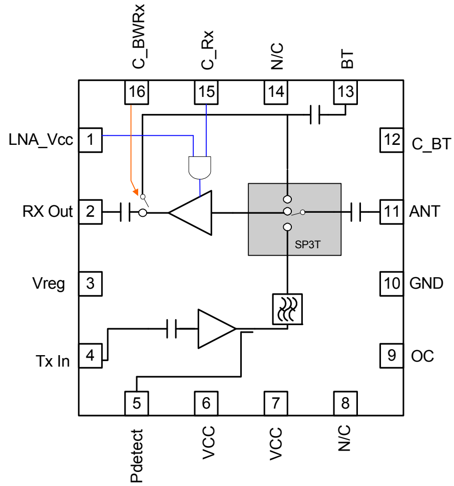
RF5755

2.4GHz TO 2.5GHz 802.11b/g/n WiFi FRONT END MODULE

Package Style: QFN, 16-pin, 3mmx3mmx0.5mm



Functional Block Diagram

Features

- Integrated 2.4GHz to 2.5GHz b/g/n Amplifier, LNA, SP3T Switch, and Power Detector Coupler
- Single Supply Voltage 3.0V to 4.8V
- P_{OUT}=19.5dBm, 11g, OFDM at <3.3% EVM, 22dBm 11b Meeting 11b Spectral Mask
- Low Height Package, Suited for SiP and CoB Designs

Applications

- Cellular handsets
- Mobile devices
- Tablets
- Consumer electronics
- Gaming
- Netbooks/Notebooks
- TV/monitors/video
- SmartEnergy

Product Description

The RF5755 provides a complete integrated solution in a single Front End Module (FEM) for WiFi 802.11b/g/n and *Bluetooth*® systems. The ultra small form factor and integrated matching greatly reduces the number of external components and layout area in the customer application. This simplifies the total Front End solution by reducing the bill of materials, system footprint, and manufacturability cost. The RF5755 integrates a 2.4GHz Power Amplifier (PA), Low Noise Amplifier (LNA), power detector coupler for improved accuracy, and some filtering for harmonic rejection. The RF5755 is capable of receiving WiFi and *Bluetooth*® simultaneously. The device is provided in a 3mmx3mmx0.5mm, 16-pin package. This module meets or exceeds the RF Front End needs of IEEE 802.11b/g/n WiFi RF systems.

Ordering Information

RF5755SQ	Standard 25 piece bag
RF5755SR	Standard 100 piece reel
RF5755TR7	Standard 2500 piece reel
RF5755PCK-410	Fully Assembled Evaluation Board with 5 loose sample pieces

Absolute Maximum Ratings

Parameter	Rating	Unit
DC Supply Voltage (Continuous with No Damage)	5.4	V
DC Supply Current	500	mA
Full Specification Temp Range (Full Spec. Compliant)	-10 to +70	°C
Extreme Operating (Reduced Performance)	-40 to -10 +70 to +85	°C
Storage Temperature	-40 to +150	°C
Antenna Port Nominal Impedance	50	Ω
Maximum Tx Input Power into 50Ω Load for 11b/g/n (No Damage)	0	dBm
Maximum Rx Input Power (No Damage)	0	dBm
Moisture Sensitivity	MSL2	

Caution! ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EUDirective2002/95/EC (at time of this document revision).

Parameter	Specification			Unit	Condition
	Min.	Typ.	Max.		
2.4GHz Transmit Parameters					
Compliance					IEEE802.11b, IEEE802.11g, FCC CFG 15.247, .205,.209, EN, and JDEC
Nominal Conditions					Specifications must be met across V_{CC}, V_{REG}, and Temperature; unless otherwise specified.
Frequency	2.4		2.5	GHz	
Power Supply	3.0	3.3	4.2	V	PA nominal voltage supply (V_{CC})
V_{REG} Voltage					
ON	3.0	3.1	3.2	V	PA in "ON" state
OFF		0.00	0.20	V	PA in "OFF" state
Output Power					
11g	18	18.5		dBm	54Mbps, OFDM 54Mbps, $V_{CC}\geq3.0V$
	19	19.5		dBm	54Mbps, OFDM 54Mbps, $V_{CC}\geq3.3V$
11b	20	22		dBm	11Mbps, CCK, $V_{CC}\geq3.0V$
EVM		3.3	4.0	%	$P_{OUT(g)}$=Rated Output Power, 54Mbps OFDM, 50Ω, see note 1
Adjacent Channel Power					$P_{OUT(b)}$=20dBm 1Mbps CCK, note 2
ACP1		-36	-33	dBc	$V_{CC}\geq3.3V$, meeting 11b spectral mask requirements
ACP2		-56	-51	dBc	
Gain	26	30	34	dB	
Gain Variation Slope					At rated power and a given supply voltage, room temp
Range	3.0		4.2	V	
V_{CC} (Average)			0.5	dB/V	
V_{CC} (Instantaneous)			1	dB/V	
Frequency	-0.5		+0.5	dB	2.4GHz to 2.5GHz
Over Temperature	-1.5		+1.5	dB	
Typical Input Power					
11g		-9		dBm	
11b		-5		dBm

.

