

# EFR32BG22C112 Wireless Gecko SoC

## Data Sheet

The EFR32BG22C112 Wireless Gecko family of SoCs is part of the Wireless Gecko portfolio. EFR32BG22C112 Wireless Gecko SoCs are ideal for enabling energy-friendly Bluetooth networking for IoT devices.

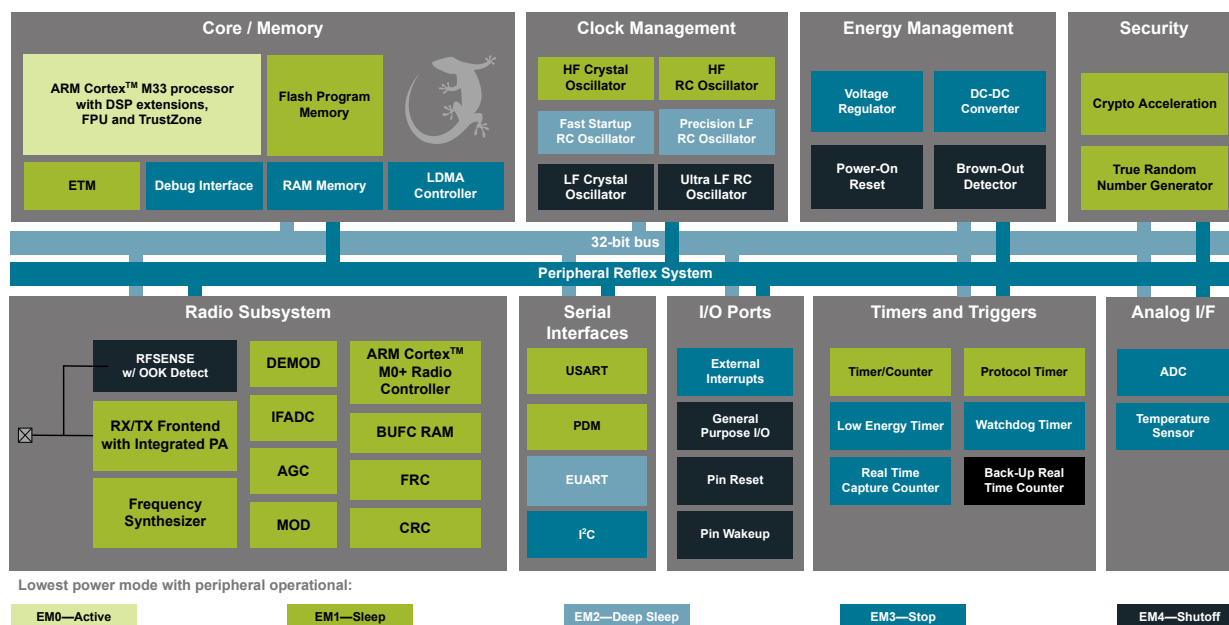

The single-die solution combines a 38.4 MHz Cortex-M33 with a high performance 2.4 GHz radio to provide an industry-leading, energy efficient, wireless SoC for IoT connected applications.

Wireless Gecko applications include:

- Asset Tags and Beacons
- Consumer Electronics Remote Controls
- Portable Medical
- Sports, Fitness, and Wellness devices
- Connected Home
- Building Automation and Security

### KEY FEATURES

- 32-bit ARM® Cortex®-M33 core with 38.4 MHz maximum operating frequency
- Up to 352 kB of flash and 32 kB of RAM
- Energy-efficient radio core with low active and sleep currents
- Integrated PA with up to 0 dBm (2.4 GHz) TX power
- Secure Boot with Root of Trust and Secure Loader (RTSL)

## 1. Feature List

The EFR32BG22C112 highlighted features are listed below.

- **Low Power Wireless System-on-Chip**
  - High Performance 32-bit 38.4 MHz ARM Cortex®-M33 with DSP instruction and floating-point unit for efficient signal processing
  - Up to 352 kB flash program memory
  - Up to 32 kB RAM data memory
  - 2.4 GHz radio operation
- **Radio Performance**
  - -98.9 dBm sensitivity @ 1 Mbit/s GFSK
  - -96.2 dBm sensitivity @ 2 Mbit/s GFSK
  - TX power up to 0 dBm
  - 2.5 mA radio receive current
  - 3.4 mA radio transmit current @ 0 dBm output power
- **Low System Energy Consumption**
  - 3.6 mA RX current (1 Mbps GFSK)
  - 4.1 mA TX current @ 0 dBm output power
  - 26 µA/MHz in Active Mode (EM0) at 38.4 MHz
  - 1.40 µA EM2 DeepSleep current (32 kB RAM retention and RTC running from LFXO)
  - 1.75 µA EM2 DeepSleep current (32 kB RAM retention and RTC running from Precision LFRCO)
  - 0.17 µA EM4 current
- **Supported Modulation Format**
  - 2 (G)FSK with fully configurable shaping
- **Protocol Support**
  - Bluetooth Low Energy
- **Wide selection of MCU peripherals**
  - Analog to Digital Converter (ADC)
    - 12-bit @ 1 Msps
    - 16-bit @ 76.9 ksp/s
  - Up to 18 General Purpose I/O pins with output state retention and asynchronous interrupts
  - 8 Channel DMA Controller
  - 12 Channel Peripheral Reflex System (PRS)
  - 4 × 16-bit Timer/Counter with 3 Compare/Capture/PWM channels
  - 1 × 32-bit Timer/Counter with 3 Compare/Capture/PWM channels
  - 32-bit Real Time Counter
  - 24-bit Low Energy Timer for waveform generation
  - 1 × Watchdog Timer
  - 2 × Universal Synchronous/Asynchronous Receiver/Transmitter (UART/SPI/SmartCard (ISO 7816)/IrDA/I<sup>2</sup>S)
  - 1 × Enhanced Universal Asynchronous Receiver/Transmitter (EUSART)
  - 2 × I<sup>2</sup>C interface with SMBus support
  - Digital microphone interface (PDM)
  - Precision Low-Frequency RC Oscillator to replace 32 kHz sleep crystal
  - RFSense with selective OOK mode
  - Die temperature sensor with +/-1.5 degree C accuracy after single-point calibration
- **Wide Operating Range**
  - 1.71 V to 3.8 V single power supply
  - -40 °C to 85 °C
- **Security Features**
  - Secure Boot with Root of Trust and Secure Loader (RTSL)
  - Hardware Cryptographic Acceleration for AES128/256, SHA-1, SHA-2 (up to 256-bit), ECC (up to 256-bit), ECDSA, and ECDH
  - True Random Number Generator (TRNG) compliant with NIST SP800-90 and AIS-31
  - ARM® TrustZone®
  - Secure Debug with lock/unlock
- **Packages**
  - QFN32 4 mm × 4 mm × 0.85 mm

## 3. System Overview

### 3.1 Introduction

The EFR32 product family combines an energy-friendly MCU with a high performance radio transceiver. The devices are well suited for secure connected IoT multi-protocol devices requiring high performance and low energy consumption. This section gives a short introduction to the full radio and MCU system. The detailed functional description can be found in the EFR32xG22 Reference Manual.

A block diagram of the EFR32BG22C112 family is shown in [Figure 3.1 Detailed EFR32BG22C112 Block Diagram on page 8](#). The diagram shows a superset of features available on the family, which vary by OPN. For more information about specific device features, consult [2. Ordering Information](#).

