

Dual line programmable transient voltage suppressor for SLIC protection

Datasheet - production data

Features

- Dual line programmable transient voltage suppressor with separated gates
- Wide negative firing voltage range: $V_{Gn} = -175\text{ V max.}$
- Low dynamic switching voltages: V_{FP} and V_{DGL}
- Low gate triggering current: $I_{GT} = 5\text{ mA max}$
- Peak pulse current: $I_{PP} = 40\text{ A (5/310 }\mu\text{s)}$
- Holding current: $I_H = 150\text{ mA min.}$

Benefits

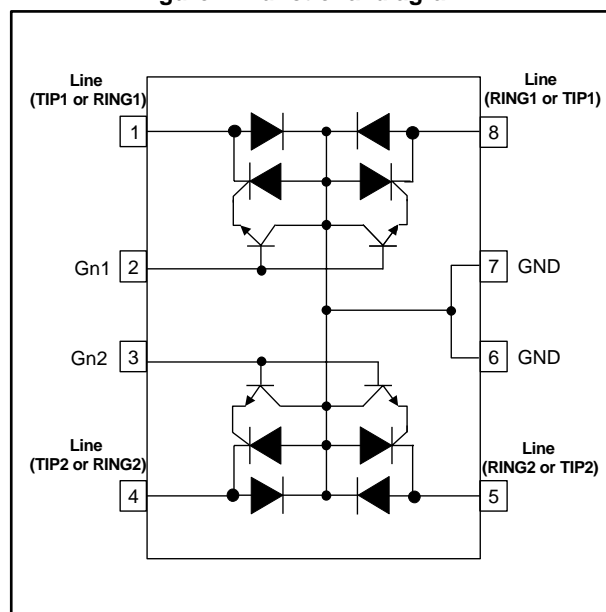

- A Trisil™ is not subject to ageing and provides a fail safe mode in short circuit for a better protection.
- Trisils are used to help equipment to meet various standards such as UL1950, IEC 60950 / CSA C22.2, UL1459 and TIA-968-A (formerly FCC part 68).
- Trisils have UL94 V0 resin approved (Trisils are UL497B approved - file: E136224).

Description

This device has been especially designed to protect 2 new high voltage, as well as classical SLICs, against transient overvoltages.

Positive overvoltages are clamped by 2 diodes. Negative surges are suppressed by 2 thyristors, their breakdown voltage being referenced to $-V_{BAT}$ through the gate. Separated gates allow the SLICs to be supplied by two different voltages.

Notes:

⁽¹⁾The rated current values may be applied either to the Ring to GND or to the Tip to GND terminal pairs. Additionally, the four terminal pairs may have their rated current values applied simultaneously (in this case the GND terminal current will be four times the rated current value of an individual terminal pair)

2 Technical information

The LCDP1521S is particularly optimized for the new telecom applications such as the fiber in the loop, the WLL, the remote central office. In this case, the operating voltages are smaller than in the classical system. This makes the high voltage SLICs particularly suitable. The schematics of [Figure 4: "Protection of high voltage SLICs"](#) shows the topologies most frequently used for these applications.