Pin	Function	Description
1	LNA VDD	Voltage supply for the LNA.
2	RX OUT	Receive port for 802.11b/g band. Internally matched to 50Ω. DC block provided.
3	VREG	Regulated voltage for the bias control circuit, and the Tx control port of the SP3T which is also tied to this pin. An external bypass capacitor may be needed on the V_{REG} line for decoupling purposes.
4	TX	RF input for the 802.11b/g PA. Input is matched to 50Ω and DC block is provided.
5	PDETECT	Power detector voltage for Tx section. PDET voltage varies with output power. May need external decoupling capacitor for noise bypassing. May need external circuitry to bring output voltage to desired level.
6	VCC	Supply voltage for the PA.
7	VCC	Supply voltage for the PA.
8	N/C	No connect.
9	OC	Open Circuit.
10	GND	Ground.
11	ANT	Port matched to 50Ω and is DC blocked internally.
12	C_BT	*Bluetooth*® switch control pin. See truth table for proper level.
13	BT	RF bidirectional port for *Bluetooth*®. Input is matched to 50Ω and DC block is provided.
14	N/C	No connect.
15	C RX	Receive switch control pin. See switch truth table for proper level.
16	C_BWRX	SPST switch control pin. (Simultaneous WiFi and BT receive.) See truth table for proper level.

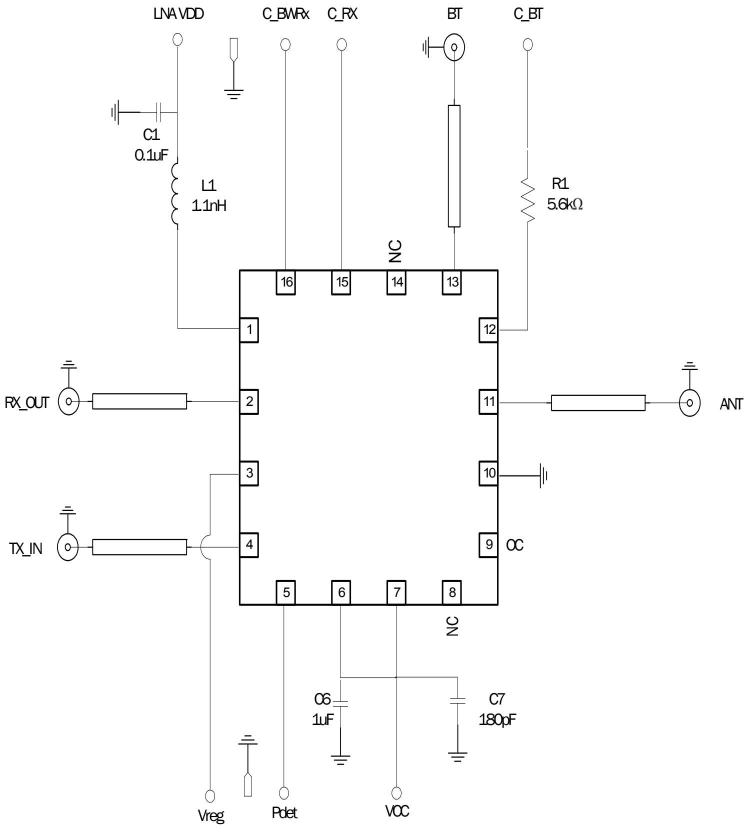
Evaluation Board Schematic



Theory of Operation

The RF5755 Front End Module (FEM) is designed for WiFi applications in the 2.5GHz ISM band. It can be applied in many portable applications such as handsets, personal media players, and portable battery power equipment. This highly integrated module can be connected directly to the battery without additional voltage regulators.

WiFi TRANSMIT MODE

The RF5755 requires a single positive supply (V_{CC}), a positive supply for switch controls, and a regulated supply for the V_{REG} to maintain nominal bias current. The RF5755 transmit path has a typical gain of 27dB from 2.4GHz to 2.5GHz, and delivers 20dBm typical output power under 54Mbps OFDM modulation and 23dBm under 1Mbps 11b modulation. The RF5755 contains basic filter components to produce a bandpass response for the transmit path. Due to space constraints inside the module, filtering is limited to a few resonant poles and additional filters may be required depending upon the end-user's application. While in transmit mode, the active components are the power amplifier (PA) and the Tx branch of the SP3T switch. Refer to the logic control table for proper settings.

Tx Biasing Instructions

- Connect the Tx input (pin-4) to a signal generator and a spectrum analyzer at the antenna output (pin-11).
- Set V_{CC} to 3.3V with V_{REG} set to 0V.
- Turn V_{REG} on and set voltage to 3.1V. V_{REG} controls the current drawn by the PA and it should quickly reach a quiescent current of approximately 90mA±20mA. Care must be exercised not to exceed 3.5V on the V_{REG} pin or the part may be damaged.
- Control bias to the transmit branch of the SP3T switch is tied directly to $V_{REG.}$
- The SP3T controls for the off branches (C_RX and C_BT) must be set to a logic "low" (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic "high" the performance of the PA will degrade significantly. Likewise, unused RF ports must be terminated in 50Ω to simulate actual system conditions and prevent RF signals from coupling back to the PA.
- Turn RF on.

