# STOD2540

PMOLED display power supply

Features

- Inductor switches boost controller
- PFM mode control
- High efficiency over wide range of load (1 mA to 40 mA)
- Integrated load disconnect switch
- Over voltage protection with automatic restart
- Soft start with adjustable peak current limit
- Enable pin
- Low shutdown current
- Small external inductor
- Supply voltage from 3.0 V to 5.5 V

Application

- PMOLED display driver

Description

STOD2540 is dedicated to passive matrix OLED (PMOLED) displays for portable handsets and provides the pre-charge and biasing voltage of the column matrix driver as shown in figure 3. The current capability of STOD2540 allows feeding a 1", 1.3" or 1.5" color PMOLED. STOD2540 is a boost converter that operates from 3.0 V to 5.5 V and can provide an output voltage as high as 25 V. The output current capability is maximum 40 mA up to 25 V output voltage. The regulation is performed by a resistor divider network (figure 3) that detects the output voltage.

QFN8 (3 x 3 mm)
In this state-of-the-art boost converter, a DC current path exists between the battery source and the load. In order to reduce the consumption in shutdown mode, a high-side load isolation switch is necessary to cut this DC current path in standby mode. The load disconnect switch (LDS) act as an isolation switch in shutdown mode.

5   Functional description

5.1   Boost controller

STOD2540 is a boost converter operating in PFM (pulsed frequency modulation) mode. The converter monitors the output voltage through the bridge resistor divider R_1 and R_2 and when the feedback voltage falls below the reference voltage, REF2, the boost switch t_{SW} turns ON and the current ramps up. The inductor current is measured by detect the temperature compensated drain voltage of the boost MOSFET. The boost turns off when its drain voltage reaches the reference REF1, the main switch remains off until the minimum off time (300 ns typical) has passed and the feedback voltage is below the reference again. A maximum ON time of 4 μs prevent the switch t_{SW} to stay ON during a too long period of time.

In order to well calculate the bridge resistors values with a fixed V_O, the following formula can be used:

$(V_O / 1.24) -1 = R_1 / R_2$

5.2   Adjustable peak inductor current limit

The peak inductor current is monitored by sensing the drain voltage of the switch t_{SW}.

Since it exceeds the temperature compensated and supply voltage compensated reference REF1, the RS flip flop is reset and t_{SW} is turned OFF.

By connecting a resistance between the pin R_{SET} and GND, the peak current limit can be adjusted from 200 mA to 1.1 A (R_{SET} from 10 kΩ to 100 kΩ). When the pin R_{SET} is directly connected to V_I, the default value is 1 A.

5.3   Enable

The ENABLE pin is a high logic input signal and allows turning on/off the controller without cutting the input voltage from the boost regulator circuit. With a high input voltage (1.2 V < V_{EN} < V_I + 0.3 V) on this pin, the device is allowed to work normally. No pull-up or pull down is present on this pin.

5.4   OVP

If the regulation loop is cut, there is no signal at the feedback pin, the PFM controller will then continue to switch without control and generate an output voltage at the SW, V_{CAP} and V_O pin exceeding the breakdown value V_{BSW}, V_{BCAP} and V_{BO}.

The over voltage protection (OVP) senses the voltage at the V_{CAP} pin. When the voltage exceed the breakdown voltage of the device the controller is automatically turned off.

A hysteresis control enables the device to automatically restart when the output voltage drops below a 2 V typical value.

5.5 Load isolation switch

When the device is in shutdown mode, a DC current path always exists between the power source and the load; increasing the standby consumption. A high side switch LDS isolates the load from the source when the STOD2540 is disabled.

5.6 Efficiency

The total consumption of some PMOLED display, can be as low as 1 mA. In order to increase the battery run time of the device, STOD2540 offers a high efficiency over a wide range of load and input voltage range.

5.7 Under voltage lockout (UVLO)

The minimum supply voltage is 3.0 V, under this value the under voltage lockout circuit operates with typical threshold 2.8 V.