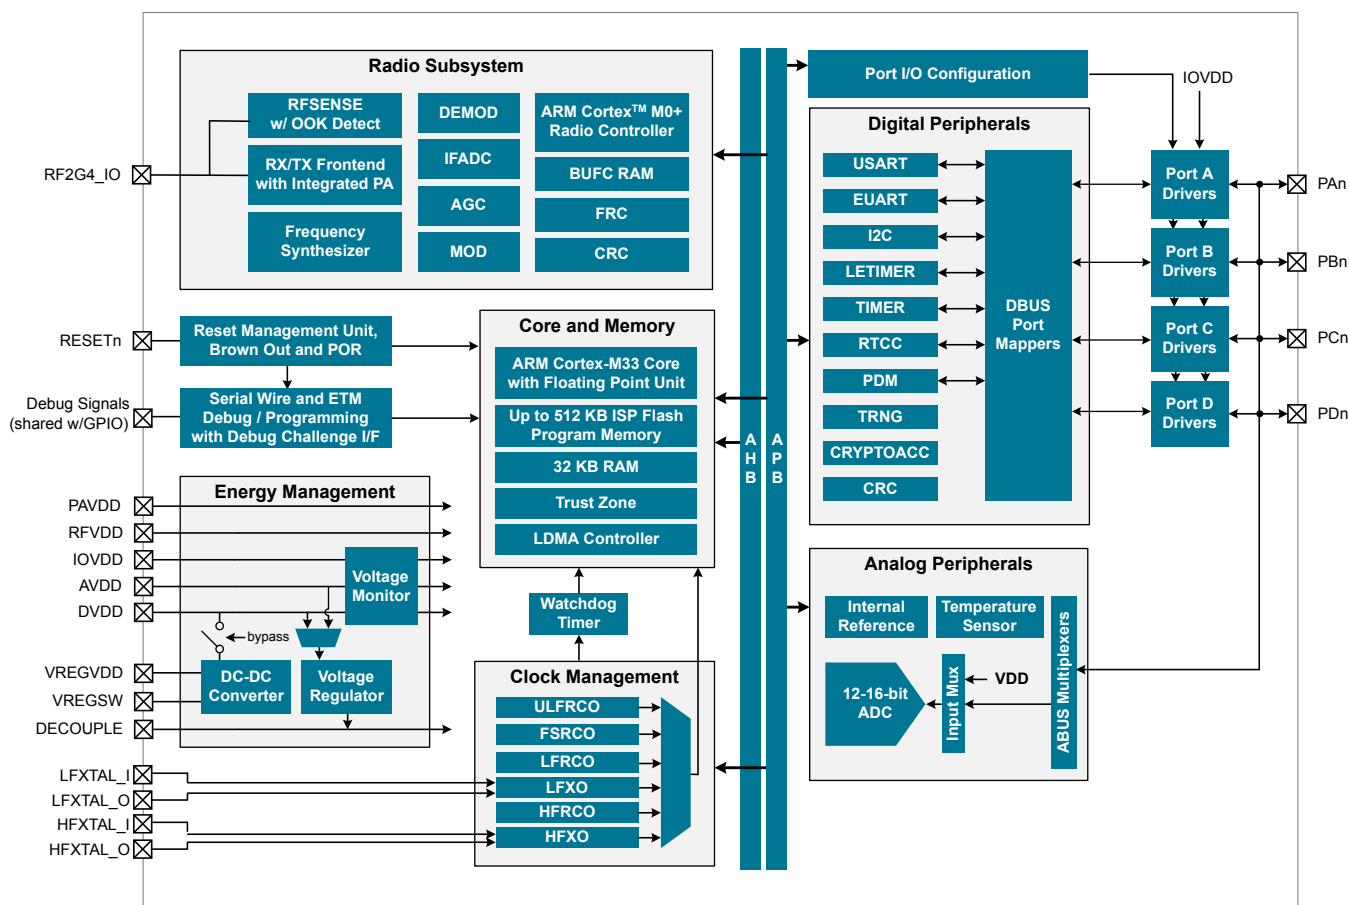

Figure 3.1. Detailed EFR32BG22C112 Block Diagram

### 3.2 Radio

The EFR32BG22C112 Wireless Gecko features a highly configurable radio transceiver supporting the Bluetooth Low Energy wireless protocol.

#### 3.2.1 Antenna Interface

The 2.4 GHz antenna interface consists of a single-ended pin (RF2G4\_IO). The external components for the antenna interface in typical applications are shown in the RF Matching Networks section.

### 3.2.2 Fractional-N Frequency Synthesizer

The EFR32BG22C112 contains a high performance, low phase noise, fully integrated fractional-N frequency synthesizer. The synthesizer is used in receive mode to generate the LO frequency for the down-conversion mixer. It is also used in transmit mode to directly generate the modulated RF carrier.

The fractional-N architecture provides excellent phase noise performance, frequency resolution better than 100 Hz, and low energy consumption. The synthesizer's fast frequency settling allows for very short receiver and transmitter wake up times to reduce system energy consumption.

### 3.2.3 Receiver Architecture

The EFR32BG22C112 uses a low-IF receiver architecture, consisting of a Low-Noise Amplifier (LNA) followed by an I/Q down-conversion mixer. The I/Q signals are further filtered and amplified before being sampled by the IF analog-to-digital converter (IFADC).

The IF frequency is configurable from 150 kHz to 1371 kHz. The IF can further be configured for high-side or low-side injection, providing flexibility with respect to known interferers at the image frequency.

The Automatic Gain Control (AGC) module adjusts the receiver gain to optimize performance and avoid saturation for excellent selectivity and blocking performance. The 2.4 GHz radio is calibrated at production to improve image rejection performance.

Demodulation is performed in the digital domain. The demodulator performs configurable decimation and channel filtering to allow receive bandwidths ranging from 0.1 to 2530 kHz. High carrier frequency and baud rate offsets are tolerated by active estimation and compensation.

### 3.2.4 Transmitter Architecture

The EFR32BG22C112 uses a direct-conversion transmitter architecture. For constant envelope modulation formats, the modulator controls phase and frequency modulation in the frequency synthesizer. Transmit symbols or chips are optionally shaped by a digital shaping filter. The shaping filter is fully configurable, including the BT product, and can be used to implement Gaussian or Raised Cosine shaping.

### 3.2.5 Packet and State Trace

The EFR32BG22C112 Frame Controller has a packet and state trace unit that provides valuable information during the development phase. It features:

- Non-intrusive trace of transmit data, receive data and state information
- Data observability on a single-pin UART data output, or on a two-pin SPI data output
- Configurable data output bitrate / baudrate
- Multiplexed transmitted data, received data and state / meta information in a single serial data stream

### 3.2.6 Data Buffering

The EFR32BG22C112 features an advanced Radio Buffer Controller (BUFC) capable of handling up to 4 buffers of adjustable size from 64 bytes to 4096 bytes. Each buffer can be used for RX, TX or both. The buffer data is located in RAM, enabling zero-copy operations.

