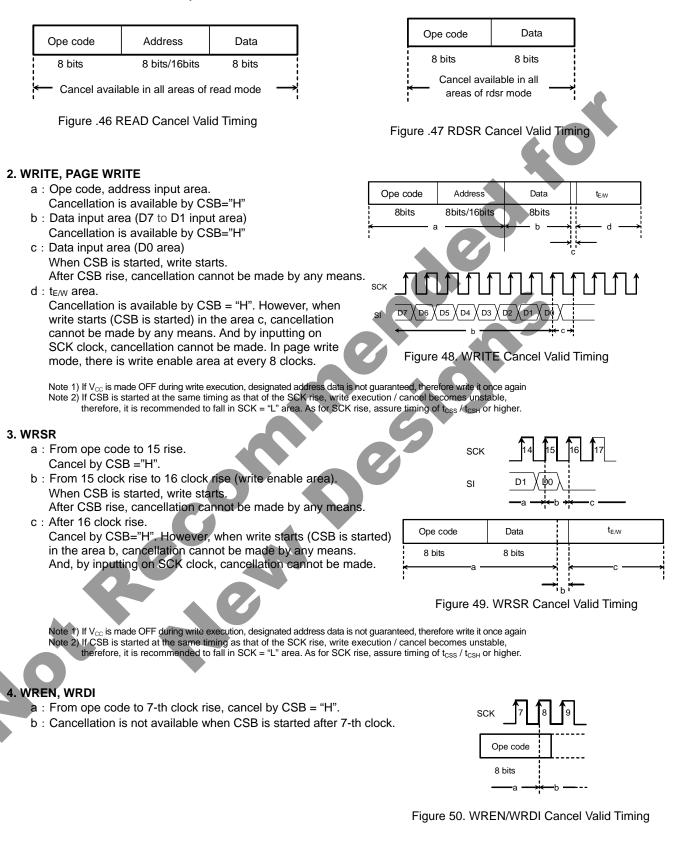

HOLDB Pin

By HOLDB pin, command communication can be stopped temporarily (HOLD status). The HOLDB pin carries out command communications normally when it is HIGH. To get in HOLD status, at command communication, when SCK=LOW, set the HOLDB pin LOW. At HOLD status, SCK and SI become Don't Care, and SO becomes high impedance (High-Z). To release the HOLD status, set the HOLDB pin HIGH when SCK=LOW. After that, communication can be restarted from the point before the HOLD status. For example, when HOLD status is made after A5 address input at read, after release of HOLD status, by starting A4 address input, read can be restarted. When in HOLD status, leave CSB LOW. When it is set CSB=HIGH in HOLD status, the IC is reset, therefore communication after that cannot be restarted.

Method to Cancel Each Command

- 1. READ, RDSR
 - Method to cancel : cancel by CSB = "H"

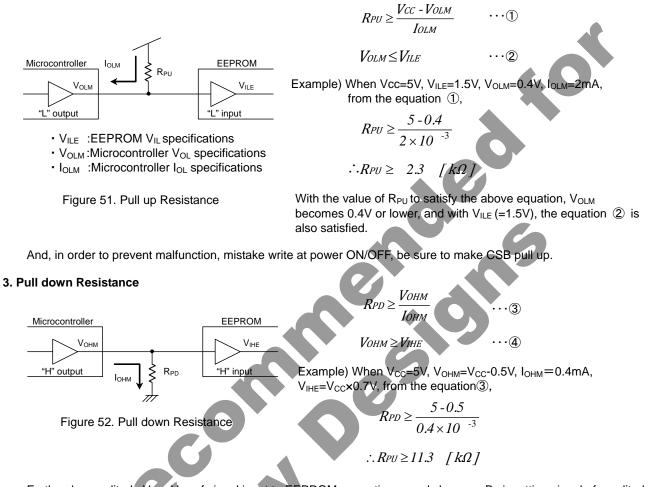

High Speed Operation

In order to realize stable high speed operations, pay attention to the following input / output pin conditions.

1. Input Pin pull up, pull down Resistance

When to attach pull up, pull down resistance to EEPROM input pin, select an appropriate value for the microcontroller V_{OL} , I_{OL} from V_{IL} characteristics of this IC.

