PCI/PXI-9527

24-Bit High-Resolution Dynamic Signal Acquisition and Generation Modules

Introduction

The PCI/PXI-9527 is a high-performance, 2-CH analog input and 2-CH analog output dynamic signal acquisition module. This module is specifically designed for audio testing, acoustic measurement, and vibration analysis applications.

The ADLINK PCI/PXI-9527 features two 24-bit simultaneous sampling analog input channels. The 24-bit sigma-delta ADC provides a sampling rate up to 432 kS/s at high resolutions, making it ideal for higher bandwidth dynamic signal measurements. The sampling rate can be adjusted by setting the module DDS clock source to an appropriate frequency. All channels are sampled simultaneously and accept an input range from ±40 V to ±0.316 V. The PCI/PXI-9527 analog input supports software selectable AC or DC coupling and 4 mA bias current for integrated electronic piezoelectric (IEPE) sensors.

The ADLINK PCI/PXI-9527 also has two channels of 24-bit resolution, high fidelity analog output. The outputs occur simultaneously at software programmable rates up to 216 kS/s. A software programmable output range of ±0.1 V, ±1 V, and ±10 V is available on the output channels.

■ Dynamic Signal Assistant

ADLINK's Dynamic Signal Assistant is a ready-to-run software utility designed for dynamic signal acquisition modules, such as the PCI/PXI-9527. This software provides a windows-based configuration interface for setting parameters, in addition to a real-time visualized data display on the screen. An instrument-like user interface is also provided for basic waveform generation. The Dynamic Signal Assistant can also log data acquired from hardware modules. With the Dynamic Signal Assistant, signal acquisition and generation can be performed in just a few minutes without any programming effort.