### 3.2.7 Radio Controller (RAC)

The Radio Controller controls the top level state of the radio subsystem in the EFR32BG22C112. It performs the following tasks:

- Precisely-timed control of enabling and disabling of the receiver and transmitter circuitry
- Run-time calibration of receiver, transmitter and frequency synthesizer

### 3.2.8 RFSense Interface

The RFSense block allows the device to remain in EM2, EM3 or EM4 and wake when RF energy above a specified threshold is detected. When operated in selective mode, the RFSense block performs OOK preamble and sync word detection, preventing false wake-up events.

### 3.3 General Purpose Input/Output (GPIO)

EFR32BG22C112 has up to 18 General Purpose Input/Output pins. Each GPIO pin can be individually configured as either an output or input. More advanced configurations including open-drain, open-source, and glitch-filtering can be configured for each individual GPIO pin. The GPIO pins can be overridden by peripheral connections, like SPI communication. Each peripheral connection can be routed to several GPIO pins on the device. The input value of a GPIO pin can be routed through the Peripheral Reflex System to other peripherals. The GPIO subsystem supports asynchronous external pin interrupts.

All of the pins on ports A and port B are EM2 capable. These pins may be used by Low-Energy peripherals in EM2/3 and may also be used as EM2/3 pin wake-ups. Pins on ports C and D are latched/retained in their current state when entering EM2 until EM2 exit upon which internal peripherals could once again drive those pads.

A few GPIOs also have EM4 wake functionality. These pins are listed in the Alternate Function Table.

### 3.4 Clocking

#### 3.4.1 Clock Management Unit (CMU)

The Clock Management Unit controls oscillators and clocks in the EFR32BG22C112. Individual enabling and disabling of clocks to all peripheral modules is performed by the CMU. The CMU also controls enabling and configuration of the oscillators. A high degree of flexibility allows software to optimize energy consumption in any specific application by minimizing power dissipation in unused peripherals and oscillators.

#### 3.4.2 Internal and External Oscillators

The EFR32BG22C112 supports two crystal oscillators and fully integrates four RC oscillators, listed below.

- A high frequency crystal oscillator (HFXO) with integrated load capacitors, tunable in small steps, provides a precise timing reference for the MCU. The HFXO provides excellent RF clocking performance using a 38.4 MHz crystal. The HFXO can also support an external clock source such as a TCXO for applications that require an extremely accurate clock frequency over temperature.
- A 32.768 kHz crystal oscillator (LFXO) provides an accurate timing reference for low energy modes.
- An integrated high frequency RC oscillator (HFRCO) is available for the MCU system, when crystal accuracy is not required. The HFRCO employs fast start-up at minimal energy consumption combined with a wide frequency range, from 1 MHz to 38.4 MHz.
- An integrated fast start-up RC oscillator (FSRCO) that runs at a fixed 20 MHz
- An integrated low frequency 32.768 kHz RC oscillator (LFRCO) for low power operation without an external crystal. Precision mode enables periodic recalibration against the 38.4 MHz HFXO crystal to improve accuracy to +/- 500 ppm, suitable for BLE sleep interval timing.
- An integrated ultra-low frequency 1 kHz RC oscillator (ULFRCO) is available to provide a timing reference at the lowest energy consumption in low energy modes.

### 3.5 Counters/Timers and PWM

#### 3.5.1 Timer/Counter (TIMER)

TIMER peripherals keep track of timing, count events, generate PWM outputs and trigger timed actions in other peripherals through the Peripheral Reflex System (PRS). The core of each TIMER is a 16-bit or 32-bit counter with up to 3 compare/capture channels. Each channel is configurable in one of three modes. In capture mode, the counter state is stored in a buffer at a selected input event. In compare mode, the channel output reflects the comparison of the counter to a programmed threshold value. In PWM mode, the TIMER supports generation of pulse-width modulation (PWM) outputs of arbitrary waveforms defined by the sequence of values written to the compare registers. In addition some timers offer dead-time insertion.

See [3.13 Configuration Summary](#) for information on the feature set of each timer.

#### 3.5.2 Low Energy Timer (LETIMER)

The unique LETIMER is a 24-bit timer that is available in energy mode EM0 Active, EM1 Sleep, EM2 Deep Sleep, and EM3 Stop. This allows it to be used for timing and output generation when most of the device is powered down, allowing simple tasks to be performed while the power consumption of the system is kept at an absolute minimum. The LETIMER can be used to output a variety of waveforms with minimal software intervention. The LETIMER is connected to the Peripheral Reflex System (PRS), and can be configured to start counting on compare matches from other peripherals such as the Real Time Clock.

### 3.5.3 Real Time Clock with Capture (RTCC)

The Real Time Clock with Capture (RTCC) is a 32-bit counter providing timekeeping down to EM3. The RTCC can be clocked by any of the on-board low-frequency oscillators, and it is capable of providing system wake-up at user defined intervals.

A secondary RTC is used by the RF protocol stack for event scheduling, leaving the primary RTCC block available exclusively for application software.

### 3.5.4 Back-Up Real Time Counter (BURTC)

The Back-Up Real Time Counter (BURTC) is a 32-bit counter providing timekeeping in all energy modes, including EM4. The BURTC can be clocked by any of the on-board low-frequency oscillators, and it is capable of providing system wake-up at user-defined intervals.

### 3.5.5 Watchdog Timer (WDOG)

The watchdog timer can act both as an independent watchdog or as a watchdog synchronous with the CPU clock. It has windowed monitoring capabilities, and can generate a reset or different interrupts depending on the failure mode of the system. The watchdog can also monitor autonomous systems driven by the Peripheral Reflex System (PRS).

## 3.6 Communications and Other Digital Peripherals

### 3.6.1 Universal Synchronous/Asynchronous Receiver/Transmitter (USART)

The Universal Synchronous/Asynchronous Receiver/Transmitter is a flexible serial I/O module. It supports full duplex asynchronous UART communication with hardware flow control as well as RS-485, SPI, MicroWire and 3-wire. It can also interface with devices supporting:

- ISO7816 SmartCards
- IrDA
- I<sup>2</sup>S

### 3.6.2 Enhanced Universal Asynchronous Receiver/Transmitter (EUSART)

The Enhanced Universal Asynchronous Receiver/Transmitter supports full duplex asynchronous UART communication with hardware flow control, RS-485 and IrDA support. In EM0 and EM1 the EUSART provides a high-speed, buffered communication interface.

When routed to GPIO ports A or B, the EUSART may also be used in a low-energy mode and operate in EM2. A 32.768 kHz clock source allows full duplex UART communication up to 9600 baud.

### 3.6.3 Inter-Integrated Circuit Interface (I<sup>2</sup>C)

The I<sup>2</sup>C module provides an interface between the MCU and a serial I<sup>2</sup>C bus. It is capable of acting as a main or secondary interface and supports multi-drop buses. Standard-mode, fast-mode and fast-mode plus speeds are supported, allowing transmission rates from 10 kbit/s up to 1 Mbit/s. Bus arbitration and timeouts are also available, allowing implementation of an SMBus-compliant system. The interface provided to software by the I<sup>2</sup>C module allows precise timing control of the transmission process and highly automated transfers. Automatic recognition of addresses is provided in active and low energy modes. Note that not all instances of I<sup>2</sup>C are available in all energy modes.

### 3.6.4 Peripheral Reflex System (PRS)

The Peripheral Reflex System provides a communication network between different peripheral modules without software involvement. Peripheral modules producing Reflex signals are called producers. The PRS routes Reflex signals from producers to consumer peripherals which in turn perform actions in response. Edge triggers and other functionality such as simple logic operations (AND, OR, NOT) can be applied by the PRS to the signals. The PRS allows peripherals to act autonomously without waking the MCU core, saving power.

