

TOSHIBA BiCD Integrated Circuit Silicon Monolithic

# **TB62262FTAG**

## **CLK-in controlled Bipolar Stepping Motor Driver**

The TB62262FTAG is a two-phase bipolar stepping motor driver using a PWM chopper. A CLK-in decoder is incorporated. Fabricated with the BiCD process, rating is 40 V/1.5 A.

### **Features**

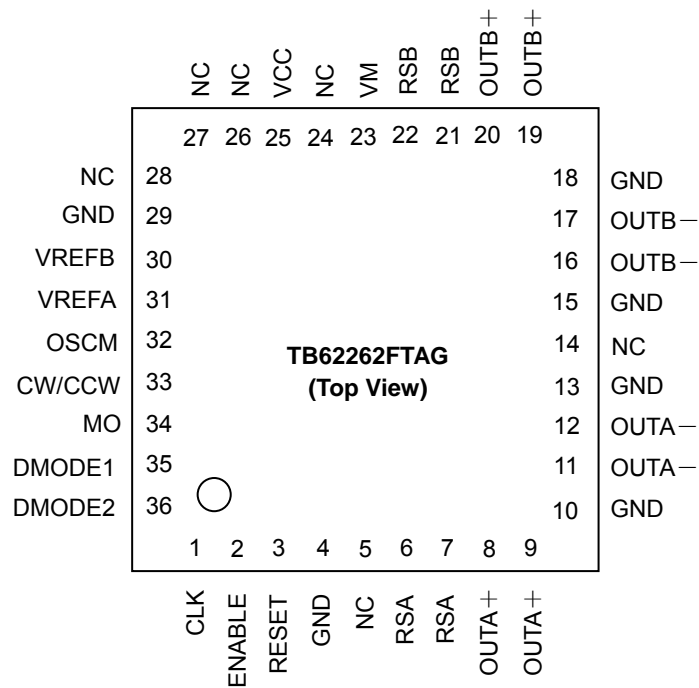

- BiCD process integrated monolithic IC.
- Capable of controlling 1 bipolar stepping motor.
- PWM controlled constant-current drive.
- Allows full, half, quarter step operation.
- Low on-resistance (High + Low side =  $0.8\ \Omega$  (typ.)) MOSFET output stage.
- High voltage and current (For specification, please refer to absolute maximum ratings and operation ranges)
- Error detection (TSD/ISD) signal output function
- Built-in error detection circuits (Thermal shutdown (TSD), over-current shutdown (ISD), and power-on reset (POR))
- Built-in VCC regulator for internal circuit use.
- Chopping frequency of a motor can be customized by external resistor and capacitor.
- Package  
TB62262FTAG: P-WQFN36-0606-0.50-002

Weight: 0.10 g (typ.)

