<p>890-2 Calibrator</p>	
<p>Sound pressure level calibrators are used before or after taking measurements with sound level meters and noise dosimeters.</p> <p>The 890-2 can adjust Simpson models 886-2 and 884-2 or other sound level meters with a 1" diameter Microphone. The 890-2 provides a constant 94 dB or 114 dB sound pressure level at 1 KHz (0 dB = 0.0002Mbar).</p> <p>Calibrator is immune to a wide range of temperature and humidity conditions while maintaining tight output level tolerances.</p>

Sound Level Systems

Simpson Type 2 sound level systems come in a variety of configurations to meet any noise measurement requirements. Each system is composed of several components designed to work together as one integrated test instrument and comes with the output jacks that will supply an AC RMS or DC Volt signal.

- **Meets IEC 651 and ANSI S1.4-1983 type 2 instruments.**
- **Meets OSHA and Walsh-Healy Noise Control Specifications**
- **Quickly and Accurately Measures Sound Levels in Factories, Offices, Etc.**
- **Full coverage 40-140 dB with special 85-115 dB OSHA range**
- **Impact-resistant case contoured to minimize sound energy field reflections**
- **Operates 40 hours on a 9V battery**
- **AC and DC voltage jacks for recorder, analyzer and tester Interface**
- **Built-in tripod mount**

884-2 & 886-2 Sound/Noise Measuring Systems

The American National Standards Institute (ANSI) provides for three weighting curves: "A", "B", and "C".

The "A" weighted curve more closely corresponds to the response of the ear and is specified by OSHA.

The "C" curve is essentially a "flat" frequency response and can be used in conjunction with a "fast" response for an approximate indication of impulse noise levels. Low Frequency noises are better monitored by the "C" curve than the "A" curve. Low frequency sounds need to be louder to be heard.

The chart below shows the relationship between frequency and relative response.