### 3.6.5 Pulse Density Modulation (PDM) Interface

The PDM module provides a serial interface and decimation filter for Pulse Density Modulation (PDM) microphones, isolated Sigma-delta ADCs, digital sensors and other PDM or sigma delta bit stream peripherals. A programmable Cascaded Integrator Comb (CIC) filter is used to decimate the incoming bit streams. PDM supports stereo or mono input data and DMA transfer.

### 3.7 Security Features

The EFR32BG22C112 supports the following extended Secure Vault Mid features:

**Table 3.1. Secure Vault Features**

Feature	Secure Vault Mid
True Random Number Generator (TRNG)	Yes
Secure Boot with Root of Trust and Secure Loader (RTSL)	Yes
Secure Debug with Lock/Unlock	Yes
DPA Countermeasures	No
Secure Attestation	Using TrustZone
Secure Key Management	Using TrustZone
Symmetric Encryption	<ul style="list-style-type: none"><li>• AES 128 / 192 / 256 bit</li><li>• ECB, CTR, CBC, CFB, CCM, GCM, CBC-MAC, and GMAC</li></ul>
Public Key Encryption - ECDSA / ECDH /	<ul style="list-style-type: none"><li>• p192 and p256</li></ul>
Key Derivation	<ul style="list-style-type: none"><li>• ECJ-PAKE p192 and p256</li></ul>
Hashes	<ul style="list-style-type: none"><li>• SHA-1</li><li>• SHA2/224</li><li>• SHA-2/256</li></ul>

#### 3.7.1 Secure Boot with Root of Trust and Secure Loader (RTSL)

The Secure Boot with RTSL authenticates a chain of trusted firmware that begins from an immutable memory (ROM).

It prevents malware injection, prevents rollback, ensures that only authentic firmware is executed, and protects Over The Air updates.

For more information about this feature, see [AN1218: Series 2 Secure Boot with RTSL](#).

#### 3.7.2 Cryptographic Accelerator

The Cryptographic Accelerator is an autonomous hardware accelerator which supports AES encryption and decryption with 128/192/256-bit keys, Elliptic Curve Cryptography (ECC) to support public key operations and hashes.

Supported block cipher modes of operation for AES include:

- ECB (Electronic Code Book)
- CTR (Counter Mode)
- CBC (Cipher Block Chaining)
- CFB (Cipher Feedback)
- GCM (Galois Counter Mode)
- CBC-MAC (Cipher Block Chaining Message Authentication Code)
- GMAC (Galois Message Authentication Code)
- CCM (Counter with CBC-MAC)

The Cryptographic Accelerator accelerates Elliptical Curve Cryptography and supports the NIST (National Institute of Standards and Technology) recommended curves including P-192 and P-256 for ECDH(Elliptic Curve Diffie-Hellman) key derivation and ECDSA (Elliptic Curve Digital Signature Algorithm) sign and verify operations.

Supported hashes include SHA-1, SHA2/224, and SHA-2/256.

This implementation provides a fast and energy efficient solution to state of the art cryptographic needs.

### 3.7.3 True Random Number Generator

The True Random Number Generator module is a non-deterministic random number generator that harvests entropy from a thermal energy source. It includes start-up health tests for the entropy source as required by NIST SP800-90B and AIS-31 as well as online health tests required for NIST SP800-90C.

The TRNG is suitable for periodically generating entropy to seed an approved pseudo random number generator.

### 3.7.4 Secure Debug with Lock/Unlock

For obvious security reasons, it is critical for a product to have its debug interface locked before being released in the field.

In addition, the EFR32BG22C112 also provides a secure debug unlock function that allows authenticated access based on public key cryptography. This functionality is particularly useful for supporting failure analysis while maintaining confidentiality of IP and sensitive end-user data.

More information on this feature can be found in [AN1190: Series 2 Secure Debug](#).

## 3.8 Analog

### 3.8.1 Analog to Digital Converter (IADC)

The IADC is a hybrid architecture combining techniques from both SAR and Delta-Sigma style converters. It has a resolution of 12 bits at 1 Msps and 16 bits at up to 76.9 ksp/s. Hardware oversampling reduces system-level noise over multiple front-end samples. The IADC includes integrated voltage reference options. Inputs are selectable from a wide range of sources, including pins configurable as either single-ended or differential.

## 3.9 Power

The EFR32BG22C112 has an Energy Management Unit (EMU) and efficient integrated regulators to generate internal supply voltages. Only a single external supply voltage is required, from which all internal voltages are created. An optional integrated DC-DC buck regulator can be utilized to further reduce the current consumption. The DC-DC regulator requires one external inductor and one external capacitor.

The EFR32BG22C112 device family includes support for internal supply voltage scaling, as well as two different power domains groups for peripherals. These enhancements allow for further supply current reductions and lower overall power consumption.

### 3.9.1 Energy Management Unit (EMU)

The Energy Management Unit manages transitions of energy modes in the device. Each energy mode defines which peripherals and features are available and the amount of current the device consumes. The EMU can also be used to implement system-wide voltage scaling and turn off the power to unused RAM blocks to optimize the energy consumption in the target application. The DC-DC regulator operation is tightly integrated with the EMU.

### 3.9.2 Voltage Scaling

The EFR32BG22C112 supports supply voltage scaling for the LDO powering DECOUPLE, with independent selections for EM0 / EM1 and EM2 / EM3. Voltage scaling helps to optimize the energy efficiency of the system by operating at lower voltages when possible. The EM0 / EM1 voltage scaling level defaults to VSCALE2, which allows the core to operate in active mode at full speed. The intermediate level, VSCALE1, allows operation in EM0 and EM1 at up to 40 MHz. The lowest level, VSCALE0, can be used to conserve power further in EM2 and EM3. The EMU will automatically switch the target voltage scaling level when transitioning between energy modes.

### 3.9.3 DC-DC Converter

The DC-DC buck converter covers a wide range of load currents, provides high efficiency in energy modes EM0, EM1, EM2 and EM3, and can supply up to 60 mA for device and radio operation. RF noise mitigation allows operation of the DC-DC converter without significantly degrading sensitivity of radio components. An on-chip supply-monitor signals when the supply voltage is low to allow bypass of the regulator via programmable software interrupt. It employs soft switching at boot and DCDC regulating-to-bypass transitions to limit the max supply slew-rate and mitigate inrush current.

### 3.9.4 Power Domains

The EFR32BG22C112 has three peripheral power domains for operation in EM2 and EM3, as well as the ability to selectively retain configurations for EM0/EM1 peripherals. A small set of peripherals always remain powered on in EM2 and EM3, including all peripherals which are available in EM4. If all of the peripherals in PD0B or PD0C are configured as unused, that power domain will be powered off in EM2 or EM3, reducing the overall current consumption of the device. Likewise, if the application can tolerate the setup time to re-configure used EM0/EM1 peripherals on wake, register retention for these peripherals can be disabled to further reduce the EM2 or EM3 current.

**Table 3.2. Peripheral Power Subdomains**

LFXO <sup>1</sup>	I2C0	
BURTC <sup>1</sup>	WDOG0	
RFSENSE <sup>1</sup>	EUART0	
ULFRCO <sup>1</sup>	PRS	
FSRCO	DEBUG	
<b>Note:</b> 1. Peripheral also available in EM4.		

