## APPLICATION SUGGESTION

The recommended values of the components are those shown on application circuit of figure 1. Different values can be used; the following table can help the designer.

Component	Recomm. Value	Purpose	Larger Than	Smaller Than
R1 and R3	1.5K $\Omega$	Close loop gain setting (*)	Increase of gain	Decrease of gain
R2 and R4	47 $\Omega$	Close loop gain setting (*)	Decrease of gain	Increase of gain
R5 and R6	4.7 $\Omega$	Frequency stability	Danger of oscillations	
C1 and C2	100nF	Input DC decoupling	Higher SVR	Higher low frequency cutoff
C3	47 $\mu$ F	- Ripple Rejection - Mute time constant	Increase of the Switch-on time	- Degradation of SVR - Worse turn-off pop by muting
C4	100nF	Supply Voltage Bypass		Danger of oscillations
C5	1000 $\mu$ F	Supply Voltage Bypass		
C6 and C7	47 $\mu$ F	Feedback input DC decoupling	Increase of the Switch-on time	Decrease of the Switch-on time
C8 and C9	0.1 $\mu$ F	Frequency stability		Danger of oscillations
C10 and C11	1000 $\mu$ F	Output DC decoupling		Higher low-frequency cut-off

(\*) Closed loop gain must be higher than 26dB

## BUILT-IN PROTECTION SYSTEMS

### THERMAL SHUT-DOWN

The presence of a thermal limiting circuit offers the following advantages:

- 1-an overload on the output (even if it is permanent), or an excessive ambient temperature can be easily withstood.
- 2-the heatsink can have a smaller factor of safety compared with that of a conventional

circuit. There is no device damage in the case of excessive junction temperature; all that happens is that  $P_o$  (and therefore  $P_{tot}$ ) and  $I_o$  are reduced.

### SHORT CIRCUIT (AC CONDITIONS)

The TDA7263M can withstand accidental short circuits across the speaker made by a wrong connection during normal play operation.