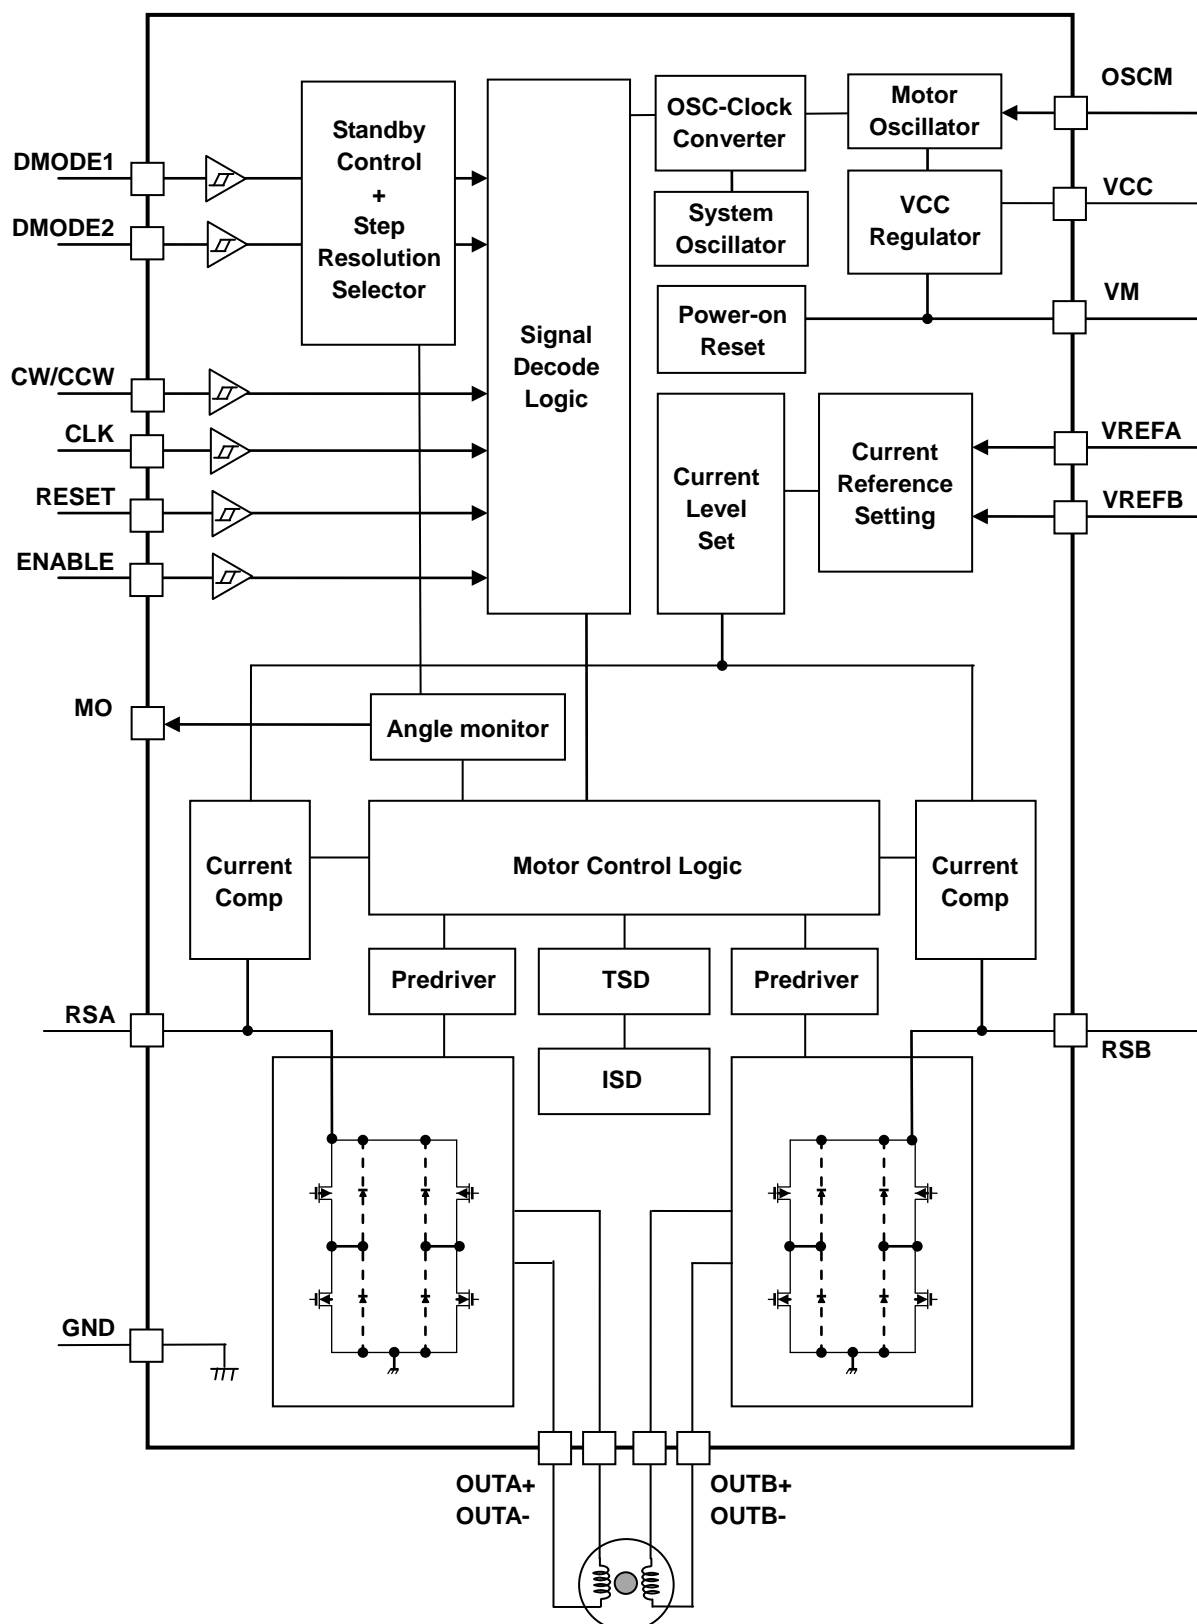

Note: Please be careful about thermal conditions during use.

Pin assignment (TB62262FTAG)

Please mount the four corner pins of the QFN package and the exposed pad to the GND area of the PCB.

TB62262FTAG Block diagram

Functional blocks/circuits/constants in the block chart etc. may be omitted or simplified for explanatory purposes.

**Notes**

All the grounding wires of the TB62262FTAG must run on the solder mask on the PCB and be externally terminated at only one point. Also, a grounding method should be considered for efficient heat dissipation.

Careful attention should be paid to the layout of the output, VM and GND traces, to avoid short circuits across output pins or to the power supply or ground. If such a short circuit occurs, the device may be permanently damaged.

Also, the utmost care should be taken for pattern designing and implementation of the device since it has power supply pins (VM, RS, OUT, GND) through which a particularly large current may run. If these pins are wired incorrectly, an operation error may occur or the device may be destroyed.

The logic input pins must also be wired correctly. Otherwise, the device may be damaged owing to a current running through the IC that is larger than the specified current.

## Pin explanations

### TB62262FTAG (QFN36)

| Pin No. | Pin Name  | Function   |
|---------|-----------|--|
| 1       | CLK       | CLK signal input pin                               |
| 2       | ENABLE    | Ach/Bch output stage ON/OFF control pin            |
| 3       | RESET     | Electric angle reset pin                           |
| 4       | GND       | Ground pin   |
| 5       | NC        | Non-connection pin                                 |
| 6       | RSA (*)   | Motor Ach current sense pin                        |
| 7       | RSA (*)   | Motor Ach current sense pin                        |
| 8       | OUTA+ (*) | Motor Ach (+) output pin                           |
| 9       | OUTA+ (*) | Motor Ach (+) output pin                           |
| 10      | GND       | Ground pin   |
| 11      | OUTA- (*) | Motor Ach (-) output pin                           |
| 12      | OUTA- (*) | Motor Ach (-) output pin                           |
| 13      | GND       | Ground pin   |
| 14      | NC        | Non-connection pin                                 |
| 15      | GND       | Ground pin   |
| 16      | OUTB- (*) | Motor Bch (-) output pin                           |
| 17      | OUTB- (*) | Motor Bch (-) output pin                           |
| 18      | GND       | Ground pin   |
| 19      | OUTB+ (*) | Motor Bch (+) output pin                           |
| 20      | OUTB+ (*) | Motor Bch (+) output pin                           |
| 21      | RSB (*)   | Motor Bch current sense pin                        |
| 22      | RSB (*)   | Motor Bch current sense pin                        |
| 23      | VM        | Motor power supply pin                             |
| 24      | NC        | Non-connection pin                                 |
| 25      | VCC       | Internal VCC regulator monitor pin                 |
| 26      | NC        | Non-connection pin                                 |
| 27      | NC        | Non-connection pin                                 |
| 28      | NC        | Non-connection pin                                 |
| 29      | GND       | Ground pin   |
| 30      | VREFB     | Motor Bch output set pin                           |
| 31      | VREFA     | Motor Ach output set pin                           |
| 32      | OSCM      | Oscillating circuit frequency for chopping set pin |
| 33      | CW/CCW    | Motor rotation direction set pin                   |
| 34      | MO        | Electric angle monitor pin                         |
| 35      | DMODE1    | Step resolution set pin no.1                       |
| 36      | DMODE2    | Step resolution set pin no.2                       |

•Please do not run patterns under NC pins.