### 3.10 Reset Management Unit (RMU)

The RMU is responsible for handling reset of the EFR32BG22C112. A wide range of reset sources are available, including several power supply monitors, pin reset, software controlled reset, core lockup reset, and watchdog reset.

### 3.11 Core and Memory

#### 3.11.1 Processor Core

The ARM Cortex-M processor includes a 32-bit RISC processor integrating the following features and tasks in the system:

- ARM Cortex-M33 RISC processor achieving 1.50 Dhrystone MIPS/MHz
- ARM TrustZone security technology
- Embedded Trace Macrocell (ETM) for real-time trace and debug
- Up to 352 KB flash program memory
- Up to 32 KB RAM data memory
- Configuration and event handling of all modules
- 2-pin Serial-Wire debug interface

#### 3.11.2 Memory System Controller (MSC)

The Memory System Controller (MSC) is the program memory unit of the microcontroller. The flash memory is readable and writable from both the Cortex-M33 and LDMA. In addition to the main flash array where Program code is normally written the MSC also provides an Information block where additional information such as special user information or flash-lock bits are stored. There is also a read-only page in the information block containing system and device calibration data. Read and write operations are supported in energy modes EM0 Active and EM1 Sleep.

#### 3.11.3 Linked Direct Memory Access Controller (LDMA)

The Linked Direct Memory Access (LDMA) controller allows the system to perform memory operations independently of software. This reduces both energy consumption and software workload. The LDMA allows operations to be linked together and staged, enabling sophisticated operations to be implemented.

### 3.12 Memory Map

The EFR32BG22C112 memory map is shown in the figures below. RAM and flash sizes are for the largest memory configuration.

### 3.13 Configuration Summary

The features of the EFR32BG22C112 are a subset of the feature set described in the device reference manual. The table below describes device specific implementation of the features. Remaining modules support full configuration.

**Table 3.3. Configuration Summary**

Module	Lowest Energy Mode	Configuration
I2C0	EM3 <sup>1</sup>	
I2C1	EM1	
IADC0	EM3	
LETIMER0	EM2 <sup>1</sup>	
PDM	EM1	2-channel
TIMER0	EM1	32-bit, 3-channels, +DTI
TIMER1	EM1	16-bit, 3-channels, +DTI
TIMER2	EM1	16-bit, 3-channels, +DTI
TIMER3	EM1	16-bit, 3-channels, +DTI
TIMER4	EM1	16-bit, 3-channels, +DTI
EUART0	EM1 - Full high-speed operation EM3 <sup>1</sup> - Low-energy operation, 9600 Baud	
USART0	EM1	+IrDA, +I2S, +SmartCard
USART1	EM1	+IrDA, +I2S, +SmartCard
<b>Note:</b> 1. EM2 and EM3 operation is only supported for digital peripheral I/O on Port A and Port B. All GPIO ports support digital peripheral operation in EM0 and EM1.		

## 4. Electrical Specifications

### 4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the following conditions, unless stated otherwise:

- Typical values are based on  $T_A=25\text{ }^{\circ}\text{C}$  and all supplies at 3.0 V, by production test and/or technology characterization.
- Radio performance numbers are measured in conducted mode, based on Silicon Laboratories reference designs using output power-specific external RF impedance-matching networks for interfacing to a 50  $\Omega$  antenna.
- Minimum and maximum values represent the worst conditions across supply voltage, process variation, and operating temperature, unless stated otherwise.

### Power Supply Pin Dependencies

Due to on-chip circuitry (e.g., diodes), some EFR32 power supply pins have a dependent relationship with one or more other power supply pins. These internal relationships between the external voltages applied to the various EFR32 supply pins are defined below. Exceeding the below constraints can result in damage to the device and/or increased current draw.

- VREGVDD & DVDD
  - In systems using the DCDC converter, DVDD (the buck converter output) should be connected to the recommended  $L_{\text{DCDC}}$  and  $C_{\text{DCDC}}$ , and should not be driven by an off-chip regulator.
  - In systems not using the DCDC converter, DVDD must be shorted to VREGVDD on the PCB ( $\text{VREGVDD}=\text{DVDD}$ )
- $\text{DVDD} \geq \text{DECOUPLE}$
- $\text{PAVDD} \geq \text{RFVDD}$
- AVDD, IOVDD: No dependency with each other or any other supply pin. Additional leakage may occur if DVDD remains unpowered with power applied to these supplies.

## 4.2 Absolute Maximum Ratings

Stresses beyond those listed below may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions beyond those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. For more information on the available quality and reliability data, see the Quality and Reliability Monitor Report at <http://www.silabs.com/support/quality/pages/default.aspx>.

**Table 4.1. Absolute Maximum Ratings**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Storage temperature range	T <sub>STG</sub>		-50	—	+150	°C

Voltage ramp rate on any supply pin	V <sub>DDRAMP</sub> MAX		—	—	1.0	V / $\mu$ s
Voltage on HFXO pins	V <sub>HFXO</sub> PIN		-0.3	—	1.2	V
DC voltage on any GPIO pin	V <sub>DIG</sub> PIN		-0.3	—	V <sub>IOVDD</sub> + 0.3	V
DC voltage on RESETn pin <sup>2</sup>	V <sub>RESETn</sub>		-0.3	—	3.8	V
Input RF level on RF pins RF2G4_IO	P <sub>RFMAX2G4</sub>		—	—	+10	dBm
Absolute voltage on RF pin RF2G4_IO	V <sub>MAX2G4</sub>		-0.3	—	V <sub>PAVDD</sub> + 0.3	V
Total current into VDD power lines	I <sub>VDDMAX</sub>	Source	—	—	200	mA
Total current into VSS ground lines	I <sub>VSSMAX</sub>	Sink	—	—	200	mA
Current per I/O pin	I <sub>IO</sub> MAX	Sink	—	—	50	mA
		Source	—	—	50	mA
Current for all I/O pins	I <sub>IOALLMAX</sub>	Sink	—	—	200	mA
		Source	—	—	200	mA

**Note:**

1. The maximum supply voltage on VREGVDD is limited under certain conditions when using the DC-DC. See the DC-DC specifications for more details.
2. The RESETn pin has a pull-up device to the DVDD supply. For minimum leakage, RESETn should not exceed the voltage at DVDD.

## 4.3 General Operating Conditions

Table 4.2. General Operating Conditions

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Operating ambient temperature range	$T_A$	-G temperature grade <sup>1</sup>	-40	—	+85	°C

External Clock Input	$f_{CLKIN}$	VSCALE2 or VSCALE1	—	—	40	MHz
DPLL Reference Clock	$f_{DPLLREFCLK}$	VSCALE2 or VSCALE1	—	—	40	MHz

**Note:**

1. The device may operate continuously at the maximum allowable ambient  $T_A$  rating as long as the absolute maximum  $T_{JMAX}$  is not exceeded. For an application with significant power dissipation, the allowable  $T_A$  may be lower than the maximum  $T_A$  rating.  $T_A = T_{JMAX} - (\text{THETA}_{JA} \times \text{PowerDissipation})$ . Refer to the Absolute Maximum Ratings table and the Thermal Characteristics table for  $T_{JMAX}$  and  $\text{THETA}_{JA}$ .
2. The DVDD supply is monitored by the DVDD BOD in EM0/1 and the LE DVDD BOD in EM2/3/4.
3. The maximum supply voltage on VREGVDD is limited under certain conditions when using the DC-DC. See the DC-DC specifications for more details.
4. Murata GCM21BL81C105KA58L used for performance characterization. Actual capacitor values can be significantly de-rated from their specified nominal value by the rated tolerance, as well as the application's AC voltage, DC bias, and temperature. The minimum capacitance counting all error sources should be no less than 0.6  $\mu\text{F}$ .
5. The recommended radio crystal frequency is 38.4 MHz. Any crystal frequency other than 38.4 MHz is expressly not supported. See HFXO specifications for more detail on crystal tolerance.

