1. Product Description

X10/15/20 DC-DC CONVERTERS: The X series DC-DC converters provide regulated output at power levels up to 20 watts. It accepts a wide range DC input and provides a fully isolated, regulated output. In forced air applications, full output power can be maintained as long as the case temperature, as measured per figure 4, is maintained at less than or equal to 100°C.

2. Electrical Specifications

Table 1. Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the Table 1. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Parameter	Module	Symbol	Min	Typ	Max	Unit
Input Voltage:						
Continuous	X10/15/20-24	Vi	0	—	50	Vdc
	X10/15/20-48	Vi	0	—	80	Vdc
Transient (100 ms)	X10/15/20-48	Vi, trans	0	—	100	V
Operating Case Temperature	All	Tc	-40	—	105*	°C
Storage Temperature	All	Tstg	-55	—	125	°C
I/O Isolation	All	—	—	—	1500	Vdc

*Maximum case temperature varies based on power dissipation. Refer to the Section 12 for all characteristic charts.

Fusing Considerations

CAUTION: This power module is not internally fused. An input line fuse must always be used.

The safety agencies require a normal-blow, dc fuse with a maximum rating of 5 A (see Safely Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

IMPORTANT LIMITATIONS OF USE

Lambda products are not authorized for use as critical components in nuclear control systems, life support systems or equipment for use in hazardous environments without the express written approval of the Managing Director/President of the Lambda Group manufacturer of the product concerned.

Table 2. Input Specifications

Parameter	Module	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	X10/15/20-24	V_i	18	24	36	Vdc
	X10/15/20-48	V_i	36	48	75	Vdc
Maximum Input Current ($V_i=0$ to V_i, max ; $I_o=I_o, \text{max}$;	X10/15/20-24	$I_{i, \text{max}}$	—	—	1.6	A
	X10/15/20-48	$I_{i, \text{max}}$	—	—	800	mA
Inrush Transient	All	I_{2t}	—	—	0.2	A $\cdot$ s
Undervoltage Lockout	X10/15/20-24	V_{uvlo}	11	14	—	V
	X10/15/20-48	V_{uvlo}	20	27	—	V
Input reflected-ripple Current (5 Hz to 20 MHz; 12 μ H source impedance;	All	I_i	—	7	—	mAp-p
Input Ripple Rejection (100 Hz-120 Hz)	All	—	—	45	—	dB

* Refer to Section 12 all characteristic charts.

3. Outline Diagram/Recommended Hole Pattern

Dimensions are in inches and mm. Tolerance: .xx ± 0.01 (.25 mm), .xxx ± .005 (.13 mm)

If slightly lower height is needed, the four standoffs can be dropped through holes on the user's PWB. By dropping the standoffs through the PWB, the module height will be decreased to 9.5 mm (0.375 in.) typical height.

Unless specified as an option, all units come with the standard pin .230 [5.84] + 0.010 [.25].

Maximum Height including tolerance is 0.405"

Pin	Function	Pin	Function
P1	Vi(-)	P4	Vo(+) or Vo1(+)
P2	Vi(+)	P5	COMMON (dual outputs) or TRIM (optional on single outputs) Pin is not present on single outputs unless option is specified. Pin is always present on dual outputs.
P3	ON/OFF (optional) Pin is not present unless option is specified.	P6	Vo(-) or Vo2(-)

4. Part Number Description

Positive logic remote on/off, output voltage adjustment and short pin [2.8mm $\pm$.25 mm (0.110 in. $\pm$ 0.010 in.)]*	/PT2
Negative Logic remote on/off and short pin [2.8mm $\pm$.25 mm (0.110 in. $\pm$ 0.010 in.)]	/N2
Negative logic remote on/off and output voltage adjustment*	/NT
Negative logic remote on/off, output voltage adjustment and short pin [2.8mm $\pm$.25 mm (0.110 in. $\pm$ 0.010 in.)]*	/NT2

5. Design Considerations

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. If the source inductance exceeds 4 mH, a 33 μ F electrolytic capacitor (ESR < 0.7 Ω at 100 kHz) mounted close to the power module helps ensure stability of the unit.