\*: Please connect the pins with the same pin name.

## Equivalent circuit (TB62262FTAG)

The equivalent circuit diagrams may be simplified or some parts of them may be omitted for explanatory purposes.

## Function explanation (Stepping motor)

### 1. CLK Function

Each up-edge of the CLK signal will shift the motor's electrical angle per step.

| CLK Input | Function   |
|-----------|--|
| Up-edge   | Shifts the electrical angle per step.            |
| Down-edge | (State of the electrical angle does not change.) |

### 2. ENABLE function

The ENABLE pin controls the ON and OFF of the corresponding output stage. This pin serves to select if the motor is stopped in Off (High impedance) mode or activated. Please set the ENABLE pin to 'L' during VM power-on and power-off sequence.

| ENABLE Input | Function                                  |
|--------------|---|
| H            | Output stage='ON' (Normal operation mode) |
| L            | Output stage='OFF' (High impedance mode)  |

### 3. CW/CCW function and the output pin function (Output logic at the time of a charge start)

The CW/CCW pin controls the rotation direction of the motor. When set to 'Clockwise', the current of OUTA is output first, with a phase difference of 90°. When set to 'Counter clockwise', the current of OUTB is output first with a phase difference of 90°.

| CW/CCW Input                         | OUT (+) | OUT (-) |
|--------------------------------------|---------|---------|
| H : Clockwise operation(CW)          | H       | L       |
| L : Counter clockwise operation(CCW) | L       | H       |

### 4. Step resolution select function

| DMODE1 | DMODE2 | Function  |
|--------|--------|---|
| L      | L      | Standby mode (the OSCM is disabled and the output stage is set to 'OFF' status) |
| L      | H      | Full step resolution  |
| H      | L      | Half step resolution  |
| H      | H      | Quarter step resolution   |

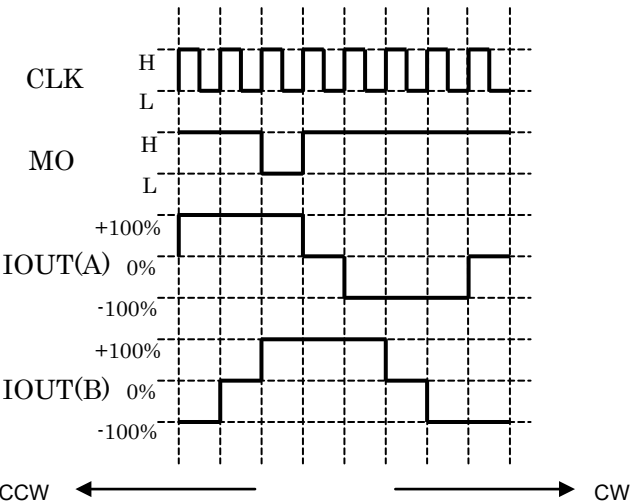

When switching the DMODE1, 2; setting the RESET signal to Low (will set the electrical angle to the initial status), is recommended.

Step resolution setting and initial angle

[Full step resolution]

[Half step resolution]

MO output shown in the timing chart is when the MO pin is pulled up.  
Timing charts may be simplified for explanatory purpose.

[Quarter step resolution]

MO output shown in the timing chart is when the MO pin is pulled up.  
Timing charts may be simplified for explanatory purpose.

5. RESET function

| RESET Input | Function  |
|-------------|---|
| H           | Sets the electrical angle to the initial condition. |
| L           | Normal operation mode                               |

The current for each channel (while RESET is applied) is shown in the table below. MO will show 'L' at this time.