#### 4.4 DC-DC Converter

Test conditions:  $L_{DCDC} = 2.2 \mu\text{H}$  (Samsung CIG22H2R2MNE),  $C_{DCDC} = 4.7 \mu\text{F}$  (Samsung CL10B475KQ8NQNC),  $V_{VREGVDD} = 3.0 \text{ V}$ ,  $V_{OUT} = 1.8 \text{ V}$ , IPKVAL in EM0/1 modes is set to 150 mA, and in EM2/3 modes is set to 90 mA, unless otherwise indicated.

**Note:**

1. The supported maximum  $V_{\text{VREGVDD}}$  in regulation mode is a function of temperature and 10-year lifetime average load current. See more details in [4.4.1 DC-DC Operating Limits](#).
2. Samsung CL10B475KQ8NQNC used for performance characterization. Actual capacitor values can be significantly de-rated from their specified nominal value by the rated tolerance, as well as the application's AC voltage, DC bias, and temperature. The minimum capacitance counting all error sources should be no less than 2.4  $\mu\text{F}$ .

#### 4.4.1 DC-DC Operating Limits

The maximum supported voltage on the VREGVDD supply pin is limited under certain conditions. Maximum input voltage is a function of temperature and the average load current over a 10-year lifetime. [Figure 4.1 Lifetime average load current limit vs. Maximum input voltage on page 23](#) shows the safe operating region under specific conditions. Exceeding this safe operating range may impact the reliability and performance of the DC-DC converter.

The average load current for an application can typically be determined by examining the current profile during the time the device is powered. For example, an application that is continuously powered which spends 99% of the time asleep consuming 2  $\mu\text{A}$  and 1% of the time active and consuming 10 mA has an average lifetime load current of about 102  $\mu\text{A}$ .

Figure 4.1. Lifetime average load current limit vs. Maximum input voltage

The minimum input voltage for the DC-DC in EM0/EM1 mode is a function of the maximum load current, and the peak current setting. [Figure 4.2 Transient maximum load current vs. Minimum input voltage on page 23](#) shows the max load current vs. input voltage for different DC-DC peak inductor current settings.

Figure 4.2. Transient maximum load current vs. Minimum input voltage

#### 4.6.4 Radio current consumption at 3.0V using DCDC

RF current consumption measured with MCU in EM1, HCLK = 38.4 MHz, and all MCU peripherals disabled. Unless otherwise indicated, typical conditions are: VREGVDD = 3.0V. AVDD = DVDD = IOVDD = RFVDD = PAVDD = 1.8 V powered from DCDC.  $T_A = 25^\circ\text{C}$ . Minimum and maximum values in this table represent the worst conditions across process variation at  $T_A = 25^\circ\text{C}$ .

## 4.8 Wake Up, Entry, and Exit times

Unless otherwise specified, these times are measured using the HFRCO at 19 MHz.

**Table 4.10. Wake Up, Entry, and Exit times**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
WakeupTime from EM1	$t_{EM1\_WU}$	Code execution from flash	—	3	—	HCLKs
		Code execution from RAM	—	1.42	—	$\mu$ s
WakeupTime from EM2	$t_{EM2\_WU}$	Code execution from flash, No Voltage Scaling	—	13.22	—	$\mu$ s
		Code execution from RAM, No Voltage Scaling	—	5.15	—	$\mu$ s
		Voltage scaling up one level <sup>1</sup>	—	37.89	—	$\mu$ s
		Voltage scaling up two levels <sup>2</sup>	—	50.56	—	$\mu$ s
WakeupTime from EM3	$t_{EM3\_WU}$	Code execution from flash, No Voltage Scaling	—	13.21	—	$\mu$ s
		Code execution from RAM, No Voltage Scaling	—	5.15	—	$\mu$ s
		Voltage scaling up one level <sup>1</sup>	—	37.90	—	$\mu$ s
		Voltage scaling up two levels <sup>2</sup>	—	50.55	—	$\mu$ s
WakeupTime from EM4	$t_{EM4\_WU}$	Code execution from flash	—	8.81	—	ms
Entry time to EM1	$t_{EM1\_ENT}$	Code execution from flash	—	1.29	—	$\mu$ s
Entry time to EM2	$t_{EM2\_ENT}$	Code execution from flash	—	5.23	—	$\mu$ s
Entry time to EM3	$t_{EM3\_ENT}$	Code execution from flash	—	5.23	—	$\mu$ s
Entry time to EM4	$t_{EM4\_ENT}$	Code execution from flash	—	9.96	—	$\mu$ s
Voltage scaling in time in EM0 <sup>3</sup>	$t_{SCALE}$	Up from VSCALE1 to VSCALE2	—	32	—	$\mu$ s
		Down from VSCALE2 to VSCALE1	—	172	—	$\mu$ s

**Note:**

1. Voltage scaling one level is between VSCALE0 and VSCALE1 or between VSCALE1 and VSCALE2.
2. Voltage scaling two levels is between VSCALE0 and VSCALE2.
3. During voltage scaling in EM0, RAM is inaccessible and processor will be halted until complete.

## 4.9 Boot Timing

Secure boot impacts the recovery time from all sources of device reset. In addition to the root code authentication process, which cannot be disabled or bypassed, the root code can authenticate a bootloader, and the bootloader can authenticate the application. In projects that include only an application and no bootloader, the root code can authenticate the application directly. The duration of each authentication operation depends on two factors: the computation of the associated image hash, which is proportional to the size of the image, and the verification of the image signature, which is independent of image size.

The duration for the root code to authenticate the bootloader will depend on the SE firmware version as well as on the size of the bootloader.

The duration for the bootloader to authenticate the application can depend on the size of the application.

The configurations below assume that the associated bootloader and application code images do not contain a bootloader certificate or an application certificate. Authenticating a bootloader certificate or an application certificate will extend the boot time by an additional 6 to 7 ms.

The table below provides the durations from the termination of reset until the completion of the secure boot process (start of main() function in the application image) under various conditions.

Conditions:

- VSE firmware version: 1.2.6
- Gecko Bootloader size: 13.0 kB

Timing is expected to be similar for subsequent VSE firmware versions. Refer to VSE firmware release notes for any significant changes.

**Table 4.11. Boot Timing**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Boot time	$t_{\text{BOOT}}$	Secure boot application check disabled, no bootloader	—	14.9	—	ms
		Secure boot application check disabled, second stage bootloader check enabled <sup>1</sup> , 50 kB application size	—	21.3	—	ms
		Secure boot application check enabled, second stage bootloader check enabled <sup>1</sup> , 50 kB application size	—	48.4	—	ms
		Secure boot application check enabled, second stage bootloader check enabled <sup>1</sup> , 150 kB application size	—	54.0	—	ms
		Secure boot application check enabled, second stage bootloader check enabled <sup>1</sup> , 350 kB application size	—	65.1	—	ms

**Note:**

1. Timing is measured with the specified bootloader size. Actual bootloader size will impact the boot timing slightly, with a similar  $\mu\text{s} / \text{kB}$  ratio as application size.