When supply voltage is below 3.0 V, possible noise in the supply line could disturb the UVLO circuit causing loss of output regulation. This behavior is eliminated choosing $C_I = 10$ µF or higher.

6 Typical application

Figure 3. Basic connection
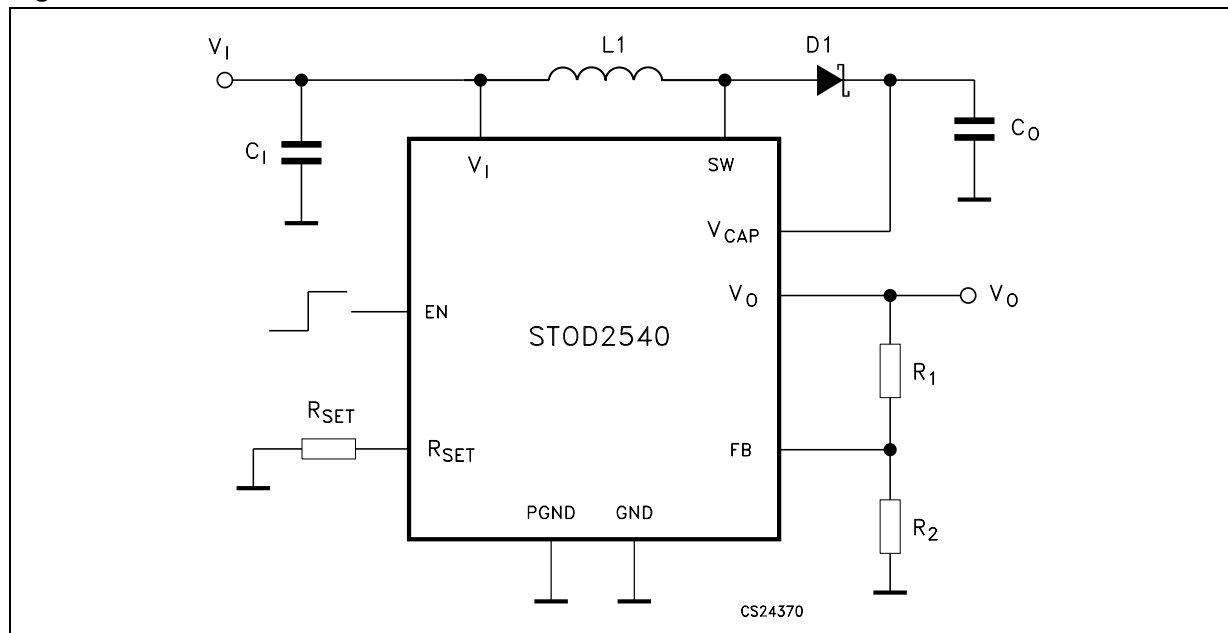

Table 6. External components (see *Figure 3*)

Symbol	Parameter	Test	Min.	Typ.	Max.	Unit
D	Boost schottky diode	VRRM	30			V
		V_F at I_F = 300 mA, T_J = 25 °C			0.5	V
		I_R at V_R = 10 V, T_J = 25 °C			30	μA
R_1	Feedback resistor			180		
R_2	Feedback resistor			10		kΩ
R_{SET}	Peak current limit adjust	I_{PK} = 200 mA to 1.1 A	10		100	
C_I	Input ceramic type low ESR	Ceramic type		4.7		μF
C_O	Output capacitance: ceramic low ESR	Capacitance	4.7			μF
		Voltage	42			V
		ESR			1.6	W
L	Boost inductor (height < 2mm)	Inductance			4.7	μH
		I_{SAT}, R_{SET} pin to V_I			1	A

Note: The external components suggested in this document should be considered as a design reference guide. The performances mentioned in the electrical characteristics table are not guaranteed for all the possible electrical parameters of the components included in this list. On other hand, the operation of STOD2540 is not limited to the use of components included in this list.