2. Pull up Resistance

Further, by amplitude V_{IHE} , V_{ILE} of signal input to EEPROM, operation speed changes. By inputting signal of amplitude of V_{CC} / GND level to input, more stable high speed operations can be realized. On the contrary, when amplitude of $0.8V_{CC}$ / $0.2V_{CC}$ is input, operation speed becomes slow. (Note1)

In order to realize more stable high speed operation, it is recommended to make the values of R_{PU} , R_{PD} as large as possible, and make the amplitude of signal input to EEPROM close to the amplitude of V_{CC} / GND level. (Note1) At this moment, operating timing guaranteed value is guaranteed.

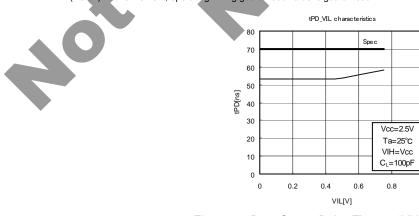

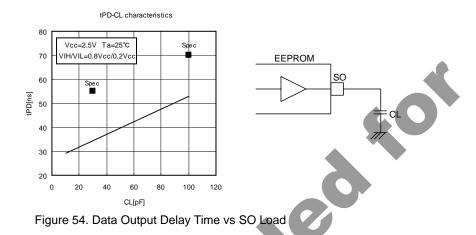

Figure 53. Data Output Delay Time vs "L" Input Voltage

4. SO Road Capacity Condition

Load capacity of SO output pin affects upon delay characteristic of SO output. (Data output delay time, time from HOLDB to High-Z) In order to make output delay characteristic into higher speed, make SO load capacity small. In concrete, "Do not connect many devices to SO bus", "Make the wire between the controller and EEPROM short", and so forth.

5. Other Cautions

Make the wire length from the microcontroller to EEPROM input signal same length, in order to prevent setup / hold violation to EEPROM, owing to difference of wire length of each input.

Input / Output Circuit 1. Output Circuit

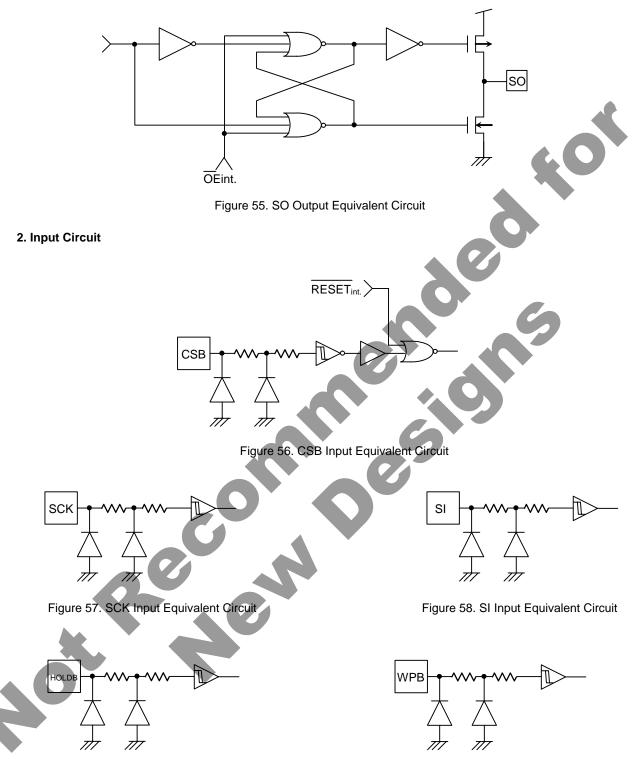

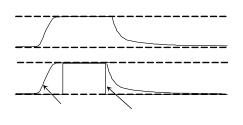

Figure 59. HOLDB Input Equivalent Circuit

Figure 60. WPB Input Equivalent Circuit

Notes on Power ON/OFF

- 1. At Power ON/OFF, Set CSB "H" (=V_{CC}). When CSB is "L", this IC gets in input accept status (active). If power is turned on in this status, noises and the likes may cause malfunction, mistake write or so. To prevent these, at power ON, set CSB "H". (When CSB is in "H" status, all inputs are canceled.)

(Good example) CSB terminal is pulled up to V_{CC}.

At power OFF, take 10ms or higher before supply. If power is turned on without observing this condition, the IC internal circuit may not be reset, which please note.