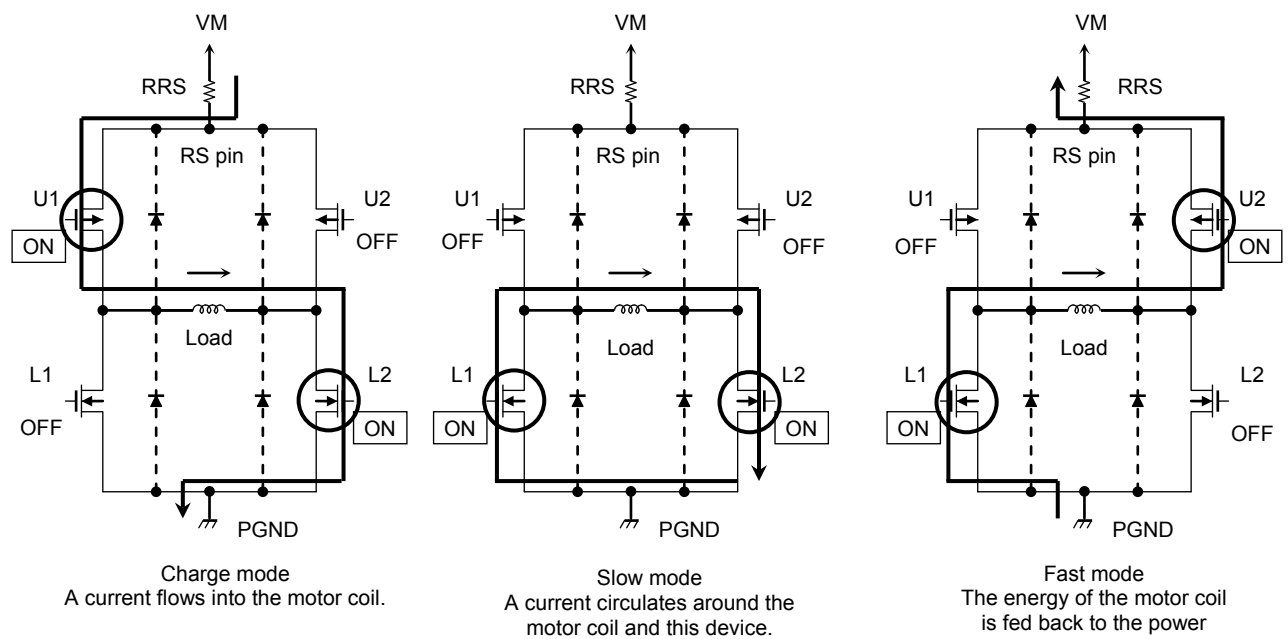

| Step resolution setting | Ach current setting | Bch current setting | Default electrical angle |
|-------------------------|---------------------|---------------------|--------------------------|
| Full step               | 100%                | 100%                | 45°                      |
| Half step               | 100%                | 100%                | 45°                      |
| Quarter step            | 71%                 | 71%                 | 45°                      |

Mixed Decay Mode /Detecting zero point

Note: When the motor current reaches the 0A level, the output transistor will turn to “Hi-Z” status.

Output transistor function mode

Output transistor function

| MODE   | U1  | U2  | L1  | L2  |
|--------|-----|-----|-----|-----|
| CHARGE | ON  | OFF | OFF | ON  |
| SLOW   | OFF | OFF | ON  | ON  |
| FAST   | OFF | ON  | ON  | OFF |

Note: This table shows an example of when the current flows as indicated by the arrows in the figures shown above. If the current flows in the opposite direction, refer to the following table.

| MODE   | U1  | U2  | L1  | L2  |
|--------|-----|-----|-----|-----|
| CHARGE | OFF | ON  | ON  | OFF |
| SLOW   | OFF | OFF | ON  | ON  |
| FAST   | ON  | OFF | OFF | ON  |

This IC controls the motor current to be constant by 3 modes listed above.

The equivalent circuit diagrams may be simplified or some parts of them may be omitted for explanatory purposes.

## Calculation of the Predefined Output Current

For PWM constant-current control, this IC uses a clock generated by the OSCM oscillator.

The peak output current (Setting current value) can be set via the current-sensing resistor (RS) and the reference voltage (Vref), as follows:

$$I_{OUT(max)} = V_{ref(gain)} \times \frac{V_{ref(V)}}{R_{RS}(\Omega)}$$

Vref(gain) : the Vref decay rate is 1/ 5.0 (typ.)

For example: In the case of a 100% setup

when Vref = 3.0 V, Torque = 100%, RS = 0.51 Ω, the motor constant current (Setting current value) will be calculated as:

$$I_{OUT} = 3.0V / 5.0 / 0.51\Omega = 1.18 A$$

## Calculation of the OSCM oscillation frequency (chopper reference frequency)

An approximation of the OSCM oscillation frequency (fOSCM) and chopper frequency (fchop) can be calculated by the following expressions.

$$f_{OSCM} = 1/[0.56 \times \{C_x(R1+500)\}]$$

\*C,R1: External components for OSCM (C = 270 pF, R1 = 3.6 kΩ=> fOSCM = 1.6 MHz (Typ.))

$$f_{chop} = f_{OSCM} / 16$$

\*fOSCM = 1.6 MHz => fchop = About 100 kHz

If chopping frequency is raised, Rippl of current will become small and wave-like reproducibility will improve. However, the gate loss inside IC goes up and generation of heat becomes large.

By lowering chopping frequency, reduction in generation of heat is expectable. However, Rippl of current may become large. It is a standard about about 70 kHz. A setup in the range of 50 to 100 kHz is recommended.

## Absolute Maximum Ratings (Ta = 25°C)

| Characteristics             | Symbol  | Rating     | Unit | Remarks                  |
|-----------------------------|---------|------------|------|--------------------------|
| Motor power supply          | VM      | 40         | V    | —                        |
| Motor output voltage        | Vout    | 40         | V    | —                        |
| Motor output current        | IOUT    | 1.5        | A    | (Note 1)                 |
| Internal Logic power supply | VCC     | 6.0        | V    | When externally applied. |
| Logic input voltage         | VIN(H)  | 6.0        | V    | —                        |
|                             | VIN(L)  | -0.4       | V    | —                        |
| MO output voltage           | VMO     | 6.0        | V    | —                        |
| MO Inflow current           | IMO     | 30         | mA   | —                        |
| Vref reference voltage      | Vref    | 5.0        | V    | —                        |
| Power dissipation           | WQFN36  | PD         | 1.3  | W                        |
| Operating temperature       | TOPR    | -20 to 85  | °C   | —                        |
| Storage temperature         | TSTG    | -55 to 150 | °C   | —                        |
| Junction temperature        | Tj(max) | 150        | °C   | —                        |

Note 1: Usually, the maximum current value at the time should use 70% or less of the absolute maximum ratings for a standard on thermal rating. The maximum output current may be further limited in view of thermal considerations, depending on ambient temperature and board conditions. (It will depend on the heat generation.)

Note 2: Device alone (Ta = 25°C)

When Ta exceeds 25°C, it is necessary to do the derating with 10.4 mW/°C.

Ta: Ambient temperature

Topr: Ambient temperature while the IC is active

Tj: Junction temperature while the IC is active. The maximum junction temperature is limited by the thermal

shutdown (TSD) circuitry. It is advisable to keep the maximum current below a certain level so that the maximum junction temperature, Tj (MAX), will not exceed 120°C.

### Caution) Absolute maximum ratings

The absolute maximum ratings of a semiconductor device are a set of ratings that must not be exceeded, even for a moment. Do not exceed any of these ratings.

Exceeding the rating(s) may cause device breakdown, damage or deterioration, and may result in injury by explosion or combustion.