WiFi RECEIVE MODE

Within the frequency band of operation 2.4GHz to 2.5GHz, the RF5755 WiFi receive path has a typical gain of 16dB and a NF of 2.1dB with about 10mA of current. In Rx mode, only the Rx branch of the SP3T and the LNA are active. Refer to the logic control table for proper settings.

Rx Biasing Instructions

- Connect the Rx input (ANT/pin-11) to a signal generator and a spectrum analyzer at the Rx output (pin-2). A VNA may be used as well.
- Turn the LNA bias on (pin-1) and set the voltage to 3.3V.
- Set C_RX (pin-15) high. This turns on the receive branch of the SP3T.
- The SP3T controls for the off branches (V_{REG} and C_BT) must be set to a logic "low" (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic "high" the performance will degrade. It is recommended to terminate unused RF Ports in 50Ω.
- Set the control bias for the SPST switch (C_BWRX/pin-16) "low" during WiFi Rx only mode.
- Turn RF on.

WiFi and *BLUETOOTH*® RECEIVE (SIMULTANEOUS MODE)

The RF755 WiFi and *Bluetooth*® receive circuits were specifically designed to address issues of simultaneous operation. In this mode both signals can be received at the same time when the C_BWRX (pin-16) is set high. The typical gain for each RF path is approximately 13dB and a NF of 3dB. During simultaneous mode the active components are the LNA, the SPST switch, and only the Rx branch of the SP3T. Refer to the logic control table for proper settings.

Simultaneous Mode Biasing Instructions

- Connect the RF input (ANT/pin-11) to a signal generator and a spectrum analyzer at the RX (pin-2) and BT (pin-13) RF ports. A multiport VNA may be used as well.
- Turn the LNA bias on (pin-1) and set the voltage to 3.3V.
- Set C_RX (pin-15) and C_BWRX (pin-16) high. This turns on the receive branch of the SP3T and the SPST switch.
- The SP3T controls for the off branches (V_{REG} and C_BT) must be set to a logic "low" (0.2V max) or grounded. In the event that one of these branches is left floating or in a logic "high" the performance will degrade. It is recommended to terminate unused RF Ports in 50Ω.
- Turn RF on.

BLUETOOTH® MODE

The RF755 *Bluetooth*® only mode is implemented through the SP3T switch by setting C_BT "high." Typical insertion loss is about 1.2dB.

Bluetooth® Biasing Instructions

- Connect the RF input (ANT/pin-11) to a signal generator and a spectrum analyzer at the BT (pin-13) RF port. A VNA may be used in place of the signal generator and SA.
- Set C_BT (pin-12) "high." This turns the *Bluetooth*® branch of the SP3T switch on.
- The SP3T controls for the off branches (V_{REG} and C_RX) must be set to a logic "low" (0.2V max) or grounded. Do not leave floating.
- Terminate unused RF Ports in 50Ω.
- Turn RF on.

APPLICATION CIRCUIT AND LAYOUT RECOMMENDATIONS

The RF5755 integrates the matching networks and DC blocking capacitors for all RF ports. This greatly reduces the number of external components and layout area needed to implement this FEM. Typically only a total of four external components are required to achieve nominal performance. However, depending on board layout and the many noise signals that could potentially couple to the RF5755, additional bypassing capacitors may be required to properly filter out unwanted signals that might degrade performance.

The LNA bias components consist of an inductor and a decoupling capacitor. The inductor value is critical to optimize NF and return loss at the Rx output. For best performance and trade off between critical parameters such as NF, Gain, and IP3, the total inductance including board trace should be approximately 1.2nH. The 5.6kΩ series resistor for the *Bluetooth*® control line helps to prevent unwanted signals from coupling to this pin. The resistor should be placed as close as possible to the package pin. The last component needed in the application circuit is a low frequency bypass capacitor on the V_{CC} line. In general, it is good RF practice to have proper decoupling of supply lines to filter out noise. Occasionally, depending on the level of coupling or parasitics of the board, a high frequency bypass capacitor must be added as well.

In order to optimize performance for both the Transmit and Receive paths, a good layout design must be implemented. As it is well know in the RF world, any mismatch and off port loading affects performance. To minimize this effect and have a more robust layout, all RF traces must be 50Ω. Adequate grounding along the RF traces and on the FEM ground slug must be exercised. This will minimize coupling and provide good thermal dissipation when the PA is operating at high power. For reference, the RFMD evaluation board uses 9 thermal ground vias (hole/capture pad 12/22mil) on the ground slug. Additionally, if space permitted, V_{CC} and control lines must be isolated from each other with ground vias in between them. RFMD evaluation board gerbers are available upon request.