6. Safety Considerations

Units are components within customers end-use system. Input to converter is 75VDC maximum. For safety agency approval of the end use system to safety standards (such as UL-1950 Third Edition, CAN CSA C22.2 No. 950-95, DIN EN60950/VDE 0805: 1997-11+A11:1998-08 and IEC 60950:1991 +A1:1992 +A2:1993 +A3:1995 +A4:1996, EN60950:1992 +A1:1993 +A2:1993 +A3:1995 +A4:1997 +A11:1997 the following considerations has to be made:

- a) If the input meets all the requirements for ELV, then the output may be considered ELV
- b) If the input meets all the requirements for SELV, then the output may be considered SELV
- c) If the input meets all the requirements for TNV, then the output may be considered TNV

The input and output are to be both floating or both grounded. The converter is to be protected by a 5 Amp fuse, provided in the ungrounded leg. The CE mark on the product is applied to show conformance to the requirements outlined in the European Union's Low Voltage Directive (72/23/EEC) as amended by the CE mark directive (93/68/EEC). Any NON-SELV input must be provided with reinforced insulation from any other hazardous voltages, including the ac mains, and must have a SELV reliability test performed on it in combination with the converter.

Anmerkungen (Notes)

1. Die maximale Umgebungstemperatur betraegt 70°C.
(Maximum operating temperature 70°C).
2. Überstrom Schutz in dem nicht geerdeten Teil des Eingangsbereichs sollte im End-Produkt vorhanden sein.
Empfohlener Sicherungswert: F 5.0 A.

(Overcurrent protection in the ungrounded side of the input supply, shall be provided in the end product.
Recommended fuse: F 5.0 AH)
Nenndaten (Fuse rating): F5.0A H 250V.

Warnung: Fuer kontinuierlichen Feuerschutz, sollten die Sicherungen nur mit einer gleichen Typs und der gleichen
Einstufung ersetzt werden .
(Warning: For continued protection against fire, replace with same type and rating of fuse).
3. Das Schaltnetzteil ist ein Geraet der Schutzklasse 1.
(Power supply is class 1 equipment).
4. Das Netzteil ist nur zum Einbau fuer IT- Geräte nach EN 60950 bestimmt.
(Power supply is EN60950 equipment. End user to meet all EN60950 requirements when installing power supply into end use product).

1. Feature Descriptions

Output Overvoltage Clamp

The output overvoltage clamp consists of control circuitry, independent of the primary regulation loop that monitors the voltage on the output terminals. This control loop has a higher voltage set point than the primary loop (see Feature Specifications table). In a fault condition, the overvoltage clamp ensures that the output voltage does not exceed $V_{o, \text{clamp, max}}$. This provides a redundant voltage-control that reduces the risk of output overvoltage.

Current Limit

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit exhibits tailout characteristics (output-current increase). The unit operates normally once the output current is brought back into its specified range.

Remote On/Off (Optional)

Two remote on/off options are available:

- Device code suffix/P, positive logic remote on/off, turns the module on during a logic-high voltage on the remote ON/OFF pin, and off during a logic low.
- Device code suffix/N, negative logic remote on/off, turns the module off during a logic high and on during a logic low.

To turn the power module on and off, the user must supply a switch to control the voltage between the on/off terminal and the V_i (-) terminal ($V_{on/off}$). The switch may be an open collector or equivalent (see figure 1). A logic low is $V_{on/off} = -0.7 \text{ V to } +1.2 \text{ V}$. The maximum $I_{on/off}$ during a logic low is 1mA. The switch should maintain a logic-low voltage while sinking 1 mA.

During a logic high, the maximum $V_{on/off}$ generated by the power module is 10 V. The maximum

allowable leakage current of the switch at $V_{on/off} = 10\text{ V}$ is $50\text{ }\mu\text{A}$.

The module has internal capacitance to reduce noise at the ON/OFF pin. Additional capacitance is not generally needed and may degrade the start-up characteristics of the module.

Figure 1. Remote On/Off Implementation

Output Voltage Adjustments (optional on Single-Output Units)

Output voltage set-point adjustment allows the user to increase or decrease the output voltage set point of a module. This is accomplished by connecting an external resistor between the Trim pin and either the $V_o(+)$ or $V_o(-)$ pins. With an external resistor between the TRIM and $V_o(+)$ pins ($R_{adj-down}$), the output voltage set point ($V_{o,adj}$) decreases (see Figure 2). The following equation determines the required external resistor value to obtain an output voltage change from $V_{o,nom}$ to $V_{o,adj}$:

$$R_{adj-down} = \frac{(V_{o,adj} - L) * G}{(V_{o,nom} - V_{o,adj})} - H$$

Where $R_{adj-down}$ is the resistance value connected between TRIM and $V_o(+)$, and G , H , and L are defined in the following table.