The value of even one parameter of the absolute maximum ratings should not be exceeded under any circumstances. The TB62262FTAG does not have overvoltage detection circuit. Therefore, the device is damaged if a voltage exceeding its rated maximum is applied.

All voltage ratings, including supply voltages, must always be followed. The other notes and considerations described later should also be referred to.

### (For reference) PD-Ta graph

#### PD - Ta

## Operation Ranges (Ta=-20 to 85°C)

| Characteristics       | Symbol       | Min | Typ. | Max | Unit | Remarks                |
|-----------------------|--------------|-----|------|-----|------|------------------------|
| Motor power supply    | VM           | 10  | 24   | 35  | V    | —                      |
| Motor output current  | IOOUT        | —   | 0.8  | 1.2 | A    | (Note 1)               |
| Logic input voltage   | VIN(H)       | 2.0 | —    | 5.5 | V    | Logic input High Level |
|                       | VIN(L)       | 0   | —    | 0.8 | V    | Logic input Low Level  |
| MO output pin voltage | VMO          | —   | 3.3  | 5.0 | V    | —                      |
| CLK input frequency   | fCLK         | —   | —    | 100 | kHz  | —                      |
| Chopper frequency     | fchop(range) | 40  | 70   | 150 | kHz  | —                      |
| Vref input voltage    | Vref         | GND | 2.0  | 3.6 | V    | —                      |

Note 1: Maximum current for actual usage may be limited by the operating circumstances such as operating conditions (exciting mode, operating time, and so on), ambient temperature, and heat conditions (board condition and so on).

## Electrical Specifications 1 (Ta = 25°C, VM = 24 V, unless specified otherwise)

| Characteristics                                    |           | Symbol   | Test condition                                       | Min | Typ. | Max | Unit |

| Motor output ON-resistance<br>(High-side+Low-side) |           | Ron(H+L) | Tj = 25°C, Forward direction<br>(High-side+Low-side) | —   | 0.8  | 1.2 | Ω    |

Note: VIN (H) is defined as the VIN voltage that causes the outputs (OUTA, OUTB) to change when a pin under test is gradually raised from 0 V. VIN (L) is defined as the VIN voltage that causes the outputs (OUTA, OUTB) to change when the pin is then gradually lowered from 5 V. The difference between VIN (H) and VIN (L) is defined as the VIN (HYS).

Note: When the logic signal is applied to the device whilst the VM power supply is not asserted; the device is designed not to function, but for safe usage, please apply the logic signal after the VM power supply is asserted and the VM voltage reaches the proper operating range.

**Electrical Specifications 2 (Ta =25°C, VM = 24 V, unless specified otherwise)**

| Characteristics                                | Symbol     | Test condition | Min   | Typ.  | Max   | Unit |
|--|------------|----------------|-------|-------|-------|------|
| Vref input current                             | Iref       | VREF = 2.0 V   | —     | 0     | 1     | μA   |
| VCC voltage                                    | VCC        | ICC = 5.0 mA   | 4.75  | 5.0   | 5.25  | V    |
| VCC current                                    | ICC        | VCC = 5.0 V    | —     | 2.5   | 5     | mA   |
| Vref gain rate                                 | Vref(gain) | Vref = 2.0 V   | 1/5.2 | 1/5.0 | 1/4.8 | —    |
| Thermal shutdown(TSD) threshold (Note1)        | TjTSD      | —              | 145   | 160   | 175   | °C   |
| VM recovery voltage                            | VMR        | —              | 7.0   | 8.0   | 9.0   | V    |
| Over-current detection (ISD) threshold (Note2) | ISD        | —              | 2.1   | 3.0   | 4.0   | A    |

**Note1: About TSD**

When the junction temperature of the device reached the TSD threshold, the TSD circuit is triggered; the internal reset circuit then turns off the output transistors. Noise rejection blanking time is built-in to avoid misdetection. Once the TSD circuit is triggered, the device will be set to standby mode, and can be cleared by reasserting the VM power source, or setting the DMODE pins to standby mode. The TSD circuit is a backup function to detect a thermal error, therefore is not recommended to be used aggressively.

**Note2: About ISD**

When the output current reaches the threshold, the ISD circuit is triggered; the internal reset circuit then turns off the output transistors. To prevent the ISD circuitry from being tripped due to switching noise, it has a masking time. Once the ISD circuit is triggered, the device keeps the output off until power-on reset (POR), is reasserted or the device is set to standby mode by DMODE pins. For fail-safe, please insert a fuse to avoid secondary trouble.

**Back-EMF**

While a motor is rotating, there is a timing at which power is fed back to the power supply. At that timing, the motor current recirculates back to the power supply due to the effect of the motor back-EMF.

If the power supply does not have enough sink capability, the power supply and output pins of the device might rise above the rated voltages. The magnitude of the motor back-EMF varies with usage conditions and motor characteristics. It is no problem to the destruction and the operation of the IC by the back electromotive force, also please fully confirm that there is no malfunction or damage to the peripheral circuit.

**Cautions on Overcurrent Shutdown (ISD) and Thermal Shutdown (TSD)**

The ISD and TSD circuits are only intended to provide temporary protection against irregular conditions such as an output short-circuit; they do not necessarily guarantee the complete IC safety.

If the device is used beyond the specified operating ranges, these circuits may not operate properly; then the device may be damaged due to an output short-circuit.

The ISD circuit is only intended to provide a temporary protection against an output short-circuit. If such a condition persists for a long time, the device may be damaged due to overstress. Overcurrent conditions must be removed immediately by external hardware.

