Packages

Note: All packages are lead-free compliant

OMNIFET™	14
Voltage regulators	15
Door modules	16
Power management for automotive systems	18
Motor control ICs	20
Special devices	22
Reverse battery	22
Integrated solenoid driver - Injection gas system	23
Ignition drivers	23
Development support tools	24
Features	24
EZ-Boards: the easiest and smartest way to evaluate VIPOWER products	25
EZ-Boards for 12 V Smart Switches (M0-7)	25
EZ-Boards for 12 V Full Bridges (VNH5/VNH7)	26
EZ-Boards for 24 V Smart Switches (M0-5T)	26
Packages	27

Note: M0-7 High-side switches and OMNIFET III are to be preferred for new design-ins.

High-side switches

Fully-protected, high-side switches safely drive resistive, inductive and capacitive grounded loads in compliance with the stringent safety and reliability requirements of automotive applications.

ST's offer of automotive high-side switches is the broadest in the market, with an unmatched range of packages, on-resistances, number of output channels and diagnostic options. Based on its proprietary VIPower™ technology, ST's high-side switches have 3 V and 5 V CMOS compatible I/Os for control and vertical MOSFETs for the power outputs, and are the perfect companions for a microcontroller.

VIPOWER MO-7 SERIES

The MO-7 series is the ultimate VIPower product generation, born to deliver the widest range of on-state resistance and number of channels with full pin-to-pin compatibility in the smallest packages. Further application benefits are:

- Best-in-class EMI performance
- Best-in-class short circuit protections and robustness
- Lower quiescent current
- Precise load-current, battery voltage and device temperature analog feedback

VIPOWER MO-5 SERIES

The MO-5 series is the largest family of VIPower high-side switches developed to drive any kind of automotive load.

The devices are equipped with digital status or analog current sense feedback. Further advantages are available in the MO-5Enhanced options:

- Extended load compatibility due to higher current limitation
- Instantaneous diagnosis of short-to-ground or overload
- OFF-state diagnosis for the analog current sense option ('E' types)

Low-side switches

Fully-protected, low-side switches safely drive resistive, inductive and capacitive loads with one terminal connected to the battery, in compliance with the stringent safety and reliability requirements of automotive applications.

ST's low-side switches offer a power output plus control and diagnostic functionalities in one single chip and are available both in single- and dual-channel options.

OMNIFET III

Built in the VIPOWER M0-5 technology, the OMNIFET III series addresses a broad range of applications in tiny packages, delivering protection and diagnostic features. Key application benefits include:

- Low stand-by current consumption
- Overload and open-load diagnostic
- Optimized EMI performances
- Enhanced short circuit robustness

OMNIFET AND OMNIFET II

ST offers a wide portfolio of low-side switches suitable for any kind of automotive load and applications rated up to 70 V.

Door module drivers

ST's door module drivers family is designed for state-of-the-art automotive door electronics. Devices are characterized by a scalable actuator driving concept, which includes packages and software specially designed to satisfy a wide range of door module variants. Drivers support all regular door module loads such as lock motors, mirror levelling and foldering, defroster, electro-chromic mirror glass, window lift and several lighting functions from incandescent bulbs to LEDs.

Power management ICs for automotive systems

Power management ICs come with enhanced power supply functions and they include various standby modes as well as LIN and HS-CAN (also with HS-CAN supporting Partial Network) physical communication layers. They offer two low-drop voltage regulators to supply the system microcontroller and external peripheral loads (sensors) and provide superior system standby functionality with programmable local and remote wake-up capabilities. Other features, like high-side and low-side drivers or operational amplifiers, are embedded to increase the system integration level.

Motor Control ICs

Taking advantage from the proprietary VIPower™ silicon technology and from miniaturized packaging solutions, the VNH family of fully integrated H-bridges combines in single packages a matchless level of diagnostic and sensing capabilities together with solid protections and robust vertical structure MOSFETs making automotive DC motor control applications - ranging from a few up to hundreds of watts - more robust and compact.

Development support tools

TwisterSIM

TwisterSIM is a unique electro-thermal simulator that helps shorten the design solution cycle by enabling complex engineering evaluations. TwisterSIM is available for download at www.st.com/twistersim.

FEATURES

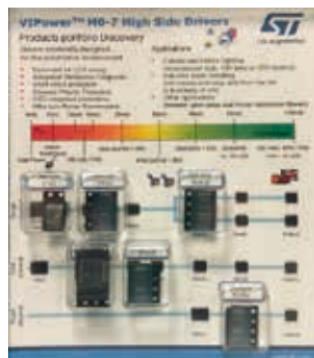

- Accurate dynamic simulations of load compatibility
- Wiring harness optimization
- Fault condition impact analysis
- Diagnostic behavior analysis
- Dynamic thermal performance

EZ-Boards

www.st.com/automotive_evalboards

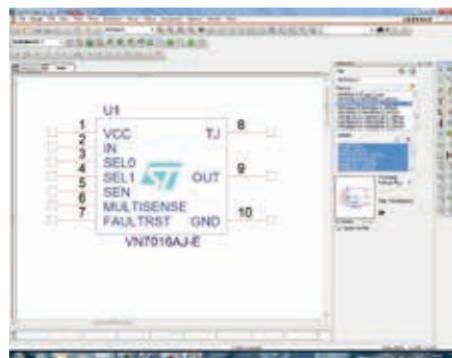

M0-7 sample kits

Order code: SAMPLEKITM0-7

OrCAD models

www.st.com/automotive-hwmodels

EZ-Boards: the easiest and smartest way to evaluate VIPower products

- Get your application's trials faster
- Cut evaluation costs
- Excellent thermal performances