(Bad example) CSB terminal is "L" at power ON/OFF.

In this case, CSB always becomes "L" (active status), and EEPROM may have malfunction, mistake write owing to noises and the likes.

Even when CSB input is High-Z, the status becomes like this case, which please note.

2. LVCC Circuit

LVCC (V_{CC}-Lockout) circuit prevents data rewrite action at low power, and prevents wrong write. At LVCC voltage (Typ =1.9V) or below, it prevent data rewrite.

3. P.O.R. Circuit

This IC has a POR (Power On Reset) circuit as mistake write countermeasure. After POR action, it gets in write disable status. The POR circuit is valid only when power is ON, and does not work when power is OFF. When power is ON, if the recommended conditions of the following t_R, t_{OFF}, and V_{bot} are not satisfied, it may become write enable status owing to noises and the likes.

Recommended conditions of t_R, t_{OFF},

t _R	toff	V _{bot}		
10ms or below	10ms or higher	0.3V or below		
100ms or below	10ms or higher	0.2V or below		

Noise Countermeasures

1. V_{CC} Noise (bypass capacitor)

When noise or surge gets in the power source line, malfunction may occur, therefore, for removing these, it is recommended to attach a bypass capacitor (0.1μ F) between IC V_{CC} and GND. At that moment, attach it as close to IC as possible. And, it is also recommended to attach a bypass capacitor between board V_{CC} and GND.

2. SCK Noise

When the rise time (t_R) of SCK is long, and a certain degree or more of noise exists, malfunction may occur owing to clock bit displacement. To avoid this, a Schmitt trigger circuit is built in SCK input. The hysterisis width of this circuit is set about 0.2V, if noises exist at SCK input, set the noise amplitude 0.2Vp-p or below. And it is recommended to set the rise time (t_R) of SCK 100ns or below. In the case when the rise time is 100ns or higher, take sufficient noise countermeasures. Make the clock rise, fall time as small as possible.

3. WPB Noise

During execution of write status register command, if there exist noises on WPB pin, mistake in recognition may occur and forcible cancellation may result, which please note. To avoid this, a Schmitt trigger circuit is built in WPB input. In the same manner, a Schmitt trigger circuit is built in CSB input, SI input and HOLDB input too.

Operational Notes

1. Reverse Connection of Power Supply

Connecting the power supply in reverse polarity can damage the IC. Take precautions against reverse polarity when connecting the power supply, such as mounting an external diode between the power supply and the IC's power supply pins.

2. Power Supply Lines

Design the PCB layout pattern to provide low impedance supply lines. Separate the ground and supply lines of the digital and analog blocks to prevent noise in the ground and supply lines of the digital block from affecting the analog block. Furthermore, connect a capacitor to ground at all power supply pins. Consider the effect of temperature and aging on the capacitance value when using electrolytic capacitors.

3. Ground Voltage

Ensure that no pins are at a voltage below that of the ground pin at any time, even during transient condition.

4. Ground Wiring Pattern

When using both small-signal and large-current ground traces, the two ground traces should be routed separately but connected to a single ground at the reference point of the application board to avoid fluctuations in the small-signal ground caused by large currents. Also ensure that the ground traces of external components do not cause variations on the ground voltage. The ground lines must be as short and thick as possible to reduce line impedance.

5. Thermal Consideration

Should by any chance the power dissipation rating be exceeded the rise in temperature of the chip may result in deterioration of the properties of the chip. The absolute maximum rating of the Pd stated in this specification is when the IC is mounted on a 70mm x 1.6mm glass epoxy board. In case of exceeding this absolute maximum rating, increase the board size and copper area to prevent exceeding the Pd rating.

6. Recommended Operating Conditions

These conditions represent a range within which the expected characteristics of the IC can be approximately obtained. The electrical characteristics are guaranteed under the conditions of each parameter.

7. Inrush Current

When power is first supplied to the IC, it is possible that the internal logic may be unstable and inrush current may flow instantaneously due to the internal powering sequence and delays, especially if the IC has more than one power supply. Therefore, give special consideration to power coupling capacitance, power wiring, width of ground wiring, and routing of connections.

Operation Under Strong Electromagnetic Field

Operating the IC in the presence of a strong electromagnetic field may cause the IC to malfunction.