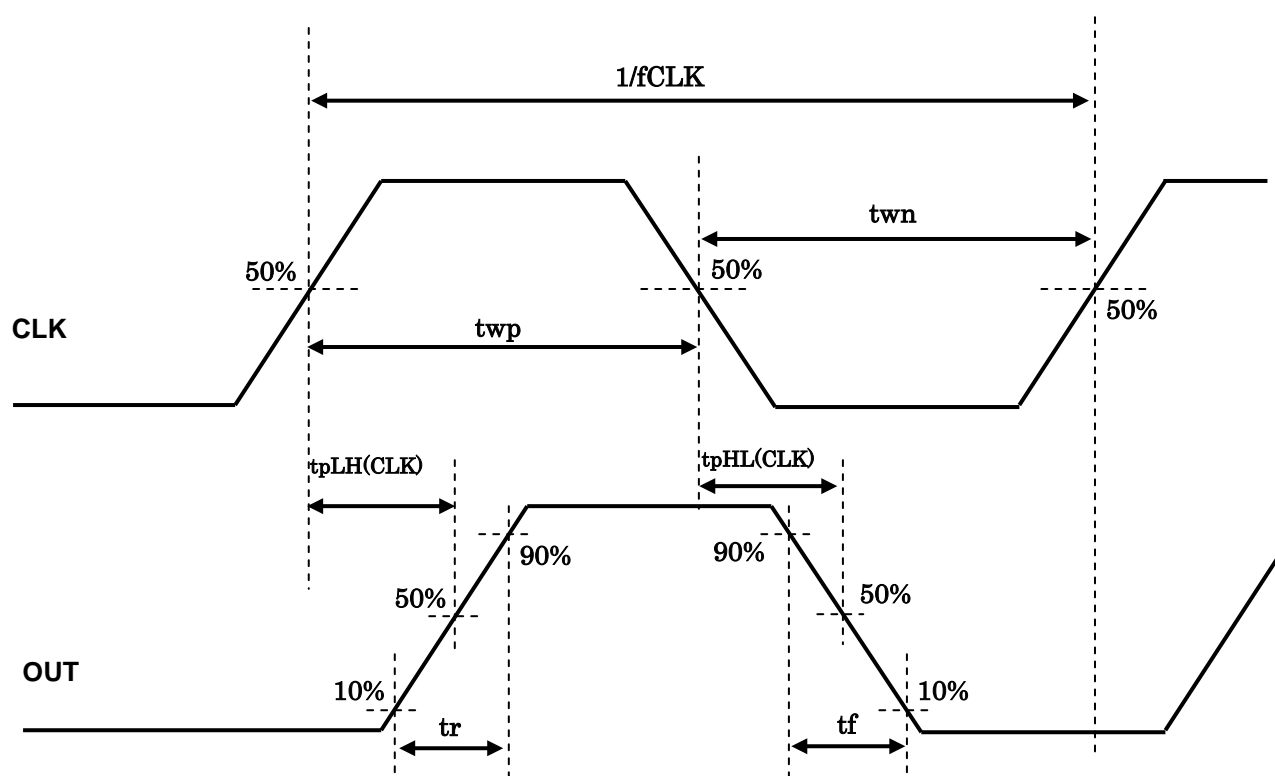

**IC Mounting**

Do not insert devices incorrectly or in the wrong orientation. Otherwise, it may cause breakdown, damage and/or deterioration of the device.

## AC Electrical Specification (Ta = 25°C, VM = 24 V, 6.8 mH/5.7 Ω)

| Characteristics                               | Symbol    | Test condition                                      | Min  | Typ. | Max  | Unit |