## 4.12 Oscillators

### 4.12.1 High Frequency Crystal Oscillator

Unless otherwise indicated, typical conditions are: AVDD = DVDD = 3.0 V.  $T_A = 25\text{ }^{\circ}\text{C}$ . Minimum and maximum values in this table represent the worst conditions across process variation, operating supply voltage range, and operating temperature range.

**Table 4.19. High Frequency Crystal Oscillator**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Crystal Frequency	$F_{\text{HFXO}}$	see note <sup>1</sup>	—	38.4	—	MHz
Supported crystal equivalent series resistance (ESR)	$\text{ESR}_{\text{HFXO\_38M4}}$	38.4 MHz, CL = 10 pF <sup>2 3</sup>	—	40	60	$\Omega$
Supported range of crystal load capacitance <sup>4</sup>	$C_{\text{HFXO\_LC}}$	38.4 MHz, ESR = 40 Ohm <sup>3</sup>	—	10	—	pF
Supply Current	$I_{\text{HFXO}}$		—	415	—	$\mu\text{A}$
Startup Time <sup>5</sup>	$T_{\text{STARTUP}}$	38.4 MHz, ESR = 40 Ohm, CL = 10 pF	—	160	—	$\mu\text{s}$
On-chip tuning cap step size <sup>6</sup>	$\text{SS}_{\text{HFXO}}$		—	0.04	—	pF

**Note:**

1. The BLE radio requires a 38.4 MHz crystal with a tolerance of  $\pm 50$  ppm over temperature and aging. Please use the recommended crystal.
2. The crystal should have a maximum ESR less than or equal to this maximum rating.
3. RF performance characteristics have been determined using crystals with an ESR of 40  $\Omega$  and CL of 10 pF.
4. Total load capacitance as seen by the crystal.
5. Startup time does not include time implemented by programmable TIMEOUTSTEADY delay.
6. The tuning step size is the effective step size when incrementing both of the tuning capacitors by one count. The step size for the each of the individual tuning capacitors is twice this value.

## 4.12.2 Low Frequency Crystal Oscillator

Table 4.20. Low Frequency Crystal Oscillator

On-chip tuning capacitor value at minimum setting <sup>5</sup>	$C_{LFXO\_MIN}$	CAPTUNE = 0	—	4	—	pF
On-chip tuning capacitor value at maximum setting <sup>5</sup>	$C_{LFXO\_MAX}$	CAPTUNE = 0x4F	—	24.5	—	pF

**Note:**

1. Total load capacitance seen by the crystal
2. Crystals with a load capacitance of greater than 12 pF require external load capacitors.
3. In LFXO\_CAL Register
4. In LFXO\_CFG Register
5. The effective load capacitance seen by the crystal will be  $C_{LFXO}/2$ . This is because each XTAL pin has a tuning cap and the two caps will be seen in series by the crystal

### 4.12.3 High Frequency RC Oscillator (HFRCO)

Unless otherwise indicated, typical conditions are: AVDD = DVDD = 3.0 V.  $T_A = 25^\circ\text{C}$ . Minimum and maximum values in this table represent the worst conditions across process variation, operating supply voltage range, and operating temperature range.

		FREQRANGE = 12	33.0	—	51.0	MHz

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
-----------	--------	----------------	-----	-----	-----	------

**Note:**

1. Does not include additional clock tree current. See specifications for additional current when selected as a clock source for a particular clock multiplexer.
2. When the HFRCO is enabled for characterization using the FORCEEN bit, the total current will be the HFRCO core current plus the specified CLKOUT current. When the HFRCO is enabled on demand, the clock current may be different.
3. Hardware delay ensures settling to within  $\pm 0.5\%$ . Hardware also enforces this delay on a band change.
4. The frequency band limits represent the lowest and highest frequency which each band can achieve over the operating range.

External reference voltage range <sup>1</sup>	V <sub>EVREF</sub>		1.0	—	AVDD	V
Internal Reference voltage	V <sub>IVREF</sub>		—	1.21	—	V

**Note:**

1. When inputs are routed to external GPIO pins, the maximum pin voltage is limited to the lower of the IOVDD and AVDD supplies.
2. ADC output resolution depends on the OSR and digital averaging settings. With no digital averaging, ADC output resolution is 12 bits at OSR=2, 13 bits at OSR = 4, 14 bits at OSR = 8, 15 bits at OSR = 16, 16 bits at OSR = 32 and 17 bits at OSR = 64. Digital averaging has a similar impact on ADC output resolution. See the product reference manual for additional details.
3. The relationship between ENOB and SNDR is specified according to the equation:  $ENOB = (SNDR - 1.76) / 6.02$ .
4. Includes error from internal VREF drift.

		After linearization in software, with single-temperature calibration at 25 °C <sup>4</sup>	-1.5	—	1.5	°C
Measurement interval	t <sub>MEAS</sub>		—	250	—	ms

**Note:**

1. The sensor reports absolute die temperature in °K. All specifications are in °C to match the units of the specified product temperature range.
2. Error is measured as the deviation of the mean temperature reading from the expected die temperature. Accuracy numbers represent statistical minimum and maximum using  $\pm 4$  standard deviations of measured error.
3. The raw output of the temperature sensor is a predictable curve. It can be linearized with a polynomial function for additional accuracy.
4. Assuming calibration accuracy of  $\pm 0.25$  °C.

Repeated START condition set-up time	t <sub>SU_STA</sub>		4.7	—	—	μs
Repeated START condition hold time	t <sub>HD_STA</sub>		4.0	—	—	μs
STOP condition set-up time	t <sub>SU_STO</sub>		4.0	—	—	μs
Bus free time between a STOP and START condition	t <sub>BUF</sub>		4.7	—	—	μs

**Note:**

1. The maximum SCL clock frequency listed is assuming that an arbitrary clock frequency is available. The maximum attainable SCL clock frequency may be slightly less using the HFXO or HFRCO due to the limited frequencies available. The CLKDIV should be set to a value that keeps the SCL clock frequency below the max value listed.

**4.20.2 I2C Fast-mode (Fm)**

CLHR set to 1 in the I2Cn\_CTRL register.

**Table 4.37. I2C Fast-mode (Fm)**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
SCL clock frequency <sup>1</sup>	f <sub>SCL</sub>		0	—	400	kHz

## 5. Typical Connections

### 5.1 Power

Typical power supply connections are shown in the following figures.

**Note:** PAVDD, RFVDD, AVDD, and IOVDD supply connections are flexible. They may be connected in other configurations or to external supplies as long as the supply limits described in [4.1 Electrical Characteristics](#) are met.

## 5.2 RF Matching Networks

### 5.2.1 2.4 GHz Matching Network

The recommended RF matching network circuit diagram is shown in [Figure 5.4 Typical RF impedance-matching network circuit on page 66](#). Typical component values are shown in [Table 5.1 Component Values on page 66](#). Please refer to the development board Bill of Materials for specific part recommendation including tolerance, component size, recommended manufacturer, and recommended part number.

