Motor driver ICs

Single-phase full-wave motor driver BA6427F

The BA6427F is a single-phase full-wave motor driver for fan motors. By using this driver, a single-phase, full-wave motor driver circuit can be built with fewer components than a circuit using operational amplifiers. Lock detection and automatic restart mechanisms, which are required for fan motors, are also built in. A rotational-speed sensing output pin is provided for Ho output.

Applications
Single-phase, full-wave fan motors

Features

- 1) Equipped with lock detection and rotational-speed sensing functions.
- Compact SOP-8 package reduces the number of external components for a reduced mounting area.

•Absolute maximum ratings (Ta = 25° C)

Parameter	Symbol	Limits	Unit
Applied voltage	Vcc	15	V
Power dissipation	Pd	550*1	mW
Operating temperature	Topr	$-35 \sim +85$	C
Storage temperature	Tstg	-55~+150	C
Output current	I _{OMax.}	700*2	mA
Output withstanding voltage	Vout	15	V
Hall signal output pin withstanding voltage	V _{но}	15	v

*1 Reduced by 4.4mW for each increase in Ta of 1°C over 25°C. When mounted on a 50mm \times 50mm \times 1.6mm glass epoxy board.

*2 Should not exceed Pd or ASO values.

Recommended operating conditions

Parameter	Symbol	Limits	Unit
Operating power supply voltage	Vcc	3.0~14.0	V

3) Automatic restart when the motor lock is undone.

Block diagram

Pin descriptions

Pin No.	Pin name	Function
1	OUT2	Output 2
2	НО	Hall signal output
3	LD	Capacitor connection pin for lock detection and automatic restart
4	Vcc	Power supply
5	Н+	Hall input (+)
6	Н-	Hall input (-)
7	OUT1	Output 1
8	GND	GND

Truth table

н+	Н-	OUT1	OUT2	НО
Н	L	Н	L	Н
L	н	L	н	L

Motor driver ICs

Parameter	Symbol	Min.	Тур.	Max.	Unit	Coniditions
Circuit current	lcc	2.2	4.5	9.0	mA	During output OFF
Lock detection capacitor charge current	Ildc	1.60	2.9	4.64	μA	VLD=1.1V
Lock detection capacitor discharge current	Ildd	0.24	0.48	0.80	μA	VLD=1.1V
Lock detection capacitor charge / discharge ratio	rcd	4.5	6.0	10.0	_	rod=llod / lldd
Lock detection capacitor clamp voltage	VLDCL	1.27	1.93	2.60	v	_
Lock detection capacitor comparator voltage	VLDCP	0.47	0.76	1.06	v	_
Output low level voltage	Vol	-	0.2	0.3	v	lo=200mA
Output high level voltage	Vон	3.4	4.1	-	V	lo=200mA
Hall signal output pin low level voltage	VHOL	-	0.3	0.5	v	IH0=5mA
Hall signal output pin leak current	IHOL	-	0	50	μA	Vно=15V

●Electrical characteristics (unless otherwise noted, Ta = 25°C, Vcc = 5V)

Lock detection

The automatic restart circuit detects a motor lock condition and automatically turns off the output power. When the lock condition is cleared, the IC automatically restarts and allow the motor to run.

In the BA6427F, automatic restart is performed as follows.

A motor lock condition is detected when the Hall signal stops switching. The output is OFF when the LD pin is being charged.

(1) The HO pin outputs a signal synchronized with the Hall signal.

(2) The HO pin is an open collector output.

The time required for the external capacitor at the LD pin to charge or discharge when the motor is locked varies with the capacitor size. The charge and discharge times are obtained by:

$$T_{ON} \text{ (charge time)} = \frac{C (V_{LDCL} - V_{LDCP})}{I_{LDC}}$$
$$T_{OFF} \text{ (discharge time)} = \frac{C (V_{LDCL} - V_{LDCP})}{I_{LDD}}$$

C is the capacitance of the external capacitor connected to the LD pin,

VLDCL is the LD pin clamp voltage	(1.93V Typ.),
VLDCP is the LD pin comparator voltage	(0.76V Typ.),
LDC is the LD pin charge current	(2.9µA Typ.),
LDD is the LD pin discharge current	(0.48µA Typ.).
For C = 0.47μ F, for example, the charge	and discharge
times are 0.19 s (output ON) and 1.15 s	s (output OFF),
respectively	

The timing of the LD pin is shown in Fig.1.

Fig.1 Timing chart of the LD and HO pins

Operation notes

(1) Thermal shutdown circuit

The IC has a built-in thermal shutdown circuit. There is a degree of hysteresis in the TSD circuit.

The circuit is activated at the temperature of about 175 °C (typical), so that all outputs are turned OFF. The circuit is deactivated when the temperature drops to about 150 °C, and normal operation resumes. (With the typical values, there is a hysteresis of 25 °C.)

(2) Current consumption

The power dissipated by the IC varies widely with the supply voltage and the output current. Make sure that your application does not exceed the allowable power dissipation of the IC package.

Fig.3 Allowable range of the Hall amplifier input voltage

1) The values of the Hall device bias resistors (see the block diagram) must be set so as to maintain the Hall amplifier input bias voltage within the range of 0V to V_{CC}-2V, including the signal amplitude. It is recommended that the same value be used for both resistors so that the Hall device output signal centered around V_{CC} / 2 is input to the IC.

2) Be careful of the input signal for the Hall inputs of this IC have no hysteresis.

(4) ASO

Make sure that the output current will not exceed the absolute maximum rating or the ASO value.

(5) Ground pin potential

Be sure to keep the GND potential lower than the potentials of the other pins.