## AC Electrical Specification Timing chart

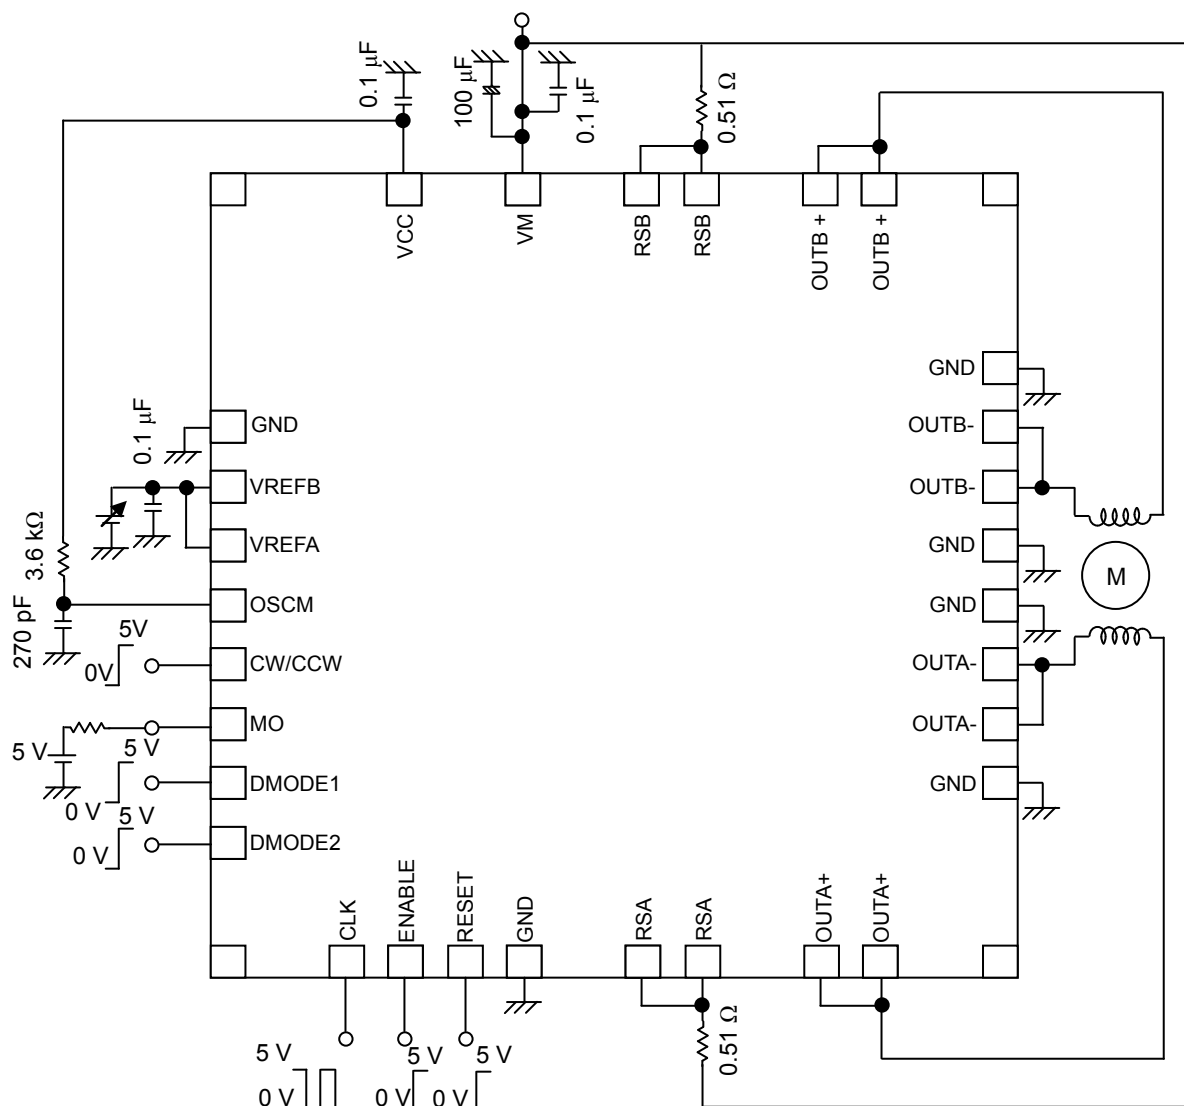

Timing charts may be simplified for explanatory purpose.

## Example Application Circuits

The values shown in the following figure are typical values. For input conditions, see the Operating Ranges.

Note: I will recommend the addition of a capacitor if necessary. The GND wiring must become one point as much as possible-earth.

The example of an applied circuit is for reference, and enough evaluation should be done before the mass-production design.

Moreover, it is not the one to permit the use of the industrial property.

Package Dimensions

(unit: mm)

P-WQFN36-0606-0.50-002

Weight: 0.10 g (typ.)

**Notes on Contents****1. Block Diagrams**

Some of the functional blocks, circuits, or constants in the block diagram may be omitted or simplified for explanatory purposes.

**2. Equivalent Circuits**

The equivalent circuit diagrams may be simplified or some parts of them may be omitted for explanatory purposes.

**3. Timing Charts**

Timing charts may be simplified for explanatory purposes.

**4. Application Circuits**

The application circuits shown in this document are provided for reference purposes only. Thorough evaluation is required, especially at the mass-production design stage.

Toshiba does not grant any license to any industrial property rights by providing these examples of application circuits.

**5. Test Circuits**

Components in the test circuits are used only to obtain and confirm the device characteristics. These components and circuits are not guaranteed to prevent malfunction or failure from occurring in the application equipment.

**IC Usage Considerations****Notes on handling of ICs**

- (1) The absolute maximum ratings of a semiconductor device are a set of ratings that must not be exceeded, even for a moment. Do not exceed any of these ratings. Exceeding the rating(s) may cause device breakdown, damage or deterioration, and may result in injury by explosion or combustion.
- (2) Do not insert devices in the wrong orientation or incorrectly. Make sure that the positive and negative terminals of power supplies are connected properly.  
Otherwise, the current or power consumption may exceed the absolute maximum rating, and exceeding the rating(s) may cause device breakdown, damage or deterioration, and may result in injury by explosion or combustion.  
In addition, do not use any device inserted in the wrong orientation or incorrectly to which current is applied even just once.
- (3) Use an appropriate power supply fuse to ensure that a large current does not continuously flow in the case of overcurrent and/or IC failure. The IC will fully break down when used under conditions that exceed its absolute maximum ratings, when the wiring is routed improperly or when an abnormal pulse noise occurs from the wiring or load, causing a large current to continuously flow and the breakdown can lead to smoke or ignition. To minimize the effects of the flow of a large current in the case of breakdown, appropriate settings, such as fuse capacity, fusing time and insertion circuit location, are required.
- (4) If your design includes an inductive load such as a motor coil, incorporate a protection circuit into the design to prevent device malfunction or breakdown caused by the current resulting from the inrush current at power ON or the negative current resulting from the back electromotive force at power OFF. IC breakdown may cause injury, smoke or ignition. Use a stable power supply with ICs with built-in protection functions. If the power supply is unstable, the protection function may not operate, causing IC breakdown. IC breakdown may cause injury, smoke or ignition.
- (5) Carefully select external components (such as inputs and negative feedback capacitors) and load components (such as speakers), for example, power amp and regulator.  
If there is a large amount of leakage current such as from input or negative feedback capacitor, the IC output DC voltage will increase. If this output voltage is connected to a speaker with low input withstand voltage, overcurrent or IC failure may cause smoke or ignition. (The overcurrent may cause smoke or ignition from the IC itself.) In particular, please pay attention when using a Bridge Tied Load (BTL) connection-type IC that inputs output DC voltage to a speaker directly.

**Points to remember on handling of ICs****Overcurrent detection Circuit**

Overcurrent detection circuits (referred to as current limiter circuits) do not necessarily protect ICs under all circumstances. If the overcurrent detection circuits operate against the overcurrent, clear the overcurrent status immediately.

Depending on the method of use and usage conditions, exceeding absolute maximum ratings may cause the overcurrent detection circuit to operate improperly or IC breakdown may occur before operation. In addition, depending on the method of use and usage conditions, if overcurrent continues to flow for a long time after operation, the IC may generate heat resulting in breakdown.

**Thermal Shutdown Circuit**

Thermal shutdown circuits do not necessarily protect ICs under all circumstances. If the thermal shutdown circuits operate against the over-temperature, clear the heat generation status immediately.