9. Testing on Application Boards

When testing the IC on an application board, connecting a capacitor directly to a low-impedance output pin may subject the IC to stress. Always discharge capacitors completely after each process or step. The IC's power supply should always be turned off completely before connecting or removing it from the test setup during the inspection process. To prevent damage from static discharge, ground the IC during assembly and use similar precautions during transport and storage.

Operational Notes – continued

10. Unused Input Pins

Input pins of an IC are often connected to the gate of a MOS transistor. The gate has extremely high impedance and extremely low capacitance. If left unconnected, the electric field from the outside can easily charge it. The small charge acquired in this way is enough to produce a significant effect on the conduction through the transistor and cause unexpected operation of the IC. So unless otherwise specified, unused input pins should be connected to the power supply or ground line.

11. Regarding the Input Pin of the IC

In the construction of this IC, P-N junctions are inevitably formed creating parasitic diodes or transistors. The operation of these parasitic elements can result in mutual interference among circuits, operational faults, or physical damage. Therefore, conditions which cause these parasitic elements to operate, such as applying a voltage to an input pin lower than the ground voltage should be avoided. Furthermore, do not apply a voltage to the input pins when no power supply voltage is applied to the IC. Even if the power supply voltage is applied, make sure that the input pins have voltages within the values specified in the electrical characteristics of this IC.

12. Inter-pin Short and Mounting Errors

Ensure that the direction and position are correct when mounting the IC on the PCB. Incorrect mounting may result in damaging the IC. Avoid nearby pins being shorted to each other especially to ground, power supply and output pin. Inter-pin shorts could be due to many reasons such as metal particles, water droplets (in very humid environment) and unintentional solder bridge deposited in between pins during assembly to name a few.

Notice

Precaution on using ROHM Products

1. If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment ^(Note 1), aircraft/spacecraft, nuclear power controllers, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM's Products for Specific Applications.

(Note1)) Medical I	Equipmei	nt Classificatio	n of the Spec	ific Applications

JAPAN	USA	EU	CHINA
CLASSI		CLASS II b	CLASS
CLASSⅣ	CLASSⅢ	CLASSⅢ	CLASSⅢ

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:

[a] Installation of protection circuits or other protective devices to improve system safety

[b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

- 3. Our Products are not designed under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM's Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc, prior to use, must be necessary:
 - [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
 - [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
 - [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
 - [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
 - [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
 - [f] Sealing or coating our Products with resin or other coating materials
 - [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
 - [h] Use of the Products in places subject to dew condensation
- 4. The Products are not subject to radiation-proof design.
- 5. Please verify and confirm characteristics of the final or mounted products in using the Products.
- 6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse. is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.
- 7. De-rate Power Dissipation (Pd) depending on Ambient temperature (Ta). When used in sealed area, confirm the actual ambient temperature.

Confirm that operation temperature is within the specified range described in the product specification.

ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

- 1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.
- 2. In principle, the reflow soldering method must be used; if flow soldering method is preferred, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification

8.

9

Precautions Regarding Application Examples and External Circuits

- 1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.
- 2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic

This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of lonizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation

- 1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
 - [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
 - [b] the temperature or humidity exceeds those recommended by ROHM
 - [c] the Products are exposed to direct sunshine or condensation
 - [d] the Products are exposed to high Electrostatic
- 2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.
- 3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.
- 4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label

QR code printed on ROHM Products label is for ROHM's internal use only.

Precaution for Disposition

When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act

Since our Products might fall under controlled goods prescribed by the applicable foreign exchange and foreign trade act, please consult with ROHM representative in case of export.

Precaution Regarding Intellectual Property Rights

1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data. ROHM shall not be in any way responsible or liable for infringement of any intellectual property rights or other damages arising from use of such information or data.:

2. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the information contained in this document.

Other Precaution

- 1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.
- 2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.
- 3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.
- 4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.

General Precaution

- 1. Before you use our Products, you are requested to care fully read this document and fully understand its contents. ROHM shall not be in an y way responsible or liable for failure, malfunction or accident arising from the use of a ny ROHM's Products against warning, caution or note contained in this document.
- 2. All information contained in this docume nt is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sale s representative.
- The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all 3. information contained in this document is accurate an d/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
