Insulation Resistance (note 4)			1,000 megohms at 500) Vdc, between each pin and	d case				
Dielectric Strength (note 4)		1,000	Vrms at 60 Hz at sea level, b	etween case and all pins c	onnected together				
Environmental Data									
Ambient Temperature Range, Operating			-55	°C to +125°C					
Altitude			80,000) feet maximum					
Shock Resistance			10	0 G's, 6 ms.					
Vibration Resistance, Sinusoidal		Z & Y E	nclosure: 30 G's, 33-300	0Hz.; X & W Enclosure:	20 G's, 33-3000Hz.				
Mechanical Data									
Approximate Weight			2.5 0	z. (71g) Max.					

NOTES

1. The accuracy requirement applies to any combination of operating temperature and voltage. Add ±10ms for timing less than one second.

2. Recycle time to assure that the next timing cycle will be completed. Units can be recycled during timing and after time-out:

Delay on operate models - Power must be OFF the input at least 10 ms. Delay on release models - Power must be ON the control terminal at least 10 ms. 3. Transient specifications are based on a maximum duty cycle of 1/50.

4. All wired terminals must be connected together during this test. Dielectric withstanding voltage and insulation resistance are measured between all mutually insulated wired terminals and between all these terminals and case.

5. Inductive loads must be diode suppressed.

Product Facts

Qualified to:

MIL-PRF-83726/28 MIL-PRF-83726/29 MIL-PRF-83726/30 MIL-PRF-83726/31

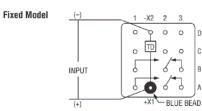

- Fixed delay on operate, fixed delay on release, adjustable delay on operate & adjustable delay on release
- Meets or exceeds electrostatic discharge MIL-STD-1686 Class Non-Sensitive
- Welded hermetically sealed enclosure occupies about 1 in³ (16.4 cm³)
- 10A, 2 form C (DPDT) output contacts

Timing Action and Terminal Wiring

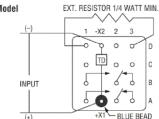

Delay On Operate:

The time delay starts on the application of input voltage to X1-X2. The timing circuit energizes the end of the time delay period.

20-30VD INPUT VOLTAGE +X1 / -X2 INPUT OFF ENERGIZED TIME OUTPUT DEENERGIZED DELAY RELAY

Adjustable Model

TD2 series time delay relays are available for delay on operate or delay on release operation. Either can be supplied as fixed or resistor adjustable types. Both military and commercial versions are offered.

These products consist of solid state timing circuits controlling our FCA-210 series relays, providing 2 Form C (DPDT) output contacts rated 10 amps. The internal timing circuit uses an R/C controlled oscillator with a programmable digital pulse counter, gating a semiconductor switch to operate the relay. Timing is independent of whether the controlling voltage is a ramp or step function.

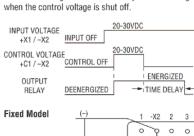

INITIAL DRAWN

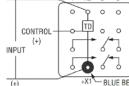

LTR

А

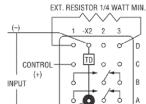

For the adjustable models the user specifies a one decade range in seconds, within which the required delay will be set. This range is programmed internally at the time of manufacture. The required delay is obtained by calculating the oscillator timing resistor as

Delay On Release: The input voltage is continuous to X1-X2. When the control voltage is applied to C1-X2 the timing circuit and the relay are both energized. The time delay starts

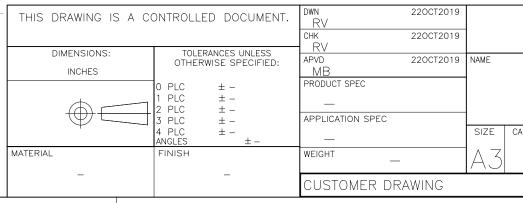

Adjustable Model

Terminal designations shown in the diagrams above are for reference only. They do not appear on the relay header.

- follows and connecting it externally to terminals 1D -3D as below.
- $R_{EXT} = [(T_1 / T_0) 1] 100K$ Ohms
- $T_0 =$ Minimum time of selected decade in seconds.
- T1 = Required time delay. EXAMPLE
- Selected Range = 3-30 sec Required Time = 15 sec
- R_{EXT} = [(15/3) -1] 100K = 400K