Depending on the method of use and usage conditions, exceeding absolute maximum ratings may cause the thermal shutdown circuit to operate improperly or IC breakdown to occur before operation.

**Heat Radiation Design**

When using an IC with large current flow such as power amp, regulator or driver, design the device so that heat is appropriately radiated, in order not to exceed the specified junction temperature ( $T_j$ ) at any time or under any condition. These ICs generate heat even during normal use. An inadequate IC heat radiation design can lead to decrease in IC life, deterioration of IC characteristics or IC breakdown. In addition, when designing the device, take into consideration the effect of IC heat radiation with peripheral components.

**Back-EMF**

When a motor rotates in the reverse direction, stops or slows abruptly, current flows back to the motor's power supply owing to the effect of back-EMF. If the current sink capability of the power supply is small, the device's motor power supply and output pins might be exposed to conditions beyond the absolute maximum ratings. To avoid this problem, take the effect of back-EMF into consideration in system design.

## RESTRICTIONS ON PRODUCT USE

- Toshiba Corporation, and its subsidiaries and affiliates (collectively "TOSHIBA"), reserve the right to make changes to the information in this document, and related hardware, software and systems (collectively "Product") without notice.
- This document and any information herein may not be reproduced without prior written permission from TOSHIBA. Even with TOSHIBA's written permission, reproduction is permissible only if reproduction is without alteration/omission.
- Though TOSHIBA works continually to improve Product's quality and reliability, Product can malfunction or fail. Customers are responsible for complying with safety standards and for providing adequate designs and safeguards for their hardware, software and systems which minimize risk and avoid situations in which a malfunction or failure of Product could cause loss of human life, bodily injury or damage to property, including data loss or corruption. Before customers use the Product, create designs including the Product, or incorporate the Product into their own applications, customers must also refer to and comply with (a) the latest versions of all relevant TOSHIBA information, including without limitation, this document, the specifications, the data sheets and application notes for Product and the precautions and conditions set forth in the "TOSHIBA Semiconductor Reliability Handbook" and (b) the instructions for the application with which the Product will be used with or for. Customers are solely responsible for all aspects of their own product design or applications, including but not limited to (a) determining the appropriateness of the use of this Product in such design or applications; (b) evaluating and determining the applicability of any information contained in this document, or in charts, diagrams, programs, algorithms, sample application circuits, or any other referenced documents; and (c) validating all operating parameters for such designs and applications. **TOSHIBA ASSUMES NO LIABILITY FOR CUSTOMERS' PRODUCT DESIGN OR APPLICATIONS.**
- **PRODUCT IS NEITHER INTENDED NOR WARRANTED FOR USE IN EQUIPMENTS OR SYSTEMS THAT REQUIRE EXTRAORDINARILY HIGH LEVELS OF QUALITY AND/OR RELIABILITY, AND/OR A MALFUNCTION OR FAILURE OF WHICH MAY CAUSE LOSS OF HUMAN LIFE, BODILY INJURY, SERIOUS PROPERTY DAMAGE AND/OR SERIOUS PUBLIC IMPACT ("UNINTENDED USE").** Except for specific applications as expressly stated in this document, Unintended Use includes, without limitation, equipment used in nuclear facilities, equipment used in the aerospace industry, medical equipment, equipment used for automobiles, trains, ships and other transportation, traffic signaling equipment, equipment used to control combustions or explosions, safety devices, elevators and escalators, devices related to electric power, and equipment used in finance-related fields. **IF YOU USE PRODUCT FOR UNINTENDED USE, TOSHIBA ASSUMES NO LIABILITY FOR PRODUCT.** For details, please contact your TOSHIBA sales representative.
- Do not disassemble, analyze, reverse-engineer, alter, modify, translate or copy Product, whether in whole or in part.
- Product shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable laws or regulations.
- The information contained herein is presented only as guidance for Product use. No responsibility is assumed by TOSHIBA for any infringement of patents or any other intellectual property rights of third parties that may result from the use of Product. No license to any intellectual property right is granted by this document, whether express or implied, by estoppel or otherwise.
- **ABSENT A WRITTEN SIGNED AGREEMENT, EXCEPT AS PROVIDED IN THE RELEVANT TERMS AND CONDITIONS OF SALE FOR PRODUCT, AND TO THE MAXIMUM EXTENT ALLOWABLE BY LAW, TOSHIBA (1) ASSUMES NO LIABILITY WHATSOEVER, INCLUDING WITHOUT LIMITATION, INDIRECT, CONSEQUENTIAL, SPECIAL, OR INCIDENTAL DAMAGES OR LOSS, INCLUDING WITHOUT LIMITATION, LOSS OF PROFITS, LOSS OF OPPORTUNITIES, BUSINESS INTERRUPTION AND LOSS OF DATA, AND (2) DISCLAIMS ANY AND ALL EXPRESS OR IMPLIED WARRANTIES AND CONDITIONS RELATED TO SALE, USE OF PRODUCT, OR INFORMATION, INCLUDING WARRANTIES OR CONDITIONS OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, ACCURACY OF INFORMATION, OR NONINFRINGEMENT.**
- Do not use or otherwise make available Product or related software or technology for any military purposes, including without limitation, for the design, development, use, stockpiling or manufacturing of nuclear, chemical, or biological weapons or missile technology products (mass destruction weapons). Product and related software and technology may be controlled under the applicable export laws and regulations including, without limitation, the Japanese Foreign Exchange and Foreign Trade Law and the U.S. Export Administration Regulations. Export and re-export of Product or related software or technology are strictly prohibited except in compliance with all applicable export laws and regulations.
- Please contact your TOSHIBA sales representative for details as to environmental matters such as the RoHS compatibility of Product. Please use Product in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. **TOSHIBA ASSUMES NO LIABILITY FOR DAMAGES OR LOSSES OCCURRING AS A RESULT OF NONCOMPLIANCE WITH APPLICABLE LAWS AND REGULATIONS.**
