### Product Description

RFMD's RFCA8818 is a low-noise, linear high performance GaAs MESFET MMIC amplifier. The RFCA8818 contains two amplifiers for use in wideband push-pull CATV amplifiers requiring excellent second order performance. The second and third order non-linearities are greatly improved in the push-pull configuration.

## Pin Names and Descriptions

Pin	Name	Description
1	RFIN	Device 1, RF input pin. This pin is internally DC blocked. An external DC blocking capacitor is not required.
2, 3, 6, 7	GND	Connection to ground. use via holes for best performance to reduce lead inductance as close to ground leads as possible.
4	RFIN	Device 1, RF input pin. This pin is internally DC blocked. An external DC blocking capacitor is not required.
5	RFOUT / VCC	Device 2, RF output and bias pin. Because DC is present on this pin, a DC blocking capacitor suitable for the frequency of operation should be used in most applications. For biasing, only an RF choke is needed.
8	RFOUT / VCC	Device 1, RF output and bias pin. Because DC is present on this pin, a DC blocking capacitor suitable for the frequency of operation should be used in most applications. For biasing, only an RF choke is needed.
EPAD	GND	Exposed area on the bottom side of the package must be soldered to the ground plane of the board for optimum thermal and RF performance. Several vias should be located under the EPAD as shown in the recommended land pattern.