### 5.3 Other Connections

Other components or connections may be required to meet the system-level requirements. Application Note AN0002.2: "EFR32 Wireless Gecko Series 2 Hardware Design Considerations" contains detailed information on these connections. Application Notes can be accessed on the Silicon Labs website ([www.silabs.com/32bit-appnotes](http://www.silabs.com/32bit-appnotes)).

## 6. Pin Definitions

### 6.1 QFN32 Device Pinout

**Figure 6.1. QFN32 Device Pinout**

The following table provides package pin connections and general descriptions of pin functionality. For detailed information on the supported features for each GPIO pin, see [6.2 Alternate Function Table](#), [6.3 Analog Peripheral Connectivity](#), and [6.4 Digital Peripheral Connectivity](#).

### 6.3 Analog Peripheral Connectivity

Many analog resources are routable and can be connected to numerous GPIO's. The table below indicates which peripherals are available on each GPIO port. When a differential connection is being used Positive inputs are restricted to the EVEN pins and Negative inputs are restricted to the ODD pins. When a single ended connection is being used positive input is available on all pins. See the device Reference Manual for more details on the ABUS and analog peripherals. Note that some functions may not be available on all device variants.

**Note:**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to the JEDEC Solid State Outline MO-220, Variation VKKD-4.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

## 7.2 QFN32 PCB Land Pattern

Figure 7.2. QFN32 PCB Land Pattern Drawing

Table 7.2. QFN32 PCB Land Pattern Dimensions

Dimension	Typ
L	0.76
W	0.22
e	0.40
S	3.21
S1	3.21
L1	2.80
W1	2.80

**Note:**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. This Land Pattern Design is based on the IPC-7351 guidelines.
3. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60  $\mu\text{m}$  minimum, all the way around the pad.
4. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
5. The stencil thickness should be 0.101 mm (4 mils).
6. The ratio of stencil aperture to land pad size can be 1:1 for all perimeter pads.
7. A 2x2 array of 1.10 mm x 1.10 mm openings on a 1.30 mm pitch can be used for the center ground pad.
8. A No-Clean, Type-3 solder paste is recommended.
9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.
10. ***Above notes and stencil design are shared as recommendations only. A customer or user may find it necessary to use different parameters and fine tune their SMT process as required for their application and tooling.***

### 7.3 QFN32 Package Marking

Figure 7.3. QFN32 Package Marking

The package marking consists of:

- FFFF – The product family codes.
  - 1. Family Code ( B | M | F )
  - 2. G (Gecko)
  - 3. Series (2)
  - 4. Device Configuration (1, 2, 3, ...)
- P P P P P P – The product option codes.
  - 1-2. MCU Feature Codes
  - 3-4. Radio Feature Codes
  - 5. Flash (J = 1024k | I = 768k | H = 512k | W= 352k | G = 256k | F = 128k)
  - 6. Temperature grade (G = -40 to 85 °C | I = -40 to 125 °C )
- T T T T T T – A trace or manufacturing code. The first letter is the device revision.
- Y Y – The last 2 digits of the assembly year.
- W W – The 2-digit workweek when the device was assembled.

## 8. Revision History

### Revision 1.2

June, 2024

- Minor formatting and styling updates, including TOC locations and boilerplate information throughout document
- Added note to [2. Ordering Information](#) regarding Bluetooth 5.x support.
- Added [Figure 2.1 Ordering Code Key on page 4](#).
- Added [Table 3.1 Secure Vault Features on page 12](#).
- Updated max voltage on HFXO pins in [Table 4.1 Absolute Maximum Ratings on page 19](#).
- Added CLKIN & DLLREFCLK max to [4.3 General Operating Conditions](#).
- Added flash erase cycles and data retention information to [Table 4.9 Flash Characteristics on page 32](#).
- Corrected unit for wake-up time from EM1 from AHB Clock to HCLKs in [Table 4.10 Wake Up, Entry, and Exit times on page 33](#).
- Added [4.9 Boot Timing](#)
- Added startup time footnote in [Table 4.19 High Frequency Crystal Oscillator on page 42](#) regarding programmable TIMEOUTSTEADY delay.
- Updated typical clock out current for HFRCODPLL in [Table 4.21 High Frequency RC Oscillator \(HFRCO\) on page 44](#).
- Added startup time footnote in [Table 4.19 High Frequency Crystal Oscillator on page 42](#) regarding programmable TIMEOUTSTEADY delay.
- Updated typical clock out current for HFRCODPLL in [Table 4.21 High Frequency RC Oscillator \(HFRCO\) on page 44](#).
- [4.14 Analog to Digital Converter \(IADC\)](#):
  - Added input sampling capacitance for 3X gain.
  - Added ADC clock limitations for 2X, 3X and 4X gain.
  - Added input sampling frequency, and updated footnote.
  - Updated the test conditions for PSRR and gain error.
- Consolidated [Table 6.2 GPIO Alternate Function Table on page 69](#) displaying support for dedicated functions across the different package options.

### Revision 1.1

June 2021

- Updated lowest energy mode for I2C0, IADC0 and EUART0 to EM3 in [3.13 Configuration Summary](#).
- Added footnote for crystal load capacitance with Gain=2 test condition in [4.12.2 Low Frequency Crystal Oscillator](#).
- Added timing specification for RESETn low time in [4.13 GPIO Pins \(3V GPIO pins\)](#).
- Added IADC 16 bit typical resolution and updated footnote in [4.14 Analog to Digital Converter \(IADC\)](#).
- Corrected clock reference to PCLK in [4.18 USART SPI Main Timing](#) and [4.19 USART SPI Secondary Timing](#).
- Added note regarding flexible power supply connections and additional application circuit in [5.1 Power](#).
- Corrected by removal IADC0.VREFN pinout from [6.2 Alternate Function Table](#); IADC0.VREFN connected internally to ground.
- Replaced select terms with inclusive lexicon.
- Minor formatting and styling updates, including TOC locations and boilerplate information throughout document.

### Revision 1.0

June, 2020

- [3.7.2 Cryptographic Accelerator](#): Removed text referencing DPA.
- [3.7.4 Secure Debug with Lock/Unlock](#): Removed text referencing Secure Element.
- [4.1 Electrical Characteristics](#):
  - Expanded Power Supply Pin Dependencies section to include more details and restrictions on DECOUPLE.
  - Finalized remaining MIN / MAX specifications according to characterization and qualification results.
  - Corrected BLE Bit Error Rate conditions for sensitivity measurements with 255 byte payload.
  - Added GPIO hysteresis specification.
  - Updated DCDC lifetime condition guidance in [4.4.1 DC-DC Operating Limits](#).
- Expanded IADC descriptions to include information at higher oversampling ratios and added typical performance curve.

**Revision 0.5**

February, 2020

- [1. Feature List](#): Updated list slightly to highlight different features.
- Removed references to non-BLE radio features.
- Expanded [3.7 Security Features](#) section and corrected security details.
- Added [3.9.2 Voltage Scaling](#) section.
- [4.1 Electrical Characteristics](#):
  - Additional characterization results and test limits added where available.
  - Removed thermistor driver specification table until full software support becomes available.
- Removed references and sections pertaining to packages other than QFN32.
- Updated [5.2 RF Matching Networks](#) section with recommended match values.

**Revision 0.4**

December, 2019

- Initial release.
