

Wire-to-Wire Splicing

SolderSleeve wire splices

Applications

In-line wire splices.

Features and benefits

- Transparent polyvinylidene fluoride or polyolefin sleeve provides encapsulation, inspectability, strain relief, and insulation.
- Prefluxed solder preform provides a controlled soldering process.
- One-piece design makes installation easy and lowers the installed cost.
- With one or two wires per end, the NAS 1744 splices meet 75,000-ft (22,000-m) altitude immersion requirement.
- Thermochromic temperature indicator in the NAS splices facilitates termination and inspection.
- UL and CUL recognized

Description

Data sheet (CWT)

Visit our website at www.tycoelectronics.com**Product options**

Product series	Minimum wire temperature rating	Maximum operating temperature	Intended application environment
CWT	85°C	125°C	Splashproof
D-110	125°C	150°C	Splashproof
D-1744 (NAS 1744)	125°C	150°C	Immersion sealed

Product selection process

From the Product Options table above, select the product series appropriate for your application based on the temperature rating and sealing performance required.

If the application has only one size of wire per side and no more than two wires on either side:

1. Determine wire gauge sizes for both sides of splice.
2. Determine number of wires (one or two wires) for each side of splice.
3. Select part numbers from the appropriate table:
 - For CWT series (low temperature):
Use Table A on page 8-6.
 - For D-110 series (splashproof):
Use Table B on page 8-7.
 - For D-1744 series (immersion sealed):
Use Table C on page 8-9.

If the application has more than one size of wire per side or more than two wires on either side (or if you prefer to work with CMA or mm² sizes):

1. Turn to "CMA/mm² Calculation" on page 8-10 and use the workspace there to calculate the total cross section to be spliced.
2. Use Table E on page 8-11 to select the sleeve recommended for that cross section.

Notes

- While all combinations listed will provide satisfactory solder joints, the degree of strain relief obtained depends on the outer diameter of the wires being joined. Refer to Table E for the recommended size ranges for the sleeves.
- Wires 16 AWG (1.21 mm²) and larger, and wires having more than 19 strands, should be pretinned prior to splicing, to obtain the optimum solder joint quality.
- Part selection for wires 26 AWG (0.15 mm²) and smaller is covered at the end of Table B on page 8-8.

Wire-to-Wire Splicing

SolderSleeve wire splices (cont'd.)

CMA/mm² Calculation

To calculate the total circular mil or mm² area of the conductors to be terminated in a single splice, follow these steps:

1. Choose either CMA or mm² as your unit of measure for selection purposes and continue to use it for all your selection criteria.
2. In the workspace below, list the CMA or mm² for each conductor that will go into the same splice. (To assist you, Table D on this page provides the CMA of typical conductors.)
3. Add together the values listed in the workspace below to obtain the total area.
4. From Table E on the next page, select the part number recommended for the total CMA or mm² you have calculated.
5. Refer to the examples on this page for further clarification.

CMA/mm² Examples (mm/in)

One-to-One Wire Splice

Total CMA = 3180

Total mm² = 1.59

Correct part number selection from Table E
(based on CMA/mm² and nominal jacket wire OD)
= CWT-9002 or D-110-41 or D-1744-02.

Multiwire Splice

Total CMA = 3408

Total mm² = 1.71

Correct part number selection from Table E
(based on CMA/mm² and nominal jacket wire OD)
= CWT-9003 or D-110-0181 or D-1744-03.