Figure 2. Circuit Configuration to Decrease Output Voltage

With an external resistor between the TRIM and Vo(-) pins (Radj-up), the output voltage set point (Vo,adj) increases (see Figure 3). The following equation determines the required external resistor value to obtain an output voltage from Vo,nom to Vo,adj:

$$R_{\text{adj-up}} = \left[\left[\frac{G-L}{((V_{o,\text{adj}} - L) - K)} \right] - H \right] \Omega$$

where Radj-up is the resistance value connected between TRIM and Vo (-), and the values of G, H, K, and L are shown in the following table:

	G	H	K	L
X15-S1.8	5110	2050	.54	1.25
X15 S2.0	5110	2050	.77	1.25
X15 S2.5	5110	2050	1.25	1.25
X15 S03	5110	2050	.77	2.5
X15 S05	5110	2050	2.5	2.5
X15-S12	10000	5110	9.5	2.5

The combination of the output voltage adjustment and the output voltage tolerance cannot exceed 110%

(115% for the S1.8,S02,S2.5) of the nominal output voltage between the $V_o(+)$ and $V_o(-)$ terminals.

Figure 3. Circuit Configuration to Increase Output Voltage.

The X series power modules have a fixed current-limit set point. Therefore, as the output voltage is adjusted down, the available output power is reduced. In addition, the minimum output current is a function of the output voltage. As the output voltage is adjusted down, the minimum required output current can increase (i.e. minimum power is constant).

8. Thermal Considerations

The power module operates in a variety of thermal environments; however, sufficient cooling should be provided to help ensure reliable operation of the unit. Heat-dissipating components inside the unit are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the case temperature. The case temperature (T_c) should be measured at the position indicated in Figure 4

Figure 4. X10/15 Case Temperature Measurement Location

Note that the view in Figure 4 is of the surface of the module. The temperatures at this location should

not exceed the maximum case temperature indicated on the derating curve. The output power of the module should not exceed the rated power for the module as listed in the ordering information table.

9. Layout Considerations

Copper paths must not be routed beneath the power module standoffs.

10. Test Configurations

Figure 5. Input reflected Ripple Test Setup.

Note: Input reflected ripple current is measured with a simulated source impedance of 12μH. Capacitor Cs offsets possible battery impedance. Current is measured at the input of the module.

Figure 6. Peak to Peak Output Noise Measurement Test Setup for Single Output Units.

Note: Use two 0.47μF ceramic capacitors. Scope measurement should be made using a BNC socket. Position the load between 50 mm and 75mm (2in and 3in.) from the module.

Figure 7. Output Voltage and Efficiency Measurement Test Setup for Single Output Units.

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

Figure 8. Peak to Peak Output Noise Measurement Test Setup for Dual Output Units.

Note: Use two 0.47μF ceramic capacitors. Scope measurement should be made using a BNC socket. Position the load between 50mm and 75mm (2in. And 3in.) from the module.

$$\eta = \left[\frac{\sum_{j=1}^2 [V_{oj} - COM] I_{oj}}{[V_I(+)-V_I(-)] I_i} \right] \times 100$$

Figure 9. Output Voltage and Efficiency Measurement Test Setup for Dual Output Units.

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

22 Recommended EMI Filter

The following table allows to specify EMI compliance necessary to meet EN55022 Level B.

24V Input Models					48V Input Models			
	Value	Rating	Vendor	Part #	Value	Rating	Vendor	Part #
C1,C2	22uF	100V	Nichicon	UPJ2A220MPH	22uF	100V	Nichicon	UPJ2A220MPH
L1	10uH	1.4A	TDK	SLF7032T-100M1R4-2	10uH	1.4A	TDK	SLF7032T-100M1R4-2

12. Characteristic Curves Index

Characteristic Charts. All figures and waveforms reflect typical performance of models. Use the chart below to locate the applicable performance chart based on the particular model of interest.
